As professoras rapidamente responderam: “As abinhas”. A formadora acrescentou: “Outra pergunta, eu preciso deixar abas em torno de todo ele?”, as professoras sinalizaram que não e, então, foi perguntado por que não e uma respondeu: “Porque tu vai fechar. Só que na dúvida de onde deixa, tu deixa em todas e vai cortando depois”. Esta estratégia relatada pela professora é interessante e, embora tenhamos incentivado o grupo a pensar nos locais que necessitavam de abas, as professoras preferiram deixar todas as abas possíveis e recortar as que sobrassem na hora da colagem.

Depois de colados, todas as professoras estavam com seus pentaedros não regulares, como pode ser visto na Imagem 2. Então explicamos que o quebra-cabeça resultante da atividade que construíram até aquele momento consistia em juntar duas peças construídas, para então formar um tetraedro regular, ou seja, uma pirâmide de base triangular. Para facilitar,

mostramos um tetraedro feito de acrílico, para as professoras entenderem a solicitação. Rapidamente, elas juntaram-se em duplas e começaram a trabalhar.

Imagem 2 – Término na montagem

Fonte: das autoras

Em duplas, elas ficaram virando as peças a fim de montarem o tetraedro, mas esse processo não ocorreu rapidamente e, algumas duplas se mostraram desmotivadas. Quando a primeira dupla encontrou a solução, conforme a Imagem 3, as demais se entusiasmaram e tentaram também resolver o desafio.

Sobre essa mesma atividade, Lorenzato (2010) faz uma ressalva sobre a importância de tomar cuidado com aquilo que nos parece simples, óbvio, fazendo referência a um “Como são só duas peças, a solução parece ser fácil, mas a experiência tem revelado que não é, a não ser para quem já a conhecia”.

Imagem 3 – Solução encontrada

Fonte: das autoras

Após a conclusão da proposta pelos pares, passamos à sua discussão, em grande grupo. Um dos aspectos que mereceu particular atenção na discussão foi a forma de a propor aos alunos dos Anos Iniciais. Algumas professoras trouxeram sugestões para adaptação da tarefa para esses anos, como, por exemplo, trazer a planificação pronta ou utilizar o Tetraedro em acrílico existente na biblioteca de modo a permitir aos alunos visualizarem o que deveriam fazer. Algumas professoras mostraram preocupação com o grau de dificuldade questionando se seus alunos conseguiriam realizar a atividade. Uma das professoras mostrou-se decidida a realizar com os seus alunos e afirmou: “Mas eu vou fazer”. A determinação dessa professora, que leciona no 3.º ano, acabou por encorajar e influenciar as colegas, que pareciam não acreditar que os seus alunos fossem capazes de resolver a tarefa. Por fim, ficou decidido dedicar um momento ao relato da realização desta atividade experimental nas aulas pelas professoras que tivessem oportunidade de propô-la.

A atividade do Submarino consiste na construção de um mini submarino, utilizando materiais alternativos, tais como: garrafa pet, tampa de caneta esferográfica e plasticina. Na formação, optou-se por não fornecer roteiro do experimento mas um conjunto de instruções produzidas pela própria formadora, os quais foram previamente pensados. Também é importante destacar que a atividade foi realizada no Laboratório de Física da instituição, o qual era desconhecido por muitas participantes, até o momento da formação.

Sendo assim, inicialmente orientou-se as professoras a montarem seus “submarinos” em duplas: deveriam acoplar uma pequena esfera de plasticina na extremidade da tampa da caneta, como pode ser observado na Imagem 4.

Imagem 4 – Construção do “submarino”

Fonte: das autoras

Cada dupla foi instruída a colocar o submarino a “navegar” dentro da garrafa com água e a tapar a garrafa com a respectiva tampa. Posto isto, a formadora solicitou às duplas para pressionarem a garrafa e observarem o que acontecia. O fenômeno pode ser observado como ilustra a Imagem 5.

Observou-se o submarino afundando.

Imagem 5 – “Submarino” afundando

Fonte: das autoras

O grupo ficou maravilhado quando a primeira professora conseguiu afundar seu submarino, motivando todas as restantes a alcançarem o mesmo objetivo. À medida que cada uma fazia a sua tentativa, foram surgindo as mais variadas reações e discussões, algumas das quais não tinham sido previstas. Alguns dos submarinos teimaram em não afundar, para surpresa de todas.

Algumas participantes não haviam vedado bem a tampa na hora de fechar a garrafa, o que comprometeu o resultado. Contudo, logo que perceberam esse fato, fecharam bem a garrafa e conseguiram fazer funcionar os seus submarinos. Uma das professoras, entretanto, não conseguiu fazer seu submarino afundar, o que deixou todo o grupo intrigado, uma vez que parecia que todos os passos tinham sido corretamente executados.

O grupo começou então a dar sugestões, procurando ajudar a colega a alcançar o objetivo proposto. A primeira sugestão apresentada foi a de diminuir a quantidade de platicina, no entanto, após a experimentação, esta hipótese rapidamente foi rejeitada. Em seguida, foi sugerido aumentar a esfera de massinha, o que feito pela professora e levou ao funcionamento do submarino. Deste modo, as professoras rapidamente perceberam que o tamanho da esfera tinha um papel decisivo no resultado desta experiência.

Assim, a discussão iniciou-se de imediato em torno do tamanho da esfera, na forma como determinar o tamanho ideal e como explicar, aos alunos, qual seria a dimensão ideal, na hora de realizarem a experiência. O grupo rapidamente concluiu que a melhor opção era deixar os alunos fazerem as suas tentativas e, nos casos em que não funcionasse, fossem eles próprios a levantar as hipóteses e a colocá-las em prática, tal como ocorreu na formação com as professoras.

Uma das professoras que estava decidida a realizar a experiência em sala de aula com seus alunos, argumentou: “Eu acho que o mais legal é isso, né, por que isso não desceu?”, referindo-se a permitir que os alunos descobrissem a relação do tamanho da esfera.

Após todas conseguirem realizar o experimento, a formadora questionou as professoras sobre as razões do afundamento do submarino. Uma professora opinou, dizendo: “Tem a ver com a pressão, talvez?”. A formadora questionou as participantes sobre o que entendiam por pressão, obtendo duas respostas: “É ar... não é alguma coisa com o ar?” e “É fazer força”. Assim, por meio de sucessivas questões, a formadora foi conduzindo as professoras ao conceito de pressão envolvido na situação referida, permitindo que elas se dessem conta de que, ao apertarem a garrafa plástica, exerciam pressão nela e, conseqüentemente, na água ali dentro, o que acarretava a compressão do ar presente no interior da tampa de garrafa. Com o ar comprimido, a água acabava ocupando uma parte do interior da tampa de garrafa, deixando o conjunto mais denso e fazendo com que o submarino afundasse. Quando se deixava de apertar a garrafa, o sistema voltava à organização inicial, fazendo com que a tampa voltasse a flutuar.

As professoras ficaram fascinadas com a explicação, seguindo na discussão do submarino. Uma delas questionou: “E se eu virar a garrafa de cabeça para baixo?”. Sem necessitar da intervenção da formadora, outra colega respondeu: “Vai entrar água na tampinha, não vai dar certo”. Não convencida, a professora decidiu testar no seu submarino, confirmando a colocação de sua colega e concordando com ela.

Outra professora aproveitou a situação para perguntar “Mas e como é que funciona quando eu vou nadar, eu não consigo nadar embaixo da água, eu subo logo?”. Juntas, as professoras foram criando hipóteses envolvendo o oxigênio e a densidade do corpo humano, estabelecendo, dessa forma, relações com outras áreas, em particular com Biologia.

O grupo presente na formação convergiu para a possibilidade de explorar a construção do submarino em diferentes anos de escolarização, uma vez que ela não apresenta etapas difíceis de serem realizadas pelas crianças. Ademais, a explicação dos fenômenos envolvidos pode ser facilmente adaptada e explorada, uma vez que o experimento permite visualizar cada um dos processos. Por exemplo, quando a garrafa é apertada, se o submarino for construído com uma tampinha transparente, as crianças poderão ver a água empurrando o ar que está lá dentro. Então, mesmo que não entendam os conceitos de pressão e densidade com clareza, perceberão que o submarino afunda somente com a entrada da água nele.

De acordo com Carvalho *et al.* (1998), o ensino de Física constitui-se como um desafio para os Anos Iniciais de escolarização, o qual não deve ser negligenciado. Segundo esse autor, “devemos trabalhar com problemas físicos que os alunos possam discutir e propor soluções compatíveis com seu desenvolvimento e sua visão do mundo, mas em um sentido que os levará, mais tarde, ao conhecimento científico” (1998, p. 13).

A última atividade a ser relatada neste trabalho, trata-se Leite Psicodélico é uma atividade muito simples, que consiste em colocar leite em um recipiente, como um prato, pingar corantes alimentícios sobre o leite e pingar detergente sobre o corante, para observar uma mistura de cores que acontece. Para o desenvolvimento da atividade experimental, as professoras foram conduzidas ao Laboratório de Química da instituição, sendo tomados alguns cuidados que o ambiente necessita, tais como o uso do jaleco.

Para o desenvolvimento na formação, optamos por entregar um roteiro e permitir que as professoras o desenvolvessem de forma autônoma. Nessa atividade, os grupos formados mostraram-se mais proativos do que em atividades anteriores desenvolvidas, provavelmente por estarem menos receosos quanto ao ambiente e materiais do Laboratório.

Durante o desenvolvimento da atividade (IMAGEM 6), algumas professoras relataram já conhece-la, mas não sabiam explicar o fenômeno. As professoras também fizeram algumas adaptações, utilizando, por exemplo, um palito para trabalhar com o detergente, o que facilita o manuseio dos pingos pelas crianças.

Imagem 6 – Leite psicodélico

Fonte: das autoras

A atividade consiste em verificar a solubilidade de substâncias polares e apolares, sendo o detergente um agente tenso ativo, capaz de inibir a tensão superficial existente entre o leite e o corante. Durante a explicação, as professoras entenderam que explicar esse fenômeno químico seria um tanto abstrato para as crianças e questionaram se essa atividade não poderia ser feita a título de curiosidade.

A formadora incentivou-as a desenvolverem a atividade, buscando uma explicação com palavras alternativas. Assim, à medida que os alunos fossem avançando, poderiam compreender com mais facilidade o ocorrido. Além disso, foi sugerida a

possibilidade de desenvolver outras atividades experimentais que envolvessem a solubilidade de substâncias, como a mistura de óleo com água, com o intuito de facilitar o entendimento de substâncias polares e apolares.

No último encontro da formação, teve lugar o relato das professoras sobre as atividades experimentais que estas desenvolveram com as suas turmas. Nessa oportunidade, percebemos que até aquele momento, a atividade do Submarino já havia sido explorada por uma professora numa turma do 4.º ano e a atividade do Leite Psicodélico havia sido explorada pela professora do último ano da Educação Infantil em conjunto com uma professora do 1.º ano do Ensino Fundamental.

De acordo com a professora do 4.º ano, para a construção do Submarino, toda a turma foi levada ao Laboratório de Física. A professora destacou o importante contributo de uma monitora para auxiliá-la, que esteve presente durante a realização da atividade experimental. Cada aluno fez o seu submarino, e a professora comentou que muitas hipóteses foram levantadas pela turma durante a construção do experimento, as quais foram confirmadas ou refutadas durante a prática. Terminado, a professora solicitou um relatório e surpreendeu-se com as constatações feitas pelos alunos, como percebemos na fala dela: “Depois nós fizemos um relatório, é bem interessante pra ver o vocabulário que eles usam. Como eles conseguem no quarto ano estabelecer uma sequência lógica, vai crescendo o vocabulário deles”.

Nesse sentido, Carvalho *et al.* (1998) explicam-nos que “quando os alunos são incitados a contar com resolveram o problema, começam a tomar consciência das coordenações dos eventos, iniciando-se a conceitualização”. Dessa forma, para estes autores, é imprescindível o registro da atividade experimental na forma de desenho e escrito.

Já a professora da Educação infantil, ao descrever a estratégia utilizada para desenvolver a prática do Leite Psicodélico com os alunos, revelou que avisou a turma no dia anterior, deixando-os curiosos para a “surpresa” que teriam no dia seguinte. Tal estratégia é amparada por Carvalho *et al.* (1998), os quais entendem que as atividades experimentais devem ser introduzidas de forma a despertar a curiosidade e o interesse dos alunos.

De acordo com a professora, a atividade do Leite Psicodélico, foi realizada integralmente pelos alunos, dando-lhes oportunidade para manusearem os materiais, o que os deixou a todos maravilhados, de tal forma que a experiência foi repetida várias vezes, até se esgotar o leite. A participante relatou ainda que estava muito preocupada com a explicação da atividade, mas que os alunos não se detiveram na teoria apresentada, pois estavam preocupados em fazer e mexer no experimento.

Interessante notar que a professora não utilizou o Laboratório de Ciências, tendo realizado a atividade mencionada na sala de aula. A professora explicou a razão pela qual decidiu não levar os seus alunos até ao laboratório. Por um lado a turma é muito numerosa, cerca de 28 alunos, por outro lado, está situada num espaço muito distante do prédio onde está situado o laboratório, o que dificultava a deslocação de todos os alunos com uma única professora. As palavras da professora deixaram evidente a possibilidade de desenvolver atividades experimentais com as crianças, mesmo na sala de aula. Durante o relato, ela revelou uma estratégia importante frente a uma turma numerosa, como pode ser percebido na fala dela: “Eles são muito da experiência, de fazer alguma coisa diferente, mas quando é muita gente e cada um precisa experimentar, meio que perde um pouco. Eu tentava geralmente pegar os mais quietinhos e deixar os outros só observando porque, depois que os mais agitados fazem, eles não querem prestar atenção, perdem o foco. Mas eles ficavam curiosos”.

Esta professora encontrou uma forma de manter a atenção dos alunos e possibilitar a realização do experimento por todos. Nesse momento, pudemos perceber que várias professoras mostravam uma expressão de aprovação do que esta professora dizia, entendendo-a como uma sugestão útil a todas, especialmente nos experimentos mais demorados.

Dando continuação aos relatos das experiências realizadas, uma professora do 1.º ano do Ensino Fundamental relatou ter explorado a atividade do leite psicodélico no Laboratório de Química. A professora explicou a sua opção pela escolha deste ambiente: “Acho que o laboratório é encantador, que é diferente de colocar o jaleco, de vir pra um ambiente diferente, isso cria uma imagem pra eles”.

A coordenadora pedagógica do nível complementou, afirmando: “Eles se sentem cientistas”. Concordando, a professora do 1.º ano retomou, falando: “É, e o preparo de vir até aqui é um acontecimento, então isso eu acho que torna mais importante a experiência”.

Esta professora relatou ainda a falta de interesse dos alunos na explicação teórica, a qual só pode ser feita no momento posterior, quando os alunos já estavam em sala de aula, pois, no laboratório, os alunos mostravam-se concentrados na prática. Percebendo a importância que a professora atribuía à explicação teórica, a formadora perguntou se, na sala de aula, os alunos tinham manifestado algum interesse pela explicação, questionando:

Formadora: Os alunos da Educação Infantil não se mostraram preocupados com a explicação, os teus estavam interessados na teoria?

Participante: Eu estava, tanto que assim. Em todos os nossos encontros, eu sempre te pergunto por quê, porque eu sempre penso que alguém vai perguntar, porque tem que ter uma razão do porquê eu estou fazendo isso. Eu sou assim, acho que é o pensamento do adulto, a criança não pensa assim. Ela, pelo simples fato de realizar a experiência, já é mágico, tanto que eles dizem vamos pegar e vamos fazer aquela mágica, aquilo que ficou pra eles. Mas eu acredito que eles entenderam, porque fizeram perguntas, e tudo que eles fizeram no relatório, foi com as palavras deles, até eles escreveram de um jeito e usaram os termos que eles costumam usar.

Ficou evidente, portanto, que o professor dos Anos Iniciais não precisa ter a preocupação de apresentar uma explicação rigorosa do ponto de vista científico, pois as crianças não possuem um repertório linguístico para poderem compreender os fenômenos envolvidos. Todavia, entendemos como importante propiciar um momento de reflexão, para que os alunos possam pensar sobre o que aconteceu. Para isso, o professor precisa buscar por palavras e expressões que os alunos sejam capazes de compreender, problematizando e contextualizando o experimento.

Outra diferença apresentada estava no relatório cobrado, o qual foi solicitado de forma escrita aos alunos depois do

experimento. De acordo com a professora, puderam ser desenvolvidas outras habilidades com base na atividade, as quais foram citadas: “Saber o que é uma lista, nomeando os materiais e escrever do jeito deles o que ocorreu”.

4. CONSIDERAÇÕES FINAIS

Acreditamos ter contribuído para a inserção de atividades experimentais nas aulas dos sujeitos envolvidos, uma vez que estes puderam vivenciar diferentes experimentos, tendo suporte teórico para entendimento dos fenômenos e oportunidade de sanar suas dúvidas. O estudo evidencia a importância de criar oportunidades de vivenciar a realização de atividades experimentais aos professores. O trabalho realizado ao longo das múltiplas sessões mostrou-se determinante para incentivar as docentes ao uso desse recurso na sua prática pedagógica. A partilha de experiências durante as sessões permitiu sanar dúvidas, testar suas hipóteses e trocar ideias com as colegas do curso e de escola.

Percebemos que, à medida que os professores foram experimentando as situações propostas, pudemos desmistificar o ensino das Ciências Exatas, principalmente no que diz respeito à Física e à Química, uma vez que percebemos o entusiasmo e a expectativa do grupo para cada atividade nova.

Ainda, mostrou-se essencial desenvolver a formação nas dependências da escola, uma vez que muitas professoras desconheciam a infraestrutura disponível para explorar as Ciências Exatas e, no decorrer do curso, permitiram-se realizar atividades nestes locais.

ABSTRACT

Business decision-making in real context involves high risks and a long time to know the impact of decisions. Using the simulator, students know the results of decisions in a few hours, without incurring financial or personal risks. The management simulators were conceived for the training of corporate cadres, but they play an important role in the training of Management students. The business and market context is very complex and the simulators are able to reflect this reality, contributing to improve management practices.

It is intended to encourage students to manage a virtual company, analyzing the recent past, outlining strategies for the near future, evaluating results obtained, making decisions in the various functional areas of the company, taking into account the market situation and the competition, aiming to obtain better results to competitors. They are encouraged to integrate acquired knowledge, making decisions that will be submitted to the simulator in a previously established calendar. They analyze historical data, evaluate results obtained in the management reports produced by the simulator and received after each decision making; These reports reflect the impact of decisions taken on adjustments to accounting and various operational parameters. Then they validate or reformulate the strategy and evaluate the competition in the different markets.

Keywords: Simulator, Strategy, Decision, Diagnosis.

1. CONTEXT

Several authors argue that simulation-based training (SBT) makes it possible to fill a gap in management teaching regarding the combination of theory and practice in student training. For example Salas, Wildman and Piccolo (2009) believe that SBT can potentially convey theory and practice simultaneously and that the nature of management work in general lends itself to simulation-based training because many of the skills needed to be a Business manager can only be acquired through practice; Are the cases, for example, of leadership and strategic decision-making and communication skills. According to Cook and Swift (2006) and Lane (1995) SBT provides a more complex and realistic learning environment than other types of training ... and trainees can practice their skills. For Salas, Wildman and Piccolo (2009) one of the main objectives of simulation is to imitate real-life situations and allows learning to be based on a context that is directly relevant to management students.

The management simulators were designed with the purpose of training company cadres, but can play an important role in the training of students of the course of Business Management. The context of companies and markets is very complex and management simulators can reflect this complex reality, contributing to improve management practices. Decision-making in real context in companies involves high risks and a longer or shorter time until one knows the impact of decisions on the company and the market. Using a simulator, students get to know the results of their decisions in a few hours, without incurring financial risks, although they are subject to other risks inherent in the competition, which encourages them to consider risks in decision making. This is because all decisions have positive and negative impacts on the company. Thus, trainees will be more likely to think creatively and test various strategies to deal with high-risk situations.

According to Keys and Wolfe (1990), cited by Salas, Wildman and Piccolo (2009), in a simulation environment the learning curve can occur at an accelerated rate as students adopt decision-making processes and adjust their strategies because feedback is immediately provided allowing you to acquire the skills and competencies that would normally be gained

over years of experience. Each team will manage a company in the market where other competing companies operate and its members will develop new skills of: strategic management, decision making, teamwork and leadership.

The use of the management simulator in the consolidation of transversal knowledge is in line with Merrill (2002, pp. 44-45) that wrote: “training is promoted when students are involved in problem solving in the real world [,] .. when the existing knowledge is activated as a foundation for the new knowledge [,] ... demonstrated to the learner [,] ... applied by the learner [,] ... [and] integrated into the student world. “

2. DESCRIPTION OF THE PEDAGOGICAL PRACTICE

The main objective of the introduction of the simulator as a pedagogical tool was to increase the practical component of the Management course, with emphasis on the simulated practice, promoting a greater interdisciplinary between the curricular units and contributing to a greater student motivation in applying and integrating knowledge acquired in the previous curricular units attended during the course. The aim is to encourage students to manage a company, analysing the recent past and outlining the strategy for the near future, analysing the results obtained, making decisions in the various areas of the company (production, commercial, financial and human resources), taking into account the competitive situation and the economic situation of the market, in order to obtain the best results from its competitors. These results are mainly reflected in stock prices, market shares and company efficiency in terms of profitability and productivity, etc. Students are encouraged to integrate the knowledge acquired and to make their own decisions in teams of 3 to 5 elements, assuming responsibilities for the consequences of these decisions, which will be submitted to the simulator in dates and time previously established without any flexibility; the responsibility for meeting deadlines is the leader of each team. SBT makes it easier for reality to be simplified and manageable, its complexity attenuated and training flexibilised, so that simulator-powered competition is possible (Cook and Swift, 2006).

2.1 Target Audience

The simulator is being applied in the discipline of Business Simulation, 3rd year of the Management course, day and post-work students, at the School of Technology and Management of the Polytechnic Institute of Portalegre. The exchange of experiences between the students of the day course and the post-work course facilitates learning in a competition that implies decision making by the students as managers of a virtual company. Former students and entrepreneurs from the region have also participated in this global management competition with the objective of increasing the competitiveness of the competition and involving the local community. The SBT environment is sufficiently realistic to stimulate critical thinking and enable the student to acquire knowledge in a practical way while allowing sufficient control of the trainer on the situation to guide learning in the desired direction ... providing an environment to test and practice innovative techniques (Salas, Wildman and Piccolo, 2009).

2.2 Methodology

The curricular unit start with a training based on theoretical and theoretical-practical sessions to explain in detail the support manual for the construction of tools to support decision making based on the management techniques learned during the course in Management. Subsequently, the training is complemented with practical sessions to support each group throughout the simulation and with some theoretical-practical classes focused on specific themes pertinent to the management game. The challenge for the various student teams is to manage a virtual company that competes with 7 other companies in the European Union, NAFTA and Internet markets (global market) with 3 long-lasting products.

The participants (8 teams with a maximum of 5 elements) must analyze the past performance of the company, at the level of the internal diagnosis, make the external diagnosis and design the company for the future, defining strategic planning based on available resources (and to be obtained in the future), the strengths and weaknesses detected in the internal analysis and the opportunities and threats found in external diagnostics. There are 2 experimental decisions in which the students test the simulator, the decisions of the competitors and prepare for the competition that will begin with the 5 definitive decisions established in a pre-defined calendar.

Students have to analyze the company's historical data, evaluate the results obtained in the management reports they receive after each decision making, and which reflect the impact of the decisions taken with adjustments to company accounts and the various operational parameters related to each one of the functional areas. They must also validate or reformulate the strategy and assess competition in different markets.

The management reports inform the companies about the operational data: the Means of Production, Raw Materials, Human Resources, Sales Channels, Products, Transportation; And Financial Data: Balance Sheets, Income Statement, Administrative Expenses, Cash Flows and the Quotation Value of the Shares.

These reports, produced by the simulator after each decision, also present information (free and other paid separately) on the activities of competing companies in the areas of prices, total employees, salaries, agents and distributors, market shares, consumer opinions and Expenses incurred by competitors in areas such as Advertising, Research and Development and website efficiency.

The categories in which decisions are made (phased in 5 steps) are distributed across the various departments of the company: there are marketing, production and distribution decisions, finances and human resources. Decisions are also broken down into nine product / market strategic segments: 3 products placed in 3 different markets. Investment in each of the strategic segments, such as advertising and R & D, should be affected. Based on the simulator, this discipline becomes

very demanding, requiring students to justify, theoretically and with calculations in excel, in detail all the decisions made and strategies implemented, after a detailed diagnosis of the company, a detailed analysis of the variables that influence each decision and estimate its repercussions on the company.

This training can be used to simulate crisis events such as catastrophic business failures, providing a relatively free opportunity for management students to apply emergency measures without fear of negative personal problems or organizational consequences (Salas, Wildman and Piccolo, 2009).

2.3 Evaluation

The data generated by the simulator is very detailed, constituting a very useful management information to be explored in practical cases by the students in others disciplines, as for example in the Control of Management and Accounting of Management I and II. When students use the information generated by the simulator in previous disciplines, they have a greater ease of adaptation and integration in global management and strategy competition.

In the classroom context, the simulator reinforces the group spirit and the competitiveness among the teams, in addition to the students verifying that they are applying the knowledge acquired in several disciplines, testing this knowledge and obtaining, in real time (a few hours later), the results of decisions taken that resulted from the application of their knowledge. This feedback is made up of a management report for each team that is provided by the simulator.

In the end, the students are evaluated based on 5 decision making, pondering the quotation of the actions achieved by each company and the technical capacity in the justification / grounds of the decisions. Each team presents orally, after the fifth decision, the remaining teams and the teacher a summary of the decisions taken, the results obtained and the strategies adopted for discussion in the classroom.

According to Merrill (1975), SBT is a way of student-controlled training that learns at its pace, facilitating effective learning.

3. RESULTS

With the use of the simulator, students apply knowledge in new competitive situations, albeit in a simulated way. The winning team at the school level (and others who also wish to participate by finding a sponsoring company) competes with teams composed of staff from large national companies and students from other polytechnics and universities competing in the Global Management Challenge (GMC), contributing to the additional motivation and self-esteem of the students.

The results achieved contribute to the feeling that they have received adequate training to compete in the labor market, that is, the students feel more motivated and more prepared to face the active life and the business reality. The use of the simulator introduces an innovative differentiation in terms of learning and teaching methods in universities and polytechnics, providing students with a stimulating teaching / learning experience.

This teaching methodology has been a success, with positive feedback from students, and has resulted in greater personal achievement of most students. Students have adhered quite well to the simulation where dynamics group have worked perfectly, in most cases, and the competitiveness among students has been a factor enhancing their motivation that leads them to work many hours out of classes to give requirements of the management game. The students' learning is based on the sharing of work with their colleagues and with the teacher and on the active involvement in the teaching activities.

The best results obtained by ESTG students from Portalegre occurred in 2009/10 with the participation in the final of the Global Management Challenge and the conquest of the 4th place at the national level. In 2014/15 the team representing the school also participated in the final of the national GMC and in the following year the same team reached a second time the final of the national GMC, but representing Caixa Geral de Depósitos. In the 2008/09 and 2015/16 school years, the ESTG teams from Portalegre reaching the 2nd round of the national competition, although they did not reach the final.

4. TRANSFERABILITY

According to Salas, Wildman and Piccolo (2009) the SBT (Simulation-Based Training) is an ideal complement to improve the quality of management training ... an opportunity to improve existing management curricula ... allows the development of management skills at a pace much higher than usual, making it an ideal technique for management education programs ... perfect opportunity to improve the quality of our business sooner in the careers of graduates.

Based on the results obtained, and considering that it is intended to share pedagogical practices that prove to be successful, it is believed that the use of a management simulator should be considered in the curricular plans of the management courses of other higher education institutions. The practical application of knowledge related to the various curricular units of the Management course, their integration and interdisciplinarity, as well as teamwork, make this teaching methodology very dynamic and motivating.

According to Salas, Wildman and Piccolo (2009), the SBT (Simulation-Based Training) is an ideal complement to improve the quality of management training ... an opportunity to improve existing management curricula ... allows the development of management skills at a pace Much higher than usual, making it an ideal technique for management education programs ... perfect opportunity to improve the quality of our business sooner in the careers of graduates.

ABSTRACT

The growing presence of social robots (robots designed to interact and collaborate with people, engaging them at a socio-affective level, Breazeal, 2008), in everyday environments, requires a growing attention to how people will behave towards them. Research results suggest a link between attitudes towards social robots and people's intention to work with them (Piçarra *et al.*, 2015). This study (N= 216) investigates the role of the following variables: gender, belief in human nature uniqueness, religiosity and interest in science fiction, as precursors of the attitudes towards social robots. Effects of these variables were studied using multiple regression. Results show men have a more positive attitude towards interactions with robots than women. Belief in human nature uniqueness is a negative predictor of attitudes towards robots with emotions and attitudes towards interactions with robots. Interest in science fiction is a positive predictor of attitudes towards robots with emotions and attitudes towards interactions with robots. Religiosity is a negative predictor of attitudes towards interactions with robots. These results underline the role of individual factors in the successful deployment of social robots in everyday tasks.

Keywords: Social Robots, Negative Attitudes Towards Robots, Belief in Human Nature Uniqueness, Religiosity.

JEL Classification: O33

1. INTRODUCTION

As the presence of technology becomes more ubiquitous, grows the need to understand how people relate to these changes. One of these changes is the social robot. These are autonomous robots capable of interacting with humans in a naturalized fashion by detecting gaze, displaying emotions, establishing social relationships, and exhibiting distinctive personalities (Fong, Nourbakhsh, & Dautenhahn, 2003). One of the tools developed to explore this new relation is the negative attitude towards robots scale (NARS), developed by Nomura, Kanda & Suzuki (2004). This research explores the role of gender, belief in human nature uniqueness, religiosity and interest in science fiction as variables contributing to the formation of attitudes towards social robots.

2. THEORETICAL UNDERPINNINGS

2.1 Attitudes towards robots

Attitudes can be shortly defined as a systematic favorable or unfavorable predisposition, towards something (object or action). The idea that one's attitudes play a major role in determining one's behavior is as old as social psychology research

itself and the concept has been central to models intended to predict behavior and behavior change (See Ajzen & Fishbein, 2005 for a review). Given their role, both in appraising the world and in directing behavior, attitudes have been studied in a large variety of settings, from health (Rew & Wong, 2005) to politics (Pratto, Sidanius, Stallworth & Malle, 1994), from computer use (Selwyn, 1997; Al-Khaldi & Al-Jabri, 1998) to internet learning (Klobas & Clyde, 2000) and acceptance of technology (Davis, 1989).

One of the first attempts at using attitudes to understand people's thoughts and expectations about robots was by Nomura *et al.* (2004). These authors proposed the concept of negative attitudes towards robots, hypothesizing that these negative attitudes could prevent people from interacting with social robots. To measure this concept, the authors developed the Negative Attitudes Towards Robots Scale (NARS).

Several studies have shown that, participants with higher negative attitudes toward interaction with robots tend to take longer to talk to robots (Nomura, Kanda, Suzuki, & Kato, 2004), to have less self-disclosure, but express more emotion in their conversation (Nomura, Kanda, Suzuki, & Kato, 2007), and that responses on the NARS were correlated with different assumptions about robot type (Nomura, Kanda, Suzuki, & Kato, 2006). Additionally, cross cultural differences were found, with Dutch and Chinese participants having lower ratings on NARS than Japanese participants (Bartneck, Suzuki, Kanda & Nomura, 2007). The use of NARS in western countries, however, showed low reliability for some items and problems with factor structure (Syrdal, Dautenhahn, Koay & Walters, 2009; Riek, Adams, & Robinson, 2011). Given this, and the reported influence of nationality on attitudes towards robots, Piçarra, Giger, Pochwatko, and Gonçalves (2015), developed the Portuguese version of the NARS.

The Portuguese version of the NARS (PNARS) is composed of 12 items and 2 factors, negative attitudes towards robots with emotions and negative attitudes towards interaction with robots. The negative attitudes towards robots with emotions subscale (NATRE) is composed of items like, "Something bad might happen if robots developed into living beings"; "I would feel relaxed talking with robots.". The negative attitudes towards interactions with robots (NATIR) is composed of items like, "I would feel uneasy if I was given a job where I had to use robots"; "I would feel nervous operating a robot in front of other people." (see Piçarra *et al.*, 2015).

The authors report Cronbach alphas of .82 for the complete scale, 0.73 for NATRE and 0.75 for NATIR. In a subsequent study Pochwatko, Giger, Róžańska-Walczyk, Świdrak, Kukiela, Możaryn, & Piçarra (2015) confirmed the validity of the two-factor structure.

2.2 Essentialism. The belief in human nature uniqueness

Given the roles envisioned for social robots it is expectable to see the rules of social perception applied to them. One way of making sense of other social agents is through social categorization. That is, to each category is attributed a set of roles, characteristics and expected behaviors. Essentialism is the belief that the members of a given category share a deep, underlying natural essence. Haslam (1998) defines these categories as having a fixed membership, an inherent nature, a sharp boundary, defining features, and homogeneous members. These categories are informative about its members and are supposed to exist independent of human desire and culture. They are historically invariant. Research has shown essentialism to be associated with prejudice, perceived differences between groups, dispositional attributions, and justifications for social inequalities (Demoulin, Leyens, & Yzerbyt, 2006). Besides being used to differentiate social groups, essentialism also plays a role in the definition of what means to be human and the level of humanness attributed to others. Research has shown that, not only people make self-biased evaluations of themselves, but also tend to think of themselves as more human than average (Loughnan *et al.*, 2010).

Social robots occupy an ambiguous social space. They don't pertain to a well-defined category. Endowed with emotions and sometimes envisioned as companions, social robots don't represent just another step in technology, they represent a shift into another category, the quasi or proto Humans (Suchman, 2001). Besides being evaluated by their usefulness, social robots will also be evaluated by the way they display attributes that are judged as uniquely human. As such, the degree of uniqueness that a person attributes to human beings (i.e. belief in human nature uniqueness – BHNU), is bound to affect her judgment and evaluation of robots attempting to display human behavioral and psychological traits.

2.3 Religiosity

Religious traditions have long been recognized as one of the major social forces that shape our worldviews about the place of Human in the world, the meaning of life and what is moral or not. Consequently, religion influence people's perception of the natural world, science and scientific practice (Geraci, 2006). The possible relation between religious beliefs and the value attributed to robotics research has already received some attention (Drees, 2002). For example, Mark Jacob (cited in Metzler & Lewis, 2008) suggested that Shintoism and Buddhism seemed to be extraordinarily open to robots in people's lives. Similarly, in 2005, Anthony Faiola (cited in Metzler & Lewis, 2008) suggested that religion may influence people attitudes toward robots writing that "In Western countries, humanoid robots are still not very accepted, but they are in Japan," [...]. "One reason is religion. In Japanese (Shinto) religion, we believe that all things have gods within them. But in Western countries, most people believe in only one God." Indeed, the Catholic Church tends to perceive machines displaying humanlike features like emotions or moral reasoning, as raising moral and theological problems (Drees, 2002). Interestingly, the three religions of the Book (i.e., Judaism, Christianity and Islam) place Humanity at the center of creation, seeing any attempt to mimic life as immoral and dangerous. The tale of the Golem of Prague or the creature of Doctor Frankenstein, are illustrations of such dilemmas. Consequently, it is reasonable to expect that a person's level of religiosity will affect her judgment and evaluation of robots attempting to display human behavioral and psychological traits.

2.4 Science Fiction

Automatons, humanoid robots and synthetic humans are recurrent themes in science fiction. From Fritz Lang's *Metropolis* to Isaac Asimov's robot series or more recently James Cameron's *Terminator*, science fiction has explored the potential forms robots can take and their relation with human and humanness. Robots have been portrayed as willing to take over the world or wanting to be human (Bartneck, 2004, April). Research suggests that the more people have seen movies with robots, the more positive are their attitudes toward robots (e.g. Riek *et al.*, 2011). In short, science fiction works seem to afford a cultural backdrop against which to think the role of technology in daily life. As such, it is reasonable to expect that a person's level of interest in science fiction influences her judgment and evaluation of social robots.

3. PARTICIPANTS AND PROCEDURE

3.1 Participants

The convenience sample is composed of 216 Portuguese participants (Mean age = 25.88; σ age = 0.53) among whom 164 women and 52 men. Of the sample, 62 participants had below high school qualifications (28.7%), 62 were undergraduate (28.7%), 54 had complete high school (25%), 26 had a master title (12%), 8 were doctoral students (3.7%).

3.2 Procedure

Data were collected during the month of November 2012 through an online questionnaire placed on *Google Docs* platform. Upon access, participants were presented a brief description of the study and information about the duration of the study, data confidentiality and anonymity. Then participants were asked to fill out a set of scales measuring the variables used and socio-demographic information.

3.3 Material

Attitude towards robots was measured with the portuguese negative attitude towards robots scale (P-NARS (Piçarra *et al.*, 2015). The PNARS displayed a good internal reliability, with Chronbach alphas of .85 for the total scale, .76 for NATRE and .78 for NATIR. Participants responded on a 7-point scale (1 = totally disagree to 7 = totally agree), with higher scores indicating a more positive attitude towards robots.

The belief in human nature uniqueness scale (BHNUS; Piçarra, 2015; Piçarra, Giger, Pochatko, & Gonçalves, 2011, May) was used to assess the extent to which people deny the possibility of a human essence to robots. Participants responded on a 7-point scale (1 = totally disagree to 7 = totally agree) to the following six items: "Even if ultra-sophisticated... (1) a robot will never be considered as human being; (2) a robot will never feel the same emotions as a human being, (3) a robot will never use language in the same way as a human being; (4) a robot will always be a mechanical imitation of the human being; (5) a robot will never have consciousness; (6) a robot will never have morality." The scale displays a good internal reliability (Chronbach α = .85). A higher score reflects a stronger belief in human nature uniqueness.

Religiosity (Rel) was measured by four items. Participants were asked to answer on a 7-point scale, to the four following items: 1) how would you describe your belief; 2) to what extent do you consider yourself as religious?; 3) in my life I follow my religion's teachings thoroughly; 4) in my opinion, the teachings and rules of my religion should have a big influence on the model of the society in my country/in the world. The scale shows a good reliability (Chronbach α = .93). Higher scores reflect a stronger level of religiosity.

Interest in science-fiction (SciFi) was measured by two items. Participants were asked to report their liking for science films and books on a 7-point scale ranging from (1) I really dislike it to (7) I really like it. The two items showed a good reliability (Chronbach α = .86). Higher scores reflect a stronger interest for science-fiction.

4. RESULTS

4.1 Descriptive statistics

Table 1 displays the descriptive statistics for the variables used.

Table 1. Descriptive statistics

	Mean	Std. Deviation	Variance	Skewness	Kurtosis
NATRE	3.63	1.23	1.52	-.11	-.21
NATIR	4.82	1.15	1.31	-.31	-.13
BHNU	5.37	1.30	1.70	-.85	.33
Rel	3.20	1.72	2.96	.37	-.92
SciFi	4.57	1.68	2.82	-.42	-.66

Notes: NATRE= Negative attitudes towards robots with emotions; NATIR= Negative attitudes towards interactions with robots; BHNU=Belief in human nature uniqueness scale; Rel= Religiosity; SciFi= Interest in science fiction.

4.2 Correlational analyses

Table 2 displays the correlations between the variables studied. Gender is positively correlated with NATIR and SciFi. Both NATRE and NATIR are positively correlated with SciFi and negatively correlated with BHNU and REL. BHNU is positively correlated with Rel and negatively correlated with Sci-Fi. No relation was found between the level of BHNU and Sci-Fi.

Table 2. Correlations

	Gender	NATRE	NATIR	BHNU	Rel	SciFi
Gender	-					
NATRE	.11	-				
NATIR	.24***	.67***	-			
BHNU	-.08	-.49***	-.34***	-		
Rel	-.11	-.21**	-.26***	.21**	-	
SciFi	.20**	.24***	.33***	-.22***	-.08	-

Notes: Two tailed. * $p < .05$; ** $p < .01$; *** $p < .001$. NATRE= Negative attitudes towards robots with emotions; NATIR= Negative attitudes towards interactions with robots; BHNU=Belief in human nature uniqueness scale; Rel= Religiosity; SciFi= Interest in science fiction.

4.3 Regression analyses

In order to clarify the role of gender, BHNU, Rel and SciFi in the formation of attitudes towards social robots, a series of multiple regression analyses were conducted. Table 3 presents the results of the multiple regression analysis for NATRE and Table 4 presents the results for NATIR.

Table 3. Predictors of NATRE

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	5.54	.46		11.91	.000
BHNU	-.43	.06	-.45	-7.23	.000
Rel	-.07	.04	-.10	-1.64	.103
SciFi	.10	.04	.15	2.37	.019
Gender	.16	.18	.05	.91	.365

Notes: N=216, F (4, 203) = 20.31, $p = .000$, $R^2 = .29$; NATRE= Negative attitudes towards robots with emotions; BHNU=Belief in human nature uniqueness scale; REL= Religiosity; SciFi= Taste for science fiction; Gender coding:1- Female, 2- Male.

Analysis of the results for the model predicting NATRE, shows that BHNU, SciFi, REL and gender account for 29% of the explained variance. Analysis of the individual coefficients identify BHNU as a statistically significant negative predictor of NATRE ($\beta = -.45$), and SciFi as a statistically significant positive predictor of NATRE ($\beta = .15$). That is, a stronger belief in human nature uniqueness leads to a less positive attitude towards robots with emotions. On the other hand, as the level of interest in science fiction increases so does the favorable attitude towards robots with emotions.

Table 3. Predictors of NATIR

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	5.11	.46		11.20	.000
BHNU	-.22	.06	-.24	-3.80	.000
Rel	-.12	.04	-.17	-2.76	.006
SciFi	.16	.04	.23	3.63	.000
Gender	.44	.17	.16	2.56	.011

Notes: N=216, F (4, 203) = 15,78, $p = .000$, $R^2 = .24$; NATIR= Negative attitudes towards interactions with robots; BHNUS=Belief in human nature uniqueness scale; REL= Religiosity; Scifi= Taste for science fiction; Gender coding: 1- Female, 2- Male.

Analysis of the results for the model predicting NATIR, shows that BHNUS, Scifi, Rel and gender account for 24% of the variance in attitudes towards interactions with robots. Analysis of the individual coefficients shows that both BHNUS ($\beta = -.24$) and Rel ($\beta = -.17$) are statistically significant negative predictors of NATIR. Scifi is a statistically significant positive predictor of NATIR ($\beta = .23$). Gender has an effect on NATIR, with men presenting a more favorable attitude. That is, a stronger belief in human nature uniqueness and higher degree of religiosity, is associated with a less positive attitude towards interaction with robots. On the other hand, a stronger interest in science fiction is associated with a more favorable attitude towards interactions with robots. Men, in general, have a more positive attitude towards interactions with robots.

As a summary, BHNU, Rel, Sci-Fi and gender are predictors of attitudes towards robots. However, it must be noted that they perform differently if one is to predict attitudes towards robots with emotions or attitudes towards interactions with robots. Results also suggest that participants are more comfortable with the idea of interactions with robots (NATIR, $M = 4.82$), than with the idea of robots with emotions (NATRE, $M = 3.63$). Also noteworthy is the role of BHNU, that not only is a predictor of both NATRE and NATIR, but also the major predictor of NATRE. This latter aspect is of particular relevance for the deployment of social robots.

5. DISCUSSION

This research set out to explore the role of gender, belief in human nature uniqueness, religiosity and interest in science fiction as antecedents of attitudes towards social robots. The results reported in the previous section confirmed the role of these variables, explaining 29% of the variance of NATRE, and 24% of the variance of NATIR.

Analysis of the individual contribution of each variable shows that BHNU is a negative predictor of both NATRE and NATIR. That is, the degree of uniqueness that a person attaches to humankind has a considerable influence in both attitudes towards interactions with robots and attitudes towards robots with emotions. That is, the stronger the belief in human nature uniqueness, the less positive the attitude towards interactions with robots and towards robots with emotions.

Interest in science fiction is a positive predictor of both NATRE and NATIR. As mentioned in a previous section, given the role of science fiction as cultural backdrop against which to think the role of technology in daily life, it makes sense that people with more interest in science fiction see social robots as a positive challenge, rather than a menace and thus have a more positive attitude both towards robots with emotions and interactions with robots.

Religiousness is a negative predictor of NATIR. As mentioned earlier, western religious traditions don't have a very favorable position towards robots (Drees, 2002; Metzler & Lewis, 2008), which can in part explain this result. Nonetheless it is not to exclude that part of this effect of religiousness is shared with BHNU, as the idea of humans as unique creatures, is a central tenet of western religions.

Finally, gender has an effect on NATIR, with men showing a more favorable attitude towards interactions with robots than women.

These results underline the significance of individual factors in the formation of attitudes towards social robots. If the relevance of attitudes towards robots in human-robot interactions has received some empirical confirmation (Nomura, Kanda, Suzuki & Kato, 2004; Nomura *et al.*, 2007), little is still known about the factors underlying the formation of those attitudes. The present study suggests that personal beliefs about what it means to be human may play a significant role. These results are even more pertinent if we consider that the current trend is towards the use of robots in household and social care tasks, and towards the humanization of robot interfaces (Leite, Martinho, & Paiva, 2013).

On the other hand, given the considerable amount of unexplained variance left, there are probably other factors unaccounted for, requiring further research.

ABSTRACT

With a growing number of robots designed to assist people, while displaying social awareness and competence, the answer to the question what are the factors underlying a person's intention to work with social robots becomes central to human-robot interaction studies. The following study uses the framework proposed by the theory of reasoned action (TRA) and its development, the theory of planned behavior (TPB) to understand a person's intention to work with social robots in the near future. For that purpose, 60 volunteers were shown a short video displaying a social robot. Participants were randomly distributed by two conditions, mechanical or android social robot. Results suggest that attitudes towards working with a social robot is the main predictor for both models (TRA: $\beta = .66$; TPB: $\beta = .55$). Subjective norms and perceived behavioral control did not present significant effects. Comparison of the two models showed no differences in their predictive value, with both accounting for 46% of the variance. These results underline the role of attitudes towards working with social robots in the development of the intention to work with social robots in the near future.

Keywords: Social Robots, Theory of Reasoned Action, Theory of Planned Behavior, Intention to Work.

JEL Classification: O33

1. INTRODUCTION

The growing trend in the automation of everyday tasks, is pushing robots from the confines of science fiction books to the pages of leading international newspapers and newsmagazines. For example, Thomas Friedman asks in the New York Times "How did the robot end up with my job?" (Friedman, 2011, January 10). The Economist reports on the development and use of robots that collaborate and work alongside humans (2013). In Foreign Affairs, Brynjolfsson, McAfee & Spence (2014, November 7), point that "machines are substituting for more types of human labor than ever before". If opinions diverge about the economic effects of the automation of work, they tend to converge when it comes to the need to accept the idea of a future, living with robots and automation (see Brynjolfsson & McAfee, 2012; 2014; Manjoo, 2011, September 26).

The present research explores the usefulness of the theory of reasoned action (TRA, Fishbein & Ajzen, 1975) and the theory of planned behavior (TPB, Ajzen, 1991), as theoretical frameworks to understand people's intention to work with social robots in the near future. Social robots are designed to interact and collaborate with people, and to engage them at an interpersonal and socio-affective level (Breazeal, Takanishi, & Kobayashi, 2008). Unlike computers and industrial robots, social robots given their physical and social presence create a sense of agency akin to that of a living entity (Young *et al.*, 2011). Their introduction in the work place will confront workers with a significant professional and personal challenges. The comprehension of the socio-cognitive factors that underlie and determine people's intention to work with a social robot, is of the utmost importance allowing the development of organizational strategies that promote a smoother transition to this new environment.

2. THEORETICAL FRAMEWORK

Albeit the growing interest in social robots, their presence is still very limited. As such, evaluating peoples' interest in using social robots will have to draw on models that account for pre-volitional and future oriented socio-cognitive variables. One of such variables is intention to perform a behavior. Behavioral intention (BI) has been identified by research in social

psychology as the proximal psychological determinant of overt behavior (Fishbein & Ajzen, 1975; Bagozzi, Baumgartner & Yi, 1989; Webb & Sheeran, 2006 for a review). When a person declares having the intention to perform a given act (e.g. working with social robots in the near future), that person is assigning a subjective probability to the action. BI constitutes a plan of action in pursuit of the behavioral goal (Ajzen, 1985). "Intentions are assumed to capture the motivational factors that influence a behavior; they are indications of how hard people are willing to try, of how much of an effort they are planning to exert, in order to perform the behavior. As a general rule, the stronger the intention to engage in a behavior, the more likely should be its performance" (Ajzen, 1991, p. 181). To sum up, BI is a measure of how willing a person is to perform a behavior.

2.1 Theory of Reasoned Action (TRA)

According to Fishbein and Ajzen (1975) the TRA main purpose is to predict BI. According to it, BI is the combined product of attitude and subjective norm towards the target behavior (i.e. the behavior to be performed). All the other variables (e.g. demographic variables, personality traits) would exert their influence on BI indirectly through attitude and subjective norm.

In the TRA attitude is defined as attitude towards a behavior, "the individual's attitude toward performing a particular act in a given situation with respect to a given object..." (Ajzen & Fishbein, 1969, p. 402). Attitude towards a behavior is determined by a person's subjective expectation of a behavior producing a certain outcome, and the subjective value attributed to that outcome, that is, attitudes are determined by a set of behavioral beliefs (Ajzen, 1985). "From an expectancy-value perspective, therefore, attitudes have an emergent quality. They develop in the course of acquiring information about the attitude object, and they keep evolving as existing beliefs change and new beliefs are formed" (Ajzen & Fishbein, 2000, p. 6).

The subjective norm can be understood as the perceived social pressure to perform (or not) a certain action. A person's normative beliefs are a function of the perceived attitude of the relevant others toward the behavior or object in question. "For example, just as a person's attitude toward a given behavior was related to his beliefs about the consequences of performing that behavior and his evaluation of those consequences, his perception of attitudes of relevant others was related to his perception of their beliefs about the consequences of performing the act and his perception of their evaluation of those consequences" (Ajzen & Fishbein, 1972, p. 8).

In summary, the TRA deals with the prediction of a specific behavioral intention in a well-defined circumstance, and assuming the person has complete control over performing the behavior.

It is hypothesized that (H1): Intention to work with a social robot in the near future, is a function of attitude towards working with a social robot and subjective norm (see Figure 1).

2.1.1 Predictive power of the TRA

Since it was first formulated the TRA has been used both in theoretical and applied research, receiving empirical support and proving itself useful in a diverse number of settings, from health behavior (e.g. Beadnell *et al.*, 2008 use the TRA to predict heterosexual men's intention to use condom), to education (e.g. Vincent, Peplau, & Hill, 1998 use the TRA to predict career behavior) and business ethics (e.g. Kurland, 1995 uses the TRA to predict insurance agent's ethical intentions towards their clients). The TRA has also been used to predict several technology related behaviors like the use of a word processor software (Davis, Bagozzi & Warshaw, 1989), acceptance of an expert systems for accountants (Liker & Sindi, 1997), use of internet banking (Yousafzai, Foxall, & Pallister, 2010) and software piracy (Aleassa, Pearson and McClurg, 2011).

2.2 Theory of Planned Behavior (TPB)

One of the central contentions of the previously presented TRA is that the model is only fit to predict behavior that is under complete volitional control. In order to overcome this limitation Ajzen (1985, 1991) advanced the TPB. According to it, perceived behavioral control (PBC), would account for the person's perception of her personal competencies and material resources. The perception of how easy or difficult it will be to perform a particular behavior. "Perceived behavioral control in the theory of planned behavior refers generally to people's expectations regarding the degree to which they are capable of performing a given behavior, the extent to which they have the requisite resources and believe they can overcome whatever obstacles they may encounter" (Ajzen, 2002, p. 676). PBC accounts both for internal or external, real or imagined obstacles and resources. They are the person's perception of the factors that might facilitate or hinder the performance of the behavior. That is, PBC can result from realistic and "not so realistic" evaluations. A high level of perceived behavioral control strengthens the intention, increasing effort and perseverance, thus affecting behavior through BI.

In short, according to the TPB, behavior is a function of intention, which is the combined expression of attitude, subjective norms and perceived behavioral control. The relative importance of these three will vary across situations, behaviors and time.

It is hypothesized that (H2): Intention to work with a social robot is a function of attitude towards working with a social robot, perceived behavioral control and subjective norm (see Figure 1).

2.2.1 Predictive power of the TPB

Like the TRA, the TPB has received ample empirical confirmation of its usefulness, both in theoretical and applied fields of research (e.g. Ajzen, 1991; Armitage and Conner, 2001). The TPB has been used in the prediction of behaviors like: exercise (see Blue, 1995; Godin, 1994 for reviews), health related behaviors (see Cooke & French, 2008; Godin & Kok, 1996;

McEachan, Conner, Taylor, & Lawton, 2011), sexual behavior (Albarracín, Johnson, Fishbein, & Muellerleile, 2001) buying behavior (Cannière, Pelsmacker, & Geuens, 2009) and consumer adoption intentions (Taylor & Todd, 1995).

The TPB has also been applied to behaviors related to the use of technology, namely, intention to use a spreadsheet software (Mathieson, 1991), online shopping (Hansen, Jensen & Solgaard, 2004), e-commerce adoption (Grandón, Nasco & Mykytyn, 2011), use of social networking sites (Baker & White, 2010), digital piracy (d'Astous, Colbert & Montpetit, 2005; Kwong & Lee, 2002; Liao, Lin & Liu, 2010; Yoon, 2011, 2012) and acceptance of social robots (Tay, Jung & Park, 2014). Albeit several of these studies use modified versions of the TPB (e.g. Baker & White, 2010; d'Astous, Colbert & Montpetit, 2005; Kwong & Lee, 2002, January; Liao, Lin & Liu, 2010; Yoon, 2011), results generally support the TPB model, with attitude towards behavior, subjective norm and perceived behavioral control explaining between 35% and 81% of behavioral intention variance.

Figure 1. The theory of reasoned action and the theory of planned behavior (based on Fishbein & Ajzen, 1975; Ajzen, 1985, 1991)

3. METHOD

3.1 Participants and procedure

The sample for this study is composed of 60 participants (33 males and 27 females) and was collected in the University of the Algarve, Gambelas campus. The mean age is 24 years (SD = 7.33). Ten participants attended science & technology degrees, while 48 attended degrees in social sciences (2 not reported). Forty six are full time students.

Participants were invited to contribute to an experiment about socio-psychological variables mediating the use of new technologies. After being informed about the conditions of participation and confidentiality of the data collected, participants were randomly assigned to one of two video conditions: a mechanical robot (Snackbot) or an android robot (Actroid DER). Participants were evenly distributed by the two conditions. The video was 1 minute and 50 seconds long and was projected on the wall facing the subjects using a ceiling video projector. This allowed for a close to real life size view of the robots. Before watching the videos, participants received the following instructions: "In the future it will be common to interact with robots. This will happen in public spaces (factories, offices, museums) and in our houses. We are going to show you a video with one of those social robots. Your task is to imagine yourself working with this robot in the near future and forming an opinion about it". During the video a female voice narrated the following: "Hello, my name is Snackbot (or Actroid) and I'm a social robot. A social robot is a robot created to interact with people in a natural fashion. In order to do that, my creators included in my design human characteristics like eyes, mouth, language and the capacity to understand and perform social behaviors. In the future, I will be performing such jobs as a hotel receptionists, personal trainer or office clerk. Some even say that in the future I will be responsible for caring for the elders. Goodbye and see you in the future."

At the end of the experiment the participants received more information about the research project and were asked for feedback about the experiment and the theme of social robots.

3.2 Material

Behavioral Intention (BI). Measures the effort a person is willing to invest in order to work with the social robot presented in the video (e.g. I'm willing to try hard to work with this robot in the future: disagree/agree).

Attitude towards working with a social robot (ATW). Measures a person's attitude towards working with the social robot presented in the video (e.g. working with this robot will be useless/ useful).

Subjective norms (SN). Measures the person's beliefs about significant others attitude towards him working with the social robot presented in the video in the future (e.g. people close to me, would approve/ disapprove that I work with robots in the future).

Perceived behavioral control (PBC). Measures the extent that a person sees himself as capable of operating the social robot presented in the video (e.g. It would be easy to work with this robot: disagree/agree).

All the measures are based on Perugini and Conner (2000). Items are measured on a 7-point Likert type scale (1 = minimum to 7 = maximum). Higher scores indicate a higher or more positive level of the variable.

Control variables. In order to control for the possible effects of robot's movement and action during the video the following measures were used, animacy (e.g. inert/ interactive) and likeability (e.g. awful/ nice). All two measures are comprised of 5 items each. These measures are adapted from the godspeed scale, developed by Bartneck, Kulic, Croft and Zoghbi (2009). Animacy (ANI) is defined as the quality of "being alive". Likeability (LIK) is the positive impression about the robot. All the items were measured on a 7-point Likert type scale (1 = minimum to 7 = maximum). Higher scores reflect a higher level of the attribute.

Social Robots used in the video. The manipulation of the level of human-likeness of the robot (mechanical vs. android) was done through the use of videos of two different social robots, Snackbot (https://www.youtube.com/watch?v=5f57dDq5_VQ), an assistive social robot developed at Carnegie Mellon University, and Actroid DR (<https://www.youtube.com/watch?v=ssVvUX7pORc>) a full body humanlike female social robot with a corporate look developed by the Japanese corporation Kokoro.

4. RESULTS

4.1 Preliminary analyses

A first analysis of the data was conducted in order to control for the effects of gender. For that purpose, a multiple analyses of variance (MANOVA) was conducted. No differences were found between genders ($V = 0.06$, $F(4, 55) = 0.83$, $p = .512$).

This study assumes that the effects of robot type are due to the external appearance of the social robots presented in the videos, mechanical versus android. The measures of likability (LIK), and animacy (ANI) are used in order to control for other factors like robot's movements and actions during the video. Results of the MANOVA show that both robots were perceived as having a similar degree of animacy and likeability ($V = 0.07$, $F(2, 57) = 2.01$, $p = .143$).

Research on human-robot interaction suggests that robots' physical appearance, like the presence of limbs (Syrdal, Dautenhahn, Woods, Walters & Koay, 2007), face's shape and size (DiSalvo, Gemperle, Forlizzi & Kiesler, 2002), or height (Lee *et al.*, 2009; Walters, Koay, Syrdal, Dautenhahn & Boekhorst, 2009), affects users' perception of the robot qualities. In order to assess the effects of the social robot appearance (mechanical vs. android) a MANOVA was conducted using ATW and PBC as outcome variables. Analysis of Pillai's trace indicates no statistically significant effects for type of robot ($V = 0.00$, $F(2, 57) = 0.11$, $p = .894$). Analysis of the univariate tests confirmed these results.

4.2 Descriptive statistics

Table 1 shows the descriptive statistics for the scales used in the study. All scales show good reliability results (all $\alpha > .70$).

In order to seize a general impression of participant's characteristics and participant's evaluation of the robots shown in the video, a one sample t-test was conducted, comparing the variables means to the medium point of the scales (i.e., 3.5; see table 1 for results of the t-test).

Table 1. Descriptive statistics

	<i>M</i>	<i>SD</i>	<i>N</i>	Potential Range	Actual Range	Cronbach alpha	Skewness	Kurtosis
ATW	4.21***	1.28	60	1-7	1-7	.93	-0.06	-0.45
SN	3.98*	1.43	60	1-7	1-7	.86	-0.29	-0.31
PBC	4.22***	1.37	60	1-7	1-7	.87	-0.44	-0.58
BI	2.91**	1.39	60	1-7	1-6	.79	0.46	-0.58
ANI	3.60	1.23	60	1-7	1-6	.79	0.36	-0.27
LIK	4.49***	1.23	60	1-7	2-7	.83	0.19	-0.46

Note. Means differ from the middle point of the scale (i.e., 3.5) at * $p < .05$, ** $p < .01$, *** $p < .001$. ATW= attitude towards working with the social robot; SN= subjective norm; PBC= perceived behavioral control; BI= behavioral intention; ANI= animacy; LIK= likability.

There is a general good impression (LIK, $M = 4.49$) and a positive attitude towards working with the social robot presented (ATW, $M = 4.21$), and participants' think it will be easy to work with it (PBC, $M = 4.22$). The idea of working with robots seems to be socially acceptable (SN, $M = 3.98$). Despite the positive attitude toward working with robots, the mean of BI ($M = 2.91$) is significantly below the medium point of the scale. This suggests that although in general people are favorable to the idea of social robots and working with them, at a personal level they may not be particularly interested in doing so.

4.3 Correlations between the components of TRA and TPB

In order to obtain an overview of the strength and direction of the relations between the variables of the TRA and TPB a two-tailed Pearson correlation was conducted (see table 2).

Table 2. Correlations for the measures of TRA and TPB

	ATW	PBC	SN	BI
ATW	-			
PBC	.76*	-		
SN	.66*	.52*	-	
BI	.69*	.59*	.49*	-
Note. * all correlations are significant at $p < .001$. ATW= attitude towards working with the social robot; PBC = perceived behavioral control; SN = subjective norms; BI= behavioral intention.				

As it would be expected from the theoretical models and previous research, attitude towards working with a social robot, perceived behavior control and subjective norms are strongly correlated with intention to work with a social robot in the near future. All the variables show correlation values close to, or above .50, indicating strong positive and significant correlations.

4.4 Regression analyses. Comparing the TRA and the TPB

In order to compare the two models and understand the role of these variables in determining the intention to work with a social robot in the near future, a hierarchical multiple regression analysis was conducted. Variables entered in the first block were ATW and SN (*i.e.* the determinants of intention according to the TRA). Variables entered in the second block were ATW, SN and PBC (*i.e.* the determinants of intention according to the TPB).

Table 3. Predicting intention to work with a social robot using the TRA and the TPB

			BI		
	B	SE B	β	t	Sig.
TRA:					
Constant	-0.30	0.47		-0.63	.528
ATW	0.71	0.14	.66	5.17	.000
SN	0.05	0.12	.05	0.43	.669
TPB:					
Constant	-0.40	0.48		-0.84	.405
ATW	0.60	0.18	.55	3.29	.002
SN	0.05	0.12	.05	0.40	.692
PBC	0.14	0.15	.14	0.94	.351
TRA:	R= .69	R ² = .48	R ² _{adj} = .46	F (2, 57) = 26.36, p = .000	
TPB:	R= .70	R ² = .49	R ² _{adj} = .46	F (3, 56) = 17.83, p = .000	
Difference between models:		F (1, 56) = 0.88, p = .351			
Note. ATW= attitude towards working with the social robot; SN = subjective norms; PBC= perceived behavioral control; BI= behavioral intention.					

The results of the regression analysis (see table 3) indicate that the TRA explains 46% of the variance of intention to work with social robots ($R^2_{adj} = .46$, $F(2, 57) = 26.36$, $p = .000$). Analysis of the beta values indicates that ATW ($\beta = .66$) is a significant positive predictor of the intention to work with a social robot in the near future. That is, the more positive the attitude towards working with a social robot, the stronger the intention to work with a social robot in the near future. On the other hand, no statistically significant effects were found for SN. This apparent lack of effect for SN is still in line with the model predictions, since it is contended that the two variables may have different weights, thus contributing differently to behavioral intention.

These results partly confirm H1: Intention to work with a social robot is a function of attitude towards working with a social robot and subjective norms.

The results of the regression analysis (see table 3) indicate that the theory of planned behavior explains 46% of the variance of intention to work with a social robot ($R^2_{adj} = .46$, $F(3, 56) = 17.83$, $p = .000$). Analysis of the Beta values indicates that ATW ($\beta = .55$) is a significant positive predictor of the intention to work with a social robot in the future. That is, the more positive the attitude towards working with a social robot, the stronger the intention to work with a social robot in the

future. No statistically significant effects were found for PBC and SN. These results partly confirm H2, that the intention to work with a social robot is a function of attitude, perceived behavioral control and subjective norms.

Both models explain the same amount of variance (46%). This is explained by the fact that only ATW has a significant effect on BI. As discussed in the theoretical part, the weight of the variables in the prediction of intention is not fixed, so it is not totally unexpected a situation where the contribution of SN and PBC is negligible. This aspect nevertheless, underlines the importance of measuring all the variables in the model prior to delineating a strategy to increase (or decrease) the intention to perform a behavior. In this case, an intervention drawn towards the change of normative beliefs or control beliefs would be ineffective in changing intention to work with a social robot.

5. DISCUSSION

Both the TRA and the TPB explain the same percentage of the observed variation of the intention to work with a social robot, 46%. In both cases the statistically significant contributor to the model is ATW. Neither SN, nor PBC showed statistically significant effects on intention to work with a social robot in the near future. This suggests that in some contexts assessing attitude towards working with a social robot may be enough to predict intention to work with a social robot.

It should be noted, however, that both models argue that, although behavioral intention is the product of attitudes towards the object and subjective norms (attitudes towards the object perceived behavioral control and subjective norms in the case of TPB), these variables may contribute with different weights, given different contexts. Thus, the fact that no statistically significant effects were identified for SN and PBC, does not mean that these variables are not relevant for the study of intention to work with a social robot in the near future, or that these variables will not prove to be the main predictors of intention in a different context.

The lack of effect for subjective norm may result from the limited presence, and lack of knowledge about social robots among the layperson. This may limit a person's expectations about what significant others think of the subject. The lack of effect for PBC may have the same cause. Given the limited chances to interact with a real robot, people may find difficult to evaluate their proficiency at doing so and judging what factors can constrain an effective interaction.

Contrary to previous research (e.g. Bartneck, Kanda, Mubin, & Al Mahmud, 2009; DiSalvo *et al.*, 2002; Ellis *et al.*, 2005; Powers, Kramer, Lim, Kuo, Lee, & Kiesler, 2005; Syrdal *et al.*, 2007) that suggests that robot design has an influence in the perception of its qualities (e.g. intelligence, competence and friendliness), this research found no effects. Several motives can account for this. First, most of these studies were using physical robots, which might have enhanced the effect of robot design. Second, given the limited access people have to social robots, it might be difficult to imagine how robot design is going to affect interactions. Third, none of these studies used the variables of the TRA/ TPB. It is possible that robot design has a negligible impact on these variables.

In brief, it can be said that both TRA and TPB are useful models to understand intention to work with social robots in the future, as both models account not only for personal tendencies, but also for the social impact that social robots will have in the person's social network. The fact that SN and PBC do not present statistically significant effects in the particular context of this study should not be interpreted as a limitation of the models but as an appeal for further research.

ABSTRACT

Environmental and cultural resources are widely recognized as the most important way to promote a destination, a tourism experience and to revitalize natural and rural areas. In fact, paths and routes for walking and cycling, are getting more and more adepts everywhere (Tovar and Carvalho, 2011).

This paper intends to comprehensively examine the most important tourism routes in the Algarve, from the perspective of tourist animation agents. The aim of the study is to characterize tourism agents based in the Algarve, that offer animation products and services in the three main routes of the region: Rota Vicentina, Rota do Guadiana and Via Algarviana.

As a methodology a questionnaire applied to the agents of tourist animation in the Algarve is used. The study considers all the agents that are registered on the national tourism register (Turismo de Portugal, 2015a) as tourist animation companies and maritime tourist operators. Data is processed in Statistical Package for the Social Sciences (SPSS), version 22.

The study analyses two different aspects: the legal form, the typology of the agents, the qualifications of its managers and employees and the existing or non-existing partnerships between them and with other stakeholders. On the other hand, the areas in which agents carry out their activity, the tourist activities/experiences they offer, the frequency, season, duration of the activities and the profile of the participants.

The results reveal the diversity and also the fragmentation of the tourism industry in the animation area. There is also a need to improve partnerships with regional, national and international agents.

Keywords: Routes, Walking and Cycling, Tourism, Animation.

JEL Classification: Q26, Z39

1. INTRODUCTION

Nowadays, there is a consensus that the most important way to promote a destination, to provide a memorable tourist experience and to revitalize natural and rural areas is to develop and promote environmental and cultural resources. In this context, paths and routes for walking and cycling, are getting more and more adepts everywhere. People want to contact with nature, to be part of a new social and cultural reality, to do exercise, to be healthy and to run away from the massification of the cities.

As Rodrigues (2006) affirms, trekking has been gaining prominence as a leisure and tourism activity in many countries. This activity has great growth potential in Portugal, since the country has resources of great interest. This paper presents the supply in the pedestrian rails in the Algarve in what concerns animation touristic products. It is important to consider that this kind of tourism infrastructure can contribute, in a sustainable way, to the development of tourism in rural and natural areas. In this context it is necessary to know the desires and needs of the tourists segments, both for practitioners and non-practitioners to adapt services to their expectation.

It is important to understand the profile of the Portuguese and the foreign walkers because there are some significant differences for example in their behaviour and environmental attitude, in the context of vacations. However we believe that it is essential first to identify who is working in this area and what are the results of that work experience to promote pedestrian paths, tourist infrastructures and sustainable management adapting to the preferences and fears of each group.

This paper intends to comprehensively examine the most important tourism routes in the Algarve, from the perspective of tourist animation agents. The study pretends to characterize tourism agents based in the Algarve that offer animation products and services in the three main routes of the region: Rota do Guadiana, Rota Vicentina and Via Algarviana.

2. LITERATURE REVIEW

2.1 Legal framework

Tourist animation services have been growing significantly in recent years (Sousa, 2014). For that reason a gradual effort has been developed to regulate the activity.

Portuguese legislation consider tourist animation all the recreational, sports or cultural activities, which include outdoor and cultural tourism that can benefit the region (n.º 3, Decreto-Lei n.º 95/2013). The outdoor activities (also called active tourism or adventure tourism), are the activities that take place predominantly in natural spaces. Those activities represent diverse tourist experiences, the opportunities to discover the nature and the landscape and a new form of space fruition. They could take place in physical facilities designed for this purpose or in any other location in the region. The outdoor activities should be logistically organized, must have supervision by the suppliers and they also require a physical interaction between tourists and the environment.

The same law clarifies further that cultural tourism activities are pedestrian or transported activities that promote contact with the cultural and natural heritage through a mediation between the tourist and the cultural resource in order to share knowledge. These categories do not include: (a) the organization of holiday camps; (b) the organization of shows, exhibitions, congresses, events of any kind (c) the rental of animation equipment.

Tourist animation must be recognized as nature tourism (n.º 20, Decreto-Lei n.º 95/2013) when integrated into the National System for Classified Areas (SNAC) and when they are not located in the urban perimeters or in the national, regional and local roads.

The same law mentions tourist entertainment activities, classified as tourist-maritime activities. Those activities could integrate: a) the maritime tourist rides; b) rent a boats with or without crew; d) services performed by river or sea taxi; e) tourist fishing; f) maritime-tourism services provided through the use of boats (moored or anchored and without means of propulsion or sealed); g) hire or use of jet skis and small boats, exempt from registration; h) other services, in particular those relating to equipment trailer services recreational character (i.e. bananas, parachutes, water skiing). All the equipment used in maritime activity-tourism must attend to the requirements and technical procedures, particularly in terms of security.

2.2 Tourist agents in Portugal

According to the information provided by the RNAAT- National Register of Tourist Agents (Turismo de Portugal, 2015a), 2729 companies were in activity in November 2015 (more 593 companies than in November 2014). 72 % of these were tourist animation companies and 28% were maritime operators (Figure 1).

Figure 1 – Active companies registered in RNAAT

Source: Turismo de Portugal (2015b)

The Lisbon and Algarve regions are the ones with the highest number of registered companies, with 37% and 20%, respectively (Figure 2).

Figure 2 – Registered companies by region

Source: Turismo de Portugal (2015b)

The survey carried out shows that most companies have diverse codes of economic activities (CAE). Only 35% of those companies indicated the CAE 93293, corresponding to the organization of tourist activity as the main activity.

When questioned about their turnover, 38% of tourist animation companies mentioned that they had a turnover around 10,000€, in 2014, and 23% claim to have had above 100,000€. More than a half reported that, in 2014, their turnover increased 51%, compared with the previous year. Approximately 63% of the companies expected to increase the turnover in 2015.

With regard to communication, 80% of tourist animation companies claim to have a website and 85% say they are present in a social network.

According to the companies that participated in this study, 71% claim to have partnerships with other entities for the definition of new tourist products (Figure 3). The regions where these partnerships are more frequent, the North of the country (80%), the Alentejo region (78%) and the Center of Portugal (77%). On the contrary, in the Algarve and in Madeira there is less investment in this strategy (58% and 54%, respectively).

Figure 3 – Partnerships with other companies

Source: Turismo de Portugal (2015b)

The companies interviewed claim that tourism outdoors activities /nature and adventure tourism are the most sought activities (62%) (figures 4 and 5). Furthermore, the companies include as the most important activities the maritime tours, guided tours to museums, monuments, and other sites of patrimonial relevance, and the rental of vessels with crew.

Figure 4 – Most searched activities

Source: Turismo de Portugal (2015b)

Figure 5 – The 5 most searched activities

Source: Turismo de Portugal (2015b)

The companies affirm the average duration of the programs is less than a day (57%) and only 23 % of companies claim to have programs that last longer than one day. With regard to the number of clients, 54% of the companies refer not more than 500 customers per year, and only 11% claim to have more than 10,000 customers/participants in 2014.

For 42% of those companies, the demand increased in 2014. They add that most customers who are looking for this kind of activity are between the ages of 25 and 54 years (67%) and, to 89% of the companies, customers are individual participants.

In 2014 an increase in the weight of the international market is recognized (from 49% in 2013 to 54% in 2014). United Kingdom and Spain are mentioned as main markets and France and Germany are in the 3rd and 4th position in the ranking.

2.3 Tourist animation

Nowadays tourist animation is a fundamental element in any destination (Almeida, 2003). Increasingly tourism destinations must be dynamic, diverse and complete. Thus, the tourist agents should work with other important stakeholders such as tourist accommodation, catering, transport and other support services. This coordinated supply can provide a competitive composite tourism product (Vieira, 2006, p. 27).

In this context, the tourist entertainment can be considered an integrated part of tourism supply, particularly important in nature tourism, eco-tourism or rural tourism in which tourists seek, above all, authentic experiences. Tourist animation should be geared to awareness, preservation and protection of natural, historical and cultural heritage. The promotion of endogenous resources (e.g. fauna, flora, gastronomy, crafts) is also a very important element to develop tourism in natural or rural areas. This kind of activity can contribute to strengthening the sense of belonging of the community and therefore to the enhancement of its identity. This animation activity can contribute to innovation, attractiveness of the tourist destination, new job and additional income opportunities and can also encourage longer stays at the destination.

To Krippendorff (1989, p. 223), the animation should “(...) provide the courage to externalize, to touch on forgotten resources, inform, suggest, encourage, create favourable conditions and lead by example. Anyway, free human beings, give you the freedom to become active.” The author adds that this activity requires the reduction of barriers and develops the pleasure of discovery and the desire for cultural contact, encouraging personal effort, individual creativity and spirit of initiative.

Animation can be defined as the set of activities offered to tourists by public or private entities, with the purpose of restoring physical and emotional balance. These could be related to culture, recreation, sports, training, dissemination or leisure (Chaves and Mesalles, 2001). “In places where animation is more than just the supply of rooms and organization, it is necessary for it to overcome for some tourists the discrepancies between wishes and abilities.” (Medlik, 1991, p. 233).

2.4 Hiking routes

According to the European Ramblers Association (ERA, 2017), walking is moving on foot in the outdoors. It is a free-time activity with physical movement of different intensities which supports both mental and physical well-being. We can consider that a typical walk has a duration of more than one hour, has been planned in advance, use appropriate resources and may require suitable equipment.

The practice of hiking and outdoor activities in Europe has been growing. The organized groups are also increasing and, in many cases, the reasons for the strong demand is related to easy access and the low cost associated with their practice. Hall and Page (1999) reported that in addition to the financial availability there are other factors that influence the demand for this type of tourism. Seasonality and weather conditions influence the practice of outdoor activities. In the case of hiking, too much heat, rain or snow are unfavourable conditions. The gender is also a powerful factor for this practice. In fact, since women with children have less free time and tend to participate less in leisure activities, the hiking activity is an exception

because women join the hiking programs in family, with small children. The same authors argue that more qualified the people, with higher income and their own transport, the more they tend to seek more active leisure forms and a variety of activities, both in and outside their residence area.

Tourism associated with walking is today considered, as referred by Kouckner and Lyard (2001), as a challenge to local development. This is a very common activity among the north European population.

Its practice has been changing. It goes from an informal stroll to an organized activity, a benefit enhancer in the area of the residence and beyond.

The walk trails could be the main or a complementary tourist product in a destination. In any case it is a kind of activity that enriches tourist experience.

There are specialized tourist operators in this kind of product. They can offer all included services such as self-guided possibilities, travellers, place of accommodation, with daily departures to different routes, individual services.

The implementation of pathways is often a form of revitalization of old paths. It is extremely important in a pedestrian path to be well signposted, able to be traversed without maps or descriptive texts. This implementation involves the preparation of a safe and comfortable experience and several entities may be responsible for its creation and implementation (public, private sector and non-profit organizations).

2.5 Marks used in hiking routes

The main infrastructure for the practice of hiking are the hiking routes, or railings, i.e. roads, promoted and disseminated for this purpose.

E-Paths are the European long distance paths (figure 6) which link the countries from North Cape to Crete and from the Atlantic Ocean to the Carpathians and the Black Sea. There are 12 E-Paths, bearing the names of E1 to E12. These E-Paths are waymarked and maintained by the members of the European Ramblers Association (ERA-EWV-FERP). The E-Paths run on existing national or regional trails with their own marking. However, it has been agreed to identify them also with a uniform marking: a blue shield with the yellow stars of Europe, in the middle of which is the letter E and the corresponding number of the E-path. Under the shield is also included the website address of the European Ramblers Association. <http://www.era-ewv-ferp.com/walking-in-europe/e-paths/>.

Each route should be clearly marked and it is usual to find published guides that provide information about directions, time required, conservation state, security, cultural and natural values and relevant landscape.

Figure 6 - European long distance paths

Source : <http://www.era-ewv-ferp.com/walking-in-europe/e-paths/>

The walking routes are classified as linear pathways/open: those that begin and end in different locations; circular/closed - those that begin and end in the same place.

The Great Routes (GR) cover more than 30 kilometres. There are trans-European routes, such as the Atlantic Way (GR-E9) which starts in St. Petersburg in Russia and crosses the whole of Europe. For this kind of route is not possible to travel on a single day. The registration and allocation of the number of the major routes are made at a national level. When these routes are trans-European (starting or ending in Portugal and more than three countries), the numbering is supplemented by the letter E (Europe) and its European numbering.

Small Routes (PR) are less than 30 kilometres long, can be travelled on a single day, and are typically set in one municipal area. They are registered by municipalities. If a route takes place in the territorial division space of two municipalities, it is assigned the numbering referring to the county with more territory covered. The numbering should be complemented with the designative letters of the municipality.

Local Routes (PL) just cover short distances.

The colours used to indicate these three different pathways are red and white (GR), yellow and red (PR), and green and white (PL), respectively.

The routes are signposted with a range of equipment, including poles and direction arrows, informative arrows and interpretation panels. In the routes, at the beginning and/or end of each section there are interpretative panels to inform walkers about that location, including the natural and cultural heritage, and accommodation and food facilities available there.

The maps in these panels have a set of symbols for each information item mentioned above, described in the following figure 7.

Figure 7 – Signaling for local, small and great routes

		Correct way	Wrong way	Change of direction		temporarily coincides with the great route (GR)	temporarily coincides with the small route (PR)
Local Route	PL			Turn left	Turn right		
							
Small Route	PR			Turn left	Turn right		
							
Great Route	GR			Turn left	Turn right

2.6 Pedestrian routes in the Algarve

The signposted footpaths in Portugal have to be approved by the Federation of Camping and Mountaineering. This is an essential element in the routes because the well-defined routes offer security to all who follow them. Walking is an activity within the reach of anyone who just needs to follow the signs on the ground in order to not getting lost.

The signage used in Portuguese territory to mark pedestrian routes is registered by the Federation of Camping and Mountaineering of Portugal at the National Institute of Industrial Property (INPI) (Tovar, 2010) of Great, Small or Local Routes Route, internationally recognized and accepted, as we mentioned before. This signposted are similar to the ones used by the countries of southern Europe (for example Spain or France).

The Algarve is known because of the beaches and the golf courses and not for his nature tourism, ecotourism or integrated forms of tourism that promote walking and cycling. Despite this, the region also has a lot to resources in these areas. The pedestrian routes that we consider in this study are a very good example of the resources and tourism product potentiality: Via Algarviana, Rota do Guadiana and Rota Vincentina.

These routes, as well as the surrounding areas, have distinctive features and tourist resources to tourism activity, some of them already developed, others in the developing stage. Those territories are characterized by its proximity from the main tourist area but, at the same time, by the low demographic density levels due to migration flow to the coastal areas and to foreign countries, the abandonment of traditional lands, activities and practices.

Via Algarviana (figure 8) has been developed by Almargem, a non-governmental organization, to generate sustainable economic opportunities. With this goal it is intended to attract activities and population. It is the main pedestrian route in the Algarve and it crosses all the region through the inland, establishing the connection between the Rota do Guadiana and the Rota Vincentina (the other two routes that we consider in this research).

Every year, Via Algarviana attracts thousands of pedestrians and provides a new way of life for local businesses. Most of the businesses located in the geographic area are tourism accommodation and restaurants.

Figure 8 – Via Algarviana

Source: <http://radicalflow-adventure.blogspot.pt/2013/01/caminhadas-planeamento-e-dicas.html>

The Rota do Guadiana (figure 9), smaller than the previous route, stretches from Vila Real de Santo António to Alcoutim. In Alcoutim it connects with Via Algarviana. It is located in a poor territory, with a low population density.

Figure 9 – Rota do Guadiana

Source : <http://escritocomluz.blogspot.pt/2016/01/gr-15-grande-rota-do-guadiana.html>

The Rota Vincentina, managed by Associação da Rota Vincentina, presents distinct features. It integrates the private sector and it is in a different stage of tourism development, if compared with the other routes, in terms of product life cycle (Butler, 1980).

Figure 10 – Rota Vincentina

Source : <http://adphaa.blogspot.pt/2012/09/a-rota-vicentina-e-via-algarviana-estao.html>

However, all the three sub regions need more development. The design of new tourism products to complete and add value to the areas associated to the sustainable use of the resources is also necessary.

3. METHODOLOGY

After an initial stage, based mainly on the analysis of secondary data to understand the dynamics of tourist animation in Algarve environmental areas, the authors adopted the method of observation in the exploratory stage of the research. This technique allowed the researchers to observe, in real time, how agents operate with tourists in the animation activities in the territory.

The use of this kind of methodological approach does not easily guarantee the validity of the data and consequent generalization. For this reason, it was decided to apply a questionnaire to the animation agents from the Algarve region, so that data triangulation could be possible.

All the agents that are registered on the national tourism register (Turismo de Portugal, 2015a) are considered, namely the tourist animation companies and maritime tourist operators. Data is processed in Statistical Package for the Social Sciences (SPSS) version 22.

The main aim of the study is to understand those agents, to know their products and services portfolio and to recognize the places where animation agents operate in the Algarve. In particular it is essential to know if they operate in these three major routes in the region: Rota do Guadiana, Rota Vincentina and Via Algarviana.

Thus the study analyses two different aspects: (1) the legal form, the typology of the agents, the qualifications of its managers and employees and the existing or non-existing partnerships between them and with other stakeholders; (2) the areas in which agents carry out their activity, the tourist activities/experiences they offer, the frequency, season, duration of the activities and the profile of the participants.

A questionnaire was prepared consisting of several sections, arranged sequentially and underlying themes: (1) profile of agents; (2) profile of participants in the activities/tourist experiences; (3) profile of employees; (4) profile of those responsible.

The questionnaire consists of open and closed questions in which respondents are asked to indicate the characteristics associated with each of the profiles.

It is considered, as the population of the study, all the tourist agents listed in the national register of tourism (Turismo de Portugal, 2015a), a total of 584. An e-mail was sent to these companies, with the link to the questionnaire in October 2016. Until February 2017, 32 responses were received representing a response rate of 5.5%. It should be noted that, in order to gather more responses, the questionnaire was sent back in November 2016 and in February 2017.

Bearing in mind that the sample obtained is not representative of the population under study due to its small size, it was decided to carry out a descriptive analysis of the results obtained not performing another kind of analysis.

To make the contents of the graphics less heavy in some cases only the categories with a percentage above 10% are presented.

4. RESULTS AND DISCUSSION

4.1 Profile of agents

Table 1 – Distribution of agents by municipality

	Count	%
Vila do Bispo	4	12.5%
Portimão	4	12.5%
Faro	4	12.5%
Silves	3	9.4%
Loulé	3	9.4%
Tavira	2	6.3%
Olhão	2	6.3%
Lagos	2	6.3%
Alcoutim	2	6.3%
Vila Real de Santo António	1	3.1%
Monchique	1	3.1%
lagoa	1	3.1%
Castro Marim	1	3.1%
Albufeira	1	3.1%
Aljezur	1	3.1%
São Brás de Alportel	0	0.0%
Total	32	100.0%

Source: own elaboration from SPSS

Chart 1 – Distribution of agents by region

Source: own elaboration from SPSS

From table 1 we can see that the municipality of São Brás de Alportel is the only in which no agents are based. The municipalities with the highest number of agents are Faro, Portimão, Vila do Bispo, with 12.5% each, Portimão and Silves, with 9.4% each. To note that agents are equally distributed between the two regions in the Algarve – Sotavento and Barlavento – chart 1.

Chart 2 -Legal form of the agents

Source: own elaboration from SPSS

Chart 3 – Typology according to RNT

Source: own elaboration from SPSS

Chart 4 -Start year of activity

Source: own elaboration from SPSS

Most agents are sole proprietors (46.9%), belonging to the maritime tourist typology (53.1%) and initiated activity between 2008 and 2016 (81.3%) and nearly half (46.9%) initiated the activity in the last two years, charts 2, 3 and 4.

Chart 5 – Partnerships undertaken by agents

Source: own elaboration from SPSS

When asked about the partnerships (Chart 5), respondents reported that these are mainly with other companies of animation (77.8%) and accommodation companies (63.0%).

Chart 6 -Routes where products/services are offered

Source: own elaboration from SPSS

Analyzing the routes in the Algarve in which the agents provide services (chart 6), these are offered on all routes, but especially in the Rota Vicentina (66.7%).

Chart 7 -Main activities offered

Source: own elaboration from SPSS

The main activities offered, as can be seen in chart 7, are: water activities (56.3%), observation Tours fauna/flora (43.8%), geological hiking (28.1%), mountain biking tours (12.5%) and boat trips (12.5%), which include visits to the caves, and cruises. This would be expected as the Algarve has a long coastline.

Chart 8 – Equipment available for the development of the activities

Source: own elaboration from SPSS

Taking into account the activities offered and according to chart 8, the major equipment provided by the agents is: motorized (55.2%) and non-motorized (24.1%) maritime equipment, equipment specific equipment for observing fauna/flora/(20.7%), motorized (20.7%) and non-motorized (17.2%) inland equipment, specific equipment for hiking (10.3%) and water and/or power supply points (10.3%).

Chart 9 -Season of carrying out the activities

Source: own elaboration from SPSS

Most agents perform the activities during the summer (96.9%), although a large number of agents (59.4%) also carry out their activities in the winter (chart 9). This shows some dispersion of activities throughout the year, in order to combat the seasonality associated with the Algarve.

Chart 10 -Average duration of activities

Source: own elaboration from SPSS

Table 2 -Descriptive Measures for activities with more than a day

Mean	7
Median	7
Mode	7
Maximum	14
Minimum	2
Standard Deviation	3.9

Source: own elaboration from SPSS

According to the chart 10 most activities lasts less than a day (78.1%). When the duration is more than a day, they last on average 7 days, and can range from 2 to 14 days (table 2).

Table 3 -Descriptive Measures for the average size of the Group

Mean	12
Median	7
Mode	4, 5, 8
Maximum	75
Minimum	2
Standard Deviation	15.1

Source: own elaboration from SPSS

Table 3 reveals that on average the groups are made up of 12 people, however these can go from 2 people up to 75. This is due to the variety of activities offered that allow the existence of different kinds of groups.

4.2 Profile of participants

Chart 11 -Main origin of participants

Source: own elaboration from SPSS

When asked about the provenance of the participants (chart 11) respondents reported that they are mostly from England (78.1%), Portugal (71.9%), France (62.5%), Spain (56.3%), Germany (53.1%) and Netherlands (43.8%).

Chart 12 -Typology of participants

Source: own elaboration from SPSS

Chart 13 -The company has activities for participants with special needs

Source: own elaboration from SPSS

Chart 14 -Activities for participants with special needs

Source: own elaboration from SPSS

Analysing the issue concerning the typology of participants (chart 12) we see that only the category associated with the participants with special needs has a limited number of participants (12.5%). Although this group has a small size it turns out that almost half (46.9%) of the agents have specific activities for this group (chart 13), in particular to participants with hearing disability (60.0%) (chart 14). This kind of disability does not prevent participants from enjoying the main activities that are proposed.

Chart 15 -Age groups of participants

Source: own elaboration from SPSS

There is a smaller, but significant, participation in activities offered by the age groups “up to 8 years” (40.6%), “of 13 to 18 years” (25.0%) and “more than 67 years” (chart 15). Probably because in the first case the parents consider that they are too young for these activities, as they may require some physical effort, the second because the young people no longer want to follow parents and last because people no longer consider that they have physical capacity for such activities.

Chart 16 -Gender of participants by age group

Source: own elaboration from SPSS

Only in adults there is a greater difference between the percentages of the two genders, this may be related with the roles that women (as mothers and wives) play within families.

4.3 Profile of employees

Table 4 -Descriptive Measures for the total number of employees

Mean	4
Median	3
Mode	4, 3
Maximum	13
Minimum	1
Standard Deviation	2.8

Source: own elaboration from SPSS

Table 5 -Descriptive Measures for the total number of employees by training area

		Mean	Median	Mode	Maximum	Minimum	Standard Deviation
Number of employees with higher education in	Tourism	2	1	1	5	1	1.6
	Tourist Animation	2	2	2	2	2	0.0
	Biology/Geology	2	2	1	3	1	1.0
	History	1	1	1	2	1	0.5
Number of employees with specific training in	Tourism	2	1	1	4	1	1.1
	Tourist Animation	1	1	1	3	1	0.8
	Another area	1	1	1	2	1	0.5
Number of employees without top or specific training		2	1	1	13	1	3.1

Source: own elaboration from SPSS

As we look at the number of employees (table 4) and related training (table 5), we have agents with only one employee to agents with 13 employees, on average the agents have 4 employees. In terms of either higher or specific training this is very

varied. In the category “another area” specific trainings within biochemistry, accounting and management, environmental education, can be noticed. This may be due to the need for people to search for their occupation outside the training area, due to lack of opportunities in their area.

4.4 Profile of the leaders

Chart 17 – Gender of the responsible

Source: own elaboration from SPSS

Table 6 -Descriptive Measures for the age of the responsible companies

Mean	44
Median	44
Mode	39, 55
Maximum	61
Minimum	32
Standard Deviation	8.3

Source: own elaboration from SPSS

The responsables of the companies are mostly men (chart 17) with ages (table 6) ranging between 32 and 61 years. This may mean that the areas linked to tourism and in particular the tourist animation are quite attractive as an early career or to supplement the family income.

Chart 18 – The head of the company's higher education

Source: own elaboration from SPSS

Chart 19 – Areas of higher education

Source: own elaboration from SPSS

Chart 20 -Professional training areas

Source: own elaboration from SPSS

When we analyse the question of training of leaders of the companies (chart 18) most (56.2%) have higher education in an area not connected to tourism and/or tourist animation (53.1%) and this includes very varied areas such as history or accounting (chart 19). Again this may be due to the fact that professional placement could not be found in the areas of training. However it turns out that 28.1% of those responsible try to address this shortcoming with the professional courses in tourism or tourism animation (chart 20).

5. CONCLUSION AND RECOMMENDATIONS

The paper shows the importance of tourism animation programs in tourism development and in particular the very important environmental resources that Algarve region has yet to be recognized also as an interesting and undiscovered destination to hiking experiences and environmental and cultural contact in the territory.

The existence of a large number of animation companies and maritime tourist operators that has been identified reveals the importance of animation for the tourist in the Algarve region.

Because it is a regional study, the results are not directly comparable with those presented in the literature review. As expected, as the Algarve is a region closely linked to the sea, most agents based there are maritime tourist operators. However there are no major discrepancies between the two groups when we compare the source of participants and the respective age group.

The results reveal the diversity and also the fragmentation of the tourism industry in the animation area. There is also a need to improve partnerships with regional, national and international agents.

With regard to the limitations of this study, particularly the reduced sample size, which does not allow the carrying out of statistical inference in order to obtain conclusions for the population. In the future, and in possession of a higher sample, other statistical techniques will be developed.

This study would have been more consistent if associated with other techniques of collection and processing of information that complement the data obtained with the application of the questionnaire. In this context, we highlight the relevance of exploratory interviews at an early stage of the research and the promotion of focus group between responsible/owners of tourist animation agents to realize the kind of relationship that is established between them.

ABSTRACT

Based on recent developments ongoing within European boundaries, such as: recent political decisions regarding the terrorism phenomenon in Europe; intentions of implementing new geographic boundaries; the ongoing economic crises in Europe; or even the latest, Brexit; among others developments that conduct us to an urgent need of finding new strategies and approaches, which allows to achieve greater territorial cohesion and cooperation between countries, once the previous project of EU seems to be disintegrated.

In this regard, the identification of critical factors for territorial success, since CBC projects can contribute not only to tackle the aforementioned problems but also to enable the creation of resilient and sustainable cities, strengthen the potential synergies and also common objectives for territorial development.

The present study aims to highlight six previous identified factors: (i) political commitment and transparency; (ii) breaking cultural barriers (extreme sense of belonging); (iii) life's standards; (iv) strong territorial cohesion; (v) proper use of EU funds; and (vi) common objectives.

The research has been carried out through a case studies methodology analysing and assessed European CBC projects. The results clearly show the importance of the cross-border cooperation to achieve territorial cohesion and sustainable development.

Keywords: Spatial Planning, Cross-Border Cooperation, Territorial Cohesion, Sustainable Development.

JEL Classification: R58

1. INTRODUCTION

By the time the Maastricht Treaty was established in 1992 (Treaty on the European Union, 1992), the project for a united and stronger Europe was still taken for granted. However, a quarter century later it is possible to denote an opposite reality, in which fragmentation, division and weakening of cohesion are increasingly growing in the European Consolidation Project (Nye, 2004; Keohane, 2007; Dale, 2016; Holmes, 2016).

To this contributed, and continue to contribute, issues such as the economic crisis of the 2000s, that shocked the world economy and particularly the European one; the relevant and persistent psychological barriers caused by previous conflicts in European territory; the attempt to redefine borders - jeopardizing national sovereignty - as the example of the Crimean Peninsula Annexation War, Ukrainian sovereign territory, by Russia (Martins, 2015; Dale, 2016; Holmes, 2016); the exit from the European project of the United Kingdom (Brexit); the phenomenon of terrorism climbing within Europe, contributing to a "dangerous" sense of belonging leading to a resurgence of nationalist extremists fractions and parties; the recent intentions of the current President of the USA of building a formal wall dividing USA and Mexico; among many other problems that Europe currently faces, have converged to the exposure of European design weaknesses (Mikail, 2011; Buti and Carnot, 2012; Martins, 2015).

In this regard, an increase of literature related to European CBC issues has been developed over the last decade (Medeiros, 2005, 2011, 2015; Fertner, 2006; Baycan-Levent *et al.*, 2010; Martín, 2013; Nicolini and Pinto, 2013; Namyslak, 2014; Domínguez *et al.*, 2015; Sohn and Giffinger, 2015; Castanho *et al.*, 2016, 2017; Castanho, 2017) focusing among others issues, some of the previously mentioned aspects.

2. RESEARCH QUESTIONS

Given the issues previously identified the research focused the clarification of two research questions, which aim to be answered throughout the use of an exploratory research based on case study analysis.

The developed research questions were defined as follow:

- How the CBC projects and strategies influences the territorial cohesion?
- Throughout the implementation of CBC projects the areas are definitely close to achieving a sustainable development?

3. METHODOLOGICAL APPROACH

Several scientific methods have been used through the present research, including indirect and direct methods and tools. In this regard, a significant amount of time and attention to the development of a proper methodological framework, as well to formulate the major questions for the research hypothesis mentioned above, by the authors have been carried out. The methodological approach was divided into three main phases (Figure 1), ending with the relevance of the CBC projects and strategies to achieve territorial success or failure.

Figure 1. Methodological approach scheme.

At this stage, should be highlighted the chosen method to assess the desired research question case study analysis, was put forward by Robert Yin (1994). This method is considered a powerful tool to analyze and obtain information for similar example, once it able to extracts the lessons learned (Francis, 1998; Levy, 2008).

In the scope of the research, a total of four CBC case studies were selected from a sample of a previous studies put forward by Castanho *et al.* (2016; 2017). The selection criteria focus European CBC case studies (Figure 2) in which it was possible to identified six critical factors for territorial success, namely:

- political commitment and transparency;
- it is present a high sense of belonging;
- increase life's standards;
- strong territorial cohesion;
- proper use of EU funds;
- common objectives between countries.

Figure 2. Selected case studies

(A)Newry ^(IE) – Dundalk ^(UK); (B) Valga ^(EE) – Valka ^(LV); (C) Vienna ^(AT) – Bratislava ^(SK); (D) La Línea de la Concepción ^(SP) – Gibraltar ^(GI)

Seeking a powerful analysis and assess over the case studies, a Territorial Impact Assessment (TIA) principles - based on the information/data available ESPON (ESPON–European Spatial Planning Observation Network) and on existing literature (ESPON, 2012; Medeiros, 2013) - was developed, evaluating the policies and strategies that were implemented in the selected case studies. Thus, enabling the analysis of economic, social cohesion, environmental sustainability, territorial governance and spatial governance issues (Medeiros, 2014; Loures *et al.*, 2016).

4. CASE STUDY ANALYSIS

4.1. Newry^(UK) - Dundalk^(UK)

4.1.1 *An Insular Twin City, A Cooperation since 70's*

Figure 3. Location of the case study, in the Irish context as well as in the regional context.

The cities of Newry and Dundalk are linked to each other by major railways and roads that are crucial to the whole island (Ireland), as they connect Belfast to Dublin (LISER, 2015; MOT, 2017). The synergy, which has begun in the 1970s, was significantly accentuated during the 2000s, thanks to reports that encouraged the creation of the Twin Cities (MOT, 2017). The institutional cooperation is developed in the scope of the “*Newry-Dundalk Twin City Region*”, which plans to secure inward investment, aiming to provide a sustainable regional development and a better life’s quality standards for the population (Castanho, 2017).

4.1.2 *Problems and Solutions*

Strategically located in the Belfast-Dublin corridor, Newry and Dundalk provides pivotal requisites to attract entrepreneurship, improve the environment, generate a wide range of public and commercial services, and also promotes a well-managed environment for tourism and recreation (ICLRD, 2008). Nevertheless, this urban environment did not have always the same level of development, which has conducted the governments of Newry and Dundalk towards the creation of a Twin City Region. Those measures and policies able Newry and Dundalk to achieve their challenges by common goals and objectives, and thus becoming not only a pole of growth in itself but also a growth engine for the entire sub-region border, which has an estimated population of 170,000 (ICLRD, 2008; MOT, 2017).

4.1.3 *Open Issues | Future Challenges*

In future, and according to with the International Centre for Local and Regional Development (2008), the Twin City Region pretends:

- continue and improve the Joint Management Group;
- implement agreed on common strategic projects;
- develop and adopt a common strategic plan for the Newry-Dundalk Twin City Region;
- identifying potential areas for future cooperation to the proper implementation of the strategic plan.

4.1.4 *Lessons Learned*

Throughout the creation of the Twin City of Newry-Dundalk has been possible to reach an integrated sustainable development strategy of cross-border ideology, and even the creation of a crucial corridor on the eastern seaboard (Castanho, 2017; MOT, 2017). These have shown many practical and mutual benefits of voluntary cooperation, which can have demonstrated by cost savings in the economic infrastructures; the sharing of knowledge; the exchange of good practices and efficiencies in business and sustainable development and management of the unique natural heritage of the Twin City Newry-Dundalk.

4.1.5 Identified Factors

Stronger territorial cohesion; political commitment; life's standards; proper use of EU funds; common objectives; marketing and advertisement of the Eurocity.

4.2. Valga^(EE) – Valka^(LV)

4.2.1 The Power of the Sense of Belonging vs the Geopolitics

Figure 4. Location of the case study, on the Estonian - Latvian context as well as in the regional context.

The Twin City of Valga-Valka is located at the South of Estonia and at the North of Latvia. Besides their small size, the twin cities present a large cultural diversity. Valga-Valka has a large history and also a resilient cultural life (Valga, 2016). These Twin City has experienced several historical fractures associated with geopolitics issues (García, 1991). Created has a single city, a first division has taking place after the I World War. However, under the Soviet regime, which lasts 50 years, they have reunified (Martins, 2015).

4.2.2 Problems and Solutions

After the independence of the Baltic States, the studied cities have divided once again. Which leads to an increase of the political ambition, aiming to build a transboundary urban center with the major goal of reunifying and increase the sense of belonging near the population but at the same break some cultural barriers, that have been survived until today, and finally in this regard generate a well and sustainable growth. Against this framework, a common master plan for the cities has been carried out in 2007, as well as a common territorial marketing strategy.

4.2.3 Open Issues | Future Challenges

With the 2007 common master plan, the cities expect do not duplicate infrastructures in all the Twin City area and surroundings; it is also expected that the common marketing strategy works as a magnet to investors to the Twin City, and thus conducts to an increase of the regional GDP/*per capita*, the same is expected regarding the increase of the life's standards of the resident population.

4.2.4 Lessons Learned

Throughout this case study, it is possible to demonstrate, the relationship with the success or failure of a CBC project and the level of sense of belonging those populations/inhabitants presents. It is an acquired data that that kind of close relationships, among populations and their increased sense of belonging it, is always a complex issue to be managed by the main actors and policies that should be carried out; any attempt of apart from these demarked feelings presented in the populations may conduct to the failure of any CBC approach. The authors believe these factor - break cultural barriers/ increase the sense of belonging - should be taken as pivotal for a CBC project with characteristics like these particular case have shown. Based on those principles, the politicians have developed a common territorial plan, officialised in 2007.

4.2.5 Identified Factors

Stronger territorial cohesion; political commitment; life's standards; proper use of EU funds; common objectives; sense of belonging; marketing and advertisement of the Eurocity.

4.3 Vienna^(AT) – Bratislava^(SK)

4.3.1 The Growth Corridor Along Danube

Figure 5. Location of the case study, on the Austrian -Slovakian context, as well as in the regional context.

Institutional relationships between the capital cities of Vienna and Bratislava are driven primarily by the desire to promote economic development (Ivanička and Ivanička, 2007). With the end of the transitional period - which limited the right of Slovakian workers to enter the labor market in the European Union (Lichtenberger, 1993) – in 2011, the level of cross-border cooperation between the two cities has increased. Actually, the leading entity in terms of cross-border cooperation is clearly the Centrope¹, which includes territories of Hungary and Czech Republic (Program INTERREG Europe, 2016). One of the main objectives of the Centrope 2013+ Strategy It is to define a coordinated approach to regional planning to improve accessibility in this vast region in infrastructure and services (LISER, 2015; Program INTERREG Europe, 2016).

Within the framework of development strategies several investments in the construction and rehabilitation of areas of the city of Bratislava were made, once the city of Bratislava compared to Vienna, in terms of public space, it showed significant differences (Fertner, 2006; Spirkova, and Ivanička, 2009; Castanho, 2017).

4.3.2 Problems and Solutions

Transportation in Bratislava, after the boom in the construction of the 90's, is a growing problem, as nearly 200,000 people move to Bratislava every day at their workplaces (Ivanička and Ivanička, 2007). The catchment areas are the entire region of Bratislava, part of the Trnava region, and actually also the border area with Austria and Hungary. Highlighting this theme can be quoted the authors Spirkova and Ivanička (2009): “The city also was not prepared for the opening of the borders and the consequent increase of the foreign traffic.”

As it happens in other cities in Eastern Europe, is the huge growth of individual transport in Bratislava (Vulevic 2013; Vulevic, 2016). This situation deeply increased the traffic intensity, as well as static transport (Vulevic, 2016), while the development of the communication network was lagging behind due to insufficient public funding mechanisms (Fertner, 2006; Spirkova and Ivanička, 2009; Sohn and Giffinger, 2015).

The Bratislava master plan established in 2007, with the active collaboration of Vienna, aims to fill those gaps throughout their implementation (Stadt Wien, 2016). According to the Stadt Wien (2016), the master plan intends the construction of the ring road, which would mean the additional connection to Vienna.

4.3.3 Open Issues | Future Challenges

Vienna and Bratislava not only have a shared history but are also connected by the Danube and the Danube National Park. The Danube wetlands are the last large, untouched, floodplain plains in all of Central Europe (Niculescu *et al.*, 2016; Stoica *et al.*, 2016). What leads to the development of ecological preservation plans of the area, which become the basis for the sustainable improvement of the quality of life (Stadt Wien, 2016).

It is also open the question of the construction of the railway corridor for high-speed trains from Paris to Budapest via Vienna, with a connection to Bratislava (TE-T 17), expected to be financed by European funds. The construction of the railway branch to Bratislava involves the construction of the 6km tunnel under the city, which may influence the development of the city around the new transport axis (Fertner, 2006; Izvolt *et al.*, 2016; Castanho, 2017).

4.3.4 Lessons Learned

Bratislava is perhaps one of the best examples of urban growth in the era of globalization (Fertner, 2006; Spirkova and Ivanička, 2009; Sohn and Giffinger, 2015). Thus occurs, mostly, by them “geographical position”, once it is in the heart of a fast European growth, showing interesting indicators of future for the resident population - regarding new opportunities and prospects (Castanho, 2017).

The development of the common master plan has been critical to achieving the territorial success on this case study, particularly, for the less developed city which is Bratislava.

¹ Centrope is an Interreg IIIA project, which aims to establishes a multinational region on the heart of Europe, through an active CBC carried out by four countries: Slovakia; Austria; Hungary and Czech Republic (Program INTERREG Europe, 2016).

4.3.5 Identified Factors

Stronger territorial cohesion; political commitment; common objectives; connectivity-movement between cities.

4.4 La Línea de la Concepción^(SP) – Gibraltar^(GI)

4.4.1 The Strait of the “no” Cooperation

Figure 6. Location of the case study, in the Iberian Peninsula context, as well as in the regional context.

La Línea de la Concepción is a Spanish city located in the province of Cadiz. It is in this city that is the border between Spain and the British colony of Gibraltar – which is a British overseas territory located on the southern tip of the Iberian Peninsula. Gibraltar corresponds to a small peninsula with a small land border with North, even limited by the Mediterranean Sea and also by the Gibraltar Strait and Bay (D’Agostino, and Favale, 2016). However, despite the short distance separating the territories, the CBC is incredibly low, or even non-existent (Girling, 2015). Such issues, leads to the interest in this particular case study, once it able an approach from a different point of view - from the “no” cooperation one.

4.4.2 Problems and Solutions

The problems related to this small territory are too many, from the claim of territory by Spain, the constant news of bad relations between the territories, such as:

- disputes over maritime space;
- suspected trafficking and money laundering in the territory²;
- overzealous on border control³;
- policies divergences.

4.4.3 Open Issues | Future Challenges

The uniformity of European standards for the territory of Gibraltar seems to be in the EU’s agenda (Government of Gibraltar, 2016). The resolution of the internal problems of the territories is pivotal to fostering a common development strategy (Castanho, 2017).

4.4.4 Lessons Learned

In this case study, probably the implementation of a common regional development strategy would mean win-win-situations for the territories, however, it is seen as one of the most difficult areas for CBC at a European level. Thus, occurs due to the lack of transparency of the Gibraltar territory and also by the political divergences between the territories.

The interest in cross-border cooperation by territories with such characteristics seems to be very low or even inexistent.

Yet some initiatives approach occasionally occurs, such as cooperation in the educational field, even very tenuously (Government of Gibraltar, 2016).

4.4.5 Identified Factors

Political commitment and transparency; sense of belonging.

4.5 Case study results summary

The results summarized, and listed below are provided by the analysis methods applied to the case studies.

² Gibraltar have been considered since a long time as a tax haven, however recent policies seems to conduct to a major transparency within the territory (npr, 2017).

³ España belongs to the Schengen Area, while the territory of Gibraltar is a non-Schengen area.

Table 1 – Summary of the analyzed topics on each case study

CASE STUDY	Population	Distance between cities (Km)	Strategy of territorial development	Border typology	Languages	Currency	GDP/ <i>capita</i> (million euros)
Newry	26 800	20	Twin City Newry-Dundalk	No Schengen Area	Irish, English	EUR GBP	58 000
Dundalk	31 100						53 300
Valga	12 200	5	Common Spatial Plan	Schengen Area	Estonian, Russian, Latvian	EUR	12 000
Valka	6 000						10 000
Vienna	1 740 000	55	Centroepe Strategy 2013	Schengen Area	Austrian, German, Slovakian	EUR	337 161
Bratislava	415 500						78 070
La Línea Gibraltar	63 300	3	—————	No Schengen Area	Spanish, English	EUR GBP	15 800
	30 000						33 500

(UN, 2013; Eurostat, 2016; PORDATA, 2016)

Table 2 – Summary of the influence of the identified factors on the case studies

Identified Factors	Selected Case Studies			
	Newry - Dundalk	Valga - Valka	Vienna - Bratislava	La Línea de La Concepción - Gibraltar
Stronger territorial cohesion	X	X	X	
Political commitment	X	X	X	
Life's standards	X	X		
Proper use of EU funds	X	x		
Common objectives	X	x	X	
Sense of belonging		X		X
Political commitment and transparency				X
Marketing and advertisement of the Eurocity	x	x		
Connectivity-movement between cities			x	

X – major influence; x –minor influence

5. DISCUSSION AND CONCLUSIONS

The performed analysis enabled us to identify that while the synergies identified in Newry-Dundalk similar to the ones observed in Vienna-Bratislava, however, the values of GDP/*per capita* and population are closer in Newry-Dundalk, turning win-win-situations more evident, or at least more balanced, once in the case of Vienna-Bratislava even if the results also demonstrated win-win-situations – i.e. the labour-market and easier of access to services (Bezák and Neumannová, 2011), since the values of GDP/*per capita* and population dynamics are clearly more unbalanced, it also reflects on the win-win-situations, favour greatly the Slovakian city. Such results conduct to the hypothesis, that, when this scenario is present – of the unbalance between cities' dimensions – normally the smallest cities is the one which benefits the most. Still is must be emphasized how the synergy between the Austrian and Slovakian territories have worked positively to increase cohesion and to achieve a greater level of development for both cities (Spirková and Ivanička, 2009), not only on the regional scale but also at a European one. Such synergic achievements considered by the authors as a successful example of which should be a well-developed CBC project or strategy.

Throughout the analysis of the case study of Valga-Valka it was possible to identify another critical factor - the sense of belonging; thus, to reach the desired territorial success, political power as well as the main actors of the whole process, are somehow “hostages” of the extreme sense of belonging to the citizens (Dujisin, 2014; Martins, 2015). It was found that, since this typology of CBC is too fragile, it must be managed meticulously, as well as the deliberated policies should also be carefully analyzed and assessed in order not to jeopardize the success of the CBC project or strategy. Similar scenarios (with extreme sense of belonging) were identified in other CBC projects along Europe – i.e. Bayonne (France) – San Sebastian (Spain), Haparanda (Finland) – Tornio (Sweden) and/or Frankfurt Oder (Germany) – Slubice (Poland) (Castanho *et al.*, 2016), showing similar results.

In the Iberian case study of La Línea de la Concepción-Gibraltar, similarly to that occurred in others CBC projects and strategies previously studied by Castanho *et al.* (2016), as is the case of Nice-Monaco, cities with “independent” governments, as the British colony of Gibraltar or the Principality of Monaco, face similar problems particularly for issues related to fiscal transparency and economic commitment. Another aspect found in this case study was the great unbalanced regarding GBP/*per capita* between Gibraltar and La Línea; always favouring, at a large scale, the city with its own government – scenario which is similar in the Monaco-Nice CBC project (Castanho, 2017). However, in the Iberian case, this scenario is even more evident considering that Gibraltar has approximately half of the population that La Línea de la Concepción but has the double of the GBP/*per capita*. This data made clear that in such cases, a strong political commitment and transparency are critical factors to achieve territorial success and cohesion.

Through the analysis of Table II is possible to endorse factors with a major influence on each of the analysed case studies, but also other critical factors, not highlighted in the present research, once they have been considered as presenting minor influence to the CBC project, as is the case of the connectivity-movement between cities and marketing and advertisement of the Eurocity. However, and according to Castanho *et al.* (2017): “*to achieve a sustainable, well-developed and abiding CBC project, all the mentioned factors, even the ones that have been assigned as having a minor influence, should be considered and not be underestimated*”.

However, those minor influence factors have been considered pivotal by several studies and authors – i.e. Lewis and Maund, 1976; Antrop, 2000, 2004; Craglia *et al.* 2004; Ballas, 2013; fact, which corroborates with the idea that no factor should be underestimated.

As final remarks, and taking into account the research questions exposed in the present research, throughout the analyzed case studies it was possible to answer to identified questions and to confirm the direct influence that CBC projects have over their influence territories. CBC projects contribute not only to reinforce several benefits related to social, cultural, environmental and economic aspects enabling the redefinition of the role of key actors in this process, placing territories closer to achieve a lasting sustainable development and well-structured growth – giving future generations the freedom to choose which planning principles should be implemented on their own territories less bounded by previous actions.

ABSTRACT

The operationalization of this study aims to investigate the quality of life of nursing students from a portuguese public university (Universidade do Algarve). This is a descriptive ...and study with quantitative and transversal approach, which used as a method of data collection the application of a scale for measuring quality of life called WHOQOL-Bref. All the participants of the study were students of the degree course in nursing at the School of Health Sciences, University of Algarve, comprising a sample of 118 students. The data collected underwent statistical tests using the Statistical Package for Social Sciences (SPSS). This study adopts the ethical assumptions for investigative research and follow the rules for research involving humans. The study results shows the quality of life index of nursing students; those students considered their quality of life “Good”, being observed a decrease in the mean score of quality of life as they progress up the graduation. It has been found correlation between quality of life and age.

It is expected that the results of this research may provide subsidies for later interventions within this problematic, generating discussions and reflections on training in the field of nursing.

Keywords: Quality of Life, Nursing, Schools, Nursing, Students, Nursing Education.

1. INTRODUCTION

In the context of nursing, the result of measuring people's quality of life has great relevance and can be considered as a tool for the formulation of actions aimed at improving people's lives.

The interest in the study of the quality of life of undergraduate students in nursing arose from the academic experience and the contact with this public, taking the attention to the investigation of this theme. It is known that entry into higher education is a critical period due to the numerous challenges, responsibilities, crises and obstacles, which can lead to some feeling of lack of control over our quality of life. Thus, it is justified to study this theme, when we consider that the quality of life has great influence on the way of living and meet the requirements of a nursing degree.

The present study aims to verify the quality of life of the students of the nursing course of a public nursing school in the Algarve (Portugal). In addition, this study intends to determine if there are significant differences in the quality of life of undergraduate students in nursing due to graduation year, professional activity, marital status, age and gender.

This research allowed us to have the perception about quality of life (QoL) of nursing undergraduate students from the School of Health of the University of Algarve (ESSUAlg).

The results obtained through it, provide us with subsidies for subsequent interventions in the scope of this problem, provoking discussions and reflections about nursing.

2. THEORETICAL CONTEXTUALIZATION

The entrance into higher education is a critical period due to the numerous challenges, responsibilities, crises and obstacles, which can lead to some sense of lack of control over our quality of life. Thus, it is justified to study this theme when we consider that the quality of life has great influence in the form of living and facing the requirements of a degree in nursing.

Quality of life is one of the main themes that has been debated in current clinical trials, according to Nobre (1995).

However, despite its broad discussion, there is still no single definition of what it means to have a quality life, since that term is related to the “subjective perception of the level of happiness and satisfaction in relation to the different aspects of life” (Kimura and Silva, 2009). That is, quality of life is a subjective concept, which involves the perceptions of each individual, and various factors such as culture, product or service provided, needs and expectations. Thus, it is concluded that quality of life is a complex concept, which has countless meanings, varied theoretical approaches and several methods of measurement, as said by Kimura and Silva (2009).

According to the World Health Organization (WHO) quality of life group, quality of life can be defined as “the individual’s perception of their position in life in the context of the culture and value systems in which he lives and in relation to its objectives, expectations, standards and concerns” (1995). That is, the concept of quality of life has several dimensions, since it encompasses objective, subjective aspects of cognitive ability, emotional well-being and abilities (Nunes, 2006).

The evaluation of the quality of life implies the study of sociodemographic, economic, political, health, health promotion and well-being indicators, as well as different levels of analysis: individual, group, community, In society in general and in transcultural approaches (Nunes, 2006).

In the context of nursing, it is understood that the result of the measurement of the quality of life of the people, represents an aid to formulate actions aimed at improving the life of individuals (Nunes, 2006).

We also emphasize the relevance and importance of the WHOQOL group, designed to assess quality of life - WHOQOL 100 and WHOQOL-Bref. The WHOQOL-100 was developed in the second half of the 1990s and evaluates six domains (physical, psychological, independence, social relations, environment and spirituality). It consists of 100 questions, which represents a disadvantage for its application. For this reason, the WHOQOL group felt the need to create a shorter instrument that could be filled in a shorter time but retain the satisfactory psychometric properties of the WHOQOL-100. Thus, the WHOQOL-Bref appears (abbreviated version of WHOQOL-100); A generic, multicultural and multidimensional measurement instrument that allows the subjective evaluation of the quality of life of healthy individuals or with psychological or physical disorders, age 18 years or older or who play the social role of an adult.

3. METHODOLOGY

This is a quantitative, descriptive and transversal study.

The *a priori* referred study was conducted by the pupils taking the degree in Nursing of the Escola Superior de Saúde do Algarve, composing a sample of 118 students.

The program SPSS was used for data processing.

3.1 Instruments and data collection

The data collection was done using an auto-administered questionnaire composed by two parts. The first one contains information such as age, gender, residence area, schooling, year of degree, professional activity, civil state and vises the population’s characterization. Then the second part consists in the WHOQOL-Bref, Portuguese (from Portugal) version, with 26 questions, in which two regard to general quality of life and the 24 others are directed to the investigation in 4 different domains: physical, psychological, social relations and the environment (Canavarró *et al.*, 2006; Vaz Serra *et al.*, 2006). Such instrument is built in the Likert type scale that is a type of scale of psychometric response used regularly in surveys, being the most used scale in opinion researches. The Likert type scale is composed by a group of sentences (items), in which the subject that is being evaluated is asked to show his/her level of agreement and his/her perception in relation to the certain question. (Cunha, 2007).

For each answer there is a numeric value (level) attributed, therefore being, each one of them comprehended in the 1 to 5 interval, 1 being the most negative value and 5 the most positive value, except for the questions 3, 4 and 26 that are inversely organized. It is very important to enhance that such instrument shows variables that are irrelevant in the context of the investigated population by this study. This because, the sample presents itself very homogeneous in relation to diverse characteristics, in between them, the age, the civil state and the professional activity.

The data referring to the answers of the WHOQOL-Bref were processed in a data base and submitted to statistic testing in the Statistical Package for Social Sciences (SPSS) program version 15.0 for Windows. Absolute and relative frequencies analysis was also performed and also non parametric tests (Kruskal Wallis), vising to compare two or more variables. In this kind of test, it is considered that when the calculated significance level is superior to 0,05, there is no relation between the variables; but, if the significance level is below 0,05, it shows that there is a relation between the analyzed variables. The average values of the studied domains and of the QV were presented in a scale of 0 to 100 to make the interpretation of the results and the comparison with other validated instruments easier. Such study contemplates the ethical assumptions preconized to researches of investigation and follows the international ethical norms. The researcher was granted permission by the ESSUAlg for the realization of the research and, beforehand to the signing of the Informed Consent Term (ICT), the participants were enlightened about the research project, and the compromise to maintain the anonymity and the sigil of the information was highlighted.

3.2 Study Hypotheses

The hypotheses consist in what is pretended to demonstrate or verify with the study. After the analysis of the results, either the initial hypotheses are rejected or accepted.

The present study has the following hypothesis:

- Statistically significant differences exist in regard to the quality of life in the various years of the degree in Nursing;
- Statistically significant differences exist in regard to the Nursing student's quality of life depending on the professional activity;
- Statistically significant differences exist in regard to the Nursing student's quality of life depending on the civil state;
- Statistically significant differences exist in regard to the Nursing student's quality of life depending on age;
- Statistically significant differences exist in regard to the Nursing student's quality of life depending on gender;

4. RESULTS

The sample's characterization contemplates the variables age, gender, year of the degree, profession and civil state. In order to make the obtained data analysis easier, it was organized in charts.

Chart 1 – Sample distribution in regard to gender

Gender	N	%
Male	20	16,9
Female	98	83,1
Total	118	100,0

The sample is predominantly of the female gender (83,1%). The remaining 16,9%, corresponds to the male gender (Chart 1).

Chart 2 – Sample characterization according to age

Age	N	Minimum	Maximum	Average	Pattern Deviation
	118	17	60	21,27	5,087

The Nursing students' age is comprehended between 17 and 60 years old. The average age is approximately 21 (with a pattern deviation of 5,087), as can be verified in Chart 2, located above.

Chart 3 – Sample distribution in regard to year of degree

Year of degree	N	%
Year 1	34	28,8
Year 2	30	25,4
Year 3	22	18,7
Year 4	32	27,1
Total	118	100,0

In what regards to the sample's distribution relatively to the year of the degree, this was composed by 118 students, in which 34 were in Year 1, 30 in Year 2, 22 in Year 3 and 32 in Year 4, as presented in Chart 3.

Chart 4 – Sample distribution in regard to civil state

Civil State	N	%
Single	112	95,0
Married	5	4,2
Separated	1	0,8
Divorced	0	0,0
Widower	0	0,0
Total	118	100,0

As presented in Chart 4, most of the enquirees are single (112), 5 are married or live together with their partner and 1 is separated.

Chart 5 – Sample distribution in regard to the exercise of a professional activity

Professional Activity	N	%
No	111	94,1
Yes	5	4,2
Did not answer	2	1,7
Total	118	100,0

According to the data presented in Chart 5 above, 5 participants work, while 111 do not exercise any professional activity. Next are presented the results, taking in consideration the 26 questions of the survey.

Chart 6 – Sample distribution (absolute frequencies) in regard to the year of the degree and the global quality of life

Question 1 How do you evaluate your quality of life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very bad	0	0	0	0	0
Bad	0	1	1	0	2
Nor good nor bad	3	4	1	10	18
Good	26	19	16	21	82
Very good	5	6	4	1	16
Total	34	30	22	32	118

In relation to global quality of life, the majority of students (82) classifies their quality of life as being “Good” and no student referred to it as being “Very bad” (Chart 6).

Chart 7 – Sample distribution (absolute frequencies) in regard to the year of degree and the global perception of health

Question 2 To which extent are you satisfied with your health?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	0	0	0	0
Unsatisfied	0	1	0	1	2
Nor satisfied nor unsatisfied	1	2	4	8	15
Satisfied	26	20	14	19	79
Very Satisfied	7	7	4	4	22
Total	34	30	22	32	118

By analyzing the Chart above, it is verified that the majority (79) of the enquirees affirms to be “Satisfied” with their health and 22 say they are “Very Satisfied”. Of the total of participants, 5 adopted a neutral attitude facing this question, affirming to be “Nor satisfied not unsatisfied” with their health and 2 considered themselves as “Unsatisfied”. None of the students said they were “Very unsatisfied” with their health.

Chart 8 – Sample distribution (absolute frequencies) in regard to the year of degree and the pain and discomfort

Question 3 In what measure does your (physical) pain prevent you to do what you need to?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
In any way	25	16	6	15	62
A little	5	9	9	7	30
Nor little nor much	2	4	7	6	19
Much	2	1	0	4	7
Very much	0	0	0	0	0
Total	34	30	22	32	118

According to Chart 8, 62 participants affirmed that their physical pain doesn't prevent them "In any way" to do what has to be done and only 7 referred that their pain influences much the realization of their tasks.

Chart 9 – Sample distribution (absolute frequencies) in regard to the year of degree and the dependency on medical care to live their day-to-day life

Question 4 In what measure do you need medical care to live your day-to-day life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Any	25	27	11	17	80
Little	8	1	7	12	28
Nor little nor much	1	2	4	1	8
Much	0	0	0	2	2
Very much	0	0	0	0	0
Total	34	30	22	32	118

According to chart 9 the majority of the Participants (80) refers not to need "any" medical care to live their day-to-day life.

Chart 10 – Sample distribution (absolute frequencies) in regard to the year of degree and the love of life

Question 5 To which extent do you love life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	0	0	0	0
Little	0	1	0	0	1
Nor little nor much	3	1	2	2	8
Much	16	13	8	18	55
Very much	15	15	12	12	54
Total	34	30	22	32	118

According to Chart 10 it is verified that 55 and 54 participants referred to like "Much" and "Very much" their life, respectively. Besides that only one student informed to like their life "little".

Chart 11 – Sample distribution (absolute frequencies) in regard to the year of degree and the meaning of life

Question 6 To which extent do you feel your life has a meaning?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	1	0	0	1
Little	0	0	0	1	1
Nor little nor much	5	2	4	5	16
Much	20	15	9	13	57
Very much	9	12	9	13	43
Total	34	30	22	32	118

By analyzing the chart above it is possible to verify that 57 participants consider their life having "much" meaning and 43 affirm that their life has "very much" meaning. Besides that it is important to highlight that only one participant referred that their life has "no" meaning.

Chart 12 – Sample distribution (absolute frequencies) in regard to the year of degree and the ability to concentrate

Question 7 To which extent are you able to concentrate?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Nothing	0	1	0	0	1
Little	1	2	1	1	5
Nor little nor much	13	7	8	10	38
Much	18	19	12	17	66
Very much	2	1	1	4	8
Total	34	30	22	32	118

According to chart 12 the majority of the enquirees (66) informs to be able to concentrate themselves “Much” meanwhile only one participant considers he/she can concentrate “nothing”.

Chart 13 – Sample distribution (absolute frequencies) in regard to the year of degree and the day-to-day security

Question 8 To which extent do you feel safe in your daily basis?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Not	0	1	0	0	1
Little	1	0	0	1	2
Nor little nor much	6	5	3	6	20
Much	24	20	18	24	86
Very much	3	4	1	1	9
Total	34	30	22	32	118

By analyzing chart 13 it is verified that the majority of the participants (86) feels “much” safe and only one informs to feel “not” safe in their day to day basis.

Chart 14 – Sample distribution (absolute frequencies) in regard to the year of degree and the physical environment

Question 9 To which extent is your physical environment healthy?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	0	0	0	0
Little	0	1	1	1	3
Nor little nor much	6	5	3	7	21
Much	26	22	15	21	84
Very much	2	2	1	3	8
Did not answer	0	0	2	0	2
Total	34	30	22	32	118

According to the chart 14 it is possible to affirm that students of nursing in their majority (84) consider that their physical environment is “much” healthy and only three participants (one in year 2, one in year three and one in year four) informed that their physical environment is little healthy. No participant characterised their physical environment as “not” healthy.

Chart 15 – Sample distribution (absolute frequencies) in regard to the year of degree and the energy for their daily life

Question 10 Have you got enough energy for your daily life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	0	0	0	0
Not really	1	0	0	0	1
Moderately	9	8	11	11	39
Quite	18	12	9	16	55

Completely	6	10	2	5	23
Total	34	30	22	32	118

By analyzing the table above it is possible to conclude that relatively to the energy for their daily life, 55 participants consider “quite” having energy, 39 “moderately” having energy and 23 refer to “completely” having energy for the performance of their tasks.

Chart 16 – Sample distribution (absolute frequencies) in regard to the year of degree and the ability to accept their physical appearance

Question 11 Are you capable of accepting your physical appearance?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	0	0	0	0
Not really	3	0	2	4	9
Moderately	4	6	5	7	22
Quite	19	16	12	14	61
Completely	8	8	3	7	26
Total	34	30	22	32	118

As suggested by chart 16, from the total of the enquiries 61 informed to be “quite” capable of accepting their physical appearance and no student refers not to accept their physical appearance.

Chart 17 – Sample distribution (absolute frequencies) in regard to the year of degree and the money to satisfy their needs

Question 12 Have you got enough money to satisfy your needs?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	1	0	0	0	1
Not really	3	1	2	5	11
Moderately	17	16	15	23	71
Quite	9	8	4	3	24
Completely	3	5	1	1	10
Did not answer	1	0	0	0	1
Total	34	30	22	32	118

From the total of the participants, 71 consider “moderately” having money to satisfy their needs and only one student informed not to have any money to satisfy their needs (chart 17).

Chart 18 – Sample distribution (absolute frequencies) in regard to the year of degree and the access to necessary information for the organization of their daily lives

Question 13 To which extent do you have easy access to the necessary information to organize your daily life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	0	0	0	0	0
Little	0	1	0	0	1
Moderate	7	2	2	7	18
Much	21	21	17	23	82
Complete	6	6	3	2	17
Total	34	30	22	32	118

According to chart 18, it is verified that 82 participants consider having “much” access to the necessary information for the organisation of their daily life, while only one student referred that his/her access to information is “little”.

Chart 19 – Sample distribution (absolute frequencies) in regard to the year of degree and the opportunity to enjoy leisure activities

Question 14 To which extent do you have opportunity to enjoy leisure activities?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
No	1	0	1	1	3
Little	3	6	4	3	16
Moderate	17	13	9	14	53
Much	13	6	8	13	40
Complete	0	5	0	1	6
Total	34	30	22	32	118

From the analysis of chart 19 it is possible to conclude that in regard to the opportunity to enjoy leisure activities, the majority of the enquirees (53) informed to have “moderate” opportunity while three referred have “no” opportunity.

Chart 20 – Sample distribution (absolute frequencies) in regard to the year of degree and the ability to move and to dislocate themselves on their own

Question 15 How would you evaluate your mobility? (Capacity to move and dislocate yourself on your own)?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very bad	0	0	0	0	0
Bad	0	0	0	0	0
Nor good nor bad	0	2	0	0	2
Good	9	5	10	17	41
Very good	24	23	11	15	73
Did not answer	1	0	1	0	2
Total	34	30	22	32	118

Analyzing the chart above, it is verified that the majority of the participants (73), considers that their capacity to move and dislocate themselves on their own is “very good”. No student evaluated their mobility as being “bad” or “very bad”.

Chart 21 – Sample distribution (absolute frequencies) in regard to the year of degree and sleep satisfaction

Question 16 To which extent are you satisfied with your sleep?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	2	1	0	0	3
Unsatisfied	5	5	5	6	21
Nor satisfied nor unsatisfied	8	7	5	9	29
Satisfied	16	15	7	16	54
Very satisfied	3	2	5	1	11
Total	34	30	22	32	118

From the total of participants, 54 informed to be “satisfied” with their sleep and three referred to be “very unsatisfied” (chart 21).

Chart 22 – Sample distribution (absolute frequencies) in regard to the year of degree and the ability to perform their day-to-day activities

Question 17 To which extent are you satisfied with the ability to perform your day-to-day activities?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	1	0	0	0	1
Unsatisfied	1	2	0	0	3
Nor satisfied nor unsatisfied	2	9	2	7	20
Satisfied	24	16	18	20	78
Very satisfied	6	3	2	5	16
Total	34	30	22	32	118

The majority of participants (78) affirmed to be “satisfied” with their capacity to perform the activities of their day-to-day and only one student informed to be “very unsatisfied” (chart 22).

Chart 23 – Sample distribution (absolute frequencies) in regard to the year of degree and the work ability

Question 18 To which extent are you satisfied with your work ability?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	1	1	0	0	2
Unsatisfied	2	2	1	1	6
Nor satisfied nor unsatisfied	9	10	6	7	32
Satisfied	17	17	15	19	68
Very satisfied	5	0	0	5	10
Total	34	30	22	32	118

According to chart 23, the majority of the enquirees (68) considered themselves “satisfied” with their ability to work, existing only two students that informed to be “very unsatisfied”.

Chart 24 – Sample distribution (absolute frequencies) in regard to the year of degree and the satisfaction with themselves

Question 19 To which extent are you satisfied with yourself?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	1	1	0	0	2
Unsatisfied	1	2	1	1	5
Nor satisfied nor unsatisfied	6	8	3	7	24
Satisfied	20	16	16	21	73
Very satisfied	5	3	2	3	13
Did not answer	1	0	0	0	1
Total	34	30	22	32	118

From the analysis of the chart above, it is verified that the majority of the participants (73) considered to be “satisfied” with themselves, 13 affirmed to be “very satisfied” and 2 declared to be “very unsatisfied”.

Chart 25 – Sample distribution (absolute frequencies) in regard to the year of degree and the satisfaction with their personal relationships

Question 20 To which extent are you satisfied with your personal relationships?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	1	0	0	1
Unsatisfied	0	3	1	0	4
Nor satisfied nor unsatisfied	4	4	4	5	17
Satisfied	22	14	14	21	71

Very satisfied	7	8	3	6	24
Did not answer	1	0	0	0	1
Total	34	30	22	32	118

Chart 25 points out that the majority of students (71) consider is that their personal relationships are satisfactory, existing only one participant that affirmed to be “very unsatisfied” with his/her personal relationships.

Chart 26 – Sample distribution (absolute frequencies) in regard to the year of degree and their sex life satisfaction

Question 21 To which extent are you satisfied with your sex life?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	1	1	2	4
Unsatisfied	2	0	0	3	5
Nor satisfied nor unsatisfied	12	6	7	9	34
Satisfied	14	17	8	10	49
Very satisfied	6	6	6	8	26
Total	34	30	22	32	118

From the analysis of the chart above, it is possible to conclude that the majority of the participants (49) declare themselves “satisfied” with their sex life. Besides that, nine students responded either “unsatisfied” or “very unsatisfied” to this question.

Chart 27 – Sample distribution (absolute frequencies) in regard to the year of degree and the satisfaction with the support they receive from their friends

Question 22 To which extent are you satisfied with the support that you receive from your friends?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	1	0	0	1
Unsatisfied	0	2	0	0	2
Nor satisfied nor unsatisfied	5	5	2	4	16
Satisfied	18	12	14	10	54
Very satisfied	11	10	6	18	45
Total	34	30	22	32	118

From the total of participants, 54 and 45 responded to be “satisfied” and “very satisfied” respectively with all the support they receive from their friends. Only one student informed to be “very unsatisfied” (chart 27).

Chart 28 – Sample distribution (absolute frequencies) in regard to the year of degree and the conditions and facilities of the place where they live

Question 23 To which extent are you satisfied with the conditions that the place where you live offers?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	0	0	0	0
Unsatisfied	0	2	0	1	3
Nor satisfied nor unsatisfied	3	1	3	6	13
Satisfied	18	14	11	16	59
Very satisfied	13	13	8	9	43
Total	34	30	22	32	118

According to chart 28, the majority of participants (59) finds themselves “satisfied” with the conditions that the place where they live offers. Only three students marked the “unsatisfied” option for this question.

Chart 29 – Sample distribution (absolute frequencies) in regard to the year of degree and the satisfaction with the access they have to health services

Question 24 To which extent are you satisfied with the access you have to health services?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	0	0	0	0
Unsatisfied	1	0	3	2	6
Nor satisfied nor unsatisfied	15	4	10	8	37
Satisfied	12	22	6	20	60
Very satisfied	5	4	3	2	14
Did not answer	1	0	0	0	1
Total	34	30	22	32	118

By the analysis of the chart 29, we can observe that the majority of participants (60) finds themselves “satisfied” with the access they have to health services, existing six students that informed to be “unsatisfied” with it.

Chart 30 – Sample distribution (absolute frequencies) in regard to the year of degree and the satisfaction with the transports they ride in

Question 25 To which extent are you satisfied with the transports you ride in?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Very unsatisfied	0	0	1	0	1
Unsatisfied	3	2	3	2	10
Nor satisfied nor unsatisfied	7	5	5	8	25
Satisfied	18	16	9	18	61
Very satisfied	6	7	4	4	21
Total	34	30	22	32	118

From the total of participants, 61 finds themselves “satisfied” with the transports they ride in, 21 inform to be “very satisfied” and only one student referred to be “very unsatisfied” (chart 30).

Chart 31 – Sample distribution (absolute frequencies) in regard to the year of degree and the frequency of negative feeling appearances

Question 26 How often do you have negative feelings, such as sorrow, despair, anxiety or depression?	Year of Degree				Total
	Year 1	Year 2	Year 3	Year 4	
Never	1	1	1	0	3
Seldom	17	12	8	10	47
Sometimes	12	14	10	16	52
Frequently	2	3	3	6	14
Always	1	0	0	0	1
Did not answer	1	0	0	0	1
Total	34	30	22	32	118

According to the chart 31, from the total of participants, 52 affirmed that “sometimes” they experiment negative feelings, 47 declared that they have these feelings “seldom” and only one participant referred to “always” having feelings like sorrow, despair, anxiety or depression.

Chart 32 – Average values of the domains and average value of quality of life per year of degree

Year of Degree	General domain	Physical domain	Psychological domain	Social network domain	Environment domain	Quality of Life
Year 1	78,03	77,97	71,88	75,33	68,15	73,97
Year 2	76,47	76,57	71,83	72,23	71,53	73,73
Year 3	75,64	73,43	71,68	73,86	65,09	71,98
Year 4	69,34	74,59	70,75	75,59	66,41	71,34
All individuals	74,83	75,85	71,52	74,33	67,97	72,82

Chart 33 –Kruskal Wallis test to determine if there exists a relation between the variable quality of life and the year of degree

Null Hypothesis	Significance level	Decision
There is no relation between the quality of life and the year of degree	0,353	Retain the null hypothesis

Test Statistics^{a,b}

	QUAL
Chi-Square	3,263
df	3
Asy mp. Sig.	,353

a. Kruskal Wallis Test

b. Grouping Variable: TURMA

By analyzing chart 32, we can observe that the environment domain was the one that showed the smallest values of average, meaning that for all the years of degree this is the domain that possesses the worst results in relation to quality of life. Besides that for all the individuals that were investigated, the average quality of life was 72, 82 (with a Std. Deviation of 10, 06). Although the results point to decreasing values from 1st to 4th year of degree, in what refers to the average quality of life, the Kruskal Wallis test shows that, statistically, there is no possible relation between the quality of life and the year of degree, which is evidenced by the significance level superior to 0,05 (0,353) (Chart 33).

Chart 34 – Average quality of life by professional activity

Professional Activity	Quality of life
No	72,70
Yes	78,28
Did not answer	65,70

Chart 35 – Kruskal Wallis test to determine if there is a relation between the variable quality of life and the existence of a professional activity

Null Hypothesis	Significance level	Decision
There is no relation between the quality of life and the existence of a professional activity	0,209	Retain the null hypothesis

Test Statistics^{a,b}

	QUAL
Chi-Square	1,581
df	1
Asymp. Sig.	,209

a. Kruskal Wallis Test

b. Grouping Variable: PROFISSÃO

Chart 34 points out that students that exercise some professional activity possess a greater quality of life. Meanwhile, the Kruskal Wallis test indicates that, statistically, there is no relation between the quality of life and the existence of a professional activity, which is evidenced by the level of significance superior to 0,05 (0,209) (Chart 35). Such result can be explained by the fact that a small number of sample subjects (5 from 118) exercise some professional activity (Chart 5), which makes the hypothesis test an inconclusive one.

Chart 36 – Average quality of life by civil state

Civil State	Quality of life
Single	72,88
Married / Together with the partner	73,20
Separated	64,40
Divorced	-
Widower	-

Chart 37 –Kruskal Wallis test to determine if there exists a relation between the variable quality of life and the civil state

Null Hypothesis	Significance level	Decision
There is no relation between the quality of life and the civil state	0,530	Retain the null hypothesis

Test Statistics^{a,b}

	QUAL
Chi-Square	2,211
df	3
Asymp. Sig.	,530

a. Kruskal Wallis Test

b. Grouping Variable: ESTADO CIVIL

The results of chart 36 indicate that the students that are married or together with their partner present a greater quality of life, while the ones that are separated show themselves with smaller values, when both the data are compared with the single group's. However, chart 37 points out that, statistically, there is no difference in the quality of life depending on the civil state, which is evidenced by the level of significance superior to 0,05 (0,530). This result can be justified by the small number of married (five) and separated (one) when compared to the single subject number (112) (chart 4), making the hypothesis test inconclusive.

Chart 38 – Average quality of life per age

Age	N	Quality of life
17 years old	2	75,00
18 years old	22	73,85
19 years old	25	75,46
20 years old	20	72,16
21 years old	22	69,69
22 years old	5	75,77
23 years old	1	59,00
24 years old	2	73,70
25 years old	4	76,85
26 years old	5	77,84
27 years old	2	70,20
28 years old	4	76,60
29 years old	1	75,40
37 years old	1	29,20
40 years old	1	58,00
60 years old	1	64,40
All individuals	118	72,82

Chart 39 –Kruskal Wallis test to determine if there exists a relation between the variable quality of life and age

Null hypothesis	Significance level	Decision
There is no relation between quality of life and age	0,271	Retain the null hypothesis

Test Statistics^{a,b}

	QUAL
Chi-Square	17,839
df	15
Asymp. Sig.	,271

a. Kruskal Wallis Test
b. Grouping Variable: IDADE

Chart 38 shows three students with advanced ages (37, 40 and 60 years old) in relation to the average of the sample (21,27 years old) (chart 2). Such individuals possess a small quality of life (29, 20; 58,00 and 64,40) when compared with the global result (72, 82). Meanwhile, according to the Kruskal Wallis test it is not possible to affirm that the older individuals have worse quality of life, because the significance level was superior to 0,05 (0,271) (Chart 39). This result can be explained because of the fact that these students constitute a very small number (three) in relation to the total of participants (118), which makes the hypothesis test inconclusive.

Chart 40 – Average quality of life per gender

Gender	Quality of life
Female	72,44
Male	74,72

Chart 41 –Kruskal Wallis test to determine if there exists a relation between the variable quality of life and gender

Null Hypothesis	Significance level	Decision
There is no relation between quality of life and gender	0,165	Retain the null hypothesis

Test Statistics^{a,b}

	QUAL
Chi-Square	1,926
df	1
Asy mp. Sig.	,165

a. Kruskal Wallis Test
b. Grouping Variable: SEXO

The results indicate that female gender students have worse quality of life when compare to the male gender (chart 40). Meanwhile the Kruskal Wallis test shows that, statistically, the quality of life does not depend on gender, which is verified by the significance level superior to 0,05 (0,165) (Chart 41).

5. CONCLUSIONS

We emphasize the limitations related to sample size, because although the study sample was composed by 118 students, this population was not enough to allow us to make generalizations. Therefore, for future work, it is suggested to increase the size of the sample, in order to obtain a number of individuals to achieve more consistent and conclusive results.

It would be interesting to develop new studies comparing, for example, with Nursing students from other institutions of public education, as well as their comparison with studies in the particular teaching.

However, it is very important to emphasize its relevance in relation to its impact in relation to the contributions that have brought us in the deepening of the problem studied.

This study showed that the average quality of life for all grade years was high, although a drop occurred as the student progresses in their training. It has also been proven that quality of life worsens as age increases. These results do not rule out the need for interventions in the field of nursing education with the purpose of helping students to deal with the activities and requirements of academic life, such as the situations of pain and suffering resulting from the practice of caring. In this sense, the adoption of Individualized monitoring of student mechanisms, as well as the introduction of a form of supervision of individualized support, aiming to reduce existing conflicts, distress and suffering. This study allowed a reflection on the area of education in nursing, regarding the curricula and pedagogical practices fundamental in nursing training.

Educational institutions should be concerned with their students about the factors that influence their quality of life, since they have a strong relationship with the ability of students to manage their education and their professionalization. Prospective professionals who recognize that external factors influence their own quality of life may possibly act to minimize the impact of such factors on the quality of life of their patients, will have a positive impact.

ABSTRACT

The current globalized scenario has placed Brazilian small and medium enterprises (SMEs) under pressure from new competitive forces. Given that their budgets are usually shy, they do not allow them access to major consultants in order to devise a strategy capable of generating competitive advantages. The major challenge for managers is to anticipate the market using innovation and technology suited to their product. The present study, carried out in a Brazilian poor performing SME in the meat industry, had, as its central objective, to outline a model for the formulation of strategies within the scope of small companies interlinking theory and practice into managerial competencies. Considering the size of the company facilities and its production system, and aiming at a substantial reduction of costs, we suggest several changes in the layout and operations organization, in order to increase production flow. On the other hand, and considering the results of the strategic diagnosis, we suggest the Balanced Scorecard as a model of performance measurement to support of the organization's management.

Keywords: Strategy Management, Small and Medium Business Enterprises, Innovation, Balanced Scorecard.

JEL Classification: M10, M20, M31

1. INTRODUCTION

Faced with an increasingly competitive and globalized scenario, it is no longer enough for companies, especially SMEs, to seek competitive advantages through orthodox strategies because they no longer guarantee effective responses to sustainable growth. Thus, to resort to innovation as allied to the management of a company is perceived as important, or even essential, since it is used as a central strategy that guides investments, defines the focus of research and new developments from the point of view from the market.

Thus, under the effects of globalization, companies have been entering into disturbed and competitive environments, seeking to increase their participation in the markets, both nationally and internationally. In this sense, many firms seek strategic alternatives and action programs aiming at competitive advantages, better performance, and even survival in the market in which they are inserted. With a broader market opening, that is to say, worldwide, it also obliged Brazilian meat companies to look for new technologies and strategies to obtain competitive advantages, both in order to face the internal and external markets.

On the other hand, the macroeconomic situation in Brazil, especially during the 1980s and 1990s, contributed substantially to the reduction of meat exports, due to the inflationary pressure that reduced the competitiveness of Brazilian companies. This situation influenced all segments of economic activity and negatively affected the systemic determinants of competitiveness (Pedrozo, Begnis and Estivalete, 2005).

The competitiveness caused by globalization makes Brazil use agribusiness as a strategy for insertion in world markets in the face of its competences, such as favorable edaphoclimatic conditions and technological advances, mainly in the areas of animal and plant management and production (Sobrinho, 2007).

In 2008, with the emergence of the global economic crisis, started in the American real estate sector and, with the United States of America as a country having influence over the world economy, the Brazilian economy again resents itself, especially the Small and Medium Enterprises (SMEs), given that one of the greatest consequences of this crisis was the difficulty in accessing resources to finance the productive chain, and they were most in need. However, small companies have the advantage of being more agile, of being able to offer a more personalized service to their clients, and also of having their employees reach higher levels of motivation and involvement, which helps to minimize difficulties.

In contrast, large organizations typically have substantial amounts of resources that enable them to invest in Research and

Development (R&D), developing studies and innovations on a large scale, and using technology acquisition (Tidd, Bessant and Pavitt, 1997).

In the current business scenario marked by rapid changes in consumer behavior, shorter product lifecycles, and increased competition both locally and globally, the company that is the subject of this study needs to improve its position in the market in order to take advantage of business opportunities while trying to limit or mitigate the main threats.

Accordingly, the present research aims to collect data for a Strategic Diagnosis and elaboration of the Strategic Map, which will serve as a basis and as a suggestion for the elaboration of the Balanced Scorecard model for the organization.

In order to fulfill the objectives proposed in the research, the methodology had a qualitative, descriptive and exploratory approach. The data were collected through bibliographic research (secondary sources) and within the company, through interviews, with the General Manager and the Administrative Manager (primary sources), carried out in the second half of 2016, as well as the application of a strategic diagnostic survey.

This research is structured in four points, in addition to this brief introduction. Following are the main concepts that guided the investigation, followed by the analysis and discussion of the results constituting the core of the present research, and finally, the conclusions, limitations and suggestions of future research on the subject under analysis.

2. THEORETICAL FRAMEWORK

2.1 Strategic and Balanced Scorecard Positioning

In order to meet the best strategic option that leads the organization to success, it is necessary, initially, to carry out a comprehensive survey of data that allows a diagnosis, capable of accurately reflecting its real situation, namely with regard to its potential, their position in relation to competition, their ability to innovate and what they foresee for their future (Russo, 2009).

The tool that is best suited for this purpose, according to many authors, is the adaptation of a Balanced Scorecard (BSC) model. The BSC is designed through scenario analysis, culminating in the development of the SWOT analysis that demonstrates the organization's threats and opportunities. In addition to the SWOT analysis, other tools, such as the Porter 5 Forces Model and the Boston Consulting Group (BCG) Matrix, were also used in the diagnostic data collection.

According to Russo (2009), the strategy of action must be focused on the future of the company. Moreover, before choosing the option, you have to take into account your mission (reason for being), define the vision (where it goes), its core values, as well as the critical success factors.

Ansoff (1977) is traditionally regarded as one of the pioneers of the study of strategy, when analyzing the importance of markets and products for the organization. For this, it discusses the possibilities of a process to program objectives and strategies based on the analysis of opportunities of the environment. This is because the organization restricts its position in terms of products and markets in the effort to gain competitive advantage. The so-called growth vector becomes the common link in the relationship between products and markets (present and future) and the purpose of the company (current and new), making it possible to define in which direction the organization is heading.

The current global economic context requires organizations that have in their daily dynamics the culture of seeking continuous improvement, eliminating waste and developing skills and competences in their human capital (Gonçalves, Prado and Campos, 2014). Votto and Fernandes (2014) reinforce this context when they mention that companies, exposed to adverse market conditions, have sought modern production management strategies to improve the flow of production and minimize the inconveniences inherent in their production systems.

Johnson, Scholes and Whitting (2011) emphasize the importance of using strategic management because it does not come about on its own; it involves people and especially the managers who implement the strategies. Strategic management includes understanding the strategic position of the organization, strategic choices for the future, and strategy management in action. It is important to emphasize that only so-called excellence organizations will be prominent if they reflect and respond to some vital issues such as: What are we? Where are we? Where do we go? And how will we go?

According to Porter (1989), a company with a good positioning is able to obtain a very good return, even if the industrial structure leaves much to be desired. The basis for good long-term market performance is the competitive advantage. Porter (1989) states that competitive advantage is the value that the company can provide to its consumers, which is larger than the cost of manufacturing.

According to Akis (2015), quality and production costs in the past were determinants of the competitiveness power, today these factors are being replaced by innovation.

According to Apak and Atay (2014), innovation is the result of a combination of knowledge, information and creativity, and is being the backbone of the changing economy due to the great competitive advantages it has been giving to companies.

2.2 Strategic Management Tools

2.2.1 *Swot Analysis*

The SWOT analysis is a tool used to make the analysis of the environment, being used as a basis for the management and strategic planning of an organization, but due to its simplicity, it can be used for any kind of environmental analysis (Oliveira, 2006). SWOT analysis is a simple system for positioning or verifying the strategic position of the company in the environment in question. Strategies for planning through SWOT analysis should maintain strengths, weaknesses should have the vision of reduction, take advantage of opportunities and protect against threats (Oliveira, 2001).

According to Oliveira (2001), the internal points are intended to highlight the deficiencies and qualities of the company being analyzed. This information is within the organization and has immediate and specific implications for the organization's administration. However Oliveira (2001) defines that the external points, aim to study the relationship between the company and the environment in terms of opportunities and threats. In this sequence, business organizations should know both their internal and external environment well and make an effort to improve their skills.

2.2.2 Porter's Five Forces Model

The Porter Five Force model (1986) can be understood as a tool that helps to define the company's strategy and takes into account both the external and the internal environment. Knowledge of the sources of competitive pressure is the pillar of the strategic agenda for action. It highlights the company's strengths and weaknesses, inspires its positioning in the industry, illuminates areas where strategic changes may provide the greatest return, and identifies where sector trends are most significant in terms of opportunities and threats.

2.2.3 BCG Matrix

In 1963 the Boston Consulting Group, better known as BCG, was founded. Bruce Henderson, the founder, added to strategy services the function of discovering "meaningful quantitative relationships" between a company and the markets it chooses (Red, 2005). Its goal is to support product or business unit portfolio analysis based on the product lifecycle concept (CVP). It is used to allocate resources in brand management activities. The matrix allows to classify the business units or products according to their market share and the growth rate in the market they operate (Maximiniano, 2008). The BCG matrix provides insight into three key areas: (1) Analysis of the strategic situation of the company; (2) Determination of the financial needs of each business unit, with a view to the whole company, balancing the cash flow; And (3) Approach in each quadrant of the BCG matrix to meet certain standard strategies, which will serve as guidelines for the formulation of policy measures.

An essential concept that supports the BCG Matrix is the Experience Curve, which specifies that for each doubling of cumulative production, the unit costs resulting from the increase in value added will fall by a fixed percentage, typically by 20%. Products with a high relative market share should therefore have a cost advantage over their competitors.

The matrix has two dimensions: market growth rate and market share (which is the participation of the company in relation to the participation of its largest competitor), the products must be positioned in the matrix and classified according to each quadrant of the matrix.

The greater the market share of a product or the faster the market for a product grows, the better for the company. This method is based on the product life cycle (CVP) and is used to prioritize the different products of a company (BCG, 2012).

In this sequence, the question marks involve decisions to withdraw the product from the market or to make greater investments in them. For star products, in this strategy, investment is recommended. For cash cows the strategy recommendation is to take advantage of the high profitability and invest in other products.

Dogs are products do not make a profit and a withdrawal from them is necessary. Thus, according to Weise, Schultz and Rocha (2010), the strategy recommends disinvestment. The BCG matrix is useful for two purposes: (1) Decisions about desirable market share positions; And (2) Allocation of strategic funds in the product portfolio (Ansoff & McDonnell, 1993).

2.2.4 The Balanced Scorecard (BSC)

Kaplan and Norton (1996), in their publications, showed that managers of large American companies had already realized that the assessment of organizational performance centered on financial indicators was becoming obsolete. Moreover, since they are predominantly short-term, they lack the link to the strategy, not making clear the ability of organizations to create value.

Authors such as Speckbacher, Bischof and Pfeiffer (2003) and Lee and Yang (2011) classified the BSC into three different types:

Type 1: This is the initial phase of the BSC in which an organization, combining financial and non-financial measures, covers the four perspectives (financial, customers, internal processes and learning and growth). This type of BSC is used to assess organizational performance and can establish indicators that show a cause and effect relationship.

Type 2: In addition to considering financial and non-financial measures, it describes strategy and measures that use cause and effect relationships. In this type of BSC, achievement of strategic objectives is rewarded in terms of values for meeting financial and non-financial goals.

Type 3: This is the last step of the BSC, when it reaches the maturity stage. It is characterized by a system that focuses on strategy, including a reward-based performance measurement system, establishing a cause and effect relationship between measures.

This model aims at balancing financial and non-financial indicators, so that organizations should balance accounting and financial results with non-financial indicators from three perspectives: clients; internal processes; learning and growth (Kaplan and Norton, 1992).

According to Saraiva and Alves (2014), in the final phase of the twentieth century there was a need to change the way of assessing the performance of organizations, which until then was strictly done by a financial perspective, culminating in

this way with the emergence of the Balanced Scorecard (BSC), developed by Kaplan and Norton. Wanderley, Cullen, and Tsamenyi (2013) identified the three main political characteristics of BSC.

First, the BSC is presented as politically neutral in its exercise of domination by the top management of the company, preventing managers from asking about the legitimacy of the proposed strategy or about the power that top management exercises over managers.

The BSC considers managers as neutral agents that maximize results. This assumption is based on neoclassical economic theory, which differs from the sociological view which emphasizes that managers do not merely seek to maximize their utility function but are influenced by cultural, political and social aspects (Norreklit & Melander, 2006). In the BSC project, the main task in the management process is to achieve the balance of all aspects related to the company's performance to ensure the organization's long-term survival (Modell, 2012). Third, BSC is a hierarchical top-down system (Norreklit and Mitchell, 2007).

3. RESEARCH METHODOLOGY

The theoretical framework providing the concepts necessary to the constitution of the problem of this research is based on two approaches. In the first, the phases through which the company undergoes are shown in a generic way. In the second, the components of a management system (finalization, organization, animation) are presented.

According to Collis and Hussey (2005, p. 26), the approach used was qualitative, "it is more suggestive and involves examining and reflecting perceptions to obtain an understanding of social and human activities." According to Gil (1991), quoted by Silva and Menezes (2001, p. 21), the objective is to describe the characteristics of a given population or phenomenon or the establishment of relations between variables "and, which also aims to provide greater familiarity with the problem in order to make it explicit or to construct hypotheses."

In relation to technical procedures, this is a case study based on bibliographical research, because according to Silva and Menezes (2001), the case study "involves the deep and exhaustive study of one or a few objects in a way that allows his ample and detailed knowledge "(p. 21).

Data collection took place in two moments. At first, a literature review was carried out through bibliographical research. The literature review allowed the understanding of the tools used in the elaboration of the strategic diagnosis, as well as understanding the relevance of SMEs to the Brazilian economy, since these are in greater numbers among the total of the operating companies, but still with small participation in the exports of the country. In order to change this picture, SMEs are seeking to form networks and consortia in order to share the costs of exports with each other and thus to find strategies that allow them to access a new market. In a second moment, interviews were carried out with the General Manager and the Administrative Manager of the company during the second half of 2016, as well as the application of a Strategic Diagnostic Inquiry.

4. CHARACTERIZATION OF THE ACTIVITIES OF THE CD COMPANY AS A PERISHABLE FOOD INDUSTRY

The company is located in the state of Rio de Janeiro since 2011, carrying out its activities in a meat processing industry under lease, counts in its industrial process with a system that vertically integrates all phases of meat processing, namely, carcasses, boning, preparation of cuts, cooling, freezing and the manufacture of sausages.

As it is a small business, its business structure is composed of the first level by a general manager, the second level composed of the administrative manager who also accumulated the functions of financial, commercial manager and industrial manager, and finally the employees.

Meat processing plants are air-conditioned, with an ambient air-conditioning temperature not exceeding 16°C, and the operations of breaking up the carcasses into pieces, both swine and cattle, can only be carried out after they have undergone the cooling process. The company has in the area of cold cuts its main source of income. Its production line is a continuous process (there is no interruption of the steps in the manufacturing process), and it has machines and equipment which, although not of the latest generation, can be said to offer a high degree of technology. Also the manufacturing process (flavoring, selection and preparation of the meats, injection and brine, curing, forming and cooking), is grounded in high technology. As additional activities, one has the sausages (sausages, mortadella, etc.) and the manufacture of hamburgers.

With respect to equipment, these comply with the standards and characteristics determined by the Ministry of Agriculture, Livestock and Food Supply (MAPA), and are controlled by the Federal Inspection Services (SIF) or State Inspection Service (SIE), and are arranged to discipline the elaboration of the hams.

The company strives to ensure that its activities meet the legal requirements and, as well, its corporate requirements, for which it already promotes training and awareness programs with its employees.

5. STRATEGIC DIAGNOSIS OF THE CD COMPANY

5.1 Swot Analysis

In order to prepare a diagnosis of the potentialities and weaknesses of the company in this study, and in order to achieve the above mentioned objectives, an extra-accounting analysis was carried out, namely a SWOT analysis. In order to do so,

we first used an analysis of the macroeconomic environment and the specific environment through Porter's 5 forces. Table 1 below summarizes the main macroeconomic forces that have an impact on the company's activities.

Table 1. Macroeconomic Forces Affecting the Company

Macro Forces	Opportunities / Threats
Policies	In Brazil one of the great difficulties faced by companies refers to the collection of high levels of taxes, which constitutes a threat; Another point to consider is the political instability that has become recurring, negatively impacting the consumer markets to which the company operates;
Economic	The world economy has faced a strong recession, which causes interest rates to rise to contain inflation, posing a real threat to the company; The devaluation of the currency against the dollar allows greater exports to the big producers opening space internally, constituting as a potential business opportunity.
Social	Gradually, there is a change in the habit of consumers caused by the economic crisis, which causes that consumers consume less of the products offered by the company constituting as a potential threat; Another point to consider is the increased mobilization of labor union entities that sometimes induce employees to behave badly to the company.
Technological	Large companies are constantly increasing their production and reducing costs through technology in the productive process and management. Regarding this factor, the company has a disadvantage, because its equipment and Management Systems are inferior to the main players in the market; Another factor to consider is the scarcity of resources to obtain cutting-edge technology.
Ecological	Increasing people's awareness of environmental issues leads them to adopt certain types of behavior that favor companies that are obviously concerned about the environment and sustainability. The CD company that has a concern with these issues, is in this way positioned to enjoy this opportunity.

Porter's Five Forces model (1986) can be understood as a tool that helps to define the strategy of the company and takes into account both the external and internal environment. Thus, the application of Porter's Five Forces model in the CD company is presented as follows:

- **Barriers to entry of new competitors:** economies of scale; high levels of initial investment; legal barriers; high logistical costs; and difficulty in accessing distribution channels.
- **Presence of substitute products:** a large number of substitute products, such as chicken, certain types of fish, products and by-products of cattle and pork from the region.
- **Rivalry in Industry:** competitors already established and of considerable size; competition based on product quality; and price-based competition.
- **Bargaining power of buyers:** buyers have considerable bargaining power, since they have many options for substitute products and for other companies with the same products.
- **Bargaining power of suppliers:** suppliers have considerable bargaining power since there is a large universe of companies that buy their products.

Table 2 shows the strategic combinations from the SWOT matrix. All combinations were made by relating the strengths and weaknesses encountered with the threats and opportunities observed in the general and specific environment of the company.

Table 2. Matrix Strategic – Swot Combinations

Internal/ External	Threats	Opportunities
Strengths	Use expertise and differentiate yourself from competitors; Develop product lines that meet <i>all</i> market segments; Use the sales force and channels of customer interactions to try to reduce the level of buyers debt; Take advantage of the good strategic location to intensify customer service; Use the flexibility and adaptability to meet the challenges posed by the difficulty in obtaining loans; Make use of speed in decision-making to limit the harmful effects of union pressures.	Take advantage of channels of interaction with suppliers and government funds to develop a pilot program for exporting the CD company's main products; Use channels of interaction with established customers (distributors) to take advantage of opportunities in new market niches; Use the facility in the relationship with local authorities to request tax exemption due to the relevance of the contribution to the local economy through the creation of jobs.

Weaknesses	Train employees; Establish partnerships with suppliers for the implementation of distribution centers that facilitate access to raw materials without the need for large investments by the CD company; Develop a contingent capital fund to meet the financial needs arising from borrowing difficulties; Establish collective agreements with the unions in order to provide more advantageous working conditions for employees while benefiting the company by differentiating it from the competition.	Implement quality certification programs with a view to increasing the competitiveness of the CD company; To seek from the authorities funds for the development of partnerships with suppliers for the implementation of the distribution centers with the aim of supplying raw materials in adequate quantities at the right time, in addition to contributing to the reduction of logistical costs; Seeking to enter new market niches where the competition is not so strong.

5.2 Product lines and contribution margins

The large number of products within a company, such as the CD company, require product policy decisions to be made at three different product levels, namely, product item, product line, and product compound. Given that these three levels are interconnected, an explanatory approach will be made on product item and product compound, developing in a deeper way the product line as it is a very important information to achieve the objectives of the present study, to know:

- Product Item: a specific version of a product that has a separate designation in the sales catalog.
- Composite of products: the composition of products offered for sale by a company or a business unit.
- Product line: a group of products that are closely related, whether because they meet a needs category or because they are used together, or because they are sold to the same customer segments. They are brought to market through the same types of points of sale or enter the same price range.
- Baked ham is a product item. The cold cuts, is a product line, and counts on: cooked ham, smoked ham and hors d'oeuvres. In the different types of products of the cold cuts, the raw materials, the condiments and the packaging, are elements that constitute the product. These elements are common to all products in the different product lines.
- Product composite: the different product lines. The product compound may be described as having a certain extent, depth and consistency.

The extent refers to how many different product lines are within the company. The company CD has several product lines among which are cited: the cold cuts, the sausages, hamburgers, salted and frozen cuts. The depth of product compound refers to the average number of items offered by the company within each product line. As an example, the company under study has eight types of sausages that are produced in order to serve different market segments, whether to meet *all* purchasing power or to meet any other requirements. The consistency of the product compound refers to the degree of relationship of the various product lines in terms of end-use, production specifications, distribution channels or otherwise.

In the company, the product lines are very consistent, since they are consumer goods that reach consumers through the same distribution channels. Normally each product line is managed by a person in charge to follow the whole process, from the conditions in which the equipment is up to the sale of each item of its line, and also how it behaves in relation to the lines of other competing products.

The success of the manager is directly linked to the degree of his knowledge and dedication, above all, what is related to his product line, because the better the universe of his functions, the faster you will find the solutions for the Issues that may arise during the process. The person in charge of the product line must know the percentage of the total sale and the profit of each line item.

Baked ham, although representing 30% of total sales within the cold cuts, contributes with 50% of the profit. On the other hand, the hams represents 50% of the total sales and contributes only with 30% in the profit. The sum of the last two items (smoked and fattened hams) represents 20% in both line sales and profits. The sales manager should pay special attention to the first two items, since they are the main products of the cold cuts segment. The evolution of competing products must be monitored, both in terms of quality and price, so that there is no abrupt drop in sales and profitability. The hams item, which represents 10% of sales and only 5% of profit, would be the item that the buyer could eliminate if there was a need to sacrifice some of the items.

One problem faced by product line managers is finding the optimal extent of their line. A product line will be very restricted if one can increase the profit by adding new items. On the other hand it will be extensive if the manager increases the profit by eliminating some items.

With the globalization of the economy, product lines tend to expand more and more, to better meet the consumer's wishes, otherwise sales will certainly decline. It is clear that the creation of new products does not only depend on the person in charge of the line but, above all, on the general policy of the company. The widening of the product line can happen both down and up. The expansion downwards is when the company starts at the top end of the market so, shortly afterwards, direct their attention to the product lines to the bottom of the market. In the expansion upwards, the company is positioned in the lower segments in the market and later enters the upper segments.

5.3 Application of the BCG matrix in the CD company

As mentioned previously, the BCG Matrix is a tool that enables the positioning of a company's product portfolio, based on their life cycle, in order to provide useful information, above all, to which products should be invested and divested, accordingly, this section deals with the application of the BCG Matrix in the CD company. However, due to the impossibility of obtaining enough data for the calculation of the Relative Market Quota of the Company as well as accurate data on the Average Market Growth Rate, it was decided to make exclusive use of the life cycle of the products of the CD company, placing them in the BCG Matrix in theoretical terms, which does not significantly alter their relevance to the study in question. In this way, the main products that compose the company's product portfolio and their respective stages in the Product Life Cycle are set out in the following Table 3:

Table 3. Product Group vs Stage in the Product Life Cycle

Product Group	Stage in the Life Cycle
Cooked hams (Cold cuts)	Growth
Burgers	Growth
Smoked Hams	Start
Mortadella	Start
Sausages	Maturity
In Natura Products	Maturity
Sausages	Decline
Salamis	Decline
Salty	Decline
Bovine small parts	Decline

Table 4 presents the application of the BCG Matrix to the CD company, based on the life cycle of its products.

Table 4. Application of the BCG matrix in the company CD

		Relative Market Quota	
		High (>1)	Reduced (<1)
Market Growth	High	Stars	Question Marks
		Boiled Hams	Smoked Hams
		Burgers	Mortadella
	Reduce	Cash Cows	Dogs
		Sausages	Sausages
		<i>In Natura Products</i>	Salamis
			Salty Bovine small parts

Cooked hams (cold cuts), located in the of stars quadrant, will gradually move toward the cash cows quadrant, as the mortadella is approaching the of stars quadrant. The main reason for this change is due to the fact that there is a reduction in the Market Growth Rate of cooked hams. Another reason is directly related to the intention of the company to try to add more value, through industrialization, to certain types of meat, which are now converted into In Natura Products, and will leave the cash cows quadrant.

In relation to the cash cow, In Natura Products, it will turn into dog due to no longer justify injections of capital so that it remains in its position, which, in fact, has already led the company to decrease its offer to the market, due to its low profitability.

With regard to the products located in the dogs quadrant, namely, sausages, salami, salted and bred, are generating some losses, however, the company cannot do without them because they contribute to the dilution of fixed costs and also, as a way to help maintain the loyalty of its key customers.

5.4 Definition of strategic objectives and strategy

In the current business scenario marked by rapid changes in consumer behavior, shorter product lifecycles, and increased local and global competition, the CD company needs to achieve market positioning in order to take advantage of Business opportunities while trying to limit or mitigate the main threats.

In the light of the analysis carried out in the present work, the analysis of the general and specific environment, an analysis of the company's internal resources and capacities, an analysis of the product line and the margin of contribution of the company, as well as the application of the BCG Matrix, we present in this section possible strategies that could be undertaken by the CD company in order to obtain competitive advantages. Among the possible strategies for the CD company we propose "Market Development", "New Product Development", "Internationalization" and "Strategic Cooperation".

The market development strategy is justified by the fact that sporadic market areas, such as market niches, arise due to a gap left by the big competitors, as they opt for increased exports backed by fluctuations in the real-dollar exchange rates.

The new product development strategy is based on the fact that the company has a good location vis-à-vis consumers, potentially increasing the company's total revenue, with a higher market share.

Another strategy that could be employed by the CD company would be internationalization, justified by government incentives and the saturation of the local market dominated by large players. Nevertheless, a cooperation strategy could be implemented both to carry out internationalization and to carry out activities and operations in the local market, especially with companies of the same size. It should be noted that a cooperation strategy would be of the utmost importance for the CD company because it divides risks and revenues, mainly due to the difficulties in obtaining loans and high level of buyers debt.

5.5 Proposal of a strategic development monitoring model for the strategic map of the CD company

In order to deepen the analysis made in the present work, the following is a map of the company's general strategic diagnosis, in which the areas described in Table 5 were analyzed by means of Performance versus Importance Matrix, which will serve as the basis for the strategic development monitoring model for the implementation of the strategic map.

Table 5. CD company areas Analyzed by Strategic Diagnosis

Areas Analyzed	Components
Strategic administration	SA1 - Strategic administration
	SA2 - Organizational structure
	SA3 - Performance indicators
Human capital	HR1- Human Resources Strategy
	HR2 - Human resource Management
	HR3 - Education and training
	HR4 - Human Resources Indicators
Finance and Costs	FC1 - Financial management
	FC2 - Financial indicators
	FC3 - Cost Management
	FC4 - Cost Indicators
Sales and marketing	SM1 - Market Assessment
	SM2 - Marketing Policy
	SM3 - Performance Analysis
Foreign trade	FT1 - Export Engineering
	FT2 - Company Export Plan
	FT3 - Government Programs for Export Assistance
	FT4 - Export Process
Product and Manufacturing	PM1 - Product development
	PM2 - Innovation management
	PM3 - Manufacturing Process
	PM4 - Quality and Indicators

	PM5- Energy Efficiency
	PM6 - Strategic Efficiency

Based on the analysis made by the strategic diagnosis to the different areas of the CD company, according to Figure 1, together with the analysis of the Performance vs. Importance Matrix, the strategic development monitoring model will now be elaborated, which will allow the construction of the strategic map.

Considering that the Performance versus Importance Matrix is consolidated in the elements obtained from the analysis resulting from the application of the tools in the company, namely the BCG Matrix, the SWOT analysis and the Five Porter Forces, whose elements after being processed and punctuated in the checklist were positioned in the matrix. This allows us to say that we have in it the actual situation of the company in a synthesized way and that provides the way for the Strategic Development Monitoring model, according to the location of those elements in the matrix.

Figure 1: shows the result of applying the Performance versus Importance Matrix, where it can be observed that all areas of the company, with the exception of the Organizational Structure component, which is part of the Strategic Administration, need improvements since they are located in the quadrant whose performance is does not met degree of importance.

Figure 1. Performance versus Importance Matrix of the CD company

Thus, the points in the different areas must be worked in order to compensate for the adverse effects of the national and international economic environment, which has degraded the purchasing power of consumers and which, as a consequence, has caused a decrease in the activities and liquidity of the market, whose effects are most felt by Small and Medium Enterprises. To achieve this improvement in performance and for the CD company to achieve the objectives it proposes in the short and medium term, it is necessary to take into account what the analysis resulting from the application of the different tools recommend us.

Given that the BSC is based on the four perspectives proposed by Kaplan and Norton (1992), and after having defined their objectives based on the strategic diagnosis of the company and according to the desired economic objective, the following objectives are suggested for each one of the BSC's perspectives:

- Financial perspective:** improving economic performance and increasing liquidity.
- Customer perspective:** increase the value proposition for the client; satisfy customers; retain current customers and create new ones, and diversify markets.
- Perspective of the internal processes:** to obtain better profits in the relationship with the client; obtain better benefits in the relationship with the supplier; improve the systematics of receiving and checking the merchandise in the warehouse; leveraging marketing actions, and maximizing financial efficiency.
- Learning and growth perspective:** obtaining employee satisfaction; improve employee performance; and involve employees in the company's strategy.

After all the previous considerations and related objectives for each perspective for the balanced scorecard, the strategic map presented in Figure 2: is proposed.

Figure 2. Strategic Map for the CD company

6. CONCLUSIONS, LIMITATIONS AND FUTURE RESEARCH

At the conclusion of this study, we can see that, with the globalization of the economy, gaining productivity has become a decisive and indispensable issue for the life of the company. Therefore, it is fundamental that the company behaves very well in relation to the scenario where it operates, and that there is a joint effort of all employees, so that they act in a systemic way and without ever losing sight of their competitive participation in the regional and national level.

The main objective of this work was to provide a framework to the CD Company management, so that it could take decisions on the various angles of the administration, taking into account the fact that it is located in a region that has one of the major consumption points, and the company has a high know-how in the area of meat processing and its derivatives, which can provide the tripod of trade: quality, price and distribution logistics.

In the marketing mix, it was concluded that the price and distribution strategy is of fundamental importance for the CD company. The price issue can be treated from the quality of the raw materials, looking for serious and quality committed suppliers using modern methods of industrialization aimed at the competitiveness of the final product. The logistics stand out, because it is possible to well supply the various points of sales because of the proximity of the company with them.

As in the last decade, the national and international economies have been experiencing a great slowdown, consequently, a reduction in the income of the populations, therefore less consumption, and therefore, less sales. The company will need to find its differentiation in the market by the quality of the service and rendering of services. In this, the sales force plays an important role, which will put the company's products in direct contact with the consumer. In general, all companies, with few exceptions, have been affected by the global economic crisis, but small and medium-sized enterprises are taking the worst of it because their greater vulnerability.

Thus, in addition to the suggestions for greater productivity presented in this work, the management of the CD company, to increase the competitiveness, should, as soon as possible, put into practice the suggested strategy, namely, internationalization and cooperation with companies of the same size, since companies that do not seek new markets and new forms of commerce become less competitive and lose market share to their competitors.

The literature review allowed the understanding of the relevance of SMEs to the Brazilian economy and reported their predominance among the number of operating companies, but still with a small share in the country's exports. However, the challenges to internationalization for small and medium-sized enterprises are also many, ranging from their size and volume, far below the larger companies in the sector, to the complexity and costs of export operations.

One of the ways to minimize the impact on SMEs for access to the external market is through an association between companies creating networks or export consortia. This relationship of trust and partnership will generate advantageous conditions for the participants, allowing them to gain scale in sales and the exchange of market experiences.

Concerning the costs of a high strategic SME diagnosis, we found in the course of this study that if the company has been able to access good external consultants for a global approach to management problems, the CD company would be in a better performing situation.

Before concluding this study, the following is a brief summary of the most important points of the strategic diagnosis, in order to present the most suitable proposals for the CD company.

In the analysis of the macroeconomic environment, it is worth noting: high levels of taxes; political instability; world economy in recession; devaluation against the dollar; change in consumer habits; mobility of labor unions; presence of high-tech enterprises; scarce resources to obtain technology; and raising people's awareness of environmental issues. In this analysis at the level of proposals, it is suggested: to take advantage of the business opportunities occupying the space left open by the exporters; seek a good relationship with the unions; and seek to enjoy preference with consumers, since the company has great concerns for the environment.

The Porter's Five Forces model is a tool that helps to define the strategy both in relation to the external and internal environment, considering: barriers to entry of new competitors; presence of substitute products; rivalry in industry; bargaining power of buyers; and Bargaining power of suppliers. As proposals, it is suggested: quality products; search for market niches that large companies do not meet; form an effective sales force; and, internally, give good training and encouragement to its employees.

With the Performance versus Importance Matrix, it is possible to observe that the areas of the company, with the exception of the Organizational Structure, component that is part of the Strategic Administration, need improvement, since they are located in the quadrant, whose performance does not meet the degree of importance.

Although this work has achieved the outlined objective, that is to know the strategic diagnosis of the CD company and the presentation of recommendations for the problems detected, it is expected that this study will help the management of the organization to better understand the strategic diagnosis of the company. And also, to evaluate the pertinence of the implementation of the proposed measures. In order to improve its performance, it is also suggested that the directors should continue the work started here with the development of a specialized tool to reduce the costs of diagnosis and to make the intervention more financially accessible for this company, and to serve as an example to other small and medium-sized enterprises.

ABSTRACT

Micro and Small Enterprises (MSE), mostly the Commercial MSE are considered the most dynamic and elastic forms of activity. In the economy, the foundation and development of these are important for the creation of the so-called “normal” economic environment. In the recent past, it was enough for enterprises to meet their needs in a profitable way to stay on the market, but that scenario has changed dramatically. The key to longevity and business competitiveness lies in innovation. Accordingly, the main objective of this research was to present a conceptual model of innovation research in Commercial MSE to analyse (1) the innovation level of Commercial MSE, (2) how the innovation presents itself in the Commercial MSE as a result of its business environments. For this the study was based on a sample of 213 Commercial MSE of the State of Piauí. The data were collected through the application of the Innovation Radar conducted by the SEBRAE Local Innovation Agents program. Statistical techniques of descriptive, exploratory and inferential nature were used. The results showed that MSE have innovation capacity between “Little Innovative” and “Occasional Innovative”.

Keywords: Micro and Small Commercial Enterprises, Innovation, Brazil, Management.

JEL Classification: M10, M20, M31

1. INTRODUCTION

In the recent past it was enough for companies to meet their needs in a profitable way to stay in the market, but that scenario has changed dramatically. It's no longer enough simply to meet needs in a profitable way; at present it's necessary to be one step ahead towards the future, because the strategies that have succeeded in the past are not guarantees of sustainable success, which can be exemplified by Tidd, Bessant and Pavitt (2005, p. 42) asserting that “organizations build capacities around a particular trajectory, and those that may be strong at a later (specific) stage of an established trajectory find, in general, next”.

Accordingly, organizations should seek tools and capabilities to assist them in gaining competitive advantages, which in Martín and López (2007, p. 267) conception refer to a “situation of superiority or favourable conditions that one thing has over another”, or as the authors themselves point out, “the concept of competitive advantage is understood as any characteristic of the company that differentiates it from the others, placing it in a relative position of superiority to compete” (p. 267), which Tidd *et al.* (2005) effectively elect as innovation, although a competitive advantage may arise from size or heritage, among other factors, the scenario gradually shifts in favour of those organizations that continuously manage to mobilize knowledge, what they already have; Information, or what is available in the environment, and the creativity to design the creation of novelties in their offerings, be they products or services, and the ways in which they create and launch these offers.

An innovation according to the Oslo Manual, which is a reference in the subject in several countries, is the implementation of a new or significantly improved product or service, or a process, or a new marketing method, or a new method organization of the workplace or in external relations (OCDE & FINEP, 2005).

Innovation is the specific instrument of business activity. It's the action that endows the resources of a new capacity to create wealth. Innovation actually creates the resource. A “resource” is something that does not exist until man discovers a use for something existing in nature and thus endows with economic value (Drucker, 1987).

Ultimately, as Tidd *et al.* (2005, p. 30), “the truth is that, whatever the technological, social or market conditions involved, the key to creating - and maintaining - competitive advantage tends to belong to those organizations that innovate continuously”. However, it should be noted that there are significant differences in the way large organizations innovate compared to their smaller counterparts, particularly Micro and Small Enterprises (MSE). Large organizations may have large resources invested

in Research and Development (R&D) or market research, which is almost impossible for MSE due to their financial fragility and the strong competitive pressure from the globalization of markets. While large organizations are apt to develop large-scale innovations, MSE often adopt innovation strategies through technology acquisition (Tidd *et al.*, 2005).

Given the importance attributed to innovation, the present research has the primary objective of verifying how the innovation presents itself in the Commercial MSE of the State of Piauí, considering that innovation is now considered as the key to obtaining competitive advantages, creating positive results both for the companies involved in the innovation process and for the economy as a whole.

Besides this brief introduction, the article is structured in four points. The following is the framework of the study, where the main concepts that guided the investigation are explained. Subsequently, the conceptual model and the research hypotheses are presented. Next, the methodology and the analysis of the results are presented, being this the core of the present investigation and, finally, the contributions of the accomplishment of this investigation.

2. THEORETICAL FRAMEWORK

2.1 Concepts of Innovation

Reichert, Camboim and Zawislak (2015) postulate that innovation is the result of the capacity of companies, taking into account the technological and market patterns in each branch of activity, of absorbing, adapting and transforming knowledge into technology and this into operational, managerial routines and commercial practices that lead companies to achieve superior performance, in keeping with Drucker's (1987) thinking that innovation is action that provides the resources of a new capacity to create wealth. In the words of Drucker (1987, p. 42), "Innovation creates, in fact, the resource. A resource is something that doesn't exist until man discovers a use for something existing in nature, and thereby endowing it with an economic value".

Schumpeter (1997), considered by some authors (*e.g.*, Titu, Raulea and Titu, 2015; Bayarçelik, Tasel and Apak, 2014; Tidd *et al.*, 2005) as a pioneer in innovation studies, states that innovation would be a spontaneous and discontinuous change in the flow channels, disturbance of equilibrium, which forever changes and shifts the pre-existing state of equilibrium, a new combination of elements in the economic system, a "creative destruction", as the result of this combination would break with the existing standards giving rise to new standards that would be followed by all the economic agents who could adapt to the new circumstances. It's a dynamic process in which new technologies replace old ones.

For OCDE and FINEP (2005) innovation can be understood as the implementation of a new or significantly improved product (product or service), or a process, or a new marketing method, or a new organizational business practices, the organization of the workplace or in external relations. The minimum requirement for defining an innovation is that the product, process, marketing method, or organizational are new (or significantly improved) for the company. This includes products, processes and methods that companies are the pioneers to develop and those that have been adopted by other companies or organizations (OCDE & FINEP, 2005).

2.2 Innovation and Competitive Advantage

The concept of competitive advantage is related to any characteristic of the company that differentiates it from the others, placing it in a position of relative superiority to compete. Martín and López (2007), explain that a competitive advantage must meet three criteria, must be related to a key factor of success in the market, must be substantial enough to give the company a differential and be sustainable in the face of changes in the environment. Although in the long run none is totally free from attacks by competitors.

In today's economy, which is considered to be a knowledge-intensive economy, innovation management is becoming one of the main drivers of change and gaining competitive advantage (Apak and Atay, 2014).

Thus, given the current competitive conditions in the markets, the only form of competitive advantage is continuous innovation at a faster pace than rival organizations (Toivonen, 2015).

Rusu (2016, pp. 166-167) states that "successful companies to survive and thrive introduce innovations that generate change within companies by implementing processes that have consequences on their business model enabling profit generation".

It's clear that the company of the present century is operating in an increasingly globalized environment, and that resources and capabilities and innovation should be considered as key elements in the strategy and in the maintenance and development of competitive advantages (Molano and Campo, 2014). For Seo and Chae (2016, p. 708), "the business world harbours a number of threats and uncertainties requiring a high degree of innovation as a factor of success. A strong degree of innovation can cover several risks when facing the market".

Specifically, innovation means efforts by companies to create economic value for consumers by positively increasing the difference between the perceived value of consumers and the economic costs incurred by companies. Companies will have a competitive advantage when they can create marginal economic value greater than their competitors. Thus, innovation can be a source of competitive advantage (Hamdani and Wirawan, 2012).

The competitiveness of a company in the market depends on the ability to "capture the market" using ideas and marketing innovation through business relationships. In this way, the competitiveness of the markets demands of the companies an innovative position, especially in what concerns the marketing (Gupta, Malhotra, Czinkota and Foroudi, 2016).

2.3 Innovation in Micro and Small Enterprises

Innovation and the development of innovative capabilities in MSE entails a number of difficulties, as Rovere (2001, p. 22) states “the innovative capacity of MSE depends on several factors related to the organization of the sector and the system of innovations in which they meet”. Paula (2014) says that for MSE it's possible to notice a greater difficulty in the innovation process, because they have less access to sources of information on technologies and sources of financing, complemented by the lack of resources, few or non-existent investments in Research and Development (R&D), strong dependence on technology acquisition (Machinery and equipment) and limited managerial capacities (Demonel and Marx, 2015; Reichert *et al.*, 2015; Taborda, Estevão and Nunes, 2013), which leads them to operate with equipment and technologically outdated facilities, carrying out low investment in Research and Development, being slow and reluctant to adopt managerial and organizational innovations (Rodrigues, 2003).

Pereira, Grapeggia, Emmendoerfer and Trê (2009) argue that, even though MSE have difficulties in assimilating managerial professionalization, precarious levels of control, financial problems such as lack of working capital and incipient knowledge of the market in which they operate, most MSE entrepreneurs associate innovation less with the differentiated elaboration of products and services and more as a business model.

As a result of this context, innovation in MSE presents itself as the result of simple actions, in some cases with its own development, acquisitions of new equipment, adoption of innovation management practices and, usually, incremental innovations, presenting as an alternative types of advantages, resulting from attributes such as quality, processes, offer of new products that promote the differentiation of the organization, since they have particularities that are presented as sources of competitive advantage when compared to large companies. They usually have a leaner and more flexible organizational structure, placing them in closer contact with their clients, as well as carrying out activities with low capital intensity and high labour intensity, which can lead to differentiated production conditions (Rodrigues, 2003; Paula, 2014).

2.4 Conceptual Model and Research Hypotheses

The Figure 1 presents the conceptual research model proposed to evaluate how innovation presents itself in Commercial MSE. The proposed model was developed based on recommendations of the Oslo Manual (OECD & FINEP, 2005), considering innovation as a system of interactions and interdependencies.

Figure 1. Conceptual Model

The justification of the model is based on Skibinski and Sipa (2015). They claim that MSE because they have limited internal resources should make use of external knowledge sources. In this way, the ability to exploit and use the knowledge that comes from abroad becomes a key element and predictor of successful innovation, which makes the environment in which they are located and the development of appropriate tools to exploit it. The general and classic models of innovation presented by Rothwell (1994) define innovation as a set of processes that should be undertaken by the organizations in isolation for the development of innovations, especially in the development of new products. Recent models of innovation such as Cooper (1988), Khurana and Rhosental (1997), Koen *et al.* (2001), Flynn, Dooley, O'sullivan and Cormican (2003), Boeddrich (2004), Reid and Brentani (2004), Wihtney (2007), Brem and Voigt (2009) and Kurkkio, Frishammar and Lichtenthaler (2011), besides being strictly theoretical, focused on large companies and on processes that companies must undertake in isolation, they also emphasize the development of products to the detriment of the development of other types of innovation, such as services, processes, marketing and organizational. The theoretical model presented in this paper differs from the models listed by (i) being a model that seeks to investigate how the degree of innovation is configured to the detriment of the business environment, having a more comprehensive perspective than the company object alone, as is the case with the above mentioned models; (ii) to characterize itself as a suitable model for the investigation of innovation in Micro and Small Enterprises by presenting a system of interactions between Micro and Small Enterprises and their business environments, thus enabling the investigation of the degree of innovation according to location geographical; (iii) to provide information on Micro and Small Enterprises innovation in a global way, not limited solely to the development of products.

Accordingly, with the main objective of the study the conceptual model, the following research hypotheses were established:

H_1 : The Micro and Small Commercial Enterprises of the State of Piauí present themselves as little innovative.

The conceptual framework of the research hypothesis 1 is based on Demonel and Marx, (2015), Reichert *et al.* (2015) and Taborda *et al.* (2013), because they say that innovation in MSE entails greater difficulties related to lack of resources, scarce or nonexistent investments in Research and Development (R&D), strong dependence on technology acquisition (Machinery and equipment) and limited managerial capacities. Nevertheless, in developing countries (DC), as Rojas and Carrillo (2014) point out, market failures such as imperfect competition, externalities and information asymmetries have a negative impact on companies' capacity for innovation, that they assume defensive and merely reactive strategies

H_2 : Innovation in Micro and Small Commercial Enterprises in the State of Piauí presents itself differently due to its business environments.

$H_{2,1}$: The Global Average Innovation Index is different by cities;

$H_{2,2}$: The Global Average Innovation Index is different by geographic location.

The conceptual framework of the 2nd research hypothesis is based on Aarstad, Kvitastein and Jakobsen (2016), since they point to the geographic environment as an important factor influencing growth, profits and business development, including survival and innovation performance. In this sense, as established by Skibinski and Sipa (2015), innovation in MSE may be associated with its ability to explore and use the knowledge that comes from its environment.

2.5 Methodology

The instrument used for data collection was a questionnaire survey. The instrument is composed of 32 items that evaluate 13 dimensions of the innovation, resulting from an adaptation made by Bachmann (2011) for application in MSE of the Innovation Radar, of Sawhney, Wolcott and Arroniz (2006), originally constituted of 12 (Twelve) dimensions. The innovation dimensions assessed by the Innovation Radar are: (1) Supply; (2) Platform; (3) Brand; (4) Customers; (5) Solutions; (6) Relationship; (7) Value Aggregation; (8) Processes; (9) Organization; (10) Supply Chain; (11) Presence; (12) Network and (13) Innovative Ambience.

The study was conducted with a sample of 213 Micro and Small Commercial Enterprises of the State of Piauí, Brazil, during the months of October 2014 to October 2015. For the treatment, analysis and interpretation of the data were used the software SPSS Statistics in its version 22 and Numbers in its version 3.1. The statistical techniques used were descriptive, exploratory and inferential in order to describe, analyse and interpret the behaviour of the attributes under study. Thus, in the first phase we chose to calculate the Global Average Innovation Index (GAII), obtained by means of the simple arithmetic mean of the above mentioned 13 (Thirteen) dimensions of Innovation Radar (Equation 1).

$$GAII = \frac{1}{n} \sum_{i=1}^n X_i \quad [1]$$

Where, n , corresponds to the number of independent variables of the Innovation Radar;

X_i , corresponds to the independent variables of the Innovation Radar ($i = 1, \dots, 13$)

$$GAII = \frac{1}{13} \sum_{i=1}^{13} X_i \quad [2]$$

Where,

X_1 , Supply; X_2 , Platform; X_3 , Brand; X_4 , Customers; X_5 , Solutions; X_6 , Relationship; X_7 , Value Aggregation; X_8 , Processes; X_9 , Organization; X_{10} , Supply Chain; X_{11} , Presence; X_{12} , Network; X_{13} , Innovative Environment.

A sample error of 6,71% and a significance level of 5% was used to calculate the sample size.

In order to make the decisions regarding the differences of research hypotheses, a 5% of significance level was assumed throughout the analysis.

2.6 Analysis and Presentation of Results

The study sample consists of 213 Commercial MSE distributed among six cities in the State of Piauí, as follows: Teresina 118 (55,4%); Bom Jesus 24 (11,3%); Floriano 11 (5,2%); Piripiri 21 (9,9%); Picos 18 (8,5%) and Parnaíba 21 (9,9%).

Regarding the location, 55,4 % of the Commercial MSE in the sample are located in the state capital, while 44,6% are located in the interior of the State. In order to answer the first research hypothesis, the Global Average Innovation Index (GAII) was calculated by means of the simple arithmetic mean of the 13 dimensions of the Innovation Radar, whose overall mean value was 2.00 points (deviation standard of 0.93), denoting globally that the Commercial MSE of the study sample have innovation capacity between “Little Innovative” and “Occasional Innovative”, according to the adapted classification of Neto and Teixeira (2011), in which the final average score 1 (One) means “Little Innovative”; The final average score 3 (Three) means “Occasional Innovative” and the final average score 5 (Five) means “Systemic Innovative”. The mean standard deviation of 0.93 indicates that the firms analysed responded to questions related to the Innovation Radar in the same sense, that is, there was little variability around them.

Since the Commercial MSE of the sample have a GAII of 2,00 points (standard deviation of 0,93), indicating that they are between “Little Innovative” and “Occasional Innovative”, responding to research hypothesis 1, we intend to verify if there are differences in the GAII average for cities and geographic location to answer the research hypothesis 2.

The verification of the existence of differences in the GAII average for the cities is done through the application of One-Way ANOVA. In order to be a parametric test, some assumptions need to be validated, namely if the variables follow the normal distribution in the different independent groups (using the Kolmogorov-Smirnov test), homogeneity of variances (Levene test), and Independency between groups, assuming a significance level of 5%. Considering the normality test, Kolmogorov-Smirnov test, it was concluded that at a significance level of 5% there is enough statistical evidence to state that the study variable does not follow a normal distribution in the independent groups under study.

Given the violation of the first assumption for the application of the parametric test, the non-parametric alternative, in the case in question, was immediately applied to the Kruskal-Wallis test, in order to compare the GAII distributions in the six cities (Independent groups).

Using the Kruskal-Wallis test, considering that the obtained value was less than 0,001, it can be concluded that there is statistical evidence at the significance level of 5% to state that at least one of the GAII distributions is different for the six cities.

In order to verify if there are differences in the GAII mean for the Geographic Location, the t-Student parametric test was used for two independent samples, where application assumptions are normal population or $n \geq 30$ observations and unknown standard deviation.

However, once the sample size is different in both groups, the Levene test was applied to verify if the variances were homogeneous assuming a significance level of 5%. From the results obtained it's concluded that there is not enough statistical evidence to affirm that the variances are significantly different for a level of significance of 5%, since the obtained value was 0,930, higher than the level of significance assumed. In relation to the t-Student, considering that the test value is 0,132, higher than the level of significance assumed, it is concluded that there is enough statistical evidence to affirm that the average GAII is equal for the Commercial MSE comparing the interior and the capital, at a level of significance of 5%.

Based on what has been presented previously, it's concluded that the first research hypothesis have not been validated, that is, since the Average Global Innovation Index obtained through the average of the 13 dimensions of the Innovation Radar applied in the 213 Commercial MSE of the State of Piauí was 2.00 (standard deviation of 0.93), the Commercial MSE of the sample under study had an innovative capacity between “Little Innovative” and “Occasional Innovative”, resulting in a non-validated research hypothesis 1. Because the GAII distribution is the not the same among cities, but though the GAII average is the same for geographical location, the research hypothesis 2 is valid since there is sufficient statistical evidence to affirm that the innovation not presents itself totally homogenized for the Commercial MSE of the study, using the control variables City and Geographic Location.

Šoltés and Gavurová (2014) argue that the effective development of innovation requires a functional innovation system composed of institutions, policies and tools to create conditions that promote innovation. After all the inferential analysis carried out, contrary to the literature on the subject (e.g., Demonel and Marx, 2015; Taborda *et al.*, 2013) that present Commercial MSE as not very innovative, it is possible to state that there are indications that the functional innovation system that promotes the promotion of innovation by Commercial MSE is to a certain extent present in the State of Piauí, although in an incipient form, since Commercial MSE have innovation capacity between “Little Innovative” and “Occasional Innovative”, leaving room for fundamental improvements in the degree of innovation, and that this capacity is homogenized for the Commercial MSE of the study.

2.7 Research Contributions

As mentioned above, the main objective of the present investigation was to verify how the innovation presents itself in the Commercial MSE of the State of Piauí, so that the following hypotheses of investigation were established: H_1 : The Micro and Small Commercial Enterprises of the State of Piauí present themselves as little innovative; H_2 : Innovation in Micro and Small Commercial Enterprises in the State of Piauí presents itself differently due to its business environments (Cities and Geographical Location).

Overall, the Commercial MSE of the sample under study has innovation capacity between “Little Innovative” and “Occasional Innovative”, since the Average Global Innovation Index (IGMI) obtained through the average of the 13 dimensions of the applied Innovation Radar in the 213 Commercial MSE of the State of Piauí was 2.00 (standard deviation 0.93). Since the classification usually adopted establishes that the final average score 1 (One) means “Little Innovative”; The final average score 3 (Three) means “Occasional Innovative” and the final average score 5 (Five) means “Systemic Innovative”, it can be affirmed that the Commercial MSE of the sample under study have innovative capacity between “Little Innovative” and “Occasional Innovative”, resulting in a non-validated the research hypothesis 1.

In order to verify in a general way how the GAI of the Commercial MSE presents as a result of the variables of control City and Geographic Location, using inferential analyzes, it was observed that the distribution of GAI is not the same between Cities and that the GAI average is the same for geographic location. Because the GAI distribution is not the same among cities, but though the GAI average is the same for geographical location, the second research hypothesis is validated, since there is sufficient statistical evidence to affirm that the innovation not presents itself totally homogenized for the Commercial MSE of the study, using the control variables City and Geographic Location.

The results obtained provide an important practical contribution to the management and monitoring of innovation in Micro and Small Enterprises in a given region by presenting an indicator that reflects how much innovation is present, serving as a parameter for potential improvements both by companies and by the public power. As theoretical contributions, the presented model leads to useful and systematic information on how innovation presents itself in Micro and Small Enterprises in a global way as a result of its business environments, and can thus be useful as a model that serves as a parameter for the Improvement of innovation through public policies aimed at improving the business environment that increase the degree of innovation of the companies that constitute it, and therefore validate the theoretical model in the case in question. Possible public policies are the establishment of partnerships with universities and local research institutes, with a view to obtaining the necessary resources for innovation, the formation of innovation networks between Micro and Small Enterprises and financial subsidies by the government for companies that join the innovation networks.

The limitations of the study are the unavailability of information on the number of employees, turnover, investments in R&D and training efforts, which would be useful for more detailed analyses of the innovation capacity of the companies studied. In addition, although the theoretical model presents useful information of the global form as the innovation presents itself, it does not make it possible to identify in detail the types of innovation developed by the companies studied, considering the innovation as a homogeneous whole within a given business environment.

As future research, we intend to develop studies that identify the factors that serve as obstacles or that facilitate innovation in Commercial MSE, the relationship between innovation and economic development, and how the quality of human resources influences Commercial MSE innovation capacity.

RESUMO

Estamos a testemunhar uma sequência de inovações disruptivas de grande impacto nos mercados de trabalho do próximo futuro. De um lado, a revolução digital, a sociedade algorítmica e a economia das plataformas e aplicações tecnológicas na senda da chamada “uberização da sociedade”; de outro, a disrupção social nos mercados de trabalho e rendimento na senda da pluriatividade e do plurirrendimento. Não obstante, este é o contexto de uma grande promessa, já em curso, a chamada “economia colaborativa” e de uma possível utopia anunciada para o século XXI, o chamado Rendimento Básico Universal (RBU). Está em causa a organização social do mercado de trabalho, por isso, a emergência de novas modalidades de pluriatividade e plurirrendimento. É, também o caso do RBU.

Palavras-chave: Sociedade Algorítmica, Inovação Disruptiva, Pluriatividade, Plurirrendimento, Rendimento Básico Universal (RBU).

JEL Classification: Z13

1. INTRODUÇÃO

A sociedade global e cosmopolita em que vivemos sofreu alterações profundas nas últimas décadas do século XX. Actualmente, vivemos na chamada “sociedade algorítmica” marcada por novos problemas, dilemas, desafios e soluções. Ao longo do século XXI continuaremos a assistir a mudanças societais e civilizacionais de grande alcance. Paralelamente à emergência e/ou agravamento de problemas específicos, assistiremos, também, e em contrapartida, ao aprofundamento da economia simbiótica ou economia circular², ao aparecimento e aprofundamento da chamada “(i)conomia” e das redes colaborativas (Sociedade Co), assim como dos seus respectivos contributos, na abertura de novas perspectivas de contemporaneidade no que toca à resolução de problemas (*problem solving*), à inovação e ao desenvolvimento. Falamos de problemas específicos das sociedades seniores no mundo ocidental, dos efeitos perversos das alterações climáticas na gestão dos recursos naturais, da permanência de um desemprego estrutural, em consequência de uma profunda desconstrução do mercado laboral tal como o conhecemos na segunda metade do século XX, dos riscos globais próprios de um mundo multipolar e da mitigação do risco moral que eles provocam. Falamos da emergência do “4º sector” ou da recomposição de uma economia do quaternário³, que ganha cada vez mais espaço, associado ao universo das tecnologias da informação e comunicação e às redes sociais e, cada vez mais, na interface entre a economia pública convencional, a economia social e solidária e a economia dos bens comuns colaborativos. Assim, admite-se que uma parte importante da inovação e do desenvolvimento na dita sociedade algorítmica tenderá a passar pela emergência da sociedade colaborativa, pelo advento da “(i)conomia” e pela multiplicação da economia das redes e suas aplicações (economia das *apps*)⁴.

Em suma, vivemos, já, em plena sociedade algorítmica. É um dado adquirido. Ela faz parte do nosso quotidiano, por isso estamos a testemunhar uma sequência de inovações disruptivas de grande impacto, quer nos mercados de trabalho actuais, quer nos do próximo futuro. De um lado, a revolução digital e a economia das plataformas e aplicações tecnológicas na senda da chamada “uberização da sociedade”; de outro, a disrupção social nos mercados de trabalho e rendimento na senda da pluriatividade e do plurirrendimento. Não obstante, este é o contexto de uma grande promessa, já em curso, a chamada “economia colaborativa” e de uma possível utopia anunciada para o século XXI, o chamado Rendimento Básico Universal (RBU). Podemos dizer que está em causa a organização social do mercado de trabalho, por isso, a emergência de novas modalidades de pluriatividade e plurirrendimento. É, também o caso do RBU.

2. A MINHA VIDA UBERIZADA

A sociedade da informação e da comunicação é dominada pelas grandes plataformas tecnológicas, quais conglomerados empresariais reunidos sob as denominações GAFA (Google, Apple, Facebook e Amazon) e NATU (Netflix, Airbnb, Tesla e Uber). O modelo de negócio destas plataformas é geralmente conhecido por “uberização”, do nome da plataforma tecnológica UBER que, através de uma aplicação informática, conecta uma comunidade de prestadores e utilizadores de serviços de táxi. Esta intermediação tecnológica processada através de uma aplicação informática e administrada por uma empresa plataforma pode ser estendida a muitas áreas e serviços e, no limite, abranger e dominar a vida quotidiana dos cidadãos.

O texto que se segue procura ilustrar, embora com algum exagero e ironia, mas não longe da realidade, o que é uma vida “uberizada”. Então vejamos ou imaginemos:

São 7 horas da manhã, acordo ao som da internet das coisas (*internet of things*) (IOT). Tocam à porta, são os serviços de *baby-sitting* que tinha contratado a uma *start-up* no dia anterior. Tocam de novo, é o *pet-sitting* um serviço para tratar dos animais. Enquanto tomo o pequeno-almoço trato de encomendar *on-demand* as compras do hipermercado para me entregarem ao fim da tarde. De repente, o sensor IOT do esquentador diz-me que há uma fuga de gás, ligo o meu aplicativo “reparações” para um serviço especializado de canalização. Por causa deste pequeno incidente, contacto o meu espaço de *co-working* a dizer que vou chegar um pouco mais tarde. Enquanto aguardo pelo canalizador, aproveito para inscrever mais alguns activos ociosos que tenho em casa na *start-up* de aluguer de objectos de ocasião, sempre é um suplemento de rendimento interessante. Faço o mesmo com o aluguer do meu carro particular que está com uma utilização frequente enquanto, do mesmo passo, chamo um carro da *start-up* local de serviços de táxi para ir até à praça principal. Aqui apanho uma boleia que consegui através da aplicação-boleias. Enquanto estou no táxi uso a aplicação-serviços domésticos e jardinagem para contratar este serviço lá para casa.

Chego ao espaço comunitário de *co-working* por volta das 10:30h. Neste espaço sou o responsável da economia *crowd*, isto é, do *crowd funding* de pequenos negócios, de *crowd sourcing* e *crowd learning* para as áreas de formação e ensino. Temos em curso uma nova *start-up* na área da IOT para a casa inteligente e estamos a negociar um financiamento participativo para o efeito. Na minha *aplicação-funding-lending* tenho toda a informação necessária.

À hora de almoço um colega sugere que encomendemos uma refeição típica do seu país natal, a refeição é pedida na aplicação de refeições ao domicílio. Depois do almoço tenho uma sessão via *Skype* com um colega da *OuiShare* de Paris por causa de um *software* que estamos a produzir em “comum colaborativo”. Entretanto, recebo uma mensagem de casa, uma das crianças está com febre. Consulto a minha aplicação serviços-médicos e consigo arranjar um médico para ir a casa ao fim da tarde. Finalmente, para o *crowd learning* estou a preparar um MOOC (*massive online open course*) para um grupo que está inscrito no meu banco do tempo. A propósito, constato no meu banco do tempo que hoje tenho duas horas para dedicar ao voluntariado no hospital de Santo António. Porém, por causa do médico lá em casa, faço a troca com um colega. São horas de voltar a casa, chamo um táxi uberizado para me transportar a casa. Enquanto faço a viagem de regresso recebo informação dos meus objectos lá de casa. O esquentador está arranjado, as compras *on-demand* estão a caminho. Chego a casa, os serviços de *baby-sitting* e *pet-sitting* devolvem-me os filhos e os cães. Depois do jantar, confeccionado por mim através de uma aplicação “*do it yourself*”, os *gadgets* cá de casa tratam das últimas horas das crianças antes do deitar. Eu tenho de terminar um serviço independente em *open source* já a noite vai avançada por causa dos fusos horários. São horas de dormir, os sensores IOT prepararam o meu quarto para uma boa soneca, desde a boa temperatura até à música de embalar. Sim, por que amanhã é outro dia.

Complicado? Talvez; mas já há uma *start-up* a trabalhar em meta-aplicações.

Exagerado? Seguramente. Ficção? Talvez. Mas ainda há mais!... Vejamos, apenas, mais um aviso à navegação:

E quanto ao *mix* de rendimentos desta vida uberizada? Aqui também há várias possibilidades. O *mix* de rendimentos pode contemplar um rendimento salarial a tempo parcial por conta de outrem; um rendimento variável de trabalho independente *on-demand*; um rendimento em espécie (*voucher*) pelo trabalho colaborativo e voluntário na comunidade local; um rendimento igualmente variável pelo aluguer e/ou venda de bens de ocasião; e, quem sabe, um “rendimento básico universal” (RBU) no próximo futuro. Para salvaguardar o máximo de possibilidades é, porém, necessário que os efeitos cruzados de reputação destas várias actividades não causem danos colaterais irremediáveis em alguma destas modalidades de rendimento.

Uma tarefa ciclópica? Sem dúvida. Trata-se de um tema complexo. Não admira, por isso, que em alguns países esteja em curso uma grande discussão sobre o RBU.

3. VEM AÍ A CIBERCULTURA DA SOCIEDADE ALGORÍTMICA!

O que se escreveu anteriormente faz parte da cibercultura da sociedade digital e algorítmica. Entre a literatura produzida mais recentemente sobre esta matéria encontramos autores como Stiegler (2015), Sadin (2015) e Serres (2012). Todos eles se debruçaram sobre a sociedade automática e as consequências da automatização sobre a organização social do emprego e do trabalho. Stiegler (2015) escreveu sobre a vida algorítmica e a crítica da razão digital; Sadin (2015) escreveu sobre os novos humanos da sociedade imaterial e Serres (2012) que se situa na mesma linha. A leitura das suas obras suscitam-nos algumas reflexões que passamos a partilhar com o leitor.

- 1) A revolução digital confunde-se, cada vez mais, com o advento da sociedade automática e da automatização, se quisermos, dos procedimentos de cálculo automático ou sociedade algorítmica. De que trata, então, a “governança algorítmica”? De plataformas tecnológicas, de redes sociais, de dados brutos extraídos dessas redes sob a forma de sinais infra pessoais, de procedimentos de cálculo e correlações estatísticas sob a forma de padrões de comportamento.
- 2) No plano estrutural, a sociedade algorítmica alimenta-se de uma cibercultura, de um vasto ambiente informacional, da hiperinteligência dos dispositivos tecnológicos (a “smartificação”), da gestão do *Big Data* e do *Cloud Computing* e, obviamente, da “adição digital” provocada junto dos utilizadores.
- 3) No plano do conhecimento, a sociedade algorítmica “sabe lidar melhor” com a complexidade, essa é “a sua verdade”, isto é, uma objectividade totalmente colada ao real, produzida em tempo real e sucessivamente reconfigurada por uma massa imensa de dados permanentemente atualizados.
- 4) No plano operacional, o sistema *Big Data* faz a limpeza, triagem, categorização e cálculo algorítmico dos dados. Não interessa o contexto, a singularidade, a significação desses dados. Os indivíduos são “agregados temporários de dados brutos”, quantificáveis e sucessivamente reconfigurados a uma escala industrial, se quisermos, uma espécie de coisificação dos indivíduos; tudo fica indexado a um qualquer indicador quantitativo, para os fins da sociedade hipercompetitiva e performativa.
- 5) No plano da teoria crítica, estamos perante uma espécie de “modelo extractivista” em que os cidadãos internautas, utilizadores de redes e plataformas, são produtores e fornecedores de uma gigantesca massa de informação pessoal, muita dela subliminar, num ambiente informacional vertiginoso e hipnótico, que tem tanto de benignidade como de toxicidade.
- 6) No plano da relação de poder, a sociedade algorítmica é, aparentemente, uma nova forma de gerir a incerteza e a insegurança políticas; todavia, ela procede por inversão dos termos da equação, isto é, são os meios (o sistema técnico e tecnológico) que tomam conta dos fins; como a inovação política e social corre muito mais lentamente há o risco de ficar prisioneira da elevada toxicidade da sociedade algorítmica.
- 7) No plano das métricas territoriais, a sociedade algorítmica permite-nos introduzir e distinguir duas métricas importantes: a métrica dos territórios-zona (T-Z) e a métrica dos territórios-rede (T-R). A primeira reporta-se ao poder vertical dos territórios convencionais, a segunda ao poder horizontal ou lateral dos territórios inteligentes que cultivam a inteligência colectiva por intermédio das novas plataformas digitais. As plataformas colaborativas e a economia dos bens comuns são uma esperança para todos os territórios, sobretudo os mais desfavorecidos⁵.
- 8) No plano cognitivo do saber-conceptual, a sociedade algorítmica, na sua exuberância calculatória, transforma os algoritmos em próteses cognitivas, que provocam não apenas a exteriorização do saber mas, também, a proletarianização de algumas / muitas classes profissionais e intelectuais. A sociedade algorítmica é, portanto, uma sociedade altamente paradoxal com inúmeros conflitos políticos e sociais no horizonte próximo.
- 9) No plano do sujeito individual, os nossos “duplos algorítmicos” podem ser muito úteis se os soubermos manipular em nosso benefício; no resto, o nosso rasto, a nossa traçabilidade, serão explorados exaustivamente em ordem a produzir padrões supra individuais que “antecipam e orientam” o nosso comportamento, tudo garantido pela racionalidade algorítmica.
- 10) No plano da organização social do emprego e do trabalho, a sociedade algorítmica da automatização é uma tecnologia verdadeiramente disruptiva, isto é, cria a breve prazo um forte desemprego estrutural. Mas é também uma grande oportunidade para a inovação social e política que chegará, estamos certos, à boleia da sociedade automática e algorítmica.

4. O MERCADO DE TRABALHO PLURIACTIVO E O RENDIMENTO BÁSICO UNIVERSAL

A sociedade global, digital e cosmopolita em que vivemos deixa prenunciar mudanças culturais e civilizacionais de grande alcance durante o século XXI. Lembremos essas mudanças. As alterações demográficas e os problemas específicos das sociedades envelhecidas (seniores), as alterações climáticas e os problemas de abastecimento local e segurança alimentar, as alterações dos mercados de trabalho e o desemprego estrutural de dois dígitos nas faixas etárias mais jovem e na de idade activa mais avançada, os riscos geopolíticos globais próprios de um mundo multipolar e os recursos crescentes despendidos em cooperação e segurança internacionais para controlar e mitigar o risco sistémico e moral dos actores nele envolvidos. Finalmente, nos últimos anos, emerge um grande desafio sob a forma de uma nova economia associada ao universo das tecnologias da informação e comunicação, às plataformas digitais e às redes sociais.

⁵ Para aprofundar a discussão de temáticas relacionadas com: 1) Processos de construção de territórios-zona (T-Z) e de territórios-rede (T-R); 2) Políticas públicas e processos de desenvolvimento territorial; 3) Processos de construção de uma nova inteligência territorial; 4) Processos de governança regional e de criação de uma racionalidade territorial multiníveis; consultar as seguintes obras: Dallabrida, V., Covas, M. M., e Covas, A. (2017); Caravaca, I. B. e García, A. (2009); Covas, A. e Covas, M.M. (2016a,b,c); (2015a,b,c,d); (2014a,b,c,d); (2013a,b,c,d); (2012a,b); Ferrão, J. (1996).

4.1 A emergência de novas correntes do pensamento

É no interior deste complexo enquadramento global e tecnológico que emergem novas correntes de pensamento e geografias económicas mais inteligentes e imateriais associadas à internet e à tecnologia das redes e plataformas digitais. São movimentos muito recentes, liderados pelas gerações que se movem à vontade no ecossistema tecnológico próprio dos sistemas interactivos de comunicação web 2.0 e web 3.0. A culminar esta pluralidade de correntes do pensamento em redor de uma economia das redes e dos recursos imateriais temos a revolução silenciosa da economia dos bens comuns colaborativos (Jeremy Rifkin, 2014), se quisermos, uma espécie de quarto sector pós-capitalista que cresce e alastra na zona de interface entre a economia pública das infra-estruturas e dos bens e serviços públicos mais convencionais, a economia social e solidária das instituições particulares de assistência social e a novel economia dos bens comuns colaborativos (a “Sociedade Co”).

Nesta linha de argumentação, a “Sociedade Co” é a sociedade do conhecimento, colaboração, comunicação, comunidade, comunhão, isto é, a “sociedade dos comuns” mas, também, da cooperação, confiança, contribuição, convivialidade e congratulação. O universo “Co” contempla uma gama muito variada de bens e serviços comuns: os consumos colaborativos de recursos ociosos (*sharing idle resources*), a produção social pelos pares (*peer to peer production*), os serviços partilhados pelas comunidades de utilizadores (*sharing economy*), o financiamento participativo (*crowdfunding*), os espaços comuns de criação criativa (*coworking e makerspaces*), a aprendizagem e a formação colaborativas (*opensourcing*), as moedas criativas e complementares (*local currencies e creative money*), entre outros empreendimentos da chamada economia colaborativa e contributiva (*collaborative ou contributive economy*).

Para darmos conta do crescimento exponencial da economia colaborativa nos últimos anos e, sobretudo, após a grande crise de 2008, referimos, apenas, alguns dos muitos autores que mais contribuíram para essa emergência e as respectivas áreas em que desenvolveram o seu pensamento e áreas de estudo. Então vejamos:

- Manuel Castells (1999) debruçou-se a era da informação, a sociedade em rede e o poder da identidade;
- Yochai Benkler (2006) analisou a riqueza das redes e ou como a produção social transforma os mercados e a liberdade;
- Lawrence Lessig (2004, 2003, 1999) trabalhou sobre a cultura livre e o código versão 2.0);
- Michel Bauwens (2015) estudou a economia política da produção social pelos pares);
- Vasilis Kostakis e Michel Bauwens (2014) debruçaram-se sobre a sociedade em rede e os cenários futuros para a economia colaborativa);
- Pierre Levy (1997) elabora o seu pensamento e escreve sobre a inteligência colectiva e a cibercultura);
- Rachel Boltzman e Roo Rogers (2010) desenvolvem a lógica da economia partilhada e o consumo colaborativo);
- Lisa Ganski (2012) elabora e escreve sobre a economia *mesh* ou a economia partilhada;
- Bernard Stiegler (2010) desenvolve o seu pensamento sobre a economia contributiva;
- André Gorz (2003) dubrou-se sobre o trabalho imaterial;
- Howard Rheingold (2003, 1993) elaborou o seu pensamento sobre a comunidade virtual e os *smart mobs*;
- Clay Shirky (2010, 2009) debruçou-se sobre o excedente cognitivo e ou a criatividade numa era conectada;
- Don Tapscott e Anthony D. Williams (2008) desenvolveram as suas ideias sobre a wikinomics ou como a colaboração em massa muda tudo;
- Chris Anderson (2012, 2008) fala-nos sobre a cauda longa, os *makers*, e a nova revolução industrial;
- Jeremy Rifkin (2014a, 2014b) escreveu obras esclarecedora sobre a 3ª revolução industrial e a sociedade do custo marginal zero).

Esta lista poderia continuar.

Posto isto, qual é a substância ou estrutura comum a este movimento polissémico mas convergente? Infra-estruturas de banda larga ou auto-estradas da informação, cultura digital disseminada, *start-ups* e plataformas tecnológicas, redes sociais e sistemas de comunicação interactivos, programação e *software open source* e modelos de negócio abertos.

Ao contrário das grandes transições civilizacionais anteriores, da oralidade para a escrita e da escrita para a imprensa, feitas sempre no universo dos átomos e moléculas, a transição da imprensa para a computação e as redes, para o mundo dos *screenagers*, é feita dos átomos para os *bits*, isto é, estamos a desmaterializar a próxima grande mutação civilizacional e a eliminar, em boa medida, as referências espaciotemporais anteriores. É assim que os novos modelos de negócio da era e da cultura digitais exprimem cada vez mais esta mutação fundamental. Numa mutação onde as plataformas tecnológicas desempenham o papel principal, pois são a placa giratória de todos os interesses em presença, estamos a assistir à transição paradigmática da sociedade dos objectos e das mercadorias para a sociedade dos ícones, dos signos, sinais e símbolos, isto é, a uma transição para a (*i*)conomia. Na nova sociedade da informação, da inteligência, da internet, da imaginação, da inovação, dos bens intangíveis e imateriais, assistiremos a um *trade off* permanente entre a “velha economia dos produtos industriais e materiais” e a “nova *iconomia* dos serviços imateriais”, numa troca constante entre produto e serviço e entre propriedade e acesso e na qual a (*i*)conomia acrescentará cada mais valor à economia convencional que se reduzirá do mesmo passo.

4.2 Uma revolução em curso no mundo do trabalho

Face a este novo ecossistema da era digital, pode legitimamente perguntar-se:

- quem será o homem do tempo novo que se avizinha? Será o homem das redes e dos écrans, da (*i*)conomia e da “Sociedade Co”?

Vejamos as tendências pesadas, sobretudo no campo dos países do chamado mundo ocidental:

- em primeiro lugar, por razões de competitividade, a economia pública reduzirá a despesa pública para poder reduzir os impostos. Pelo meio reduzirá o emprego público, substituindo funcionários públicos por prestadores de serviços em *outsourcing*;
- em segundo lugar, a economia social e solidária passará por uma forte racionalização e contracção na medida em que depende dos subsídios públicos. Pelo meio reduzirá o emprego social e muitas das suas funções serão externalizadas para as comunidades locais da Sociedade “Co”;
- em terceiro lugar, a economia privada capitalista, devido à automatização e à concorrência feroz dos mercados globais, reduzirá ainda mais o emprego convencional e externalizará muitas tarefas que passarão a ser oferecidas pela economia *on-demand* para onde se transferirão muitos trabalhadores em regime de *freelance*;
- em quarto lugar, a economia “Co”, em sentido amplo, será uma espécie de lugar geométrico de todas as externalidades, positivas e negativas, das várias economias. Nesta enorme placa giratória o mais importante é mesmo a adesão aos valores “Co”. Se essa adesão for sincera e entusiástica, a “Sociedade Co” será muito provavelmente a grande casa comum para a maioria dos cidadãos. Nesta “Sociedade Co” circularão, muito provavelmente, para além da moeda oficial, várias moedas locais e criativas.

No final, não surpreenderia que este “cidadão multifunções” e adepto dos bens comuns colaborativos acumulasse rendimentos, monetarizados e não-monetarizados, com diversas proveniências, a saber: um emprego em *part-time* num serviço público e/ou numa empresa privada; uma prestação de serviço em regime de *freelance* numa empresa *on-demand*; algumas horas num banco do tempo local em troca de um *voucher*; e, finalmente, uma “inscrição” numa *startup* colaborativa de uma parte dos seus recursos ociosos (*idle resources*) em troca de uma receita eventual.

Como facilmente se comprova, estaremos num futuro não muito longínquo, devido à quebra estrutural do emprego, condenados a uma sociedade de regimes laborais muito diversos, uns em *part-time*, outros em regime de *freelance*, outros ainda em regime contributivo e colaborativo, sob muitos formatos, condições e reputações, se quisermos, uma sociedade onde o indivíduo “se produz a si próprio” numa espécie de *corporate individualism*. Estamos em crer que regressaremos ao “homem dos sete ofícios” que o capitalismo industrial tinha desconstruído para construir o profissional especializado do capitalismo industrial da nova era. E porquê novamente o “homem dos sete ofícios” na era da internet?

- Em primeiro lugar, por que a auto-formação, oferecida em *opensourcing* estará muito próxima do custo marginal zero.
- Em segundo lugar, por que a escassez de empregos obrigará a repartir os horários de trabalho e a oferecer um leque mais diversificado de oportunidades.
- Em terceiro lugar, por que todo o mercado de trabalho se tornará muito mais volátil e adaptativo.
- Em quarto lugar, por que se tornará absolutamente imprescindível a complementaridade de rendimentos, monetarizados ou não.
- Em quinto lugar, por que as actividades da economia colaborativa e contributiva permitirão ensaiar novas experiências, novos saberes e novas ocupações.

Quer dizer, através da economia colaborativa e contributiva, as diferentes comunidades de utilizadores e fornecedores organizarão novos formatos de prestação de serviços com suporte em plataformas tecnológicas cujas aplicações informáticas serão instaladas nos telefones móveis dos jovens e menos jovens que desejam entrar no “mercado de trabalho”. É aqui que entra, progressivamente, “o homem dos sete ofícios”. De acordo com as suas faculdades, capacidades e experiências ele irá inscrever-se em diferentes “aplicações” (*apps*), geridas muito provavelmente por uma *start-up* tecnológica recém constituída, nas modalidades horário, tempo de trabalho, pagamento, qualidade de serviço, que a sua “presumida reputação” lhe permitir oferecer. Poderão ser sete ofícios, mais ou menos, mas dificilmente serão sete profissões. Entretanto, enquanto aguarda por uma chamada, poderá continuar, em sua casa, a formação permanente num MOOC (*massive open online course*) a custo zero. É o maravilhoso mundo novo que chega!!!!

4.3 O decoupling (separação) entre trabalho e rendimento e o rendimento básico universal (RBU)

Aqui chegados, abre-se um campo imenso de possibilidades que cruza várias acepções de pluriactividade e plurirrendimento. Doravante, em matéria socio-laboral e no espaço público, os termos da discussão serão, entre outros, os seguintes:

- polarização e bipolarização do mundo do trabalho;
- fraccionamento dos horários e do tempo de trabalho;
- intermitência e descontinuidade das relações laborais;
- empregabilidade e formação ao longo da vida;
- polivalência e multifuncionalidade das competências pessoais;
- um direito universal de protecção social em vez de um simples direito socio-laboral;
- um direito de pluriactividade horizontal em vez de um simples direito laboral;
- um direito fiscal que tenha em devida conta o plurirrendimento e a pluriactividade;
- um direito comercial que tenha em devida conta a intermitência e o trabalho independente;
- finalmente, emergirá no debate público a discussão em redor do conceito de rendimento básico universal e/ou incondicional, um rendimento mínimo garantido desligado da actividade económica convencional associada a uma relação laboral.

Esta evolução do universo sócio laboral não tem, por enquanto, um guião ou argumento conhecido e, sobretudo, não se conhecem bem as circunstâncias em que irá decorrer. Suspeitamos, porém, que os percursos profissionais passarão por um

período de forte turbulência sócio laboral e sócio familiar e, nesta exacta medida, o próprio RBU terá uma história muito atribulada, com inúmeros afloramentos no espaço público e versões muito mitigadas que se confundirão com rendimentos mínimos garantidos e rendimentos sociais de inserção, até versões mais elaboradas e completas, inclusive no espaço europeu como medida complementar de estabilização financeira. Seja como for, a utopia permanecerá e alimentará o debate no espaço público em redor do Estado-Providência do século XXI.

5. NOTAS FINAIS

Chegados aqui, estamos certos de que por detrás da exuberância tecnológica, da economia das aplicações e dos “empreendedores startups” há uma revolução silenciosa em curso, uma revolução do bom senso, da inteligência colectiva e da convivialidade. Por isso, está em curso, também, o lado mais utópico da cibercultura, em versões muito variadas: a denominada sociedade colaborativa; a economia do 4º sector (o dom, o voluntariado, a comunhão, a contribuição); a organização dos bens comuns colaborativos; as moedas sociais e complementares; a inteligência colectiva territorial e a formação de actores-rede; o rendimento básico de existência (a grande utopia do século XXI); a plena aplicação dos princípios da economia circular; e uma nova organização do trabalho mais criativa e inovadora.

Para finalizar, em tempo de cibercultura, sociedade automática e governação algorítmica, atrevemo-nos a acrescentar um último tópico para debate:

- Trata-se do debate essencial que está por fazer acerca das relações de causalidade entre a métrica das redes digitais e a métrica dos territórios hierárquicos, sobretudo político-administrativos, muito em especial os territórios mais remotos e desfavorecidos do interior do país.

Sobre este tópico levantamos as seguintes interrogações:

- deve-se optar por serviços públicos fixos e permanentes e devidamente municipalizados ou por serviços públicos polivalentes, itinerantes e multimunicipais?
- o que é que a sociedade digital, as comunidades *online* e a governação algorítmica podem fazer por estes territórios remotos e esquecidos e pelas comunidades reais do país oculto?
- Abandonam, reocupam, retalham, privatizam?

Teremos de voltar mais vezes ao assunto.

RESUMO

Vários estudos mostram que a escola está longe de preparar os jovens para os desafios da sociedade atual. Neste sentido parece importante dar voz aos jovens de forma a conhecer a sua visão acerca da escola e do processo de ensino aprendizagem, em simultâneo, perceber como projetam a escola no século XXI. Esta comunicação apresenta resultados de um estudo em desenvolvimento no Brasil para o qual foram realizados *focus groups* com jovens de 15 anos. Os alunos defendem uma aproximação mais afetiva do professor onde prevaleça confiança e respeito mútuo e aclamam por aulas que privilegiem a experimentação, a manipulação, ambicionam aulas dinâmicas, que ultrapassem os limites da sala de aula. Defendem também uma sala de aula mais consistente com a atualidade, onde sejam permitidas as ferramentas tecnológicas que favorecem a aprendizagem. As narrativas apresentam percepções dos alunos sobre a necessidade de dinamizar as práticas do professor para além da sala de aula; a importância das relações afetivas e interpessoais entre professor/aluno; a possibilidade de o conhecimento ser oriundo tanto de alunos quanto dos professores. O estudo busca, com estas contribuições, pensar o estudante como ator e protagonista do processo de ensino e aprendizagem.

Palavras-chave: Prática Docente, Alunos, Ensino e Aprendizagem, Escola.

1. INTRODUÇÃO

Estamos em um tempo de reconfiguração dos processos de ensino e aprendizagem onde o papel da escola e do professor têm sido cada vez mais questionados. Nossas escolas, atualmente, constituem-se por alunos intensamente conectados e aclamando mudanças tanto de cunho prático como curricular, pois estes pedem mudanças nas metodologias de ensino, na forma de aprender, nos conteúdos que lhes são ensinados e na maneira que são lhes transmitidos esses ensinamentos.

As atribuições dos professores se tornam cada vez mais numerosas no contexto da escola contemporânea. Entretanto, essas atribuições são diferentes daquelas que lhe foram ensinadas durante a sua formação, o que coloca em discussão a forma de ensinar do professor. Ao tentar pensar a partir do olhar dos jovens estudantes, emergem questionamentos sobre como estes percebem a ação docente na contemporaneidade. Como os estudantes veem a escola do século XXI? Como estes se sentem na escola? Como ensinar essa geração de alunos que, muitas vezes, não está de acordo com a forma de aprender que lhes é imposta? Ou que não quer aprender através do método tradicional de ensino que ainda permanece sendo ofertado na maioria das escolas? O que estes jovens têm a dizer sobre a prática de ensino que os professores vêm utilizando nas suas aulas?

O presente estudo objetiva refletir, a partir do olhar de estudantes adolescentes, acerca da escola e do processo de ensino aprendizagem, assim como, perceber como os adolescentes projetam a escola no século XXI e a importância do professor no processo de ensino e aprendizagem. A temática aqui abordada emergiu a partir das discussões realizadas em grupos focais com estudantes do segundo ano do Ensino Médio em escolas brasileiras.

2. APORTE TEÓRICO

Vivemos em meio a era contemporânea onde a escola encontra-se em um momento histórico de muitas incertezas e desafios. A escola enfrenta um período de crise de identidade, o que pode ser entendido a partir das reestruturações que vêm ocorrendo ao longo das últimas décadas. Autores como Canário (2006), Ramos de Ó e Costa (2007) e Sibília (2012) ajudam-nos a pensar o cenário atual da escola contemporânea por meio de seus discursos sobre este período de incertezas que a escola vem enfrentando.

Para tentar entender o período pelo qual passamos, faz-se necessário recorrer aos períodos que antecederam tal crise, conforme explica Sibília (2012, p. 13):

“Entre tantas perguntas em aberto e cada vez mais difíceis de responder, em função de sua crescente especificidade e da dificuldade de imaginar alternativas para o nosso futuro, uma certeza é quase óbvia e poderia servir aqui como ponto de partida: a escola está em crise. Por quê? Os fatores que levaram a essa situação são inúmeros e sumamente complexos, mas um caminho para compreender os motivos desse mal-estar consiste em recorrer à sua genealogia”.

A autora Sibília (2012), explica que a escola, pode ser considerada como uma máquina antiquada por compor-se de um funcionamento que não se encontra em sintonia com os jovens do século XXI. Pois a escola, está moldada e caracterizada fisicamente como as escolas do século XIX, e permanece com o ensino de forma similar ao do século XX, onde prevalece métodos que requerem quase exclusivamente, resultados quantitativos. Em contrapartida, os estudantes atuais nasceram numa era tecnológica, e possuem anseios e expectativas compatíveis com uma sociedade tecnológica, porém encontram-se aprisionados a um sistema educativo que se encontra no século XIX.

Assim, a autora também afirma que:

“[...] Por um lado, então, temos a escola, com todo o classicismo que ela carrega nas costas; por outro, a presença cada vez mais incontestável desses “modos de ser” tipicamente contemporâneos. Tornou-se muito difícil evitar tamanha desarticulação com um olhar para o outro lado, ou um fingir que não há nada acontecendo, ou em buscar em vão remendar esse artefacto abstruso que, ao que tudo indica, parece ter perdido boa parte de sua eficácia e seu sentido ao se deparar com a nova paisagem que cresceu a seu redor” (Sibília, 2012, p. 16).

Para tal, é importante analisar o cenário atual das nossas escolas e o contexto que as envolve. Cabe perguntar: Quem são os sujeitos que constituem a escola? Como os adolescentes veem a escola? Compete refletir sobre os desafios que a escola enfrenta nos dias de hoje. Acredita-se que um dos maiores desafios está vinculada com a forma de ensinar aos alunos do século XXI. Neste sentido, Ramos de O e Costa (2007, p. 112) afirmam que estamos perante uma espécie de guerra entre gerações, de linguagem e de tecnologia:

Há aqui um conflito que não é apenas de gerações; é primordialmente de linguagem. Fatalmente temos que nos adaptar aos artefactos da tecnologia e utilizá-los como recurso para a transformação da nossa mundividência. Isso porque o mundo tornou-se muito mais extenso, mais complexo, sobretudo, através das novas tecnologias, não fazendo mais sentido, por exemplo, opor natureza e cultura.

Para ajudar a entender a divergência que existe na falta de entendimento entre jovens e a escola, Sibília (2012) destaca que enquanto os alunos de hoje vivem em meio aos inúmeros dispositivos eletrônicos e digitais, a escola continua em seus métodos e linguagens analógicos. Desta forma, necessita-se direcionar o olhar para aqueles que estão diretamente ligados com essas transformações, que são os alunos. Sabemos que os adolescentes por si só possuem inúmeros anseios, porém pouco tem se parado para ouvi-los, para de fato, dar voz ativa dentro de um sistema educativo, dentro do processo que eles são os protagonistas. Como são os nossos estudantes adolescentes? Como estes gostariam de participar do processo de ensino e de aprendizagem? O que estes querem dizer a seus professores?

Perante a sociedade, os adolescentes são vistos e rotulados através de suas condutas e, conseqüentemente, sofrem algum tipo de pré-julgamento, sem sequer realizar ato em si. Importante destacar que a compreensão da juventude e da adolescência são fenômenos históricos, políticos e culturais. O surgimento do termo ‘adolescência’, assim como o de juventude, está associado ao nascimento da modernidade (Berté, 2013), e tão logo assumem a definição de problema social e a fase da crise.

No caso deste estudo, usamos a terminologia adolescência fase que é caracterizada pela transição entre o período da infância e a vida adulta. São ouvidas expressões corriqueiras em nosso dia a dia, como ‘a adolescência é uma fase conturbada’, ‘fase de crises’, fase de dúvidas. Os estereótipos são inúmeros, segundo Berté (2013), na tentativa de caracterização, conceituação e adjetivação da adolescência, que visam dar a ela uma única identidade.

A identidade do adolescente, pode ser compreendida na teoria do psicanalista Erik Erickson, que ao longo do século XX preocupou-se em estudar e desenvolver uma teoria do desenvolvimento, trazendo três aspetos principais para a construção da identidade e a dimensão psicossocial do indivíduo: o processo biológico, o processo psíquico e processo social (Erikson, 1976). Assim, o autor desenvolveu a teoria psicossocial de desenvolvimento humano, dividida em oito estágios que definem a personalidade humana.

Como conceito da sua teoria, Erikson (1976) destaca a noção de *crise* ou *conflito* que o indivíduo vive ao longo dos diferentes períodos da vida. Essa crise ocorre em dois polos distintos, sendo um positivo e outro negativo. Para o autor, a crise da identidade é um marco da adolescência, que vive seu quinto estágio de desenvolvimento, denominada por ele como o estágio da *identidade/ confusão da identidade* (dos 13 aos 18 anos). Este estágio é evidenciado pela preocupação que o adolescente possui em encontrar um papel na sociedade, provocando uma confusão na sua identidade.

Para tal, cabe compreender o que significa ser adolescente na contemporaneidade, que para Berté (2013) é uma fase atravessada por características que são próprias a este tempo, nas relações que o adolescente estabelece com o mundo a sua volta, relações que estão “[...] permeadas pela mobilidade, fluidez, inatualidade, mudança, transformação, rapidez e também mediadas pelos mecanismos tecnológicos que intensificam a troca de informações e ampliam as conversações”.

É nesse sentido que se encontram as singularidades dos adolescentes. Enquanto, por um lado, há a crítica ao esvaziamento da imagem adolescente, operada pelos discursos que objetivam a busca de uma identidade fixa e única a partir da comparação com as gerações passadas, são visualizadas, por outro, maneiras próprias de ser, de agir e de estar diante do mundo em que vivem (Berté, 2013).

No século XXI, tem-se visto alunos cada vez mais questionadores, assumindo e ganhando espaço para a sua 'voz', assim a escola e a figura do professor começam a serem questionadas, examinadas, confrontadas pelos adolescentes. Diante disso, cabe novamente questionar, quais são as esperanças para o ensino de adolescente na escola contemporânea? Mas será que, ao invés de pensar em como frear esses corpos em crises, não caberia aos professores se aliarem a estes alunos?

Na perspectiva de pensar em possíveis alternativas para o ensino, projetou-se este estudo com o intuito de dar voz a jovens estudantes sobre como estes percebem o cenário escolar atual e como sob olhar destes pode-se buscar alternativas para a melhorar o processo de ensino e aprendizagem.

3. METODOLOGIA

Este é um estudo de caráter qualitativo (Biklen & Bogdan, 1994), onde utilizou-se como principal instrumento de recolha de dados a técnica de grupo focais. Para tal, estiveram envolvidos vinte e dois estudantes adolescentes de duas escolas de Ensino Médio de um município do interior do estado do Rio Grande do Sul, Brasil. A recolha de dados decorreu ao longo do primeiro semestre de 2016. A análise de dados se deu através da análise textual discursiva (Moraes, 2011).

A escolha pelo uso da técnica de grupos focais deve-se ao fato de esta técnica permitir que os sujeitos envolvidos na pesquisa exponham as suas opiniões, os seus anseios de uma forma espontânea. Através do recurso de grupos focais, conforme Barbour (2009), podemos compreender a perspectiva interna do grupo, como os valores próprios do grupo em estudo, e as discussões permitem entender como este grupo processa e significa os temas pautados no debate.

Para Gatti (2005), com o uso da técnica de grupos focais em pesquisas qualitativas é possível que se manifestem uma variedade de pontos de vista, por se tratar de uma técnica que favorece as interações entre o grupo e permite a captação de significados. As potencialidades desenvolvidas em pesquisas através de grupo focais são interessantes, de acordo com a autora, pois o material que emerge das discussões, como ideias, opiniões, modo de ver, atitudes, valores, que são produzidos num coletivo, pode ser processado e evidenciado mostrando mudanças que vão se alternando ao longo das dinâmicas de trabalho.

Os encontros foram organizados, estruturados e realizados pela própria pesquisadora e primeira autora deste artigo, que assumiu o papel de 'moderadora' do grupo, conduzindo as discussões, de modo a envolver todos os participantes, intervindo apenas para introduzir novas questões e/ou para facilitar o processo em curso. Para cada encontro foi proposta uma questão que pudesse nortear o debate entre os adolescentes. Os encontros foram gravados por meio de gravador digital e, posteriormente, transcritos na sua íntegra para análise dos dados.

O estudo buscou deixar com que os fenômenos do discurso se manifestassem, sem impor-lhes direcionamento. Desta forma, a partir das narrativas apresentadas, foram emergindo algumas categorias de análise que nos ajudam a compreender a percepção e os olhares dos estudantes envolvidos neste estudo. Para identificar as narrativas dos estudantes e manter o anonimato, os participantes foram denominados por "E1, E2, E3..." e assim respetivamente. Já as escolas foram identificadas como escola A e a escola B.

4. ANÁLISE DE DADOS

A partir das questões lançadas aos grupos, emergiram inúmeros debates entre os adolescentes. As narrativas apresentam a visão e as perspectivas que os estudantes possuem sobre seus professores e os seus métodos de ensino, assim como os diversos papéis que a escola desempenha, a função do professor, o pouco espaço que as escolas dedicam à voz dos alunos. Pudemos elencar também algumas narrativas que apontam as percepções em relação à forma com que o professor desenvolve o processo de ensino e como, na visão dos alunos, esse processo poderia ocorrer.

As percepções dos jovens envolvem temáticas como a necessidade de dinamizar as práticas do professor para além da sala de aula; a importância de estabelecer relações afetivas e interpessoais entre professores e alunos; a possibilidade de o conhecimento ser oriundo tanto de alunos quanto de professores. O estudo busca, com estas contribuições, pensar o estudante como ator e protagonista do processo de ensino e aprendizagem.

4.1 Ensino Enraizado no Método Tradicional: "eu acho que é tudo muito igual ainda"

A partir das narrativas apresentadas em ambas as escolas, percebe-se que o ensino ainda se encontra fortemente enraizado no método tradicional de ensino, onde há um professor à frente da turma, dando as ordens e seguindo uma sequência de uma aula pré-estabelecida culturalmente pela sociedade escolar. Esse fato é narrado pelo estudante 1, da escola B: "é eu acho que é tudo muito igual ainda, sentamos ali e o professor escreve no quadro. Ou pegamos o livro e tal página e fazemos os exercícios. Não tem coisas diferentes que estimulem a gente a fazer, de querer gostar de estudar. Não estudamos para uma prova, decoramos, sabe! Então não estamos aprendendo, só estamos decorando para tirar uma nota boa".

Percebe-se um descontentamento com o modelo tradicional de ensino que prevalece nas escolas, os quais na sua maioria ainda são processos cumulativos, teóricos, em forma de treino, como percebe-se na fala do adolescente anteriormente citado: "não estudamos para uma prova, decoramos". O ensino escolar promove quase que unicamente a memorização do aluno, como nos explica Canário (2006), o que acaba por penalizar o erro do aluno, sendo que ao aluno não é permitido a experimentação do erro para que o mesmo possa aprender.

Os alunos anseiam por uma aprendizagem que não seja cumulativa e sim, que possa ser uma aprendizagem significativa, que possa ser incorporada e que dê sentido aos jovens. A narrativa do estudante 1, aponta para o descontentamento dos jovens sobre as metodologias de ensino utilizadas pelos professores em pleno século XXI. Percebe-se que a sistemática das

aulas atualmente nas escolas é similar ao do século passado, com a predominância do quadro branco (antigo quadro negro), e com o uso do livro didático que prevalece como instrumento principal para o ensino. Fato que é corroborado na fala de Sibília (2012, p. 51):

“Todavia, surge aqui um choque digno de nota: justamente essas crianças e adolescentes, que nasceram ou cresceram no novo ambiente, têm de se submeter todos os dias ao contato mais ou menos violento com os envelhecidos rigores escolares. Tais rigores alimentam as engrenagens oxigenadas dessa instituição de confinamento fundada há vários séculos e que, mais ou menos fiel a suas tradições, continua a funcionar com o instrumental analógico do giz e do quadro-negro, dos regulamentos e boletins, dos horários fixos e das carteiras alinhadas, dos uniformes, da prova escrita e da lição oral”.

No que diz respeito à prática de ensino, os estudantes destacaram que esta deveria envolver aulas dinâmicas, que extrapole os limites da sala de aula, conforme um estudante destacou: *“A gente não precisa só estar estudando dentro da sala de aula. A gente pode estar ao ar livre estudando. É, ao ar livre fazendo pesquisa (...) a gente podia fazer dentro ou fora da escola”* (Estudante 9, Escola A). Percebemos com essas falas que muitas aulas ainda permanecem com características de um ensino enraizado no método tradicional: com um professor transmitindo o conhecimento por meio de uma técnica, como o uso do quadro.

Entende-se que os alunos anseiam por práticas que possam romper com o espaço da sala de aula, do quadro negro e práticas que possam possibilitar outros ambientes e ferramentas que favoreçam a aprendizagem. Não apenas como mudança de cenário, mas como modificação na forma de entender as relações com conhecimento, o processo de ensino e de aprendizagem.

4.2 Relação de Afeto Professor/Aluno: “quando o professor tem essa característica humana”

Outro aspecto importante destacado na fala dos alunos diz respeito a afetividade do professor para com o aluno. Segundo a visão dos alunos participantes da pesquisa, para que a aprendizagem de fato se efetive, é imprescindível a disponibilidade do professor de se aproximar afetivamente do aluno, estabelecendo vínculos como evidencia uma das falas: *“[...] é eu acho que se tu tem uma afinidade com o professor tu aprende muito mais, quando tu sabe que o professor se preocupa contigo, quando ele conversa contigo. Não é aquele professor que só cumpre aquilo que foi dado a ele. Ele te ajuda, tá ali contigo, acho que é muito melhor...”* (Estudante 1, escola B).

Pudemos perceber também o quanto o a figura do professor influencia no processo de aprendizagem dos jovens. Para estes é imprescindível que o professor esteja disponível para o ato de ensinar. Esta disponibilidade, sugerida por um dos estudantes, diz respeito às características humanas do professor. *“Quando um professor não está bem, ele não consegue tirar tudo e entrar numa porta de sala de aula e entrar bem para dar a sua aula. São poucos os que conseguem fazer isso. E a gente consegue perceber se ele está bem ou não. Da mesma forma que quando o professor gosta da gente ele sabe quando a gente não está bem. Quando ele tem essa característica humana, acaba que a gente se preocupa mais com nossos estudos, e o professor acaba criando esse carinho pelos alunos”* (Estudante 1, escola B).

Nesta perspectiva também discursa Freire (2011) ao dizer que o problema não está em uma aula expositiva, e sim, na forma que o professor faz ou deixa de fazer a explicação. Mas o tipo de relação que o professor estabelece com seu aluno, quando este se considera o exclusivo educador do educando. Em que o educador rompe ou não aceita a condição fundamental do ato de conhecer, pois que é a relação dialógica quem deve prevalecer no ensino.

As palavras dos jovens mostram que eles reconhecem e valorizam a presença do professor no seu percurso de formação, e o significado deste em suas vidas, dando especial destaque à qualidade das relações que se estabelecem, como apresenta a narrativa do estudante 1, da escola B *“[...] é porque o professor acaba se tornando nossa segunda mãe, nosso segundo pai, porque criamos laços, vínculos e é muito bom isso”*.

Essas experiências também são sentidas pelos alunos quando eles explanam em suas discussões que com o passar do tempo, na medida que os alunos vão crescendo as relações de aproximação entre professores e alunos é enfraquecida: *“... quando somos pequenos os professores mimam e agora, parece que não estão nem aí”* (Estudante 9, Escola A). Ainda relacionam o fato de que não gostar de um determinado professor interfere diretamente em não gostar de determinada disciplina: *“Quando tu não gosta do professor, tu acaba se desinteressando pela matéria”* (Estudante 9, Escola A).

4.3 Aquisição do Conhecimento: A gente é adolescente, a gente não quer a ideia pronta!

Para os adolescentes é perceptível que o conhecimento possa ser oriundo tanto por parte dos alunos, através de diálogos, de debates em aula, como através dos ensinamentos dos professores. Entretanto estes querem formar as suas próprias ideias, e cabe ao professor estimular essa aprendizagem em suas aulas.

Podemos perceber isso na sequência das narrativas entre os alunos da escola B, em um dos encontros:

- *Muitos professores acham que somos novos para falar sobre política. A gente tem uma única professora que teve capacidade de te dizer porquê? Já temos toda uma ideia pronta, mas ela te pergunta o porquê tu achas isso? Ai tu tem que explicar... e ela contesta dizendo, mas e se fosse assim?* (Estudante 2)
- *é o professor que te faz pensar!* (Estudante 1)
- *é onde tu mais aprende!* (Estudante 6)
- *É! e o professor acaba aprendendo junto!* (Estudante 1)

Os adolescentes anseiam por aulas que permitam a sua participação ativa, onde possam formar as suas ideias a partir do diálogo com o próximo, o que pode ser evidenciado na fala da Estudante 2, da escola B: *“A gente é adolescente, a gente não quer a ideia pronta, a gente quer formar o nosso ideal!”*

A fala dessa estudante nos faz pensar o quanto nós adultos esquecemos que estes alunos são apenas adolescentes, no tempo deles, que carregam expectativas, que naquele determinado momento de suas vidas querem ser apenas adolescentes, poder ter a liberdade de serem eles próprios. É quase como um grito de ‘permitam me ser apenas um adolescente!’, ‘permitam me errar para depois poder acertar!’

Percebe-se também que há uma transformação no campo das relações professor/aluno, assim como nos diferentes saberes que compõem o processo de ensino e aprendizagem. Essa transformação que está atrelada ao ‘saber’ vindo do campo do ‘outro’, no caso, o saber que estava até então, unicamente, na figura do professor, passa a ser legitimado por diferentes saberes, oriundos tanto dos alunos quanto dos professores. As infinitas possibilidades na qual sociedade tecnológica se configura atualmente faz com que o professor deixa de ser o detentor de todo o conhecimento e se torna aprendente junto de seu aluno.

Os alunos possuem a percepção de que o professor não é mais aquela figura detentora de todo o conhecimento: “O professor, não sabe tudo, mas o básico, para poder explicar. Ele não precisa saber tudo também, ninguém sabe” (Estudante 9, Escola B). “Ele aprende também quando a gente fala alguma coisa que ele não sabe” (Estudante 9, Escola B).

Além disso, os estudantes reconheceram que o papel do professor na escola contemporânea não é unicamente de transmitir o conhecimento e sim de desconstruir ideias e valorizar o conhecimento prévio com que o aluno chega a sua aula.

O diálogo é a melhor relação que podemos estabelecer com os adolescentes, um *diálogo* baseado no amor, na humildade como nos cita Freire (2011, p. 107):

Nutre-se do amor, da humildade, da esperança, da fé, da confiança. Por isso, só o diálogo comunica. E quando os dois pólos do diálogo se ligam assim, com amor, com esperança, com fé um no outro, se fazem críticos na busca de algo. Instala-se, então, uma relação de simpatia entre ambos.

Ainda segundo Freire (2011), o diálogo tem significado importante na educação, porque os sujeitos dialógicos não apenas conservam sua identidade, mas a defendem e assim crescem um com o outro. O diálogo implica, um respeito um com o outro, diferentemente do que se denomina de autoritarismo, algo que rompe ou que não permite que o diálogo se constitua.

Neste sentido, também expressa o estudante 1, da escola B: “Eu acho que a gente precisa um professor que nos deixa debater sobre um determinado assunto e quando a gente consegue fazer isso, a aula rende muito. Quando debatemos, ali cara a cara, dialogando sobre isso, aprendemos muito mais fácil do que ler no livro, ou copiar a matéria do quadro”.

5. CONSIDERAÇÕES FINAIS

O contato com os estudantes permitiu averiguar, através de suas narrativas, o quanto a figura do professor é um elemento importante da escola e o quanto a sua conduta influência nos processos de ensino e de aprendizagem. Importante considerar que estes processos de ensino necessitam do envolvimento nas relações interpessoais, criando vínculos de afeto entre professor/aluno. Um dos aspectos destacado pelos estudantes foi a importância dessa intensa relação interpessoal para o bom andamento do processo de ensino e aprendizagem. E para que ela se efetive, é imprescindível a disponibilidade do professor em se aproximar afetivamente do aluno, estabelecendo vínculos de confiança e de respeito.

Outro ponto igualmente considerável, diz respeito ao fato da estrutura da escola, especialmente a sala de aula permanecem fielmente ao esquema tradicional de ensino, desde o uso do quadro negro, a disposição das classes em sala de aula (geralmente enfileiradas). A questão que alguns professores, vêm incorporando novas ferramentas tecnológicas em suas aulas, como recompensa de mudança no método de ensino. Os adolescentes de hoje clamam por práticas que possam romper com o limitado/fechado espaço da sala de aula e o quadro negro, sugerindo outros ambientes e ferramentas que favoreçam a aprendizagem.

Neste sentido existe uma reconfiguração dos papéis em sala de aula, onde o professor deixa de ser o transmissor do conhecimento e a possibilidade de o conhecimento ser oriundo tanto de alunos quanto de professores passa a ser efetiva. Para concluir, as narrativas apresentam percepções dos alunos sobre a necessidade de manter-se um diálogo harmonioso, onde todos possam ter a liberdade de expressão e de formar os seus ideais, que as práticas de ensino do professor rompam o espaço físico da sala de aula; que a importância das relações afetivas e interpessoais entre professor/aluno; a possibilidade de o conhecimento ser oriundo tanto de alunos quanto de professores, o qual deixa de ser o transmissor. O estudo busca, com estas contribuições, pensar o estudante como ator e protagonista do processo de ensino e aprendizagem.

ABSTRACT

The first modern-era pharmacy schools began to be established in the nineteenth century, with some universities offering degrees or similar-level courses. However, the traditional pharmaceutical education continued in parallel, in the form of apprenticeships and “on the job” experience.

The decline of manufacturing in pharmacies, caused by the development of pharmaceutical industry, and the ensuing advisory role of pharmacists led to additional educational reforms in the last 50 or so years. Subjects such as anatomy-physiology, physiopathology and pharmacotherapy were incorporated into the pharmacy courses, which became longer. This reflected the growing body of relevant knowledge and the perceived need to increase the capacity of pharmacists to act as pharmacy-therapeutic advisors to both health professionals and general public.

The degrees offered now include Doctorates in Pharmaceutical Sciences as well as Masters and Integrated Masters (IM). The typical duration of an undergraduate degree in Portugal (IM) is now five years. Pharmacists may now receive instruction in social disciplines, such as health psychology, economics and public health.

Students should be prepared for lifelong learning, since their formal training cannot provide them with all that they will need in future, thus each individual pharmacist is personally responsible for ‘the maintenance, development and broadening of knowledge, skills and attitudes, to ensure competence as a professional, throughout their career’.

The present communication describes the structure of the Pharmaceutical Sciences degree in Portugal, satisfying the needs of the labour market in such health professionals.

Keywords: Education, Medicines, Pharmacy, Pharmacist, Portugal.

1. INTRODUÇÃO

Este artigo pretende dar uma perspetiva histórica da educação em farmácia relacionando-a com diferentes áreas de trabalho do farmacêutico.

2. PERSPETIVA HISTÓRICA DOS ESTUDOS FARMACÊUTICOS

No Renascimento (Séc. XVI), mais propriamente em 1521, o Regimento do Físico-mor do Reino determinava a obrigatoriedade da realização de um exame para o exercício da profissão farmacêutica: “(...) nenhum boticário nem pessoa outra em todos nossos Reinos e Senhorios não possa assentar botica nem usar do ofício de boticário sem que primeiro seja examinado pelo físico-mor com os físicos da Corte...” Tratava-se de uma autorização para o exercício profissional.

Nesse mesmo século no Reinado de D. Sebastião (1554-1578) foram instituídos 20 partidos (bolsas) para aqueles que quisessem ser boticários de profissão. O curso era de 6 anos, sendo que nos dois primeiros os alunos aprendiam Latim e os restantes 4 anos os alunos eram colocados numa botica onde praticavam a arte farmacêutica. Após esse período voltavam à Universidade de Coimbra onde eram sujeitos a um exame, sendo o júri composto por médicos professores da Faculdade de Medicina e por boticários de reconhecida competência. O curso não conduzia qualquer grau académico, em oposição ao que acontecia com medicina. O boticário era um profissional mecânico, o que em termos sociais dentro dos profissionais sanitários os médicos estavam no topo, a nível intermedio encontravam-se os boticários e cirurgiões e abaixo os sangradores, os barbeiros, etc.

Estes dois regimes de formação de boticários, o concedido pelo Físico-mor e outro pela Universidade de Coimbra mantiveram-se em paralelo.

Em 1772, houve alteração do regime de estudos com a Reforma Pombalina da Universidade de Coimbra. O Rei D. José conferiu ao seu ministro Marquês de Pombal plenos poderes para fazer uma reforma Universitária. Pretendia-se desenvolver

as ciências exatas promovendo o espírito experimental na Universidade. Foi fundada na Universidade de Coimbra locais destinados à investigação e ensino, entre os quais, e com importância para o ensino farmacêutico, temos o Jardim Botânico, o Laboratório de Química e o Dispensatório Farmacêutico que era a Botica do Hospital. O dispensatório que estava na dependência da Faculdade de Medicina era onde funcionava um curso para boticários. O curso constava de 4 anos, nos dois primeiros os alunos frequentavam o laboratório de química aprendendo as operações químicas e os dois últimos anos praticavam no Dispensatório Farmacêutico aprendendo as operações farmacêuticas. Depois destes quatro anos os alunos sujeitavam-se a um exame e se aprovados poderiam exercer a profissão em qualquer ponto do país. Contudo a frequência deste curso era baixa uma vez permanecia uma segunda via de formação de boticários.

Em 1794 a Casa Pia de Lisboa fundou um curso para boticários tendo como base o modelo de Coimbra.

Só em 1836 foi extinto o acesso à profissão farmacêutica por exame realizado por o físico-mor. Embora nos Séc. XVII e XVIII a formação para boticário eram maioritariamente concedidas pelo físico-mor.

Foi também em 1836 que foram criadas as Escolas de Farmácia de Coimbra, de Lisboa e do Porto. A primeira anexa à Faculdade de Medicina e as de Lisboa e Porto em anexo às Escolas Médico-cirúrgicas também recém-criadas. O Decreto de 5 Dezembro de 1836 reorganizou o curso de medicina e farmácia, preconizando para este último para além dos 4 anos de prática no laboratório de química e no dispensatório os alunos deviam frequentar cursos de zoologia, botânica, física e mineralogia na Universidade de Filosofia. Em Lisboa e Porto o curso ficou organizado do seguinte modo: 4 disciplinas teóricas (botânica, história natural dos medicamentos, química e farmácia) e também um curso prático no Dispensatório Farmacêutico da Escola ou em qualquer outra oficina aprovada ou acreditada. Esta reforma de 1836 também estabeleceu uma outra via paralela para o acesso à profissão estabelecendo que todos os que não tivessem frequentado os cursos teóricos e cursos práticos das Escolas de Farmácia podiam ser admitidos a exame final para obtenção do título de farmacêuticos desde que tivessem oito anos de prática na farmácia. Temos os farmacêuticos de 1ª Classe e de 2ª Classe.

Só em 1902 por Carta de Lei de 19 Julho e de acordo com o Regulamento das Escolas promulgado em 27 de Novembro, o curso de farmácia foi considerado Superior até lá os cursos ministrados em Escolas não eram conducentes a um título académico.

Os cursos superiores de Farmácia passaram a ser estruturados em dois anos cada um com 4 cadeiras: no 1º Ano tinham como disciplinas História Natural das Drogas e Posologia, Farmácia Química, Análises Microscópicas e Químicas Aplicadas à Medicina e à Farmácia; e Farmacotecnia e Esterilizações; no 2º ano as disciplinas eram Análises Toxicológicas, Química Legal, Alterações e Falsificações de Medicamentos e Alimentos.

Em 1921 as três Escolas Superiores de Farmácia ascenderam a Faculdades de Farmácia, competindo-lhes atribuir os graus de licenciado e doutor em Farmácia. A conquista foi breve e como parte do programa de contenção das despesas orçamentais determinada pelo Estado Novo, a Faculdade de Farmácia de Coimbra foi extinta em 1928 a que se seguiu a de Lisboa em 1932, sendo criadas em sua substituição as Escolas de Farmácia de Coimbra e Lisboa, que passaram a conferir o grau de bacharel, que habilitava à profissão.

O grau de licenciado passou a ser conferido somente no Porto, onde a Faculdade de Farmácia manteve o seu estatuto. Esta situação manteve-se durante mais de três décadas, até que, em 1968, foram restabelecidas as Faculdades de Farmácia de Coimbra e Lisboa.

Em 1978, uma reforma no ensino farmacêutico instituiu três ramos [farmácia de oficina e hospitalar (opção A); farmácia industrial (opção B); análises químico-biológicas (opção C)] para uma mesma licenciatura, que passou a denominar-se de “Ciências Farmacêuticas” (Decreto n.º 111/78 de 19 de Outubro).

Face à necessidade de sintonizar os estudos farmacêuticos com as orientações Europeias, a Portaria 528/88 de 8 de Agosto, veio introduzir o grau único de licenciado em Ciências Farmacêuticas.

Assim, e dadas as várias reformas do ensino instituídas desde 1932, encontram-se presentemente a exercer a profissão farmacêutica Licenciados em Farmácia, Licenciados em Ciências Farmacêuticas – Opções A, B e C e Licenciados em Ciências Farmacêuticas.

No início da década de 90 a licenciatura em Ciências Farmacêuticas era conferida por três Faculdades de Farmácia públicas – as Faculdades de Farmácia das Universidades de Coimbra, Lisboa e Porto. Em 1993, foram criadas as primeiras duas licenciaturas em instituições privadas, designadamente no Instituto Superior de Ciências da Saúde Egas Moniz e Instituto Superior de Ciências da Saúde do Porto.

Em 1999 é aprovada mais uma licenciatura em Ciências Farmacêuticas, desta feita na Universidade Lusófona em Lisboa, sendo que em 2000 é a Universidade Fernando Pessoa, no Porto que vê aprovada a sua licenciatura em Ciências Farmacêuticas.

Em 2005 o ensino farmacêutico estendeu o à Universidade do Algarve e 2006 à Universidade da Beira Interior.

Na atualidade temos assim 5 Universidades Públicas e 4 Universidades privadas a ministrar o ensino farmacêutico em Portugal.

As licenciaturas em Ciências Farmacêuticas deram lugar a Mestrado Integrado em Ciências Farmacêuticas em 2007 por adequação ao Processo de Bolonha. O Mestrado é Integrado tem a duração de 5 anos, abrangendo o 1º e 2º ciclo e encontra-se organizado segundo o sistema de ECTS (European Credit Transfer System). O 1º ciclo tem a duração de 3 anos (180 ECTS) e confere ao aluno o grau de Licenciatura em Estudos Básicos de Ciências Farmacêuticas. Apenas é permitido o acesso à profissão de farmacêutico aos alunos que terminem o 2º Ciclo (120 ECTS) com duração de 2 anos e confere o grau de Mestre em Ciências Farmacêuticas.

3. FARMÁCIA EM NÚMEROS

Nos últimos quinze anos o número de farmacêuticos tem vindo a aumentar passando de 8032 no ano de 2000 para 15140 no ano de 2015, correspondendo a um aumento de 473 farmacêuticos a mais por ano (Figura 1).

Figura 1. Número de farmacêuticos por ano (Dados obtidos no site da Ordem dos Farmacêuticos: http://www.ordemfarmaceuticos.pt/scid/ofWebInst_09/)

A Figura 2 mostra o acréscimo do número de farmacêuticos nos últimos quinze anos, sendo o ano de 2009 o registou maior número de entradas no mercado de trabalho.

Figura 2. Acréscimo do número farmacêuticos desde o ano de 2001 a 2015 (Dados obtidos no site da Ordem dos Farmacêuticos: http://www.ordemfarmaceuticos.pt/scid/ofWebInst_09/)

Relativamente ao número de vagas para entrada no Curso de Ciências Farmacêuticas nas Universidades Públicas (Figura 3) verifica-se um aumento significativo nos últimos 20 anos, registando-se nos anos de 2000 e 2003 os maiores incrementos.

O ensino das Ciências farmacêuticas era realizado apenas nas 3 Universidades públicas, sendo elas a Universidade Lisboa, Coimbra e Porto, em 2005 a Universidade do Algarve e 2006 a Universidade da Beira Interior passaram também a dispor do mesmo curso. Estas Universidades contudo apenas têm um número de vagas que não chega a metade do número de vagas de qualquer uma das mais antigas.

Figura 3. Número de vagas na 1ª fase na Faculdade de Farmácia da Universidade de Lisboa (FFUL), na Faculdade de Farmácia na Universidade de Coimbra (FFUC) na Faculdade de Farmácia de Universidade do Porto (FFUP) e na Universidade do Algarve (UALG) e na Universidade da Beira Interior (UBI), de 1997 a 2016 (Dados obtidos no site da Direção-Geral do Ensino Superior: <https://www.dges.gov.pt/pt>)

Neste trabalho não são consideradas as universidades privadas, nomeadamente a Universidade Lusófona de Humanidades e Tecnologia e Instituto Superior de Ciências da Saúde Egas Moniz situadas na região sul do país e no norte temos a Universidade Fernando Pessoa e Instituto Superior de Ciências da Saúde – Norte (CESPU).

Sendo assim o aumento do número de farmacêuticos no mercado de trabalho deve-se principalmente a dois factores: ao aumento significativo do número de vagas nas Universidades ditas clássicas e o aumento do número de cursos de Ciências Farmacêuticas (CF) ministrado em Universidades publicas e privadas.

A formação de um tão elevado numero de farmacêuticos nos últimos anos levou a que em 2016 os farmacêuticos constituam uma classe muito jovem: 41% dos farmacêuticos têm idade inferior a 35 anos, 27% estão entre os 35-44 anos, 10% entre 55-64 anos e sómente 7% tenham idade superior a 65 anos (Figura 4). Este último caso não se esperaria uma percentagem elevada uma vez que corresponde à idade da reforma. Ou seja a grande maioria dos farmacêuticos em atividade tem idade inferior a 44 anos.

Figura 4. Distribuição dos farmacêuticos em atividade por faixa etária (Dados obtidos no site da Ordem dos Farmacêuticos: http://www.ordemfarmaceuticos.pt/scid/ofWebInst_09/)

4. CURRÍCULO DOS CURSOS DE MESTRADO EM CIÊNCIAS FARMACÊUTICAS EM PORTUGAL

Para ser farmacêutico em Portugal é preciso ter o Curso de Mestrado Integrado em Ciências Farmacêuticas. Trata-se de um curso de banda larga que permite formar profissionais que possam exercer as possíveis atividades associadas à profissão farmacêutica, nomeadamente a nível da Farmácia de Oficina, Farmácia Hospitalar, Indústria Farmacêutica (desenvolvimento, fabrico, controlo de qualidade, marketing e assuntos regulamentares), Distribuição Grossista de medicamentos, Análises Clínicas e variadas outras atividades de índole Analítica (análises químicas, hidrológicas, bromatológicas, microbiológicas, toxicológicas, etc.), Ensino e Investigação. A estrutura do curso nas diferentes Universidades tem semelhanças entre si. Assim sendo têm todos a duração de 5 anos, em que se associam de forma equilibrada as matérias básicas (nos primeiros anos) com disciplinas de especialidade (a partir do 3º ano), a que acresce um Estágio profissionalizante (no 2º semestre do 5º ano), integrador dos conhecimentos e facilitador da inserção dos alunos na atividade profissional (Figura 5). As matérias básicas ao Curso de CF incluem-se em três áreas fundamentais sendo elas a química, a biologia e a medicina.

Figura 5. Educação em Ciências Farmacêuticas

O Mestrado Integrado em Ciências Farmacêuticas encontra-se organizado pelo sistema de ECTS (European Credit Transfer System), tendo a totalidade do primeiro e segundo ciclo 300 ECTS. Aos estudantes que tenham realizado os 180 créditos correspondentes aos primeiros seis semestres curriculares de trabalho é-lhe conferido o grau de licenciado em Estudos Básicos de Ciências Farmacêuticas. Esta licenciatura permite ao estudante aceder a vários mestrados (2º ciclo). Existem em todos os cursos Unidades Curriculares de opção que poderão realizar em alguns cursos a partir do 3º ano em outros casos a partir do 4º ano. Estas Unidades curriculares são de livre escolha do aluno e poderão pertencer aos primeiros ou segundos ciclos de outros cursos inclusivé noutras Universidades. Contudo na maioria dos casos terá que haver uma prévia aprovação pela Comissão de curso. O estágio curricular tem a duração de 6 meses e corresponde a 30 ECTS do curso e apresenta três vertentes, são elas o estágio em farmácia comunitária, o estágio em serviços farmacêuticos hospitalares e a elaboração de uma monografia ou trabalho de campo ou projeto. O estágio na farmácia comunitária e nos serviços farmacêuticos tem a duração de 4 e 2 meses respetivamente. Em alternativa o estágio poderá apenas ser feito em farmácia comunitária.

5. ESPECIALIZAÇÃO

Existem cinco especialidades que o farmacêutico poderá aceder através da prestação de provas feitas pelos respectivos colégios da especialidade da Ordem dos Farmacêuticos. São elas a Especialidade em Análises Clínicas, em Genética Humana, em Assuntos Regulamentares, em Farmácia Hospitalar e em Indústria Farmacêutica.

Os candidatos à especialidade em *Indústria Farmacêutica* têm que ter experiência mínima de 5 anos, devendo os últimos três ter sido consecutivos numa das três áreas da Indústria Farmacêutica, na produção, ou na qualidade ou na gestão de materiais. O laboratórios tem que ser licenciados pelo INFARMED.

A Especialidade de *Análises Clínicas* é concedida após um estágio de 4 anos em laboratório considerado idóneo para o efeito e aprovação de um exame realizado pelo colegio de especialidade. No Laboratório o candidato terá que passar 14 meses na seção de Química Clínica e igual período nas seções de Hematologia e Microbiologia e três meses na secção de Imunologia e igualmente três meses na seção de Genética.

A atribuição do Título de Especialista em *Genética Humana* fica condicionada a um período de estágio profissional de 4 anos em laboratório considerado idóneo para o efeito e a uma prova de avaliação final, na Ordem dos Farmacêuticos. No laboratório terá trabalhar 2 anos em Citogenética e Citogenética Molecular e 1 ano em Genética Molecular e Oncogenética igualmente um ano em Bioquímica Genética.

A atribuição do título de especialista em *Assuntos Regulamentares* fica condicionada à prestação de um exame após um período de exercício profissional em entidade pública ou privada no âmbito do registo e regulamentação farmacêutica. Este período de exercício profissional terá a duração mínima de 5 anos de atividade exclusiva nas áreas funcionais nucleares, subnucleares e complementares classificadas no Artigo 11º das Normas que regulamentam esta especialidade.

Os candidatos ao título de Especialista de *Farmácia Hospitalar* deverão ter uma experiência mínima de cinco anos em Farmácia Hospitalar, devendo nos últimos três anos ter sido consecutiva, sendo que o candidato deve estar em exercício de funções no momento da candidatura e ser membro efetivo da Ordem dos Farmacêuticos (OF).

6. DESAFIOS EDUCACIONAIS

No meio universitário tem-se assistido a uma profunda discussão relativa à reforma dos planos curriculares, que, muito provavelmente, será ajustada aos parâmetros definidos pela Agência de Avaliação e Acreditação do Ensino Superior (A3ES).

Contudo o estudante, quando concluir o curso deverá ter adquirido conhecimentos e competências que se traduzam num exercício profissional cujo objetivo compreenda, essencialmente, a pessoa do doente e a Saúde Pública. Assim sendo deve ter conhecimentos adequados dos medicamentos e substâncias utilizadas no respetivo fabrico; conhecimentos adequados da tecnologia farmacêutica e do ensaio físico, químico, biológico e microbiológico dos medicamentos; conhecimentos adequados do metabolismo e dos efeitos dos medicamentos e da ação dos tóxicos, bem como do uso dos medicamentos; conhecimentos adequados que permitam avaliar os dados científicos respeitantes aos medicamentos para poder, com base neles, prestar informações apropriadas; conhecimentos adequados dos requisitos legais e outros em matéria de exercício da atividade farmacêutica; a preparação, ensaio, armazenamento e distribuição de medicamentos em farmácias abertas ao público; preparação, ensaio, armazenamento e distribuição de medicamentos em hospitais; e a capacidade de difundir informações e conselhos sobre medicamentos.

Esperamos, pois, que a haver processo de reforma ele se faça de forma planeada e estruturada.

7. A PRÁTICA FARMACÊUTICA

No Séc. XX assiste-se à modificação da farmácia, na vertente técnica, científica e socioprofissional.

A indústria farmacêutica portuguesa iniciou o seu desenvolvimento nos finais do Séc. XIX, prolongando-se este processo de industrialização do medicamento no Séc. XX. Contudo as farmácias continuavam a produzir medicamentos magistrais mas a indústria galopava na intenção de ultrapassar esse exclusivo das farmácias de oficina. Nas receitas médicas, progressivamente o formulário magistral dá lugar ao nome comercial do medicamento. As farmácias passam de local de fabrico e dispensa de medicamentos em locais de cedência de medicamentos.

O uso do título de farmacêutico e o exercício da profissão farmacêutica ou a prática de atos próprios desta profissão, dependem da inscrição na Ordem dos Farmacêuticos.

Na definição do ato farmacêutico encontramos os medicamentos de uso humano ou veterinário como pilar essencial da atividade do farmacêutico mas também este poderá ter uma atividade de interesse sanitário como as análises clínicas, toxicológicas, bromatológicas, ou hidrológicas.

Esta componente do exercício farmacêutico revela-nos que o farmacêutico além de ser um especialista do medicamento pode ser um especialista em Saúde Pública, consolidando deste modo o seu estatuto profissional na hierarquia dos profissionais de saúde.

Segundo dados disponibilizados pela Ordem dos Farmacêuticos os farmacêuticos encontram-se distribuídos por diversas áreas profissionais: Farmácia de Oficina, Análises Clínicas, Farmácia Hospitalar, Indústria Farmacêutica, Distribuição Farmacêutica, Ensino, Investigação e Outras Áreas. A Figura 6 mostra a distribuição dos farmacêuticos em atividade no ano de 2016 pelas diferentes áreas profissionais.

Figura 6. Distribuição por área profissional

A farmácia de oficina representa a área profissional de eleição de mais de metade dos farmacêuticos portugueses, seguida da área hospitalar. Dado curioso, e digno de registo, é o número de farmacêuticos a exercer em áreas agrupadas no item outras áreas, estando aqui englobados cerca de 300 farmacêuticos que desempenham atividades nas áreas de toxicologia, bromatologia e hidrologia.

As principais funções do farmacêutico hospitalar em Portugal são a organização e gestão; distribuição e informação; farmacotecnia; controlo de qualidade; farmacovigilância; ensaios clínicos e meio hospitalar; farmacocinética; radiofarmácia e acompanhamento farmacêutico. Contudo a dimensão dos serviços farmacêuticos está de acordo com a dimensão dos hospitais onde se encontram instalados e de acordo com a natureza dos hospitais, que podem ser do estado ou de instituições privadas.

Atualmente existem em Portugal diversos armazéns grossistas de medicamentos com diferentes regimes de propriedade. Cerca de 40% estão em regime de cooperativas, 29% sob poder de empresas multinacionais, 9,5% são detidos por empresas nacionais, havendo outras possibilidades que rondam os 21,5%. Trata-se de um sector que passou por uma modernização profunda, no plano institucional e no plano técnico e científico. A direção técnica de um farmacêutico e a utilização de Boas Práticas de distribuição grossista modernizaram e atualizaram o sector. As indústrias farmacêuticas estabelecidas em Portugal são na sua esmagadora maioria de capital estrangeiro sendo muito reduzido o capital nacional envolvido. De um modo geral as indústrias farmacêuticas estabelecidas em Portugal dedicam-se à produção e entrada de medicamentos no mercado e são em reduzido número as que investem na investigação ou em atividades de I&D, que são decisivas na conquista de novos mercados e na expansão do produto e das instituições. Depois da entrada de Portugal na Comunidade Europeia, questões relacionadas com as boas práticas de fabrico; a qualidade, segurança e eficácia do medicamento; a informação e a publicidade do medicamento; a sua autorização e introdução no mercado, passaram a ser questões de primeira importância com legislação e regulamentação apropriadas.

8. FUTURO DA FARMÁCIA PRÁTICA

Algumas alterações estão a ocorrer na farmácia prática especialmente em farmácias, que poderão ter algum impacto no programa de educação em Portugal nomeadamente a) dado haver hoje em dia as redes hospital-comunidade, muitos fármacos poderão vir a ser disponibilizados aos doentes na farmácia comunitária, é o caso do tratamento para o vírus da imunodeficiência e síndrome da imunodeficiência adquirida ou quimioterapia; b) aumento da ênfase na educação dos doentes procurando-se estabelecer redes com os doentes crónicos com diabetes ou asma por exemplo; c) devido ao desporto, viagens e trabalhos ocasionais, os ortopédicos estão a tornar-se importantes na farmácia comunitária e os farmacêuticos têm que se adaptar; d) os cuidados de saúde em casa estão aumentar devido ao aumento da população idosa pelo que os farmacêuticos poderão ter que desempenhar aí um papel importante.

A nível da indústria farmacêutica muitos têm sido os desenvolvimentos devido à descodificação do genoma humano que constituiu um dos pilares fundamentais para a identificação de alvos terapêuticos e para o desenvolvimento de estratégias de prevenção e tratamento de doenças. O aparecimento de novos ramos da ciência como a bioinformática, a quimioinformática e a genómica funcional contribuiu igualmente para uma nova realidade. O desenvolvimento da química combinatória permitiu a síntese de numerosos compostos análogos, permitindo à indústria farmacêutica testa-los no que respeita à ação sobre um determinado potencial alvo terapêutico.

A síntese de medicamentos biológicos está a aumentar pois respondem a necessidades terapêuticas até aqui sem resposta.

A possibilidade da realização de testes fenotípicos ou genéticos dividindo a população de doentes em subgrupos de acordo com a resposta a determinado fármaco, permitira uma terapia individualizada.

A nanotecnologia constitui uma área de investigação em tecnologia farmacêutica que será certamente um tópico a introduzir nos programas desta área, assim como a terapia genica, e a terapia com células somáticas ou a engenharia de tecidos são tópicos a desenvolver na área da biologia.

9. CONCLUSÕES

O número de farmacêuticos depende do número de vagas existente nas 9 Universidades. A formação de um farmacêutico dura no mínimo 5 anos estando no final apto a desempenhar qualquer uma das atividades que estão incluídas no ato farmacêutico. O título de especialista só é possível após 4 a 5 anos de prática na área da especialidade e a aprovação do exame à Ordem dos Farmacêuticos. A maioria dos farmacêuticos desempenha a sua atividade na farmácia comunitária. Portugal tem uma excelente rede de farmácias pois cobre todo o território nacional.

Vários têm sido os desafios dos farmacêuticos ao longo da história mas a sua formação multidisciplinar faz dele um profissional com características próprias mas adequadas ao desempenho de cada uma das suas possíveis atividades profissionais.

TEACHING IN TWO CYCLES OF PROFESSIONAL LIFE: A COMPARATIVE BRAZILIAN CASE STUDY

Jordana Wruck Timm

Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS
(jordana.timm@acad.pucrs.br)

Claus Dieter Stobäus

Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS
(stobaus@pucrs.br)

(juan.mosquera@pucrs.br)

ABSTRACT

The teaching profession has been increasingly discussed, both for its relevance and for the growing social and economic devaluation it has been undergoing. The objective of this study is a qualitative analysis of a speech of a teacher interviewed after being in this profession for 24 years, comparing quantitatively with spontaneous responses of people interested in taking the Pedagogy course and entering the educational area. It is, therefore, a comparative study between a professional that is oscillating in the cycle of diversification/activism/questioning and young people who are entering the career, in order to verify the meaning and meaning of the teaching work in the life of these people. The analysis of these data was performed according to the Discursive Textual Analysis. The text runs through the bias of Health Psychology. It was concluded that the interviewees, entering the course of Pedagogy, are afraid of the choice of profession due to the mishaps found in it. Most of these subjects think about the option to enter the area through some family member or to recognize the importance of the profession. The interviewee with a longer career recognizes the difficulties encountered, however, the positive points she reports prevail, giving the immensity that this work has in her life.

Keywords: Teaching, Professional Life Cycles, Adult Life.

JEL Classification: I20, I23, I31, I29

1. INTRODUCTION

In his Doctoral Thesis, Timm (in progress) proposed to interview teachers, who teach in *Stricto Sensu* Post-Graduation, at different stages of the occupational life cycle. With the discussions with Mosquera and Stobäus, the theoretical framework was expanded. According to Huberman (2013), this cycle is subdivided into five phases, they are: entry into the career; The stabilization phase; The stage of diversification, the questioning; Serenity, affective detachment, and conservatism; And, finally, the divestment, distributed according to Frame 1:

Frame 1: Phases/Career themes

Source: Huberman (2013, p. 47)¹

¹ Translated by the authors.

Before conducting the official interviews, Timm proposed to conduct two Pilot interviews to verify the way of conducting and analyzing them, who generated material to analyze and, consequently, the possibility of making the choice of the methodological process and of analysis to be adopted for the Thesis. For what is being presented here, we are based on the discussion about the results of these pilots. That, besides working with histories of occupational life interviews, at the end of the interview the following questioning was realized: “what is the meaning and meaning of the teaching work in your life?” It is from this questioning that the discussion developed for the writing of this text.

In addition, at the end of 2015, was held, an internal event of our institution, called Open Campus, to welcome for the new students, and to clarify for those interested in taking a university entrance exam. It was given three workshops (in partnership) for those interested in the Pedagogy course, one of them entitled: “why does the pedagogue make a difference in education?” This workshop began by questioning the participants about the meaning and meaning of the teaching work for them.

The Pilot study gave the qualitative margin for this text, based on the speech of a professional who has been working in the area for some time. Already the result obtained in the workshop given, gave the quantitative character, seeking to verify what they are looking for in this profession the people who are now interested in the area.

2. LITERATURE REVIEW

The teaching profession, according to Guarany (2012), was not seen as a work activity, but rather associated with a personal vocation. For a long time, teaching was recognized as a vocation, apostolate, a lay priesthood, and its exercise was mainly based on moral qualities, a virtue which good masters had to possess and exhibit, according Lessard and Tardif (2008). With the university reform of 1968, the chair was abolished and the figure of the professor like final position of career was instituted. Teachers, instead of being allocated at their courses, began to move through departments. In public institutions, teachers begin to have a career that is based on academic degrees and degrees; The Dedicated Work Scheme (ED) is established; And teachers begin to be admitted by employment contract, and the regency becomes effective through the labor regime, says Morosini (2009).

Mosquera (1987) proposed that adult or adult life (adulthood) is a constant personality development stage, involving many aspects of personality construction, such as: identity, self-image, self-esteem, self-realization, always related to the context In which the person grows and develops and acts.

In this sense, during the last decades (marked by the context of the generalization and massification of education and bureaucratization of educational systems), teachers’ unionism and professional associations insisted that education be recognized as a trade, and therefore, teachers as qualified workers should Be treated by the employer respecting the material, social and symbolic plans, said by Lessard and Tardif (2008).

The historical process of teacher professionalization, and at that moment, states that the key period in the history of education and the teaching profession is in the second half of the eighteenth century, when the profile of the ideal teacher is outlined, placed Nóvoa (1999). In dealing with this, it is important to consider issues related to the identity of this professional.

For Pimenta and Anastasiou (2014), in relation to the profession, they affirm that it is by nature a process mediating between teacher and students (essentially different subjects), in the confrontation and the conquest of knowledge. Morosini and Comarú (2009), specifically on the teaching figure, affirm that their identity and professional formation are influenced by governmental and institutional public policies.

Moreover, the teacher is never a teacher in isolation, he is in the encounter with the subjectivity of each student, constructing the heterogeneity of a group (Grillo, 2008). For Morosini and Comarú (2009), this identity constitutes a process of construction, reconstruction and transformation of referential, responsible for dynamizing the teaching profession, from the social meanings and the reaffirmation of culturally consecrated practices, significant and that resist the Innovations, since it contains valid knowledge to the needs considered current in the confrontation between theory and practice.

We can add that the construction of the identity process and used concepts of a teacher, according to Rodrigues, Stobäus and Mosquera (2016, p. 1119):

Are not static and are due to the interactions of the subject with the environment in which it develops leads us to consider that this is a plausible way to add healthy identity to the objects of study of Positive Psychology.

This process, which is considered formative, says Pereira (2013, p. 35):

[...] I am understanding that teacherality is not an identity that a subject constructs or assumes or embodies, but otherwise it is a difference that the subject produces in itself. To become a teacher is to become something that was not being, is to differ from itself. And, in the case of being a difference, it is not the recurrence to the same, to a model or pattern. For this reason, teacherality is not, in my view, an identity: it is a difference produced in the subject. And, as a difference, it can not be a stable state to which the subject would arrive. Teacherality is a state at risk of permanent imbalance. If it is a stable, stagnant state, it would result in an identity and the flow would be impaired.

It is also important to take into account the vision not only of being a teacher, as a professional, but of looking at the teacher as a person (Mosquera and Stobäus, 2008, 2006a). Grillo (2008) states that for the analysis of the dimensions of teaching, the starting point is the figure of the teacher as a person and professional, which, for the author, are inseparable references

to this profession that is built on ethical-philosophical foundations and is impregnated with Values and intentionality. These fundamentals stimulate an existential project (more than pedagogical) explaining the human dimension of teaching.

Morosini and Comarú (2009) also defend the inseparability between the personal development and the life history of the teacher, considering that from the process of continuous formation, the collective and participative dimensions of work are taken as reference, with the intention that by this process Awareness, consolidation and teacher autonomy. For the authors, the work with teaching is characterized by an investment, for which the teacher needs to invest in himself as a person.

For Maciel (2009a), the investment in the career depends on motivational aspects, that is, it is necessary to administer social and personal requirements. Through work, there is a process that alters the nature and autotransforms the being that works, for Antunes (2009).

When the question of teaching comes into discussion, with the current context it is impossible not to remit the multiplicities of roles and responsibilities to which the teachers are affected, many of them extrapolating the educational character, besides the numerous legislations and collections made for these professionals. Morosini (2008) argues that there is an image created that teachers are incompetent, referring to the teaching function that has come to have a complexity that generates the feeling of incapacity in teachers to exercise it.

This is because there is a diversity of actions developed by teachers beyond the space of the classroom that are encompassed in teaching (Morosini and Comarú, 2009).

Pimenta and Anastasiou (2014) also defend that teaching surpasses the processes of the classroom in Higher Education, putting in discussion the purposes of teaching in this level. Morosini (2009) states that the teaching functions are under discussion. We can no longer see a teacher as a model, as an ideal type, as in the past was seen/idealized. As well, it is verified that multiple teachers are dependent on their work regime, the qualification and the institution where they teach.

Morosini and Comarú (2009) describe about the formality and recognition by the numerous legislations of the Brazilian Higher Education system. The charges to teachers differ according to the level of education and the institution in which they work. If the teacher teaches at a university, for example, in addition to teaching activities, he should conduct research; If it is in a university center and/or in isolated colleges, it is not charged with compliance in research activities; If it is at the *Stricto Sensu* Postgraduate level, you will necessarily be charged for the master's and/or doctorate course.

It was already believed that he could know how to teach one who was a good professional (Masetto, 2003). Pimenta and Anastasiou (2014) point out as some of the problems of teaching, the fact of putting professionals/researchers from a certain area to act as a teacher. As if the knowledge specific to their area of expertise was sufficient. For them, nobody is born professional/researcher and wakes up teacher.

In this sense, according Pereira (2013, back cover),:

Being a teacher is like a brand that is produced in the subject. It is not vocation, it is not identity, it is not destiny. It's a product of you. The search for the formation walks in the direction to look for ways of appropriation and activation of this mark in consonance with the singularities of the subject. If I become a teacher, I need to open myself to the forms of constitution of myself and propose situations of experiences that give support so that students also experience themselves as teachers in formation.

All this discussion is necessary, because later, when we discuss the speeches of the interviewees, we perceive the question of the vocation quite marked in the speech of those who want to enter into the profession, however the same falls to the ground, when analyzing the speech of those who have been teaching in the area for the longest time.

3. METHODOLOGY

The data collection consists of a cut of a pilot interview, focusing on occupational life history, performed for the author's doctoral thesis. Concomitant to this, were used statements of students interested in providing a college entrance examination for the Pedagogy course. Both cuts were aimed at the meaning and meaning of teaching.

In the pilot interview, the discourse of a female teacher was interviewed because she had a lot of experience, after being in school for 24 years, 10 years in Higher Education (the time was calculated at the time of the interview, Held in 2015). It acts in the area of Physical Education. The interview lasted 46 minutes and 13 seconds, with the main objective being life history and occupational life history. It was performed at a previously scheduled time and place, being recorded and then transcribed before analyzing it.

Already, the methodology adopted for data analysis, as mentioned previously, respects the principles of Discursive Textual Analysis proposed by Moraes and Galiazzi (2011). The way this methodology is used to perform the analysis can be better understood, from Figure 1.

Figure 1 - Schematic on the steps of Discursive Textual Analysis

Source: Timm *et al.* (2016, p. 1769), based in Moraes e Galiazzi (2011)

4. RESULTS AND DISCUSSION

In the Open Campus workshop, when they were asked about the meaning and meaning of teaching, the answers of possible future teachers, the following categories emerged:

- Taste/passion for teaching;
- Vocation;
- Affectivity for working with children;
- Follow the professional career of the mother and/or other relative.

Already, in the execution of the pilot interview, before this question and according to the Discursive Textual Analysis of Moraes and Galiazzi (2013), twenty-nine subcategories appeared and from these emerged six categories, arranged in Frame 2.

Frame 2 – Subcategories and Emergent categories indicating the meaning and meaning of teaching, according to the interviewed teacher

SUBCATEGORIES	FINAL CATEGORIES
Peculiar area; Classes differentiated as course; Only those who experience the course of Physical Education, recognizes; peculiar area in which people express themselves; Peculiarity and possibility of knowing the student; Different classes that require an active student behavior, particular area of expertise	Peculiar acting area
Music as a form of expression; Expression and unfold ; Corporal conscience; The student's need to express themselves, The transpires body language very essence of teaching in this area; Body language	(Self) expression.
Know the other through body language; Knowing the other is one of the characteristics of physical education; It works with the body of the other; Need to (self) meet bodily to meet and work with the other's body. Know the other/the other's body	Know the other/other's body
Taste for teaching; Taste and interest of teachers with their work; I taste for teaching	Taste for teaching
Daily renewal; The renew and teaching. The encounter with the unexpected; Unpredictability; (Re) learning; Constant renewal	Constant renewal
Multiplicity of meanings; The meaning and significance vary with the perception of each; The meaning and significance vary with the perception of each; different perceptions; Feeling of importance for the activity carried out, so that people can know; Source: prepared by the authors	Multiplicity of meanings that vary according to the perception of each

Source: Timm *et al.* (2016, p. 1770), based in Moraes e Galiazzi (2011)

In view of the six categories that emerged from the pilot interview, it is pertinent to point out that they were constituted from the open question “what is the meaning and meaning of the teaching work in your life?” In the first emergent category, entitled peculiar area of activity, we perceive that the interviewee brings this very strong in her report, because she is teaching in the area of Physical Education, which differs from teaching, learning, socializing and relating, when compared to other areas.

We believe that this category is closely linked to the following two, since the question of (self) expression and knowing the other and the body of the other, is also something more visible and recurrent in professionals who teach in that area. In the following section, it is possible to observe the interviewee putting herself in relation to this, interpreting that the meaning and meaning of the teaching work, especially in the area in which it works, offers:

[...] to get to know people a little more. And my course, my area is an area that greatly favors this. It is different from other areas, it is a very peculiar course, [...]. And there we see a little more of the students, we know the students a little more, and that's a very interesting thing. It has a very big interaction, because we deal with body issues a lot. (Pilot Interview 1).

Linked to this, the taste for teaching is another emerging category of this research and that also emerged during the realization of the workshop, as we wrote at the beginning of this subtitle. In the meantime, the interview of the exhibition exposes the experience with a student who had always been quiet in his classes, until the day that was given as an activity the creation of a choreography for a certain music, through which the students could express themselves, being this student highlighted with the interpretation made.

That scene created a new meaning and meaning in the teacher interviewed, making her realize the taste she has for the activity she carries out. Even at this point in the interview, she commented: “[...] I love to teach because, in fact, this is the big balcony [...]” (Interview pilot1), observing this as a constant renewal and as a Unpredictability that for her is one of the great senses of her profession.

In the fifth category, called Constant renewal, it is noticed that the daily renewal, the encounter with the unexpected, the unpredictability and (re-)learning in the performance of the said profession, are constant in the speech of the interview, as shown in the following section:

We arrive and do not know what to expect from the students. It's this thing like that, you renew yourself every day. [...]. And that there renews you in a certain way, and that renews you every semester or every class you give. Because you do not know what's going to happen, it's not a predictable class. So the idea of the meaning and meaning of teaching is not? It is this renewal thing, that of you also learning, of your learning a little every day. (Pilot Interview 1).

In fact, as the interviewee brings in her report, teaching brings very strong this question of the new, the unexpected. The classes in Graduation and Post-Graduation, have their characters changed every semester, so each beginning of semester is a new story to write and live. Of course in the intention of teaching, we always learn from each other. There is a mutual exchange in this teaching-learning process. When the interviewee talks about this issue of renewal and learning constantly, we refer to what Pimenta and Anastasiou (2014) defend by teaching, while the unfinished being constantly relearn, learn as he teaches. Freire (2000) also defended this idea of being unfinished beings and that we came in a state of conditioned and not determined.

Finally, in the last emergent category, entitled multiplicity of meanings that varies according to the perception of each one, it appears quite marked that the meaning and meaning of this profession varies according to the perception of each one, therefore, characterized by the individual perceptions obtained individually and the Which characterizes the multiplicity of meanings. For the interviewee, in addition and above all, what constitutes their sense of importance for their activity is that people can get to know each other, but believes that this can change according to each individual and according to the area of activity.

Therefore, in confronting the emerging categories, it is perceived that in both phases, the taste for teaching appears as one of the meanings and meanings of the said profession. The affection with the field of work is also characteristic present in both, however, one focused more on the issue of the child as a whole and another on the question of the body, which is understood if we take into account the specific area of performance. The other categories differ and we believe that this happens, precisely, by the time of performance.

In this sense, we emphasize the aspects related to affectivity, in which Mosquera and Stobäus (2006b) report that,;

[...] for personal aspects [...], also for Social Aspects [...], and Institutional Aspects [...], which leads, in general to the understanding that, for teachers interviewed, Affection is very important in the educational context and depends on individual (self) training so it can be used positively in this environment as a tool for learning and for healthy interpersonal relationships (contextualization).

The other categories, both in the workshop and the interview, are different, and we believe that this precisely happens through the teacher's time in the field.

5. CONCLUSIONS

In view of the above and the lines analyzed, it is possible to perceive some similarities between those who seek teaching and those who practice it, however, others are modified along the professional path. The question of meaning and feeling in this profession is quite strong and appears demarcated in both situations. Another strong factor is the issue of constant learning, since those who opt for this professional branch need to be in constant (re-)learning, aiming to meet the needs that emerge and constantly change in this segment.

The foregoing reveals a great deal about lifelong learning and the feelings derived from this profession; however, as future work, we suggest conducting interviews in each one of the phases, and then analyzing when changes occur in discourses about the way you feel about your work

ABSTRACT

The purpose of this study was to study and identify the number and structure of the different dispositional goal orientations's profiles that can be formed and to investigate the differences between clusters on beliefs about athletic ability constructs related in a sample of students at the Physical Education classes of basic and secondary school of education public in Portugal.

To carry out present study we used an aleatory sample, comprising 505 students, aged between 12 and 18 years of both gender.

Different instruments were used in order to assess the achievement goals motivational's orientations for success in sport and athletic ability's beliefs. To confirm the existence of clusters profiles we perform hierarchical's clustering method and the non-hierarchic method K-means. In order to examine the characteristics of each goals profile's cluster obtained was done a multivariate analysis of variance.

The Cluster analysis showed a solution with four profiles describing goal orientations Z score's "high", "moderated" and "low". Results of multivariate analysis have shown that students highly motivational's profile have high significant levels of motivation task-oriented and present greater score of incremental beliefs about athletic ability than those with motivational profile low.

The outcomes pointed in accordance positive nature of task orientation have been associated with a belief that athletic ability is incremental, changeable with learning.

Keywords: Goal Profiles, Motivational's Orientations, Athletic Ability's Beliefs.

JEL Classification: I29

1. INTRODUCTION

The yearning to learn is the most important foundation of the learning and the human development (Lemos, 2005). In the educative environment, as in the sport or other contexts of work, the motivation not only produces a better learning and performance, but also produces more confidence and a greater satisfaction. When young students are motivated they tend to build thoughts and to develop behaviours that lead to the most satisfying learning's performance results. They take initiative in facing challenges or and use strategies to resolve problems. These young students also have a greater willingness, more enthusiasm, curiosity and interest to learning (Lemos, 2005). On the other hand, when they are not motivated, they internalize thoughts and develop negative behaviours (Lemos, 2005). They are passive, not strengthen, avoid the challenges, dropout easily and use the same inefficacious strategies repeatedly: showing annoyance, depression or anxiousness. They place themselves to the edge of the chance of same learning or they are against their educative agents. In other words, the motivation takes the individual to make things that facilitates its learning and improves its performance.

Motivation at the PE context is basically derived from the level of autonomy that someone has to choose tasks, as well as the perception of competence (Ntoumanis and Biddle, 1999; Prusak, Treasure, Darst, and Pangrazi, 2004). Particularly in PE, Roberts (2001) considers that understand the dynamic and complex psychological process of motivation is crucial to understand the human behaviour. A research produced by Biddle, Sallis and Cavill, (1998) confirmed that regular participation in physical activity for young people can contribute to the enhancement of physical, psychological, and social well-being.

In this sense, taking into account the importance of the study of the motivation models, the PE shows a particularly ideal achievement's context to evaluate the motivation process.

At the dissemination abundant of educational's psychology at the classroom, the achievement goals theory has been vastly used for sport's psychologists for a detailed understanding of the motivation in youth in sports environments and contexts of PE (Biddle, 2001; Duda and Hall, 2001). The current thought of motivational psychology research is based on a social-cognitive perspective, and this has been adopted in many domains of psychology, as the educational, social, health, developmental and sport's psychology. There are a lot of theoretical perspectives in sport and PE. In fact, in the PE domain, a social-cognitive approach has become dominant to understand young's motivation in PE (Wang and Biddle, 2001) the achievement goals theory through of perspectives of the Nicholls's theory (1989) and about ability beliefs of Dweck's theories (1999).

This work is supported at perspective of the achievement goals theory (Ames, 1992; Nicholls, 1989). In the scope of the PE, it has been likely one of the theoretical models that more contributions have carried out to understand the cognitions, behaviours and affective responses related with the achievement of students in PE's classes (Papaioannou, 1998).

This theory is based on the idea that the person's achievement goals is determined at time of initiating, maintaining or leaving a conduct, and defends that intent of the individual on doing something at the achievement's contexts, like at PE's classes is show the ability (Nicholls, 1989).

Two main concepts of ability have been identified in achievement contexts and they are manifested through two different of goal's involvement states namely task and ego. (Nicholls, 1989).

The way which an individual adopts the task and ego's involvement is known as their goal orientation. The "goal orientations" express the individual differences in a specific life domain, and they are usually expressed as 'task' and 'ego' goal orientations.

The findings have demonstrated typically that the person ego-orientated is concentrated in normative ability and will be motivationally more fragile when is in doubt with his own ability, but will evidence more adaptive outcomes when it is confident in his competence. Because it tends to be motivated, the individual to task-orientated is only interested in self-improvement regardless of ability or perceived competence.

Concerning how process activities, the achievement goals theory assumes that dispositional factors task and ego orientations of same construct are not mutually exclusive, but orthogonal (distinct and independent's states). It means that a person can be highly associates to a goal but not to the other, while others can be associated in both (Nicholls, 1989). A person is more likely to experiences two directions when it is able to vary in intensity or degree of motivational's involvement pattern (ego and task simultaneously) (Duda, 2001; Nicholls, 1989).

The individual that is in a state of task's involvement believes that his competence will be showed through the development of new skills, raising high levels of ability and exerting maximum possible effort. Since a state of task's involvement is self-referenced, this individual will perceives success when demonstrates mastery (Dweck and Elliott, 1983; Nicholls, 1989).

In contrast, an individual that is in a state of ego's involvement believes that his competence will be demonstrated with favourable s normative it compares with others. The ego's involved individual is focused on the social comparison, his competence will be demonstrated when perceives that his performance exceeded of the other person, particularly when achieves it to exert little effort (Nicholls, 1989).

In addition, Dweck (1999) noted that children process different ways the information ability-related in a classroom. This author presented the conceptions of ability in terms of beliefs on nature of intelligence. She noted while for someone the intelligence is relatively fixed for other people is being changeable. Other research proves that children who believe in a more fixed notion of intelligence (an "Entity Theory" of intelligence) are more likely to adopt an ego-orientated goal and show less adaptable answers to failure (Mueller and Dweck, 1998). On the other hand, those children who believe that intelligence is changeable (an "Incremental Theory" of intelligence) are more likely to adopt a task-orientated goal and show a positive motivation (Hong, Chiu, Dweck, Lin, and Wan, 1999). The study of how PE students interpret or build the changeable nature of athletic ability, in combination with goal orientations has at this moment a promising line of research for furthering understanding of the motivational construct.

When we assess person's task and ego goal's orientations and classify them as 'high' or 'low' in combination, it has been known as "goal profiles" (Fox, Goudas, Biddle, Duda, and Armstrong, 1994). These authors suggested that the best representation of achievement goals, and their subsequent consequences should derive of the analysis motivational goal profiles.

Standage and Treasure (2002), consider that the number of possible combinations between goal orientations correspond to the identification of four profiles, called high task and high ego (Hi-T/Hi-E), high task and low ego (Hi-T/Lo-E), low task and high ego (Lo-T/Hi-E) and low task and low ego (Lo-T/Lo-E).

A research by Wang, Chatzisarantis, Spray and Biddle (2002) that tested the process of cluster analysis to established possible relationships among goal orientation, self-determination and perceived competence, found three motivational profiles: "lowly motivated", which has low score in ego orientation and perceived competence, "highly motivated" which has high scores in the three variables and "moderately motivated" which has moderated task orientation, low ego orientation and moderately perceived competence. Biddle (2001) outlined that when we analyses a whole goal profile the outcomes may be different than when we analyses each goal separately.

In this line, knowing that ego orientation is frequently considered as less motivationally adaptable than a task orientation, some researches have used a goal profile approaching to the study of achievement goals and they have shown that individuals with high profiles in task orientation, either single or in combination with ego orientation, are associated with a high motivation and they display higher levels of adaptive responses than those people with low levels in task orientation (Dorobantu, and Biddle, 1997; Duda, 2001; Duda and Hall, 2001; Fox *et al.*, 1994; Roberts, Treasure, and Kavussanu, 1996;

Vlachopoulos and Biddle, 1996; Wang, and Biddle, 2001).

We consider that the identification of PE student's clusters profile represents different patterns of motivation and self-perception through which they could be instructive and that identification of the homogeneous groups is useful to develop strategies, increasing effectiveness of interventions and promoting physical activity in the youth.

Therefore, the present study is an evaluation work of the achievement goals theory which is composed of 505 students between 12 – 18 years olds involved in PE's context. In view of the results obtained and the importance of research of the PE education the aim of this study is to identify motivational profiles in PE, taking into account the influence of dispositional orientations as well as checking the differences of ability beliefs at each one of the profiles.

Based at the developed work previously (Wang and Biddle, 2001; Wang *et al.*, 2002) we hypothesized that there are relations's significant differences in the PE goal orientations profiles with scores "high", "moderate" and "low" among each profile with beliefs about of nature of athletic abilities. In relation to a highly motivated cluster (Hi-T/Hi-E) and moderately motivated profiles have a significant relation with incremental ability beliefs. On the other hand the entity ability beliefs become related with weakly motivated profile (Lo-T/Lo-E) and moderated's high ego cluster.

2. METHOD

2.1 Sample size and Procedure

To carry out present study we used an aleatory sample, comprising 505 students, aged between 12 and 18 years (Mean = 14:46, Standart Deviation: SD = 1.48) of both gender (235 boys and 270 girls) of the basic and secondary school's public education from the educational community of the municipality of Sesimbra, Setúbal's district. To accomplish the goals of our research, we contacted the Presidents of the Executive Councils and the teachers of departments EF of the participating schools, explaining them the objectives of research and requesting permission for their students participate in the completing the questionnaires. Thereafter, and similarly, were presented the study's objectives and was requested the authorization of the parents and tutors for its students participate at the fill the assessment tools. Students were also asked to give its assent to participate and informed about the mechanic fill of questionnaires, presenting them with the overall objectives of the study, in order to ensure greater interest and commitment to participation. It were clarified some terms that could raise doubts, asking them to answer as truthfully as possible, ensuring them that the answers were confidential and that only the head of research would have access to the collected information.

The evaluation instruments CNAAQ-2vp (Portuguese version) and POSQvp (Portuguese version) were applied to 25 classes of 7th to 12th grade within the study "Motivation and its Behavioural Consequences at Young PE students in Portugal".

Thus, before the EF class, each student has 15 to 20 minutes to carry out the complete filling of questionnaires, individually, in a climate that would allow them to focus without distractions. There were not detected difficulties in the interpretation of items's meaning or at fill mode.

2.2 Measures

2.2.1 *Questionnaire about Perception of Success at the PE classes:*

To assess the dispositional orientations to achievement goals of students in PE classes, we used the translated and validated to Portuguese's language (Fonseca & Brito, 2001), with adaptation at the educational context, of the English version Perception of Success Questionnaire (POSQ) Balagué and Roberts (1991) and Roberts, Treasure and Balagué (1998).

This questionnaire is made up by the description of 12 situations that could occur in educational / sporting contexts, of which include 6 that evaluate the task orientation's dimension (eg "demonstrate ... clear improvement in my performance "or" ... reach a goal ") and six others that refer to the ego orientation's dimension (eg "... am better "or" ... I defeat my colleagues "). For each of them the respondent indicates the degree to which considers that feel successful and if it occurred effectively, by using a Likert scale 5 points from 1 (completely disagree) to 5 (totally agree).

The reliability of the questionnaire has shown, in different developed studies satisfactory internal consistency coefficients both in sports (Fonseca & Brito, 2001: Ego = .84 and Task = .78) and in Physical Education (Roberts, Treasure, & Hall, 1994: Ego = .82, Task = .85). In this study were obtained Cronbach alpha's values of .87 and .82, respectively ego orientation and task orientation.

2.2.2 *Questionnaire about the perception of athletic ability beliefs - 2:*

To evaluate the conceptions about the nature of athletic ability of students at the PE classes, we used the translation and validated to Portuguese language (Durão, 2010), with adjustment to the educational context, of the Questionnaire's English version of the Conceptions of the Nature of Athletic Ability - 2 (CNAAQ-2) Biddle *et al.* (2003).

This assessment tool includes two dimensional scales called Incremental and entity ability's conceptions. The first construct, incremental conceptions, covers two subscales corresponding to two factorial dimensions of first order: "Learning" (3 items, eg, "... to succeed in the sport i need to learn techniques and skills, and then train them regularly ") and "Improvement" (3 items, eg, "... to be good at sport, will always improve if to work and endeavor to it "). The second dimension, entity conceptions, includes two first-order sub-scales: "Stable" (3 items, eg, "... I feel it is difficult to change my conviction how i am good at sports ") and" Innate "(3 items, eg, "... to be good in sport, i need to be naturally talented "). Analogously to previous questionnaire, the questions are formulated in a scale type Likert wherein each item has a range of 1 response

(totally disagree) to 5 (totally agree) according to the degree of personal convictions of each student. Two previous studies on the psychometric properties of the CNAAQ-2 (Biddle *et al.* 2003; Wang, & Biddle, 2001) revealed satisfactory reliability coefficients: $\alpha_{\text{Cronbach}} = .75$ and $.73$ for Incremental conceptions and $\alpha_{\text{Cronbach}} = .70$ and $.71$ for the entity conceptions of the athletic ability. In our study were obtained Cronbach alpha's values of $.75$ and $.74$, respectively incremental and entity ability beliefs.

2.3 Results

2.3.1 Descriptive statistics and correlational data of all factors

Table 1 shows the descriptive and correlations analyses of the different variables in the study.

Generally, the students has shown high task orientation and moderately high levels of incremental beliefs. This mean that goal orientation's constructs fluctuate between $M = 3.3$ for ego and $M = 4.14$ for task. The athletic ability conceptions were respectively 2.67 and 3.67 for entity and incremental beliefs.

Table 1. Means, Standart Deviation and intercorrelations of the variables (* $p < .01$; ** $p < .001$)

	M	SD	1	2	3	4
1. Ego orientation	3.3	.93	-	.25**	.32**	.22**
2. Task orientation	4.14	.64	-	-	-.10*	.44**
3. Entity belief	2.67	.74	-	-	-	.07
4. Incremental belief	3.67	.68	-	-	-	-

Own elaboration

The bivaried correlation (moment of Pearson) show that ego orientation was positively and significantly related with all of them. Task orientation is positively and significantly related with incremental beliefs and negatively with entity beliefs. We did not find evidence statistical ($r = .07$) what proves its orthogonality.

2.3.2 Analysis of goal profile clustering

To study the motivational profiles we follow the methodology drawn by Maroco (2003), using the statistical analysis procedure of clusters. In the first phase we perform hierarchical's clustering method (MH) according to their proximity (agglomerative methods) by the Ward's method using the square of Euclidean distance as dissimilarity measure between individuals. To evaluate the solution to retain of clusters number, we used as heuristic method the discretion of the R-squared through the ANOVA on-way analysis. To choose the minimum number of clusters to retain we have used as criterion the significant percentage of the total variability than $.8$ ($> 80\%$) were found four clusters as the most suitable solution.

In a second stage of clusters analysis, in order to confirm the existence of the four clusters, the non-hierarchic method K-means (NHM) clustering procedure was used and profiles were obtained, which corresponded to those obtained by HM.

Before cluster analyses the variables were standardised using Z scores which values are between ± 0.5 . The final centroid centres obtained are shown in table 2.

Table 2. Means, Standart Deviation and Z scores of Final Cluster Centres (Motivational Profiles)

	Cluster 1 (Hi-T/Hi-E) (N = 162)			Cluster 2 (Lo-T/Lo-E) (N = 60)			Cluster 3 (MLo-T/MHi-E) (N = 156)			Cluster 4 (MHi-T/Lo-E) (N = 122)		
	M	SD	Z _{Score}	M	SD	Z _{Score}	M	SD	Z _{Score}	M	SD	Z _{Score}
Ego Orientation	4.12	.51	.92	2.35	.61	-.98	3.51	.41	.27	2.25	.57	-1.09
Task Orientation	4.65	.28	.79	3.04	.51	-1.71	3.78	.32	-.56	4.47	.35	.51

Own elaboration

Four profiles were identified:

Cluster 1: High task and high ego (Hi-T/Hi-E). It is composed of 162 students (32.4%). Positive Z score's higher at ego orientation (.92) and task orientation (.79) were found.

Cluster 2: Low task and low ego (Lo-T/Lo-E). It is comprised 60 students (12 %). Negative Z score's higher at task orientation (-1.71) and ego orientation (-.98) were found.

Cluster 3: Moderated low task and moderated high ego (MLo-T/MHi-E). It is composed of 156 students (31.2%). This cluster has Z score's positively moderated to ego orientation (.27) and negative moderated's score for task orientation (-.56).

Cluster 4: Moderated high task and low ego (MHi-T/Lo-E). It is comprised 122 students (24.4%). This group had high negative Z score in ego orientation (- 1.09) and positive moderated's score for task orientation (.51).

2.3.3 Goals profiles comparisons

In order to examine the characteristics of each goals profile's cluster obtained, a multivariate analysis of variance (MANOVA) was carried out in which the athletic ability beliefs were considered as dependent variables and the profiles as independent variables (Table 3). The results have showed that there are differences's significantly in every dependent variable (Test Wilks' = .113, $F(30; 1430,12) = 52.46$, $p < .001$, $\eta^2 = .516$; Power = 1.00). Tests of inter-subjects effects have showed for entity belief ($F(3; 6.47) = 12.57$, $p < .001$, $\eta^2 = .071$, Power = 1.00) and for incremental belief ($F(3; 10.76) = 26.84$, $p < .001$, $\eta^2 = .140$, Power = 1.00). To identify and compare whether there are differences among groups between which or which pairs of groups there are statistical differences we used tests of mean comparisons post-hoc (Test of Tukey Honestly Significance Difference). Concerning entity beliefs the results showed significantly's effects between moderated Hi-T/Lo-E's cluster with highly motivated profile (Hi-T/Hi-E) and MLo-T/MHi-E's cluster ($p < .05$), but statistical differences between highly motivated, weakly motivated (Lo-T/Lo-E) and MHi-T/Lo-E motivation's profiles were not found ($p > .05$). For incremental beliefs there was not significance's effect between highly motivated profile and MHi-T/Lo-E's cluster, as well as MLo-T/MHi-E's profile and MHi-T/Lo-E's cluster ($p > .05$).

Table 3. Means, Standart Deviation by cluster and differences according to athletic ability beliefs. Multiple comparisons of clusters (Test Tukey HSD)

	Cluster 1 (Hi-T/Hi-E)			Cluster 2 (Lo-T/Lo-E)			Cluster 3 (MLo-T/MHi-E)			Cluster 4 (MHi-T/Lo-E)		
	M	SD	Z	M	SD	Z	M	SD	Z	M	SD	Z
Entity Beliefs	2,77	,80	.45	2,62	,61	1.12	2,83	,69	-.09	2,31	,67	-.95
Incremental Beliefs	3,99	,64	1.04	3,12	,66	-.07	3,58	,60	-.74	3,74	,63	.18

Own elaboration

Cluster 1 showed highest mean's value to incremental beliefs ($M = 3.99$). In cluster 2 the value of entity beliefs was 2.62 and incremental beliefs has obtained lowest values of the four clusters ($M = 3.12$). In cluster 3 entity beliefs ($M = 2.83$) has showed highest values than in other clusters. In cluster 4 entity beliefs ($M = 2.31$) has showed the lowest value of the four clusters.

3. DISCUSSION

As hypothesised the four profiles's resulted from the cluster analysis were found. At first cluster, the students scored positive high scores at ego and task orientation (Hi-T/ Hi-E), in the second one, students scored negatively high at task and ego orientations (Lo-T/Lo-E), the third one, moderated's negatively task and moderated's positively ego (MLo-T/MHi-E) and finally they scored high negative Z score's ego orientation and moderated positive in task orientation (MHi-T/Lo-E).

The outcomes show that students with highly motivational's profile (Hi-T/Hi-E cluster) had high significant levels of motivation task-oriented and present greater score of incremental beliefs than those with a Lo-T/Lo-E's profile.

On the other hand, students with MLo-T/MHi-E's profile had high levels of entity beliefs than participants who display MHi-T/Lo-E's group (moderately motivated's young students). As hypothesised the individual 's situation motivational is different in accordance with the goal profiles.

Furthermore, results demonstrated that those students highly motivated and moderately motivated showed high score of the incremental beliefs than the lower task-oriented classmates (Lo-T/Lo-E and MLo-T/MHi-E's clusters). In this line, we found out that in general groups that show high levels in both orientations (highly motivated) present same adaptive responses than the MHi-T/Lo-E's cluster (moderately motivated). The task orientation in the current study seems to be a decisive construct to increase the motivation, what confirms the consistency of the research carried out by Duda (1997). Contemplating the motivational patterns we found out that a lack of motivation had emerged in groups low task orientation's involvement that showed higher levels in entity beliefs of that groups high and moderated task orientation's involvement, which means that PE students are fundamentally focused on demonstrate more competence than the others. These results are similar to the study by Standage and Treasure (2002). Moreover, this perception of success appears to moderate effect's weak provoked by ego orientation's involvement (Roberts *et al.*, 1996).

The outcomes concerning of clusters pointed in accordance with the positive nature which task orientation have been associated in turn with a belief that athletic ability is changeable with learning. These findings suggest that if there are an

appropriate environmental structures youth students can be motivated for the physical activity.(e.g., positive incentive of the teachers).

From a theoretical point of view, this study identifies different motivational profiles in PE, whose data can supply to PE teachers an idea of complexity of student's motivation, because it can appears with motivational's different types in the same achievement environment. Moreover, from an applied perspective of Achievement goals Theory, these findings suggest that PE teachers should look to emphasise task-oriented involvement in their students if they want to facilitate forms of situational motivation and consequent better interest and participation rates. Finally, these results also provides some psychological tools of how teachers may increase the interests and participation in PE students creating favourable conditions that lead to improve their personal goals.

PARALLEL SESSION V

PEOPLE, AGEING COMMUNITIES AND DIVERSITY

Maria Cristina Faria
Polytechnic Institute of Beja-Portugal
(mcfaria@ipbeja.pt)

ABSTRACT

Adopting healthy lifestyles in old age and engaging in productive tasks provides a potential benefit to preserving health and autonomy, enabling successful aging. Aging with well-being and quality of life implies the involvement of one's own, one's family, one's community and one's society. We are facing a set of dynamics to develop in the area of individual, family, social, community and political responsibility. Ageing populations are becoming more diverse in terms of behavior, culture, identity, disability and socio-economic standing. Giving more life each year from the age of 65 implies creating support and empowerment structures for older people in society and preparing young people and technicians to know how to deal assertively and competently with aging in their community. By observing the diversity of people, we understand how determinant the specificity and articulation of the action in this domain is. Providing older people with a quality life means that professionals working with this population should talk to each other and articulate their actions. The cooperative action articulates people, times and spaces, techniques and knowledge located in family, community, social, educational, health or political contexts. Several structures and services to support aging have been created and a number of programs have been carried out to ensure social support, health promotion, disease prevention and control, in the pursuit of healthy ageing. This symposium seeks to show the diversity of aging in the community, the protective factors of productive aging and the relevance of community mental health to the promotion of healthy lifestyles in older people.

Keywords: Ageing, Diversity, Community, Healthy Ageing, Mental Health.

1. INTRODUCTION

The forecasts speak for themselves and give us little time to prepare for the future. It is estimated that by 2025 there are about 1.2 billion individuals aged 65 or over. According to the forecast by the “*European Agency for Safety and Health at Work in the European Union*” (European Commission, 2014) the percentage of older workers will increase in the coming decades. Trends in the EU-27's active population suggest an increase of about 16.2% (9.9 million) in the age group 55-64 between 2010-2030 and a decrease in the rest. In many countries older workers will account for 30% or more of the active population. After 2030, population aging will continue at a lower intensity, so in 2060, the elderly are expected to account for 29.5% of the total population in the EU-27. In 2060, the elderly population will be 152.6 million, where the proportion of the elderly (aged 80 or over) is estimated at 12%. (European Commission, 2014).

The “*European Agency for Safety and Health at Work in the European Union*” further notes that the EU-28 employment rate for citizens aged 55-64 increased from 39.9% in 2003 to 50, 1% in 2013. However, these figures are still lower than the employment rate for the 22-64 age group. The average age of exit from the labor market increased from 59.9 years in 2001 to 61.5 years in 2010.

According to CENSOS 2011- Portugal (INE, 2012), we observed that the percentage of young people declined from 16% in 2001 to 15% in 2011, however, the percentage of older people increased from 16% to 19%. The direct consequence of the country's demographic structure was the fact that the aging rate rose from 102 in 2001 to 128 in 2011. On the other hand, the number of classic families increased to 4 043 726, but the average number of people decreased per family for 2.58. Ageing becomes a real concern (INE, 2002, 2012).

In Portugal, the fact that the retirement age has passed to the age of 66 or more shows us that citizens will have to work longer and older, also belonging to the working population for a longer period of time. According to projections by the *National Institute of Statistics* (INE), in 2060 the proportion of people over 65 will increase from 17.4% to 32.3% of the total population. Until when are humans available to work actively? Certainly, not all will have the same resistance and some strategies need to be implemented to ensure the work in a healthy way.

European citizens will have a more proactive working life. Hence “*gains*” (wisdom, strategic thinking, holistic perception, decision-making, professional experience and specialized knowledge) and “*losses*” (reduction of functional aptitudes, particularly physical and sensory ones) that arise with advancing age. However, everything seems to be dependent on lifestyle, nutrition, physical condition, genetic predisposition to the disease, educational level and environments where it lives, in particular at work.

The conscious adoption of healthy lifestyles in old age provides a potential benefit to the preservation of the health and autonomy of the elderly, enabling a healthy and rewarding aging. The World Health Organization (WHO) (2002) presented the concept of “*active ageing*”, referring to the capacity for ageing with health and autonomy, participating in society by exercising active citizenship and enjoying quality of life.

The organization of society, patterns of family interaction and filial responsibility in providing care for their parents has undergone changes in recent times (Pereira & Roncon, 2010), having in a way contributed to the isolation and loneliness of the elderly and of their institutionalization. In a study carried out by the authors, intra-family stress correlates negatively with quality of life and positively with depression. Therefore, when the family cannot support or does not exist, it is necessary to create support structures for older citizens. But when families want to care for and support their loved ones, it is necessary to create structures that support the family in the ageing process so that it does not wear away. It is therefore necessary to create social and health policies for ageing and a specialized intervention in the community to support the family.

Contemporary studies emphasize that quality of life, well-being, and maintenance of mental, physical and social qualities are directly related to the performance of meaningful and rewarding occupations. According to *“European Union and Committee of the Regions”* it is necessary to know how to make senior citizens more participatory in society as actors of their own development (Andor, Bresso, & Sedmak, 2011). It is therefore necessary to invest in the autonomy of older adults in society, thus enabling them to develop their capacity to remain autonomous as long as possible and to bring about changes that will improve their lives, in particular for people with disabilities or problems of health.

Faced with concepts and prejudices, perceptions and conceptions, stereotypes and discrimination, society is not always ready to invest in policies and actions to promote healthy ageing. This evidence only shows that there is a lot of work to be done and many synergies to be developed at local, regional, national and global levels, involving all aging-related actors and decision-makers, and, in particular, older people.

Increasingly, we can see the growth in the mobility of people within the *European Union* and the trend of world migration, where we observe 3% of the population is migrant. The facts put on the table the discussion on mental health and the psychological well-being of these populations and call attention to their diversity. According to Moleiro and Gonçalves (2010, p. 507) the effectiveness of psychotherapeutic and health services with ethnic minority groups results from a group of factors to be considered: 1) the understanding that the historical roots of psychotherapy are not neutral from the cultural point of view; 2) the recognition of some processes (reactions, behaviors or attitudes) of clients may be related to contextual and cultural aspects; 3) the existence of a vast literature on *“evidence-based practice”*, which emphasizes the use of clinical trials for demonstrating the efficacy of interventions that have neglected their applicability to minority client adjustment; and 4) the finding that health professionals themselves are not immune to biases and preconceptions that influence diagnosis, evaluation and intervention. This situation worsens when we combine multiculturalism with diversity in aging. For that reason, it is necessary to consider the training in multicultural competencies and ageing in health professionals, psychotherapists and trainers in higher education.

2. UNDERSTANDING AGE AND AGEING

What humans most fear in ageing or the onset of old age is the fact that it may arise associated with certain physical, mental, and social frailties. People are afraid to be sick, to stop being able to think, to be alone and helpless, to lose autonomy and power, to suffer and to die. Anxious feelings arise throughout human life and knowing how to deal with them makes the difference between a more peaceful life or not. Many people, when they become aware of the ageing process they are subjected to, deny, forget, or seek to slow down the evolution of events through strategies that minimize or hide signs of ageing (hair painting, hair implantation, plastic surgery and esthetics, anti-ageing creams, special makeup, procurement of material goods and services, involvement in too much tasks, ingestion of anti-ageing foods and taking anti-ageing medication). The mass media and the cosmetic and pharmaceutical industries have accentuated this phenomenon, which ends up reaching the older generations as well as the younger ones. Considering that no one can escape to the ageing process, some individuals adopt potentially destructive responses that endanger their personality and well-being. Concern about age is common among humans, but their overkill can take on proportions that lead to persistent, abnormal, obsessive and unjustified fear. High anxiety and persistent anguish arise that set in and trigger a specific psychological problem, which is reflected in a person's own distressing symptoms (insomnia, difficulty in relaxation, constant anguish, significant irritability, difficulty concentrating, headache, muscle aches, stomach aches, tachycardia, dizziness, tingling and cold sweats) affecting it psychologically and physically. We are talking about an anxiety disorder called gerascophobia, that is, *“a kind of phobia, which refers to abnormal persistent fear and unjustified to grow old, leading to unhappiness, regardless of the good health and financial position of the phobic subject”* (Delboni, Joaquim, Ploner & Cyrino, 2013, p. 204). Only people with gerascophobia become horrified and obsessed with the idea of growing old and facing one's own mortality. The excessive fear of becoming an adult or of aging, presents the usual manifestations of a phobia, such as, anxiety, fear and constant negative thoughts, that takeover of the individual life, causing him real fear when he thinks or refers to the theme of getting older and old age. According to Almeida and Azevedo (2004), the profile of the individual suffering from gerascophobia (irrational and persistent fear of growing old) presents as main characteristics traits of anxious, hysterical or narcissistic personality, and usually overestimates material possessions, has difficulty dealing with the loss of the seductive power or wealth.

The fear of aging comes within the scope of the problems related to a changing body, but also the fear of marginalization or rejection that old age can cause. After Butler's (1969) article on *“Ageism: Another form of bigotry”*, Butler and Lewis (cit. Garcia, 1988, p. 132) drew attention to popular myths about old age, highlighting three myths: 1) *Predominance of chronological age* (misconception that age expressed in numbers is more significant than the age at which the person feels and with which the person expresses himself in terms of efficacy and maturity); 2) *senility* (conviction that all old people are *“senile”*); and 3) *tranquility* (old age is understood to be a sea of roses and without fear). According to Lima and Viedas (1988), old age is a category of thought and in this perspective constitutes a central element of the social representation of the life cycle of individuals. The historical and cultural variability of conceptions about old age reflects the social construction of the

reinterpretation of the biological process (individual and universal) of the ageing of a society contextualized in a given epoch. Thus, we find different understandings about old age throughout the ages and from society to society at a given time.

Evidence has shown that vulnerability to aging in old age is associated demographically with being a woman living alone and in poor health (Kimmel, 1988). Discriminatory attitudes, mental health services and employment policies are examples of the interface between age and psychology, enabling new approaches to promote the well-being of older people. In this follow-up, ageing can be reduced by emphasizing diversity among older people, paying attention to compensating for reduced skills, and developing public policies based on need rather than age (Kimmel, 1988).

In our day, we can observe that associated with the uncontrollable fear of becoming adult and of ageing, also denominated of gerontophobia (*irrational and persistent fear of growing old, hatred or anger toward the elderly, or fear of the elderly*) we have the ageism (*describe stereotypes and prejudices held about older people on the grounds of their age*) (Clark, 2009). Ray, Sharp and Abrams (2006) identify three different types of discrimination: (1) under representative – passive/indirect discrimination by omission; (2) positive/protective – special treatment to benefit group; and (3) negative/overtly harmful – direct discrimination.

We can say that stereotyping based on age means that whoever does it attributes certain thoughts, attitudes or characteristics that are common to people of a certain age group. But, age-based prejudice arises when certain discriminatory behaviors are taken against people, in this case, the elderly, based on these stereotypes. According to the authors, “*Ageism is reflected in negative or positive stereotypes, as well as in prejudice or discrimination against (or to the benefit of) older people because of their age*”. (Iversen *et al.*, 2009; cit. José & Amado, 2016, p. 1). In its “*World Report on Aging and Health*” WHO (2015) considers it a priority to combat ageism. Consequently, political and local actors must be held accountable so that countries become more aware of and think more seriously about their public policies to implement for older people.

The document refers to the outcome of a worldwide investigation into the experience of ageing. More than 83,000 people from 57 countries participated in the study and the results were alarming, with 60% of respondents believing that older people are disrespected, particularly in poorer countries. In light of the evidence, WHO (2015) considers ageism as a public health issue. The main reasons are that the negative perception that the elderly population has an impact on public policies, for example, may inhibit politicians from taking actions aimed at this population, since public opinion believes it to be a “*burden*” or a “*less important*” question. On the other hand, most health problems faced by older people are associated with chronic conditions, especially non-communicable diseases. If there was an investment in health promotion and risk prevention for the elderly, these diseases could be prevented or delayed, but for that to happen society has to make a coordinated effort to promote healthy aging - and this depends on a vision more positive about it.

Another aspect highlighted by the report (WHO, 2015) concerns the observation of the stereotype about the understanding of what is a “*typically old person*”, stating that it does not exist. It turns out that one observes a diversity in the way each one ages, and everything will depend on how they lived their life and the resources they had available in their environment. For example, in some adults over the age of 80, levels of physical and mental capacity comparable to the levels of many 20-year-olds can be observed, but some 60-year-olds may need help. Despite this diversity, society persists in older people in a stereotyped way. As in discrimination by gender or race, in the case of age this ends up presenting itself as a definition of disability, regardless of the intrinsic capabilities of each.

Another stereotype of age discrimination that is generally observable over older people is that they are either dependent or burdened with the assumption that spending on aging is a loss in the economy and that the costs must be contained. Nowadays, we see another myth, since it is not clear that the elderly population generates high costs, ignoring the many contributions of older people to the economy. Another assumption is that older people will lead to unsustainable increases in health care costs by forgetting data suggesting that ageing has much less influence on health spending than a number of other factors, such as technology. Another myth that needs clarification.

Another myth is evidenced by the expression that “*70 is the new 60*”. It should be borne in mind that the fact that people live longer does not mean that they do so with a better quality of life and that they are healthier, and therefore it can be concluded that there is no longer any need for public policies to support them. For the 70s to be the new 60, it requires much more public health action focused on ageing.

Growing old in the future will be different from today. According to the report, change is occurring and has its implications at various levels: (1) urbanization and globalization have been accompanied by increased migration and deregulation of labor markets, which may be an opportunity for older people; (2) gender norms and the role of women have changed, they are no longer caregivers, performing higher safety functions at an advanced age; (3) the old models of family care are not sustainable, they require new approaches; and (4) technological change at the level of communication and information provides opportunities for family access and self-care orientation; and (5) the emergence of new support resources that are more functional and accessible, enabling opportunities for monitoring and personalized health care. Therefore, policies should update their performance at the level of aging through innovative and more productive approaches to enable ageing with well-being in health settings.

According to WHO (2015), there are a number of sectors and actors that can influence “*Healthy Ageing*” through a coordinated approach to policy and practice, which puts the needs and aspirations of older people at the center of attention. The report identifies three approaches as priorities for implementation and covering most sectors: (1) combating age discrimination; (2) allowing autonomy; and (3) supporting “*Healthy Ageing*” in all policies and at all levels of government. On the other hand, proposals are presented in the report for improving the effectiveness of interventions to improve the “*Healthy Ageing*”, which require a better understanding of common trajectories of intrinsic capacity and functional capacity, their determinants and the effectiveness of interventions to modify them. It is considered that the main actions to be taken to achieve this goal are three actions: (1) to identify the range and types of trajectories of intrinsic capacity and functional capacity and their determinants in different populations; (2) to quantify the impact of health care, long-term care and environmental interventions on the path of “*Healthy Ageing*” and identify the ways in which they operate; and (3) to better

quantify the economic contribution of older adults and the costs of providing the services they need for “*Healthy Ageing*” and to develop rigorous, valid and comparable ways of analyzing return on investment.

3. PROMOTION OF PSYCHOLOGICAL DEVELOPMENT IN AGEING

The contemporary perspectives of the study of human development call attention to several aspects to be considered in its approach that refer us to: (1) the relation between nature and nurture variables, between continuity and discontinuity, in the course of human development; (2) the integration of all levels of organization defined by the ecology of human development (from the biological and physiological to the cultural and historical); (3) developmental regulation through a mutual influence between the previous levels, from the genetic part to mental functioning, behavior, culture and society, and history; (4) plasticity in human development (a consequence of integrating levels of human development analysis, where the developmental system is characterized by a potential for change over time); and (5) relative plasticity (the regulation of development imposed, for example, by biological or contextual issues, can simultaneously facilitate or constrain opportunities for change, so that the magnitude of plasticity can vary throughout the life cycle). In any case, the potential for plasticity constitutes a fundamental orientation of human development (Sifuentes, Dessen & Oliveira, 2007; Fonseca, 2010).

Last century, from the 1970s, Urie Bronfenbrenner developed a scientific and epistemological model that came to be known as the “*Bioecological Model of Development*” (Bronfenbrenner & Ceci, 1994; Bronfenbrenner & Morris, 1998; cit. Sifuentes, Dessen & Oliveira, 2007). In this model, the interactions and interfaces between the subsystems of the ecological environment and the system that Bronfenbrenner (1994) called the chronosystem, the time system, are evidenced. The model proposes that human development be studied through the interaction of four interrelated elements: *the process, the person, the context and the time* (Ceconell & Koller, 1998; cit. Ceconell & Koller, 2013). Thus evidencing a holistic and systemic conception of human development. Considering the connection between the individual and the environment, Bronfenbrenner (1977) emphasizes the active role of the individual as an agent of his own development process. The author understands the development through a systemic vision, contemplating the continuity and reciprocity of biological, psychological and social aspects, and the changes and continuity of the individual are prospected in the prism of the evolutionary processes and variations that occur in the person and its environment to the over time.

The ecological environment is understood as a system composed of socially organized subsystems that support and guide human development and are confined to the ecological environment: *the microsystem* (patterns of activities, social roles and interpersonal relationships experienced by the individual, in a given environment, the From face-to-face interactions); *the mesosystem* (relation between microsystems); *the exosystem*, (environments in which the individual does not participate directly, but indirectly influence it); and the macrosystem (observed in the individual’s intimacy, in his behaviors and in his ways of intervening and relating in the microsystem) (Sifuentes, Dessen & Oliveira, 2007). The chronosystem added by Bronfenbrenner (1994) is understood as another level of the development context and refers simultaneously to the chronological age of the individual and to the social and historical time in which he lives.

How can we explain that aging can be “*successful*” in the face of an oscillation between developmental gains and losses in the sense of a progressive predominance of losses on gains that people are even fully aware of? The “*Selective Optimization with Compensation*” Model (SOC), allows answering the question posed. The use of “selection-optimization-compensation” mechanisms as a way of explaining the successful orchestration of human life is, starting from the pioneering work of Paul Baltes, a model of adaptation that can be applied to several domains Of human functioning (physical performance, social relations, cognitive activity, etc.), especially from middle age and during old age. (Fonseca, 2012).

Many authors note the idea that “*Not only is the world aging, but it is also aging differently*”. We must transpose the current image of older people in society associated with frailty, dependency, unproductive or a burden for society and for future generations. Studies show that the quality of life, welfare, maintenance of mental qualities are directly related to social activity, socializing, integrated feel and useful in family and community. However, ageing can also occur associated with certain physical, mental and social weaknesses. We know that good mental health and good memory enables seniors to realize their full potential and cope with life transitions and major life events. While poor mental health and poor memory has the opposite effect. So, we need to explore the changing social dynamics of aging and their multiple contexts and promote wellbeing in all aging people.

Studies have shown how the quality of life, welfare, maintenance of mental, physical and social qualities are directly related to the performance of meaningful and rewarding occupations (Carvalho & Dias, 2011). Thus, according to “*European Union and Committee of the Regions*”, (Andor, Bresso and Sedmak, 2011), one must know how to make the most participatory senior citizens in society, the actors in their own development.

The studies show that “*the fact that individuals are transformed not only in appearance over the adult years, but in social and life patterns, in interests and priorities, and in relationships and inner qualities. No longer is the mature adult to emerge fully formed after a succession of developmental stages in childhood. Adulthood itself is now recognized as a period of active and seemingly systematic change*” (Wortley & Amatea, 1982, p. 476). According to Fernandez-Ballesteros (2000), the understanding of the indicators of functional age (functional capacity, reaction time, Satisfaction with life, the breadth of social networks) makes it possible to create the conditions for a satisfactory aging. Maintaining functional capacity throughout life, in particular starting at age 65, is now a priority for healthy aging. Purpose of the World Health Organization, draws attention to the relevance of educating people from middle age, “*in healthy lifestyles, management of stress, the need for adequate exercise and nutrition and the prevention of autonomy as well as Prevention of disease. This process must begin in midlife in order to be fully effective*” (Schroots, Fernández-Balesteros & Rudinger, 1999, p. 144).

The possibility that older people, despite their chronological age, may continue to show positive traits of psychological development is increasingly accepted by scholars. Positive traits of development are particularly visible in individuals whose

aging process corresponds to “successful aging” (Baltes & Carstensen, 1996).

Martin Seligman (2011) in his book “*Flourish*” comes up with a “*visionary new understanding of happiness and well-being*” and presents us as goal of positive psychology to increase the amount of flowering in the life of humans and the planet. In his theory of well-being (The PERMA Model) he presents us five elements (positive emotion, engagement, meaning, positive relationships and accomplishment) and each one has three properties: (1) contribute to well-being; (2) be desired by many people for their intrinsic value; and (3) be defined and measured independently of the other elements (exclusivity). To flourish the individual has to possess all the nuclear characteristics (positive emotions, engagement, interest, meaning, purpose) and three of the six additional characteristics (self-esteem, optimism, resilience, vitality, self-determination, positive relationships). However, not all humans are fit or have the skills to achieve happiness. There are strategies and plans to achieve happiness, such as forming the mind for happiness, paying attention to others, such as spending money on others to promote happiness and follow the code for well-being and happiness. In this sense, a positive lifelong education can be an action to be favored and implemented by decision-makers and politicians, which will be welcomed and worked by psychologists. Therefore, the importance of aging as a psychological issue must be recognized and included in the public debate and training of gerontology professionals

4. PROMOTING HEALTH IN AGEING

Studies have shown how quality of life, well-being, and maintenance of mental, physical and social qualities are directly related to the performance of meaningful and rewarding occupations (Carvalho & Dias, 2011). Thus, according to European Union and Committee of the Regions (Andor, Bresso, & Sedmak, 2011), it is necessary to know how to make senior citizens more participatory in society as actors of their own development. The developmental perspective of the aging process is based on three aspects (Fonseca, 2005): (1) *the development potential*; (2) *adaptive capacity*; and (3) *the limits of this adaptive capacity*. Thus, we can expect older people to be competent and responsive to ageing, to enable them to deal with the situations and problems of the transition and the implications of aging. The ability of the elders to self-actualize with their new stage of their lives allows them to be open to new challenges, willing to experience different experiences, and to outline a new life project.

Providing senior citizens with a quality life means that professionals working with this population (in social, educational, health or political contexts) dialogue and implement continued strategies of productive aging, so that these citizens are participative in society and perceive well and satisfaction with life. It is also important that they know and can consciously protect their health by outlining their limits and taking precautions to protect their health and not put them at risk.

Adopting healthy lifestyles in old age provides a potential benefit to the preservation of senior health and autonomy, enabling healthy aging. Various aging support structures have therefore been created and a number of programs have been developed to ensure social support, personal training and development, health promotion or disease prevention and control.

The concept of quality of life has been presented in several perspectives, but the definition of quality of life of the World Health Organization is the one with the greatest international consensus (Canavarró & Vaz Serra, 2010). Quality of life is defined as “*the individual's perception of their position in life within the context of the culture systems and values in which they are inserted and in relation to their goals, expectations, standards and concerns*” (WHOQOL Group, 1994, p. 28). The WHOQOL-100 (WHOQOL Group, 1993, 1994, 2006) was developed to assess the quality of life, with the following domains: Physical; Psychological; Level of Independence; Social relationships; Environment; and Spirituality. Later, a shortened version of the WHOQOL was made up of 26 items and organized into 4 domains: Physical, Psychological, Social Relations and Environment, including a facet about general QoL (quality of life in general and general perception of health).

Baltes and Baltes (1990) presented the concept of “*Successful ageing*” (SA), highlighting the heterogeneity of the aging process and the existence of a reserve in order to compensate for the decline of certain skills. Although they defend the principle of developmental continuity of gains and losses throughout the life cycle, they consider that there are limits exposed by age for adaptation and behavioral plasticity, triggering an increase of losses and a decrease of gains. Thus, in this perspective, aging can be understood through the selection, optimization and compensation model, interactive adaptation mechanisms that always seek the maximization of gains and the minimization of losses (Baltes, Staundinger, & Lindenberger, 1999, Martins, Guedes, Cabral Pinto & Fonseca, 2006).

The World Health Organization (WHO, 2002) went even further when it emerged with the concept of active aging, such as the “*process of optimizing opportunities for health, participation and safety, in order to increase the quality of life during ageing*”. On the other hand, studies show that quality of life, well-being, and maintenance of mental qualities are directly related to social activity, socializing, feeling integrated and useful in the family and community (Carvalho & Dias, 2011). In evidence of the diversity of the world in which we live, the approach of older people to promote their healthy aging should be carried out in a specialized manner taking into account their needs and specificities.

5. DISCUSSION

It is a reality that we are all in a process of development throughout the life cycle. That progression has to consider the ageing process of a personality contextualized in its environment. The understanding of ageing is related to the thinking and feeling of a person in a particular space and time of life, in particular, understanding the meaning of change and continuity in time. But also, with the conception produced differently in each society, the social representation of the life cycle, the relations that are established between the members of the community and society and the quality of the integration of the person in the social and ecological context.

Ageing with well-being and quality of life implies the involvement of one's own family, community, and society. It is therefore necessary to create and organize conditions for community participation that respects senior involvement and the promotion of synergies in support of ageing with happiness. We are facing a set of dynamics to develop in the area of individual, family, social and political responsibility. Giving more life each year from the age of 65 implies creating support and empowerment structures for older people in society and preparing young people and coaches to be able to deal assertively with the ageing of their community. Seligman (2012) mentions that public policies derive only from what we measure. In recent times, there has been an overvaluation of money, of gross domestic product and of the economy, which has little to do with the development of human welfare. We are in the line of Seligman (2011), the goal of generating wealth only makes sense if it generates human flourishing, and consequently happiness for all. It is necessary to embrace the challenge of positive psychology, to measure and develop human flourishing, and now, throughout the life cycle. We do not want the increase of ageism or gerontophobia, nor of cases gerascophobia, therefore, we must work to prevent this from happening. The importance of ageing as a positive psychological issue must be recognized and included in the public debate. Psychology training for professionals working with older people at an individual and community level also needs to be considered and implemented with greater awareness, only in this way can it promote the flowering of people of all ages and end demystification of ageing.

COMMUNITY INTERVENTIONS TO PROMOTE HEALTHY AGING

Ana Sobral Canhestro
Polytechnic Institute of Beja - Portugal
(ana.canhestro@ipbeja.pt)

ABSTRACT

Healthy aging interventions emerge as a priority due to the demographic and epidemiological transitions in the second half of the twentieth century, mainly in the developed countries. This promotion should be developed throughout life, because a childhood and healthy adult ages are an important factor for a healthy aging. This article presents a secondary analyses of data from a qualitative study that investigates healthy lifestyle interventions in Baixo Alentejo, Portugal.

From the analysis of the interviews, it is highlighted that healthy lifestyles promotion is part of the practices developed in community interventions. Health professionals and municipalities are committed to implementing community interventions to promote health, based in policies addressed to physical and cultural environment and to the educational process of communities, promoting active participation, empowerment and equity. Partnerships, active citizen participation and evaluation of effectiveness are considered essential in the development of community interventions, despite the difficulties encountered. The majority of the interventions have as participants the children and the elderly, evidencing difficulties in the participation of people in active age.

Keywords: Healthy Aging, Healthy Lifestyles, Community, Intervention.

JEL Classification: I18

1. INTRODUCTION

Health promotion interventions are a priority considering the demographic and epidemiological transitions. Life expectancy has progressively increased over recent decades and is expected to continue. In association to the demographic aging, non communicable diseases such heart disease, high blood pressure, cancer and diabetes are the major causes of morbidity and mortality, increasing health expenditures and reducing the life's quality of older people. Many studies now suggest that non-communicable diseases may not be a necessary consequence of aging if a healthier lifestyle is adopted throughout life. Since a healthy lifestyle seems to be more influential than genetic factors in maintaining health throughout the aging process and although the risk of disease and disability increases with age, poor health should not be a necessary result of aging (Nuñez, Armbruster, Phillips, and Gale, 2003; Oxley, 2009).

Although the promotion of healthy lifestyles should be developed throughout life, the adulthood and particularly the middle-age has become the focus of specific interventions for healthy aging promotion and to reduce risk factors of non-communicable diseases. However, because they are busy with multiple professional and family tasks, middle-aged adults do not participate much in health promotion interventions and despite the great benefits from the adoption of health promotion behaviors they are not always able to incorporate and maintain healthy behaviors in the daily lifestyle.

2. BACKGROUND

Portugal integrates in the present the list of the most aged countries of the world and Alentejo constitutes, for several years, the most aged region of the whole national territory, and also presents the most elevated percentage of persons with decline of the level of health, as a result of acute and chronic conditions (Santana, 2000; Santana, Alves, Couceiro, and Santos, 2008; INE, 2012).

Pogressive aging of our societies should be viewed as positive phenomena and an opportunity to focus on a positive health promotion throughout the life-course (Ruciman *et al.*, 2006), however this new reality is also a challenge for many sectors of society and recent projections predict an overall increase in public spending related to population aging, there is however a general consensus that the impact of these costs can be minimized by keeping healthy, autonomous and independent people for the longest period possible (Oxley, 2009; Davim *et al.*, 2010; Drennan *et al.*, 2005; Ming, Gao and Pusari, 2006).

The World Health Organization (WHO) policy framework on ageing comprise a life-course approach to healthy ageing, recognizing that actions to ensure quality of life in old age should begin well before older age is reached. Central to the maintenance or improvement of health of the individual, families, groups and communities are health promotion and disease prevention activities. Health promotion is the process of enabling people to increase control over the determinants of health and thereby improve their health (WHO, 1986; Nutbeam, 1998). Increasing evidence shows that in order to have interventions effective and sustainable communities need more than information, they need to be involved in decisions about the implementation of interventions to promote health or to prevent disease (Rifkin, 2016). Participation is essential to sustain health promotion actions (Nutbeam, 1998). Health promotion embraces not only actions directed at strengthening the skills and capabilities of individuals, but also actions directed towards changing social, environmental and economic

conditions so as to influence public and individual health. It includes political and social interventions designed to change policies and services as well as to promote social responsibility for health (Nutbeam, 1998).

The principles of Primary Health Care are articulated, in 1978, in the Alma-Ata declaration signed by member states of the World Health Organization (OMS, 1978). Portugal is one of the countries that has been determined to put primary health care principles into practice with excellent results in most health indicators. Primary health care is nowadays the central pillar of the Portuguese health system, based on a community health center network covering the entire country. In 2005, Portugal began a reform of Primary Health Care and five different types of small multi-professional teams were created, called functional units of the health center groups, one of these teams is a Community Care Unit that is coordinated by nurses and has as one of its specific tasks: providing community interventions in response to community needs (Biscaia *et al.*, 2008).

The Helsinki statement on Health in All Policies (WHO, 2013) reinforces the idea of the inter-sectorial action and healthy public policy as central elements for the promotion of health, the achievement of health equity, and the realization of health as a human right. Health in All Policies is an approach to public policies across sectors that systematically takes into account the health implications of decisions, seeks synergies, and avoids harmful health impacts in order to improve population health and health equity. It improves accountability of policymakers for health impacts at all levels of policy-making. It includes an emphasis on the consequences of public policies on health systems, determinants of health and well-being (WHO, 2013).

For the development of community health promotion interventions, it is crucial to build partnerships between primary health care and local government as well as with community institutions (e.g. schools). The key role of local government in tackling the social determinants of health and in health promotion interventions has been increasingly recognized because the municipalities offer support environments for healthy living and also because they are par excellence the partners of other community organizations and health care to the achievement of health-promoting interventions (Loureiro and Miranda, 2010). In Portugal, the involvement of municipalities in issues related traditionally to the health sector is not very expressive, and only about two decades a relatively small number of municipalities has been committed explicitly in this aspect of the citizen's life (Loureiro, Miranda, and Miguel, 2013).

Health promotion in general, and the promotion of healthy aging in particular, is a process in which the community nursing plays an important role, always ensuring the active participation of citizens and the involvement of all relevant stakeholders. The work of community nurses is increasingly putting the emphasis on promoting healthy lifestyles throughout life in order to healthy aging. Working in partnership with groups to achieve a deep understanding of local contexts may assist nurses when building up pictures of people's health-related needs and views (Manthorpe, Maim, and Stubbs, 2004; Ruciman *et al.*, 2006; Ming *et al.*, 2006).

3. METHODS

This article presents a secondary analyses of data from a qualitative study intended to understand, in the perspective of health professionals and representatives of local authorities, how the promotion of healthy lifestyles is prosecuted in Baixo Alentejo, Portugal. It was developed with resource to a qualitative methodology: qualitative content analysis of the fourteen semi-structured interviews conducted. The key informant interviewees were purposively selected, based on the snowball method, from professionals identified as having an important role in community health promotion interventions.

The interviews were conducted by the researcher using guided questions. All interviews were recorded, after the participants' consent, and fully transcribed afterwards. The thematic content analysis method proposed by Bardin was used, resulting in the categorization process (Bardin, 2009). This method is based on the analysis of the contents described based on the interviews, in order to identify the divergences and convergences the subjects defined and group them in categories. This methodological trajectory is organized in three phases: Pre-analysis; Exploration of the material; and, finally, Treatment of the results: inference and interpretation (Bardin, 2009).

The researcher conducting the analyses familiarized herself with the transcribed data by reading through the transcripts numerous times with the aim of identifying main themes and sub-themes. The guide questions also informed the identification of themes in the analysis process, as these questions referred to the main issues that needed to be covered in the interviews.

3.1 Ethical considerations

Approval was obtained from the Baixo Alentejo Health Local Unit Ethics Committee. The author provided information about the study to all participants. Informed consent was obtained from all participants, who were assured of confidentiality and of their right to refuse to answer any question or withdraw from the study at any time.

4. FINDINGS AND DISCUSSION

From the analysis of the interviews, it is highlighted that the promotion of healthy lifestyles is part of the practices developed both in the context of consultation in primary health care and in community interventions. Schools are the main community context where those interventions are developed, often integrated in the school health program and especially for the promotion of healthy eating and the prevention of childhood obesity as is widely recommended (George, 2014). These results highlight the traditional partnership between Schools and Health Centers already mentioned by Loureiro, Gomes and Santos (2011), who emphasize that the role of municipalities in health has been residual, however with the extension of their competencies at the level of Education, makes possible a greater investment of the municipalities in the promotion of the

health of the communities, aspect that is reinforced by the findings of our study. Community health professionals are the main promoters of community interventions to promote healthy lifestyles however municipalities also play an important role in promoting activities mostly for promoting of physical activity, activities that require greater investments in skilled human resources, adequate spaces, and equipment, being recognized by the professionals interviewed that the existence of conditions that favor the practice of physical activity is, today, a reality in all municipalities of the Baixo Alentejo.

Most interventions developed by municipalities are for children and elderly. Similar results was found in other Portuguese studies (Loureiro *et al.*, 2011; Bárrios and Fernandes, 2014) and it is emphasized that the aging of the population, the complexity and the multidisciplinary nature of health are increasingly leading municipalities to intervene in the area of health promotion and disease prevention.

Health promotion interventions for middle-aged people and other adults at active age are less frequent and the professionals recognized that this group of population participate less because they are busy and therefore less available and often the timing of interventions are not compatible to their availability. Interventions to promote health of middle-aged people are considered crucial, since it is an important period in adulthood, known as a dynamic transactional stage of development with important changes of roles and health status and where important decisions are made that will have an impact on later life (Grossbaum and Bates, 2002; Fagulha, 2005; Papalia, Olds, and Feldman, 2006). So that professional support and information to assist the decision-making may be useful (Manthorpe *et al.*, 2004). Non communicable diseases such heart conditions, high blood pressure, cancer and diabetes are the major causes of morbidity and mortality often begin in middle age (Lachman, 2004), making it a key stage in the prevention and control of these diseases (Darnton-Hill, Nishida, and James, 2004). Preventive interventions may target populations that are in good health, just as health promotion interventions may address people with a chronic illness and although health promotion and disease prevention originate from different theoretical backgrounds, in practice, the interventions tend to overlap (Wosinski, Cordier, Bachmann, Gagnon, and Kiszio, 2016).

With regard to gender, men participate less than women in community interventions, an aspect which is corroborated by international studies (OMS, 2007; Papalia *et al.*, 2006; Zhang *et al.*, 2011).

Respondents also refer the cultural, economic and educational issues as important determinants of participation in community interventions. Economic issues (often related to educational level) dramatically influence people's health and health behaviors (Bicudo, 2009; Loureiro and Miranda, 2010; Pender, Murdaugh, and Parsons, 2011) and also the demand for health care (Loureiro and Miranda, 2010). It is not possible to affirm that there is a direct relationship between health and educational level in all situations, since not always knowledge is synonymous with the adoption of healthy lifestyles (Loureiro and Miranda, 2010), however, it is recognized that the educational level influences the choice of behaviors to adopt because *"an individual's ability to obtain, process, and understand information is essential to being an informed consumer who can make appropriate decisions for self-care, health, and well-being."* (Pender *et al.*, 2011, p. 267) but also because limited literacy skills have been associated with negative health behaviors (e. g., people with the lowest level of education consume more tobacco, alcohol, and illicit substances, engage in less physical activity, use less the seat belt) and with less availability and access to preventive health services and screenings (e. g., flu vaccines, mammograms, colonoscopies) as well as lower adherence to therapy for the control of chronic diseases and consequently worse health and higher mortality (Loureiro and Miranda, 2010; Pender *et al.*, 2011; Crisp *et al.*, 2014).

An interesting range of inter-professional and inter-sectoral collaborative partnerships in health promotion intervention, mostly initiated by primary care teams, were described. Municipalities and other community organizations also seek the health sector as a preferred partner in health promotion interventions. These findings suggest that professionals are aware that interventions developed in partnership achieve health outcomes or intermediate health outcomes in a way which is more effective, efficient or sustainable than might be achieved by the health sector acting alone (Nutbeam, 1998; WHO, 2013). Similar results were found by Runciman, Watson, McIntosh, and Tolson (2006) that reinforce the important role that community nurses have in these partnerships, which emerged as a strategic response to policy, and as a pragmatic response on the part of community nurses to sharing the load and getting the work done. However, we need to emphasize that this partnerships should consider the patient a partner and an active member in the planning, implementation and evaluation of health promoting care (Manthorpe *et al.*, 2004; Runciman *et al.*, 2006; Guedes *et al.*, 2012). It should also be noted that these partnerships, particularly with regard to municipalities, are usually integrated into networking, an area where municipalities have great experience (Loureiro *et al.*, 2013). Despite the mentioned advantages, some difficulties are also mentioned in the work in partnership, being mentioned difficulties of articulation with the Schools and in the articulation between the health sector and the local authorities.

In regard to active citizen participation in the planning, implementation and evaluation of health promoting care, the respondents are aware of this importance and seek to promote it, which is consistent with the WHO recommendations: *"health promotion activities may be participatory, involving all those with a vested interest in the initiative; interdisciplinary, by involving a variety of disciplinary perspectives; integrated into all stages of the development and implementation of a health promotion initiative; and help build the capacity of individuals, communities, organizations and governments to address important health problems"* (Nutbeam, 1998, p. 22). This perspective of the interviewed professionals is corroborated by Rifkin (2016) who reports that there is growing evidence that, in order to have more effective interventions, communities and citizens need to have more than information, they need to be involved in decisions about the implementation of interventions. The identification and involvement of community leaders in the process of intervention planning is one of the strategies, mentioned by the interviewees, to promote active citizen participation. This strategy had already been mentioned by Davim and colleagues (2006) as fundamental for increasing active participation of citizens. The prominent role given by the interviewees to the establishment of a partnership between the professionals and the participants during the planning and execution of the interventions, is in line with what is considered essential by several authors (Nuñez *et al.*, 2003; Davim *et al.*, 2006; Ming *et al.*, 2006; Runciman *et al.*, 2006) however are

reported difficulties: some interviewees report an absence of participation culture, considering that people continue to leave important health decisions in the hands of health professionals. This aspect is in line with some passivity of the Portuguese population in its relations with health professionals and the health system, referred to in the report 'A future for health - we all have a role to play' (Crisp *et al.*, 2014) and does not seem to be unique to the Portuguese population since, in a study carried out in Spain, difficulties in the active participation of citizens were recognized as a threat to community intervention (Adella, Ruab, Solerc, Alvareza and Farga, 2016).

Should also be noted that health services alone can never create a large, self-sustaining community participation, since people and communities have other priorities in their daily lives and it will not be realistic to set and follow standard models of community participation as they may collide with cultural and historical aspects strongly entrenched in the communities, it is very important that active citizen participation is seen as a process and extends to other aspects of community life in an inclusive perspective of community development (Rifkin, 2009). *"Programs that mobilize communities around health issues alone have proved to have short lives"* (Rifkin, 2009, p. 33). Although there is not much scientific evidence to directly connect community participation to better health outcomes (Rifkin, 2009), it is increasingly recognized as fundamental to improve and maintain the interventions that bring significant contributions to health improvements (Rifkin, 2014), particularly in the vulnerable groups (Rifkin, 2009). Specific practical initiatives are recommended to empower citizens and begin to change the cultural aspects that act as barriers to their participation in decisions concerning their health (Crisp *et al.*, 2014).

This study also reported difficulties inherent to the professionals, which often take the lead role in the planning and implementation of interventions without being able to involve citizens. Health is an area where the main decisions are based on expert knowledge, is therefore a traditionally more hermetic area of citizen participation, which justifies in some way the difficulties experienced by health professionals and citizens, it is important that citizens want to be involved or express their opinion on health care planning and organization, in other words, participation should depend on the will of the citizens and not on a previously stipulated obligation (Serapioni and Matos, 2013). It also seems clear that many of the health professionals' difficulties arise from the fact that health professionals continue to have a training and practice centered on the biomedical model, which, being essential for disease prevention and control, has limitations when directed to promote health (OMS, 2008). In this biomedical model the participation of citizens is seen as their mobilization to respond to information provided to them by health professionals and not as their active involvement in decision making (Bathia and Rifkin, 2013), being the professional experts who take the leading role and the citizens have a passive role.

The findings of this study show the importance of interventions to promote healthy lifestyles are effective generating gains in health. To evaluate the effectiveness of interventions professionals seek to use objective indicators, but since it is not always easy to find reliable and valid measures (Nutbeam, 1999) are reported some difficulties and sometimes adopted a subjective assessment based on the perception that professionals have on improving the health and lifestyles after the interventions. The resolution of this aspect seems to be crucial, since the evaluation of the interventions is very important, allowing to modify or adapt the planning or the strategies, and can even influence the policies of health promotion and reduction of inequalities (Lopes, Mendes, Nunes, Ruivo, and Amaral, 2014).

In order to increase the effectiveness of the interventions, some strategies are mentioned, emphasizing adequate health planning that starts with the assessment of health needs, the characteristics of the community or group, and the opportunities and resources. This planning should be carried out with the active participation of the community, aspects corroborated by several authors (Nuñez *et al.*, 2003; Manthorpe *et al.*, 2004; Ming *et al.*, 2006; Runciman *et al.*, 2006; Pender *et al.*, 2011; Bárrios and Fernandes, 2014). Another strategy that is considered essential by the interviewees is the empowerment and accountability of people for their health, in line with what was recommended by the WHO, reinforced in several International Conferences for Health Promotion and this strategy is strongly linked to the previous one because the active participation requires empowered citizens, who express their opinions and their knowledge experiential in order to more appropriate interventions (Serapioni and Matos, 2013). The early start of healthy lifestyle promotion interventions is also considered strategic and meets international recommendations (WHO, 2003; WHO, 2005a; WHO, 2005b; WHO, 2009; CDSS, 2010; Marmot, 2014), being widely recognized that a healthy childhood and adulthood are important determinants of healthy aging (Oxley, 2009; Sanders, 2006; Hartman-Stein and Potkanowicz, 2003; Nuñez *et al.*, 2003; Marmot, 2014).

5. CONCLUSIONS

The results of this study cannot be generalized, as they refer to particularities related by the fourteen participants about their perspective from the promotion of healthy aging interventions in Baixo Alentejo – Portugal, however findings can be compared with those of other studies in the literature.

Community interventions to promote healthy lifestyles are mostly developed by health professionals working in community and municipalities. Partnerships, active citizen participation and evaluation of effectiveness are considered essential in the development of community interventions, by the respondents, despite some difficulties related.

Children, young people, and elderly are the main participants of the programs of healthy lifestyles promotion. Health promotion interventions for middle-aged people and other adults of working age are less frequent. Age and gender are considered as the main factors related to participants that influence the development of interventions to promote healthy lifestyles.

Most community interventions to promote healthy lifestyles interventions are not evaluated reflecting a lack of standardized measurement tools and methods.

One of the most mentioned strategies to increase the effectiveness of health promotion interventions is the involvement of the community and partners in the planning, implementation and evaluation of interventions, however there are difficulties

in community empowerment and a lack of culture of participation in people and communities.

Our findings suggest that there may be merit in:

- Consulting and actively involving people and communities in health promotion interventions.
- Finding strategies to enable increased participation of adults at active age and particularly middle-aged people.
- Strengthening a life-course approach to healthy ageing.
- Strengthening inter-sectoral and multi-professional partnerships.
- Promoting mechanisms for evaluating the effectiveness of interventions promoting healthy lifestyles.
- Considering effective ways of developing and evaluating practice change.
- Valuing the health promotion work in the community by primary care and municipalities.
- Continuing to design interventions based on the assessment of the health needs of populations.
- Being alert to trends and changes in all sectors of society and understand how these may affect the health of the population.

ACKNOWLEDGEMENTS

The researcher gratefully acknowledges the help received from the participants in this study and the advisory panel.

ABSTRACT

Based on an action-research perspective, the main objective of the present research is to know the experiences of the retirement, mental health and quality of life of pensioners of a Transit Detachment of the GNR to delineate intervention strategies that promote the well-being of retirees Professional group. For its accomplishment a qualitative and quantitative research methodology was used, of exploratory and transversal character. Participants in this study were people who were selected intentionally and with criteria, namely: to reside in Beja, to be willing to participate in the project and to be retired from the GNR Transit Detachment of the same locality. This included the participation of three elderly men, all male, aged 58-68, their wives and the District Commander of the GNR. The evaluation tools used were: the Semi- structured Interview on Mental Health and Well-being in gerontologists, the Mental Health Inventory and the WHOQOL-OLD adapted for the Portuguese population. The results obtained after this work, showed that the aging of the elderly is not happening in an active and successful way. Through the application of the Mental Health Inventory, it was verified that two participants did not present symptoms and one (P1) presented total results of severe symptoms, values indicative of lack of positive affection and low scores in the level of positive well-being. This participant was found to have severe mental health symptoms and indicative values that indicate that he “needs to improve his quality of life” due to deficiencies in past, present and future Satisfaction with goals achieved in life and projects to be carried out) and Social Participation (which assesses participation in daily activities, namely, in the community) The other two senior point to results of: “*regular quality of life*.” The research carried out allowed a better understanding of the specificity of the dynamics of reform in the GNR and contributes to reflect on intervention strategies in this area.

Keywords: Aging, Reform, Mental Health, Quality of life, Retired.

1. INTRODUCTION

Aging arises naturally and working life comes to an end and entry into retirement begins. At present, the advancement of medicine has provided conditions for people to live longer. Aging is a vital process inherent in all human beings, but the longevity achieved has no meaning without the essential conditions for obtaining quality of life. The existing paradigm, faced with the issues of aging, appears to be more comprehensive, in the sense of recommending the quality of life and health, in its most diverse nomenclatures, of the older ones with maintenance of physical, psychological and social autonomy, in which the elderly people are integrated into a secure society and can enjoy a full citizenship, considering this fact, together with the consolidation of the reform, its experiences and its consequences, it is thought that the relevance and timeliness of the theme is relevant. In that the promotion of the quality of life, in a stage of life in which the physical decline is unavoidable, implies to consider multidimensional criteria, like the maintenance of the social network and of significant activities.

The perspective of active aging emphasizes simultaneously the contributions made by the elderly to society through the goods they produce and the welfare and quality of life derived from the process (Kaye, Butter, & Webster, 2003). This concept applies at both individual and population level. Active aging, according to (Lopes, 2008, quoted by Escoval, 2008: 282), “enables people to reach their potential for physical, social and mental well-being through the course of life and to participate in society in accordance with Their needs, desires and abilities (...)”. At bottom, a stage of life with the continuation of active participation in society and not only the physically active body. Health is, for the generality of the elderly, a fundamental aspect when it is equated the respective psychological well-being. Maintaining mental health and active memory is a constant challenge as not all intelligence skills decline and others are preserved or may slightly improve. Mental illnesses are mostly associated with structural and functional alterations of the brain, often repercussions on some cognitive processes, such as memory (Nunes, 2008). As Fonseca (2011) argues, there is a great effort to understand the transition and adaptation to retirement, but it is important to note that none of these approaches can fully explain this transition. Therefore, the general objective of this work is related to the starting question: “*How are the experiences of the retirement related to the quality of life and mental health of the Gerontes of the Transitional National Guard of the Republican Guard in Beja?*”.

2. AGING

Aging is a process in development, common to all living things, but containing differentiated characteristics. It is an irreversible process, in which its natural term is the death of the organism (Fontaine, 1999). The same author also mentions that aging assumes a differentiated processing that reveals objective data, such as the reduction of intellectual capacity, physical degradation, tendency decrease of the perceptual and mnesic functioning, among others, and at the same time, subjective data, which constitute the representation that The person himself makes of his own aging. These changes suggest a set of movements in the individual's adaptive capacity, which may result in gains, which translate into growth, or losses, which translate into decline (Fonseca, 2005). The loss of social roles and the transition to an inactive life through retirement bring changes in the daily life of the elderly that may have negative repercussions on the healthy aging process (Bortolanza, Krahl & Blasus, 2005). In today's society, not only are older people more and more, but they also live longer, that is, there is a high average life expectancy, something that did not happen before. With the increase in the average life expectancy and the number of the elderly, the study of aging becomes essential. This is an issue that has arisen in today's societies, as a result of the growing decline in fertility rates, where the renewal of future generations is not guaranteed. This process usually occurs in the transition between the working age and the retirement age, which is more evident from the point of departure from the labor market and a separation from a period delimited by schedules, routines and responsibilities, ending in one unexpectedly, suggesting a break in the interrelationships of individuals. There is then a decrease in daily coexistence and the obligation to perform certain tasks, which is a privileged space for declining (Esteves, 1995).

Being old is not, as it has been in the past, an exceptional situation and tends to become increasingly vulgar (Rosa, 1993). Aging is a universal and irreversible process, replete with changes and transformations caused by time. According to Lima (2010), these transformations are linked to the interaction of internal factors, namely genetic and external patrimony, such as lifestyle (food, activity, among others). The concept of aging in Portuguese society is often associated with a specific phase of the life cycle, the retirement age (65 years), which is perceived as the beginning of old age (Squire, 2002). In turn, Paúl and Fonseca (2005) define aging as a genetically determined and environmentally conditioned energy loss, leading to an increased likelihood of contracting diseases, accidents, and instabilities. Already Moniz (2003), affirms that the aging is a process influenced by the social and cultural context in which the person inserts itself. As a multidimensional process, it focuses on the interdependence between biological, psychological and social age: the first is linked to organic aging and integrates the changes in the body associated with the passage of time, in which each organ undergoes modifications that alter the functional and individual capacity; the age psychological relationship is related to the skills that the individual mobilizes in response to changes in the environment and includes, for example, intelligence, memory and motivation; The social age refers to the role, status and habits of the individual relative to other members of society, is strongly determined by the culture and history of the country and translates indicators of family and social health. *"It is noteworthy that human aging is not only a demographic problem, but it is above all a more complex phenomenon that involves sociocultural, political and economic aspects in dynamic and permanent interaction with the biological and subjective dimension of individuals"* (Carvalho & Dias, 2011: 4). This means that it is not just a broader age pyramid at the top, the current situation is much more pertinent than this reality. Socio-cultural factors, Political and economic factors are daily causing several obstacles in the life of the elderly, allowing a decrease in subjective well-being. According to Costa (2002), although there is no biological, psychological or social basis for marking or defining the onset of aging, it may be seen as a decrease in adaptive capacities to the environment and life aggressions. Studies show that it becomes crucial to associate old age with a life stage with joy and disposition, interspersing opportunities related to an active life. It is important to stimulate the brain as well as constantly challenge the body and mind. Following an earlier concept of healthy aging, "Active Aging" emerges, which was introduced in 2002 by the World Health Organization (WHO) and is intended to be more comprehensive, extending beyond health, To socioeconomic, psychological and environmental aspects, in order to improve the quality of life of people who, over time, are aging (Ribeiro & Paúl, 2012). WHO (2005: 13) proposed the concept of active aging as the *"process of optimizing opportunities for health, participation and safety in order to increase quality of life during aging"*.

Quality of life, well-being, and maintenance of mental qualities are directly related to social activity, socializing, feeling integrated and useful in the family and community (Carvalho & Dias, 2011: 164). This concept applies at both individual and population level. Active aging, according to (Lopes, 2008, quoted by Escoval, 2008: 282), *"enables people to reach their potential for physical, social and mental well-being through the course of life and to participate in society in accordance with Their needs, desires and abilities (...). At bottom, a stage of life with the continuation of active participation in society and not only the physically active body. Often, derived from the constant stereotypes, the elderly are considered as burdens, or someone who no longer 'produces'".* On the contrary, it is evoked without realizing that the older is the individual, the more active his role in society is, which represents a potential in it. In order to make society more aware of the contribution of older people, the European institutions in 2012, the European Year for Active Aging and Solidarity between Generations, launched a series of actions aimed at combating social exclusion Reinforcing their active participation in society, thus allowing healthy and independent aging. Active Aging is promoted in three areas: employment, participation in society and autonomy. With regard to the former, it is necessary to give better prospects of employment to older workers; As regards the latter, to ensure greater recognition of the contribution of older people to society and to create the conditions to provide them with more support; In relation to the third domain (autonomy), it is also necessary to develop the capacity of the elders in order to maintain their autonomy for the maximum possible time.

Verdi composed the opera "Falstaff", about eighty years old, Michelangelo made the frescoes of the Sistine Chapel almost at the end of his life, at the age of eighty-nine. These facts point to a heterogeneity, in which aging is not a fatality, but a time with new aspects of life and combinations gathered by experience and facts lived and shared previously. In short, the way of aging is related to the way we develop and the aging process is characterized by being continuous, irreversible

and universal, implying the occurrence of several changes in the organism that have repercussions in different dimensions of human development. The notion of active aging refers to the possibility of aging with health and autonomy, continuing to participate fully in society as an active citizen. Regardless of age, everyone can continue to play a role in society and enjoy a good quality of life. The challenge is to make the most of the enormous potential that each one retains to the end of life. Nevertheless, in their universality, there are several forms of aging, associated with both the variability of the characteristics of the individuals and the socio-cultural context. In this sense, aging is related not only to biological and psychological changes, but also to the dominant social patterns and the way societies view aging.

3. MENTAL HEALTH IN AGING

Although old age is not synonymous with diseases, aging can result in multiple illnesses, impairments and disabilities, with consequent deterioration in the health of the elderly, both in physical and / or mental aspects. The capacity we have to pay attention, to remember, to work the information received from our interior and the external environment, is due to cognition. This allows us to communicate with others, plan our interventions, execute them, evaluate the results. Throughout life, all the activity developed, however simple it may be, depends on the articulation of the various capacities that the person possesses. When these capacities are altered, this will sharply compromise the interaction with the environment that surrounds us. Mental illnesses are mostly associated with structural and functional alterations of the brain, often repercussions on some cognitive processes, such as memory (Nunes, 2008). Aging is the height of life in which the person is confronted with significant losses, not only of people who have had importance for himself, such as family members, friends, but also, with the loss of the autonomy in the accomplishment of their activities of daily life that appear of normal form (progressively) or of pathological form (abrupt or gradual). Aging is a common experience for all those who have the privilege of living long lives.

The process of aging differs from person to person, it is marked by different modes of experimentation of the experiences that cross it. Health is, for the generality of the elderly, a fundamental aspect when it is equated the respective psychological well-being. Maintaining mental health and active memory is a constant challenge as not all intelligence skills decline and others are preserved or may slightly improve.

Cognitive decline in the elderly is confined to normalcy on the one hand and dementia on the other. Both boundaries are difficult to delimit, which leads to relevant questions regarding differential diagnosis. These difficulties stem from the fact, for example, that memory complaints are frequent in elderly people and that there is some cognitive decline in normal aging. Old age is a period of many changes in a person's life, learning to cope with these changes is critical if this period is to flow naturally and not undermine the interpersonal relationships of the elderly.

4. RETIREMENT

At the present time, practically all the people assume the expectation that after working a specific period of time, they retire. Retirement is therefore a key aspect of modern life and widely held to be a guarantee. However, the pension system and the retirement process is a relatively recent life cycle event in the industrialized world. From the historical point of view, it was only from the second half of the twentieth century onwards that it became possible for older workers not only to retire, but also to do so at specific mandatory ages. Thus, retirement as a distinct period of human life derives from social security systems that provide adequate income for the elderly, allowing them to withdraw from the labor market. Old age and retirement came to represent two distinct realities (the age of being old now appears later than retirement age), which undermines the legitimacy of the reform in the face of old age and the assumptions of social solidarity and contracts Interrelationships, on which they were based (Fernandes, 2008).

This disturbance of social security systems, not only in terms of sustainability, but also in terms of the legitimacy of social contracts and the principles of social citizenship (Mendes, 2011) promises, in Portugal, given the projections in Demographic aging, and the sharp decrease in the number of active contributors, is a social challenge, the resolution of which will imply the emergence of new strategies and social policies, adequate to the sociocultural characteristics of our country. Among them is the increase in the age established for entry into retirement, which is estimated to reach within a few years at 70 years of age (Mendes, 2011).

5. RETIREMENT IN GNR

The regime of transition to pre-retirement (reserve) and reform of the military of the National Republican Guard, has some peculiarities, a little different from those of other citizens, which I will state, with the applicable legislation and the definitions of some concepts, indispensable For a good understanding, of the whole process.

It is important to define some pertinent concepts in order to understand the present chapter:

- *Military Service Time* - The length of service is counted as a period of military service, plus the percentages of legally established increases and the length of time the military stays in the reserve outside the service effectiveness, which may not exceed five years. (Article 108 of the EMGNR);
- *Length of Service Provided to the State* - The length of service, in the sense of service rendered to the State, is counted as the length of military service, plus that provided in the exercise of public functions; The period of service rendered to

the State shall be counted for the purpose of calculating the remuneration of the reserve and the retirement pension in accordance with the respective legal regimes applicable. (Article 107 of the EMGNR)

- *Effective Service Time* - The length of service rendered in the Guard or in military or police functions outside its scope, as well as in other situations expressly provided for in the EMGNR, is counted as an effective service time: Frequency of training courses that enable entry in the pictures of the Guard; From the time when the military was compulsively removed from service, provided that he was reinstated by review of the respective process; (Article 109 of the EMGNR)
- *Reservation* - The reservation situation is the one to which the Guardian military travels, verified that the conditions established in the GNR military statute, while remaining available for the service: - on the effectiveness of the service, or - out of service effectiveness (article 72 of the EMGNR);
- *Conditions of Passage to the Reserve* - Reach the age limit established for the respective station; Or has provided 20 or more years of service, the request is granted; Or declare, upon reaching the age of 55 years and 36 years of service; (Article 85 of the EMGNR);
- *Retirement* - Military personnel in the asset or in the reserve who, after the age of 60, require a change to the retirement situation (Article 93.1 (b) of the EMGNR).

According to the Resolution of the Council of Ministers No. 110/2005 of June 2, “*the Government determined that special retirement and retirement regimes, which establish retirement ages, minimum service hours or Different from the general regime applicable to public servants. In the case of the security forces, and in particular the Republican National Guard, it is understood that, on the one hand, the special pain and wear and tear on the performance of their duties and, on the other hand, the physical conditions necessary for the performance of the task, the same length of retirement age as for the generality is not justified Of the servants of the State (for 65 years), maintaining the age, already in force today, of 60 years (...)*”. However, it is noted that the age at which the actual service rendered in GNR ceases. Is much lower than the age of 60 years provided for by law since the Guardian military is entitled to change to 36 years of service regardless of age. As these 36 years of service are counted with a 25% increase, the age at which the actual service can cease can be less than 50 years. After 5 years in the reserve, the GNR military retired, regardless of age and without any pension reduction.

6. METHODOLOGY

This chapter aims to approach the methodology used to carry out the research process, so as to frame it from the methodological point of view. Thus, to answer the question of departure, the objectives and characteristics of the methodology were taken into account.

The methodology assumes an essential relevance in the course of any social project, taking into account that the final results are dependent on the procedure, due to the method and the way the results were obtained (Perez Serrano, 2008). In the accomplishment of the present work the methodology of qualitative and quantitative research was used, through a cross-sectional exploratory case study based on action research. According to Fortin (1999: 40) the research design is the “logical plan elaborated and used by the researcher to obtain answers to the research questions”. Agreeing to Bogdan & Biklen (1994), “*action research is the collection of systemic information with the aim of promoting social change*” (p.292). Action research is the type of applied research in which the researcher is actively involved in the cause of research. In order to develop greater familiarity with the problem and to explain it, the objective of the present investigation is exploratory. Exploratory research aims to “develop, clarify and modify concepts and ideas, in order to formulate more precise problems” (Gil, 2008: 46).

In order to understand the question of the experiences of the reform, mental health and quality of life of the military of the GNR, who served in the Transit Detachment of the city of Beja, a case study was carried out in that city. With this, the retired professionals of this security force, their relatives (wives) and the current District Commander of the Institution were approached to obtain data in order to respond to the starting point stated at the beginning of the investigation. The type of approach carried out in this study was the mixed approach, since qualitative and quantitative research techniques were used to collect the data, through interviews and questionnaires, respectively. According to Fortin (1999: 22) the quantitative method is the “collection of observable and quantifiable data” and aims to “*contribute to the development and validation of knowledge*”. The same author says that the qualitative method is the “*absolute and broad understanding of the phenomenon*” and its purpose is “*to describe and to interpret*”. In this way, through the interviews and questionnaires, a better perception of the studied phenomenon can be obtained.

As a purpose and delimitation of the problem, the research project under study has as main objective to know the experiences of the reform, mental health and quality of life of the gerontes of the Transit Detachment of the National Republican Guard in Beja. The intention is to identify the experiences of the reform, to know the mental health and to evaluate the quality of life of the participants. According to Espinoza, 1986 quoted in (Perez Serrano, 2008: 46), the general objectives are: “*those broader purposes that define the frame of reference of the project*”. However, the specific objectives are distinguished by particularizing more than the general objectives, which makes it clarify more what is desired with the project (Perez Serrano, 2008).

The starting point of the present investigation is to understand, “*In what way are the experiences of the reform related to the quality of life and mental health of the Gerontes of the Transit Detachment of the Republican National Guard in Beja?*”

It presents as general objective:

- To know the experiences of the reform, mental health and quality of life of the gerontes of the Transit Detachment of the National Republican Guard in Beja.

And as specific objectives:

- Identify the experiences of the retirement, to know the mental health in gerontes, to evaluate the quality of life and to increase the feeling of utility and belonging to the community.

6.1 Participants

According to Quivy & Campenhoudt (2005: 80) a population is “a set of constituent elements of a whole” and the “subset of a population or a group of subjects that form part of the same population” (Fortin, 1999: 202) is the sample. In this study, the target audience consists of elements that contain selection criteria, previously defined by the researcher. That being said, this is a sample for convenience. Thus, the present investigation had as participants (population) a total of 3 military personnel, all male, with 58 (P1), 63 (P2) and 68 (P3) years of age, all married and with children, their wives (Respectively P4, P5 and P6) and the Honorary District Commander of GNR de Beja (P7), as mentioned in the table below (Table 1). They were selected for having in common the criteria of: residing in Beja, of showing availability and being retired from the GNR Transit Detachment of the same locality.

Table 1 - Characterization of Participants

Code Participant/ Kinship / Function	Gender	Status	Age	Formation	Children	Grand children
P1 - Participant 1	Male	Pré-retirement	58	9th year	2	No
P2 - Participant 2	Male	Retirement	63	8th year	4	4
P3 - Participant 3	Male	Retirement	68	9th year	2	3
P4 - Wife of the P1	Female	Active	52	Bachelor's Degree	----	----
P5 - Wife of the P2	Female	Retirement	60	11th year	----	----
P6 – Wife of P3	Female	Retirement	65	6th year	----	----
P7 - - District Commander of GNR /Beja	Male	Active	51	Masters	----	----

6.2 Instruments

At this point, the instruments used to collect data and to whom they were addressed are explained and explained. For (Perez Serrano, 2008) the selection of instruments to be used in research must be very demanding and clear. It is up to the researcher to choose the best type of instrument to use, through his / her study objectives, as well as the results that he / she intends to reach. Questionnaires and interviews are “primary data,” since they are “researched by the researcher in order to satisfy a need for present and specific information” (Sarmento, 2013: 16). Thus, in this study, as instruments of data collection, the following were used: the semi-structured Neuropsychological Evaluation Interview; Mental Health Inventories Adapted from the Mental, Health Inventory (Ribeiro, 2001) and the WHOQOL - OLD quality of life assessment. The Interview with a Semistructured Neuropsychological Assessment model, of mental health and wellbeing in seniors, was used to collect data about the participants / gerontes, their relatives (wives) and the excellent district commander of the GNR of Beja. The Semistructured Interview applied to the district commander of the GNR of Beja, had as general objective to collect institutional information on the process of retirement of the geronte in GNR. In this sense, it was considered fundamental to carry out an in-depth anamnesis, in order to obtain information about their understanding of the reform, in a military context, and about how the GNR institution prepares the retirement of its gerontes.

The dimensions and sub-dimensions discussed in the interview were: the understanding of GNR reform, reform process in GNR (GNR reform process, successful GNR reform and preparation for Reform), to understand the interference of the reform process in the mental health of the GNR military (interference of the mental health reform) and to understand the interference of the reform process in the quality of life of the GNR military (interference of the reform in the quality of life).

The Semistructured Interview applied to the relatives of the gerontes had as general objective to collect familiar information about the experiences of the gerontes reform. In order to do this, it was considered fundamental to carry out an in-depth anamnesis in order to obtain information about their understanding of the reform in a military context, about the way in which their families experience their reforms and understand the interference of the health reform process Mental health and quality of life of gerontes.

The dimensions and sub-dimensions discussed in the interview were: understanding of GNR reform (understanding about retirement, family reform process, transition to successful family retirement and retirement preparation), understanding the Reform process in the mental health of the GNR military and to understand the interference of the reform process in the quality of life of the GNR military (interference of the reform in the quality of life).

The Semistructured Interview applied to the gerontologists had as general objective to collect information on the experiences of the reform, mental health and quality of life of gerontes. In order to comply with this objective, it was considered fundamental to carry out an in-depth anamnesis, in order to obtain information about their sociodemographic

data, state of consciousness, health and well-being, understanding about their health, wellbeing, understanding interference of the reform process in the mental health and quality of life of the geronte, as well as the experiences of successful reforms.

The dimensions and sub-dimensions addressed in the interview were: the sociodemographic data and the interviewee's state of consciousness (orientation, pre-morbid level and attitude of the interviewee in relation to their situation), interviewee's main complaints (subjective and spontaneous complaints), social support (Social integration networks, neighbors and family members, social isolation and friendship), aging (successful aging), mental health (mental health reform interference), quality of life (interference of the reform in the quality of life) and experiences of the Successful retirement (and successful retirement experiences).

The Mental Health Inventory, adapted from the Mental Health Inventory (MHI) by Ribeiro (2001), was also used. Regarding the questionnaire survey, this is "a research tool that allows data to be collected, which, after its introduction into a database (...), produces information, which results in results" (Sarmiento, 2013: 67).). The Mental Health Inventory, adapted from the Mental Health Inventory (MHI) by Ribeiro (2001) consists of a self-response questionnaire, with 38 items, which are distributed in five scales: Anxiety; With ten items; Depression, with five items; Loss of Emotional / Behavioral Control, with nine items; Positive affection, with eleven items; Emotional Ties, with three items. In turn, these five subscales are grouped into two other dimensions that measure respectively: Psychological Distress (resulting from the grouping of subscales of Anxiety, Depression, and Loss of Emotional / Behavioral Control); And Psychological Well-Being (obtained from the grouping of subscales, Positive Affect and Emotional Bonds). The answer to each item is organized in an ordinal scale of 1 to 6, with items 1 and 28 being punctuated from 1 to 5 and the other items are quoted inverted. The total score will result from the sum of the gross values of the items that make up each scale, and the total results below level 52 will point to the existence of severe symptomatology and the results below 60, for the existence of moderate symptomatology. The higher values will correspond to a higher level of Mental Health.

Finally, the WHOQOL - OLD quality of life assessment inventory was also used. This instrument of quality of life assessment, WHOQOL-OLD module consists of 24 questions and their answers follow a Likert scale (from 1 to 5), whose score is attributed to six domains, which are: "Sensorial Functioning", "Autonomy", "Past Activities, Gifts and Future", "Social Participation", "Death and Dying" and "Intimacy". Each of the domains has 4 questions; And responses range from 4 to 20. Basically, high values represent a high quality of life, low values represent a poor quality of life.

6.3 Procedure

In this chapter, the procedures and techniques used to carry out the investigation, which began in November 2016, are explained. The procedures employed are in accordance with the techniques explained by Fortin (1999), Sarmiento (2003) and Quivy & Campenhoudt (2005), who are the authors of reference in the scope of the research methodology and, when consulting different authors, it was possible to compare the different points of view and to use those that best fit the present investigation.

It was therefore necessary to provide clarification on the purpose of the investigation to the participants in it and to request their informed consent to allow the use of the data collection instruments. All participants in the project were previously contacted by phone in order to hear their availability for interviews, questionnaires and scheduling.

All data collection instruments (Semistructured Interview on Mental Health and Wellbeing in Geronetes, Mental Health inventories and Quality of Life assessment) were individual and performed in the participants' homes, except for the GNR of Beja that was made in the GNR barracks. They were performed on different days, had the average duration of approximately 1 hour per session, in a total of 3 sessions and with a spacing of one week between each test. Its application was conducted in a context that safeguards the privacy of participants.

They were asked to respond as honestly as possible, ensuring that the answers obtained were anonymous and confidential. Interview procedures required a number of considerations, namely: encouragement of verbal interaction, reinforcement that all responses would be valid and that there were no right or wrong answers, formulation of simple questions, repeating or clarifying, to ensure that the Interviewee understood what was being asked.

In applying the Mental Health and Quality of Life assessment inventories, although they were self-response questionnaires, the interviewer read the instructions and explained how they were completed to the participants, informing them that the reference period Answers is relative to the period of the last two weeks.

7. RESULTS

At this point, the data obtained in the questionnaire surveys carried out and the interviews are presented. According to (Amado, 2013: 299), *"the question of data analysis is central to research." The truth is that it is not enough to collect the data, it is necessary, later, to analyze and interpret them, because it is not possible to do one thing without the other. The analysis involves working with the data, its organization, division into units, synthesis, search for patterns, discovery of important aspects of what (eg, Must be seized and the decision of what is to be passed on to others.*" Thus, in the analysis of the interviews, the analysis of its contents was used, each interview being explored individually, and, subsequently, a global analysis of the interviews was carried out.

For the analysis of the Mental Health Inventory data, Excel software was used to obtain the total results of each questionnaire and for the evaluation of the quality of life evaluation data, the evaluation of the quotation of the items by the dimensions was carried out. Therefore, 7 interviews (3 interviews with the seniors, 3 with their wives and 1 with the GNR district commander) were carried out to the participants in the investigation and 6 questionnaires to gerontologists (3 on mental health and 3 on quality of life), Which have been thoroughly analyzed in order to arrive at the results and then to answer the objectives that will answer the question of departure.

7.1 Neuropsychological Assessment Interviews

Participant 7 (interviewed E7) is the current District Commander of the Republican National Guard, is 51 years old, has 32 years of service and has been running GNR de Beja since March 2013. Previously served in the district of Portalegre, where it is natural. He has a degree in Business Management and a Master's degree in Journalism and Garrison. The general objective of the interview was to collect institutional information on the process of reform of the geronte in the GNR. Through the Semistructured Interview on Mental Health and Wellbeing in Gerontes it was concluded that in the dimension “*what the understanding about the reform in the military context*” and sub-dimension, understanding about the reform in GNR:

Table 2 - General Analysis of Neuropsychological Evaluation Interviews

DIMENSION	SUB-DIMENSION	GLOBAL ANALYSIS
Collect sociodemographic and State of consciousness	Orientation	- Reveal spatial, temporal and diachronic orientation (E1, E2 and E3)
	Pre-morbid level	- Respond to questions (E1, E2 and E3)
	Geronte's attitude towards his situation	- Reveal good attitude (E1, E2 and E3); - It easily locks up (E1)
Main patient complaints	Subjective and spontaneous complaints	- You feel depressed (E1); - Loss of normal vision at age (E2); - Short-term memory loss (E3); - Feel anxiety (E1, E2 and E3)
	informal support networks - neighbors and family members	- You feel good where you live and maintain a good neighborly relationship (E1, E2 and E3) - Lives with spouse (E1, E2 and E3)
Social support	Social isolation	- Spends many hours alone (E1); - Spends a few hours alone (E2, E3); - Does not have social support (E1); - Have social support (E2, E3).
	Friendship relations	- Family and friends (E1, E2, and E3)
Aging	Aging Successful	- Have health (E1, E2 and E3); - Economic well-being (E1, E2); - Together with the family (E1, E2 and E3); - Do not be doing nothing (E2, E3). - Have social activities (E1); - Being with family and friends (E2, E3)
Mental health	Interference with mental health reform	- Positive form, acquired better mental health (E2 and E3); - Have more free time (E3); - More comfortable, less agitated (E3); - Exercise (E2); - Negative form, acquired worse mental health, causes depression (E1); - Being unoccupied, proves anxiety (E1)
Quality of life	Interference with the quality of life reform	- Acquired better quality of life (E2 and E3); - Acquired worse quality of life (E1); - Free time for social and / or play activities and be with friends and family (E2, E3); - Disappointment at being unemployed (E1). - Sit alone (E1); - Good to have free time (E1 and E2); - Desired and expected (E1, E2 and E3); - Good, family and leisure (E2); - Too busy in activities (E3)
Experiences / Reform successful	Successful retirement experience	-
Participation in community project	Participation in community project	- Yes (E1, E2 and E3)

The Commander thinks that the reform in the GNR obeys several legal requirements (age and length of service), is no more than a separation of the service with the allocation of a pension. The most important aspects to emphasize are those included in the Statute of the Military of the Guard, such as age, length of service, requisition, reaching the age limit.

The general analysis of the Neuropsychological Assessment Interviews (Table 2), in the state of consciousness dimension, made it possible to record the interviewees' information regarding the sub-dimensions, orientation, pre-morbid level and patient's attitude towards their situation. In the sub-dimension guidance, respondents were oriented and assertive in their responses; In relation to the pre-morbid level, answered all the questions, being able to identify their daily routines, as well as aspects of their personal and professional life, past and present, regarding the participants' attitude towards their situation, showed a good attitude and comfort with your life. In the interviewees' main dimension, the analysis allowed to scrutinize

subjective and spontaneous complaints, where E1, E2 and E3 feel anxiety and E3 feels depressed, while E2 has vision loss and E3 reveals short-term memory loss. In the social support dimension, the participants present very positive responses, since the sub-dimensions, informal-neighbor support networks and family / friendship relations are quite complete and social isolation is practically null. In the dimension of aging and sub-dimension of successful aging, the participants consider this theme as a period of well-being, where themes related to good health, economic well-being and being with the family stand out.

In the dimension of mental health and interference of the reform in this, it is emphasized the personality trait that the interviewees demonstrate: E1 presents symptoms of depression, spends a lot of time alone, points out as a factor of destabilization the fact that the wife continues in the active life, is A very introverted person. E2 and E3 are more “socially extroverted”, they do not present indicators of problems at this level. In the dimension of quality of life and sub-dimension interference of the reform in this, it should be noted that the respondents E2 and E3, have acquired better quality of life, and E1 states that worsened their quality of life and disappointed with the reform. Finally, in relation to the experience / retirement dimension and experience of successful reform, participants E2 and E3 view it as quiet, close to the family and with some economic power; He shares, but says that he has not improved his quality of life because he feels very lonely. In conclusion, we can say that the interviewees show very positive sociodemographic indexes, although. E1 is very dependent on the family, (the availability of the wife), a factor that depresses him. E2 and E3 reveal that their experiences of retirement, mental health and quality of life reveal clear indicators of balance, although E3 shows that they are involved in many activities which, for the moment, presents no problem to them, Will make it more fragile in the future.

7.2 Mental Health Inventory

Through the application of the Mental Health Inventory, the objective was to evaluate the Mental Health of the elderly participants. This assessment is based on five scales, characterized by: positive affect, emotional ties, loss of emotional / behavioral control, anxiety and depression. These scales are divided into two dimensions: positive well-being and distress. Positive well-being is the sum of the scale of positive affect and emotional ties, whereas distress is the sum of the range of emotional / behavioral control, anxiety and depression. In the graphs will be presented the individual results, transformed to zero to one hundred (0 to 100), of each one of the interviewees / participants.

The Participant P1, regarding the primary dimensions, in terms of the positive affect, presents 32.7 points; Emotional ties point to 53.3 points, loss of emotional / behavioral control to 56.8 points, anxiety to 50 points and depression to 58.3 points. In the positive well-being dimension it obtained 37.1 points, the distress reached 54.2 points. The total of the result is 47.8 points (below 52 points) points to the existence of severe symptoms, at the level of the evaluation of the mental health of the participant P1.

The Participant P2, regarding the primary dimensions, at the level of the positive affect presents 67.2 points, the emotional ties show 100 points, the loss of emotional / behavioral control 97.7 points , Anxiety points to 96 points and depression to 91.6 points. In relation to the positive well-being dimensions, it obtained 74.2 points, and the distress reached 95.7 points. The total result is 87.7 points. The total result of 87.7 points (above 60 points) points to the absence of any symptoms at the level of the assessment of the mental health of the participant P2.

By means of the graphical representation (graphic 3) it is possible to visualize that the Participant P3, with respect to the primary dimensions, at the level of the positive affect presents 49.09 points, the emotional ties show 53.3 points, the loss of emotional / behavioral control 88 , 6 points, anxiety point to 84 points and depression to 87.5 points. In relation to the positive well-being dimensions obtained 50 points, the distress reached 86.4 points. The total result is 72.8 points. The total result of 72.8 points (above 60 points) points to the absence of any symptoms in the evaluation of the mental health of the participant P3.

The application of the WHOQOL-OLD Quality of Life Inventory was aimed at evaluating the quality of life of the elderly participants. The Inventory consists of 24 questions. Their responses follow a Likert scale (from 1 to 5) attributed to six domains / facets, which are: “Sensory Skills”, “Autonomy”, “Past Activities, Gifts and Future”, “Social Participation”, “Death and Dying “and” Intimacy “. Each of the domains / facets has 4 questions, and the answers can range from 4 to 20 points, for a total of 6 domains. Therefore, a total 120 (5 points average) points corresponds to 100% quality of life. Table 2 shows the WHOQOL-OLD results, bearing in mind that: quality of life needs to improve (when the mean for 1 to 2.9 or total up to 11.6 points); Regular (average for 3 up to 3.9 or total up to 15.6); Good (average 4 up to 4.9 or total up to 19.6) and very good (average equal to 5 or total 20).

P1 - Through the representation of table 2 it is verified that the participant, in relation to the domains / facets, has the following values:

- Sensory functioning / abilities, which assess sensory functioning and the impact of loss of sensory abilities on participation in activities and interaction, presents 10 points; Needs improvement:
- Autonomy, which assesses the ability to live independently / independence and make decisions, presents 11 points; Needs improvement:
- Past, present and future activities, which assesses the satisfaction with goals achieved in life and projects to be carried out, presents 9 points, needs to improve;
- Social participation, which evaluates participation in daily activities, namely in the community, presents 9 points; Needs improvement:
- Death and dying, which evaluates concerns and fears about death and dying, presents 11 points; Needs improvement:
- Intimacy, which evaluates the ability to have personal and intimate relationships, 15 points; Regular quality of life.

The total result of 65 points, (2.66 of average) that corresponds to a percentage of 53.3%, points to the result of: needs to improve their quality of life.

P2 - With respect to the participant P2, also through the representation of table 2, it is possible to visualize that with respect to the domains / facets, it presents the following values:

- Sensory functioning / abilities, which evaluate sensory functioning and the impact of loss of sensory abilities on participation in activities and interaction, presents 15 points; regular:
- Autonomy, which evaluates the ability to live independently / independence and make decisions, presents 16 points; good:
- Past, present and future activities, which assesses the satisfaction with goals achieved in life and projects to be carried out, presents 17 points; good:
- Social participation, which evaluates participation in daily activities, namely in the community, presents 17 points, good:
- Death and dying, which assesses concerns and fears about death and dying, presents 12 points, regular:
- Intimacy, which evaluates the ability to have personal and intimate relationships, 17 points; Good quality of life.

The total score of 94 points, (3.91 average) that corresponds to a percentage of 78.3%, points to the result of: regular quality of life.

P3 - Through the representation of table 2, it is possible to visualize that the participant P3, with respect to domains / facets, has the following values:

- Sensory functioning / abilities, which assess sensory functioning and the impact of loss of sensory abilities on participation in activities and interaction, presents 12 points; regular:
- Autonomy, which evaluates the ability to live independently / independence and make decisions, presents 15 points; regular:
- Past, present and future activities, which assesses the satisfaction with goals achieved in life and projects to be carried out, presents 12 points; regular:
- Social participation, which assesses participation in daily activities, namely in the community, has 14 points; regular:
- Death and dying, which assesses concerns and fears about death and dying, presents 12 points; regular:
- Intimacy, which assesses the ability to have personal and intimate relationships, 13 points; regular.

The total score of 76 points, (3.16 of average) that corresponds to a percentage of 63.3%, points to the result of: regular quality of life.

8. CONCLUSIONS

It was possible to verify that the participating seniors are not actively aging. In addition, one of them points to the existence of serious symptoms in the evaluation of mental health and that needs to improve their quality of life. The evidence from this study has shown that the newly retired participant perceives the transition to retirement as a transition from life and that the change that involves this same process requires an adaptive effort, endowed with some complexity that has not yet dominated. Also, the way in which all participants experience this adaptive process is based on their personal characteristics, the coping experiences and strategies they already had, the support networks they have and the characteristics of the process of conjugality which have been building over time.

It turns out that the participants are very dependent on the availability of the people with whom they live (wives). If they are still in the active life, it makes them feel a few "lost", not knowing well what to do with their available time, preventing them from having a greater mental readiness, to face the reform of a more positive way. On the other hand, if they are already reformed, it seems to increase their quality of life and their mental health.

Regarding the contextualization of previous experiences, which was transversal and was very present in the discourses of the participants of this study, its emission noted that the present options result largely from past experiences (agriculture) and that would have been due to the Which made their options adaptive to reform.

In short, it can be concluded that the condition of being alone or accompanied in terms of marital relationship, influence the quality of life and the experiences of the reform.

ABSTRACT

This is a case study of an elderly woman of 70 years of age, informal caregiving, professionally active and living in the Santa Margarida do Sado community.

After interviewing the caregiver and applying the evaluation scales (Sense of Community Index, Basic Need Satisfaction in General Scale and Carers Assessment of Difficulties Index - CADI) it is possible to conclude that the caregiver is well integrated in her community, establishing good relationships with her family, and customers/neighbors. Her skills as caregiver and professional activity are recognized and social support is evident. Although she faces her aging process positively she assumes to have less time for herself, family and friends, and consequently less quality of life. Concerning the others interviewers (caretakers, husband, son, and customers/neighbors) they recognize her skills as caregiver as they are her main family and community support.

Regarding these results it is present the intervention project "Caring for the carers - + 65 - Strategies and Support", which aims to respond to the identified needs by the Caregiver and making the task of caring less complex and demanding.

Keywords: Informal Caregiver, Productive/Successful Aging, Community Feeling, Life Quality and Well-being.

1. PRODUCTIVE/SUCCESSFUL AGING

The concept of productive aging emerged in the 70's among professionals from political, social and academic contexts, in order to combat the current image of the elderly, who presented them as fragile, dependent and non-productive people, that is, a burden for Society and for the younger generations (Caro, Bass and Chen, 1993).

Productivity in the aging process, where there is significant and satisfactory activity, where the elderly are involved in a structured and continuous way, has a positive impact on their lives.

Productive/successful aging is associated with the elderly's proactivity who regulate their life quality through the definition of objectives and efforts to achieve them. They use resources that are useful for adapting to age-related changes: health and well-being, emotional stability, autonomy, life histories, lifestyles, family relationships and friendship, among other things.

Healthy aging depends on the environment and social support, as it prevents isolation and loneliness, vulnerability to abuse, neglect, access to information and training, and economic determinants such as pay or social protection. Given that the health and functionality of individuals can be influenced by extrinsic factors to aging. It is possible to increase the percentage of elderly people whose aging can be productive and / or successful (Botelho, 2000).

There are two parallel dimensions to the concept of productive aging: an objective, which emphasizes the contributions made by the elderly to their relatives, social group or community and a subjective view, which privileges the affective component of the process, in the sense of its positive consequences: well-being and life quality of the elderly (Kaye, Butter and Webster, 2003).

The paradigm underlying productive aging conceptualizes aging from a positive perspective, refuting stereotypes and valuing the role played by the elderly, as well as the contributions they provide to society. To incapacity and dependence, productive aging opposes an image of health and well-being, where autonomy is not only possible but also desirable and where the elderly are no longer a vulnerable and passive individual but rather an active agent in their aging and can continue to make a significant decision (Rozario *et al.*, 2004). In fact, the elderly have an extremely important role within the groups in which they are inserted, as they provide models of aging, represent ancestry and are a living example of the ability to survive and adapt to the life adversities.

Fontaine (2000) defines aging as a set of processes that the organism undergoes after its development phase. However, it is not synonymous of old age, since the latter is considered a state that characterizes a group of a certain age (people over sixty).

From the point of view of psychosocial research, relevant steps were taken regarding the conception of aging, which has favored a change in the image of older individuals and allows this image to be projected into intervention actions to improve living conditions in Post-retirement phase.

Although the aging process can be interpreted from different points of view, it is a normal, universal, gradual and irreversible process at the level of changes and transformations that occur over time. It is a phenomenon linked to the processes of differentiation and growth, that interact internal factors such as genetic heritage and external factors such as the lifestyle, education or environment in which it lives (Figueiredo, 2007).

The concept of aging and attitudes towards the elderly have been changing, reflecting the level of knowledge about human physiology and anatomy and the established culture and social relationships (Paúl and Fonseca, 2005).

Living for many years means that the individual has gone through several experiences with a differently impact from the emotional point of view. It also means that different affective-emotional relationships have been established and that among these relations, the most important are those related to important investments in caregivers (parents, grandparents, siblings or friends) (Paúl and Fonseca, 2005).

Learning is constant throughout life. However, it requires training at the level of competencies, according to individual capacity. The access to information makes the elderly recognize that they are not all losses and that there are capacities that they can maintain or even improve, allowing them to feel useful in the groups where they are inserted.

2. LIFE QUALITY AND WELL-BEING

Assessing the Life Quality of the elderly is an increasingly important aspect, due to the increasing prevalence of chronic diseases and, in turn, to an increase in life expectancy.

In the words of Neri (1993), the life quality in old age depends on several interactive aspects. Multidimensional objective aspects, namely in terms of functionality, cognitive competence and interaction with the environment and subjective aspects that refer to feelings of satisfaction and perception about health status.

Promoting the life quality of the elderly implies at the same time, taking care of prevention and health promotion, caring for the feeling of living in safety and, above all, facilitating the maintenance of active social participation in its various settings, from significant interpersonal exchanges, to the exercise of rights and duties of citizenship, extending the participation of the senior population to community structures and associations.

The elder's life quality is closely related to his biological, but also intellectual, social, labor, psychological, affective, and economic resources that have been accumulated during his life and which greatly influence him (Fairman, 2006: 16).

3. LOSS OF AUTONOMY AND DEPENDENCE

People live longer and although most of the elderly are neither sick nor dependent, the truth is that the bio-psycho-social transformations that all of them undergo, alter their homeostatic balance and demand a new equilibrium to which each individual adapts more or less easily (Palma, 1999).

Figueiredo (2007) assumes that the task of caring for a dependent elderly person requires time and dedication and that when this does not happen, feelings of guilt arise. Restriction of time results from different factors, such as insufficiency or even lack of external support, increased needs of caregivers, and the requirement for professional activities.

4. ELDERLY AS CARE RECEIVER

The majority of elder people who have a health that allows them to an independently live, undertake tasks without recourse to help. However, those who suffer from chronic diseases become more vulnerable and in need of help.

Caregivers end up giving more help than is necessary, given their family's advanced age and the inability to perform certain tasks. The person receiving care is usually female, married or widowed and has children. Female longevity makes them more susceptible to chronic diseases (osteoporosis, hypertension, diabetes, arthritis, among others), while men are more likely to suffer from heart disease or stroke. Therefore, at the origin of care delivery lies a multiplicity of health problems that require assistance in domestic tasks, transportation and purchases (Figueiredo, 2007).

The relationship between the elderly caregiver and the caregiver is fostered by the common experience of both (childhood and married life) and individual stories. Caregiving requires large reconstructions in the relationship, taking into account the dependency relationship established (Figueiredo, 2007).

5. INFORMAL CAREGIVERS

Informal caregivers are becoming more and more important, since social and health policies and financial limitations lead the elderly to stay at home, a place where the intimacy that characterizes self-care is preserved.

According to Coelho (2011) caring is a difficult task because it implies dealing with the beliefs and values of the other. It

consists of the relationship with the other, responding to their needs, transmitting security and attention, through the sharing and articulation of difficulties during care delivery.

The care action aims to promote the physical well-being of the dependent elderly, taking care of their pain; mental well-being, helping him to face fears and insecurities; social welfare, ensuring their socio-economic and relational needs.

6. INFORMAL CAREGIVER: CAREGIVING

Informal caregivers are an essential support for the support of elderly dependents in a home context. It is important to know the relationship between their socio - demographic and contextual characteristics.

Informal caregivers must provide the dependent elderly with support in the instrumental activities of their daily lives (dealing with household and clothing, shopping, among others), dealing with functional difficulties associated with daily basic necessities of life (hygiene and food), responding to the need for emotional support (company) and managing psychological pressures.

According to Figueiredo (2007) most caregivers provide help because they feel that this is their obligation. There are other reasons, such as altruism, gaining social approval or avoidance of censorship, feelings of gratitude to one who cares.

Albert (1992) highlights some points about the caregiver's ideology:

- the question of "duty" and "solidarity", especially when caregivers are direct relatives;
- the tendency of studies to relate the caregiver's ideology to variables of a psychological nature, to the detriment of variables linked to the social structure.

The informal caregiver is the person on whom the responsibility for the provision of most of the care related to the maintenance and continuity of life of the dependent elderly person is borne and who is not remunerated for what he or she does and who does not have any specific training.

According to Figueiredo (2007), the Portuguese cultural tradition attributes to the family and particularly to the female members, the responsibility of caring for the elderly. Thus, caring for elderly relatives is assumed to be an extension of the normal family roles.

Many caregivers assume this role since they believe that their care for the dependent person is the best because of the intimate / personal knowledge they possess. Thus, in the same way that a source of satisfaction is promoted this conviction serves to oblige the caregiver to fulfill this role even if institutionalization is considered (Nolan, Grant and Keady, 1996).

7. INFORMAL CAREGIVER NEEDS

The ability of the informal caregiver to perform other activities outside the home can be beneficial, since it provides opportunities to rest from direct tasks with the elderly person, besides favoring social interaction, minimizing problems such as isolation, distress or depression.

Identifying the needs of informal caregivers is a complex process which depends on the individual variability, the care delivery phase and the context in which it occurs. The provision of care to a dependent family member and associated subjective reactions are likely to generate difficulties that will affect other aspects of the caregiver's life (Figueiredo, 2007).

Another of the most felt needs of caregivers is to have someone with whom to share their difficulties, concerns or satisfactions in caregiving, who hears them and acknowledges their dedication, so that they feel valued.

Although participation in support groups is poorly emphasized as a necessity among family caregivers, they can play an important role in serving as a source of information and advice on diseases affecting caregivers, the techniques and available aids. They also favor social interaction through the breakdown of isolation and solitude.

Another type of need is free time, in which the caregiver is dispensed, even temporarily, from the task and responsibility of caring. The need for free time can be translated into replacements over a period of time. Finally, the need for information and training on available services, allowances and rights which is felt when the dependency of the caregiver increases. Therefore, the effectiveness of the intervention requires the appreciation of the caregivers' points of view in the course of assessing their needs.

8. SOCIAL, FINANCIAL, PHYSICAL AND EMOTIONAL IMPLICATIONS

Family caregivers differ in the type of motivation or circumstance that led them to assume such responsibilities, in the resources they have, in their competencies / capacities for care and also in function of the degree and type of dependence of the person cared for, the history of the relationship with the caregiver and the way they accept the care provided (Figueiredo, 2007).

The fact that caregivers can count on the help of someone, such as the secondary caregiver, relieves them of the demands of care, improving their health perception (Brito, 2002; Lage, 2005), and quality of life, attenuating the consequences of changes in their lifestyle and contributing naturally to the perception of greater psychic vigor and greater energy (Lage, 2005).

Paul (1997) points out that although family members are the major source of physical and emotional support for the elderly, friends have a strong effect on subjective well-being, involving multiple aspects ranging from intimacy sharing, emotional support and opportunities of socialization.

Caring can be a full-time task for some caregivers or cumulative with a profession for others. The time spent in the exercise of their professional functions can be beneficial for the caregiver since it is an escape from the care tasks, it alleviates some economic difficulties and also the interaction and interaction with colleagues and friends. However, the reconciliation of responsibilities as caregiver to the elderly and the maintenance of the job can generate certain constraints, such as: increased tasks, pressures and concern for the well-being of dependents while carrying out their professional duties. These constraints will have a greater or lesser impact at the professional level depending on the work conditions of the caregiver: schedules, functions, wear, among other aspects (Figueiredo, 2007).

The author also points out that the cessation of the caregiver's professional activity, despite providing an increase in the time available for elderly care, can have negative consequences, since employment is an escape from the performance of these (routine) tasks, it provides a financial improvement of the family and the interaction between colleagues and / or friends.

9. CAREGIVER WEARNESS

The process of caring is usually a complex and demanding process, which involves a set of experiences of health care and well-being of the care provider and whose consequences are more accentuated.

The repercussions that manifest themselves on caregivers vary throughout the caring process, with overload / wear being more intense at the beginning of the relationship, with the probability of decreasing as the caregiver adapts to the new situation and acquiring more skills to care for (Andreasen, 2003).

Stephens (1993) reports that informal caregivers make little use of formal services as a form of support for caregiving activities and point out the reasons for this: unawareness and cost of care, criticism from third parties and discomfort due to the behavior of the family member who care.

10. SENSE OF COMMUNITY

The Sense of Community was used first in 1974 with Seymour Sarason who presented it as a central and dominant concept in the field of Community Psychology.

Mobilization and involvement around community problems in a specific locality contribute significantly to increased sense of community and place identity. Speaking of community feeling is "related to belonging to a group or community, in which people consider themselves to be similar, acting interdependently to meet their needs" (Prezza and Constantini, 1998: 181).

For McMillan and Chavis (1986), community feeling is based on four essential elements that define the specific qualities of the concept. These elements are: to be part of something; influence; integration and fulfillment of needs and sharing of emotional attachments, which are defined as membership feeling, membership feeling for another member and group and conviction that members' needs will be met through an union commitment.

Services should be developed to make individuals, especially the elderly, capable of controlling their own lives, to remain productive and to remain as active as possible in the community for as long as possible. This is the so-called empowering of citizens that is, giving the elderly control over their lives and making them part of the process of choice within their family and social network and building a healthier and more prepared community for future challenges. The greater it's degree of commitment and its resources the more possibility it has of making this population capable and autonomous. In this way, they can maintain an active role in society and in their community providing positive / productive aging.

11. NEEDS SATISFACTIONS: THE IMPORTANCE OF SOCIAL NETWORK AND SOCIAL SUPPORT

Antonucci (2001) defines social network taking into account the characteristics that describe the people with whom interpersonal relationships are maintained: age, gender, proximity and frequency of contacts among its members.

According to the same author social support functions as an interpersonal exchange that involves three elements: help, affection or affirmation. Thus, while the social network concept focuses its attention on the surrounding contexts and social systems, social support / support focuses on interpersonal exchanges between members of a network, especially at the level of health care, housework, administrative matters and financial aid.

12. COMMUNITY AS A PROTECTIVE AND SUPPORTIVE FACTOR

Sarason (1974: 1) described the psychological feeling of community as "the feeling that we are part of a mutually supportive relationship network, always available and on which we can depend."

Community participation is not just about support and / or help among members of a particular group but also about their contribution to decision making. This type of participation can take place in very diverse ways and focus on areas such as life quality, environmental issues, safety and prevention of interpersonal violence (Dalton, Elias, and Wandersman, 2001). The greater the level of integration and satisfaction of individuals in a community, the greater the individual and community benefits. At the individual level it manifests itself in higher levels of well-being, satisfaction and quality of life; sense of

justice; less solitude and isolation. At community level there is greater collaboration and community mobilization around change. (Elvas and Moniz, 2010).

13. EMPIRICAL STUDY

13.1 Methodological study

The research began with an interdisciplinary bibliographical research and analysis on the importance of community feeling and productive aging as protective factors for the wear and tear of an elderly informal caregiver in order to be approached and based on the theme.

13.2 Methods

The method used was the qualitative method since it presents characteristics that allow a greater depth of information collected.

This method allowed to obtain a comprehensive understanding the context of informal care provided by an elderly woman who remains professionally active and to understand whether or not there is the influence of community feeling and productive aging as protective factors.

Qualitative research is “descriptive”, that is, the description must be accurate and result directly from the data collected. The research included transcripts of the interviews through recordings of the interviews and application of Sense of Community Index, Basic Need Satisfaction in General Scale and Carers Assessment of Difficulties Index – CADI. It has the consent of the interviewees.

13.3 Techniques

The technique used for the data collection was a semi-directional or semi-structured interview.

13.4 Instruments

The information obtained through the application of interviews to the participants in the study (caregiver, caregivers, husband, son and two clients / neighbors) and evaluation scales (Sense of Community Index, Basic Need Satisfaction in General Scale and Carers Assessment of Difficulties Index – CADI) to the Caregiver, allowed the verification of community’s integration level as well as their community participation, the existence of social support, the way they view the aging process and the recognition of her skills as a caregiver and active professional.

13.5 Interviews

The interviews were carried out from the 4th to 8th April of 2016 through the elaboration of an Guide Interview applied to each participant in the study and treated using the thematic-categorical content analysis method.

14. RESULTS

14.1 Sense of Community Index

According to the quotation of the Sense of Community Index it is verified that for the informal caregiver it is important to be part of the local community, given that the total value of the scale is of 53 points. The answer to the first question is then reinforced by the values obtained in the subscales of Belonging (14 points) as well as in the emotional Link subscale (15 points). It is also noted that the caregiver feels the influence that the community has in their life, given the value of the subscale Influence (12 points). According to the caregiver her community has the capacity to respond to their needs given the value obtained in the subscale Reinforcement of needs (12 points). There is a connection to this community, as the same is felt as a network support, to which it is important to belong.

14.2 Basic Need Satisfaction in General Scale

According to the Basic Need Satisfaction in General Scale it is observed that the caregiver, in general, feels that her needs are satisfied (score in the total scale of 120 points). It is also possible to verify that it is well integrated in its community maintaining good relations, feeling that it can trust and that it is supported by the people that are close to him (subscale - relations of belonging = 47 points).

She is a caregiver who feels competent in the performance of her role (subscale - competence = 36 points), maintaining her autonomy and freedom in her choices (subscale - autonomy = 37).

14.3 Carers Assessment of Difficulties Index – CADI)

According to the results obtained, it is possible to observe that for the caregiver the main difficulties are related to the professional support (10 points) revealing the lack of support in the social and health services. Following are the reactions

in the care (15 points), where the caregiver revealed a constant concern with the elderly as well as feeling of impotence in relation to their condition. The dimension where are observed some difficulties is related to the dimensions of the caregiver (22 points) where he presented some physical fatigue and a decrease in her health. On the other hand, it turns out that the family assumes a preponderant role for itself (10 points). Regarding the relational problems (23 points) it is verified that the caregiver experiences moments of irritation and situations of despair in which the elderly will be one of the causes.

To conclude the analysis, in the social constraints dimension (18 points), the caregiver mentions that she spends less time on herself, family and friends with a decrease in her life quality.

15. DISCUSSION

The present investigation focuses on the case of an elderly informal caregiver, who presents unusual characteristics: 70 years old, single daughter, both parents living at 90 and 93 years of age, professionally and socially active and caregiver. In this sense, the need arose to study in depth her daily routine, what motivates her, her difficulties and strengths, her role with the community where she resides and the way she views her role as caregiver.

The Caregiver resides and carries out her professional activity in a rural community, where there is social support and affective ties between their members. This information is reinforced through the Carvalho study (2009), in which rural communities still have the duty of solidarity and mutual assistance, associated with a moral duty towards one another, involving the care of moral values and principles and respect for with the other.

Diogo *et al.* (2005) reinforce the sharing made by the Caregiver, noting that the positive aspects of caring are related to personal growth increased sense of accomplishment, pride and competence to face challenges, improvement in interpersonal relationship, both with the elderly and with other people, increased meaning of life, pleasure, satisfaction, retribution, satisfaction with oneself and well-being with the quality of well-being offered.

Sommerhalder (2001) also identifies positive or beneficial aspects experienced by caregivers: personal growth; increased sense of accomplishment, pride and ability to face challenges; Improving interpersonal relationships; Increased meaning of life; pleasure; satisfaction; retribution; self-satisfaction and well-being with the quality of care offered.

The Caretaker highlights the strong family connection, concern for the well-being of caregivers (parents) and the importance that social support has in overcoming the difficulties inherent in caring and being professionally active.

It was possible to perceive more broadly the process of productive and / or successful aging of the Caregiver influenced by psychosocial factors, the existence of a professional activity and the support of the family.

In the present investigation the caregiver highlights the positive way she has faced the aging process, the support of the social network, the socialization in the community and the way she is dedicated to her professional activity and provides care to the parents, assuming multiple roles. Despite this she says that her free time for leisure activities with her husband is reduced.

The implementation of programs to support informal caregivers will allow them to easily face more difficulties encountered in the caring process, to understand the different alterations present in the aging of the individuals to develop procedures that facilitate the relationship with the elderly on a daily basis - Day and implement informal help groups for informal caregivers, with a view to promoting processes of sharing and identifying problems and to the interaction of experiences.

16. INTERVENTION PROJECT

The intervention project emerges as a strategy to care for those who care through a formal educational process of a multidisciplinary nature which aims not only to increase the skills of informal caregivers related to knowledge but also to their integration into a group that having in common the experience of caring, promote mutual assistance while benefiting from a network of social support.

17. PROPOSED INTERVENTION PROJECT: "CARING FOR THOSE WHO CARE - +65 - STRATEGIES AND SUPPORT"

One of the needs identified by the Caregiver is the lack of free time, which may influence her psychological well-being. To meet this need, the creation of a group of volunteers who can ensure the company of care recipients in times of absence of caregivers is essential.

They are not intended to be cared for except that they keep company with small tasks of leisure.

In this sense, local authorities are an important partnership because of their proximity policy, which acts as a vehicle for transmitting information and identifying potential stakeholders.

Volunteers with an interest in the elderly are available and willing to support caregivers and provide them with free time to do some leisure activities (or not) and improve their well-being.

After the creation of the volunteer group, a little training is necessary to alert the most important and challenging aspects of the care recipients.

It should also be noted that the training action will be adapted to the characteristics of the care recipients.

Simultaneously with the creation of a group of volunteers to support caregivers, it is intended to energize a caregiver sharing group, as will be described in the following objective.

The present objective would be carried out by a PsychoGerontology technician.

Based on the needs of the caregiver previously identified in the research, some measures are suggested that intend to respond to these needs, as well as to increase the physical and emotional well-being of the caregiver. In addition to supporting caregivers, this proposal also aims to make the task of caring fewer complexes and demanding. It is suggested that to stimulate a training action aimed at caregivers and future caregivers, it should be developed by health professionals and PsychoGerontology technicians. Finally, it is also intended to create a space for counseling and referral to caregivers and future caregivers.

18. CONCLUSION

The present research focuses on how community feeling and productive aging are protective factors for the wear of an elderly informal caregiver.

After analyzing all the data collected it is concluded that this Caregiver has a strong connection to the community where she resides due to the fact that she maintains her professional activity that allows her daily contact with her members and also the existence of a network of Social support (family network, professional and friendship / neighborhood), promoting their well-being and / or quality of life.

The positive way in which she sees her aging process is fundamental to face the daily adversities, especially those that come from her role as Caregiver.

It was demonstrated by the study that the Caregiver defends the presence of their parents (caregivers) at home, since only then can they preserve their dignity and provide quality of life. Thus, the manifestation of happiness in caring for the loved one at home was manifested by the Caregiver by fulfilling the wishes of her parents and providing them with a decent end of life.

ABSTRACT

Differential equations constitute a large and very important branch of modern mathematics. From the early days of the calculus this subject has been an area of great theoretical research and practical applications in several branches of science. Despite this importance, the largest part of the students reveals strong difficulties to understand the theory of differential equations and its applications.

As a consequence of what was mentioned above we decided to create a new educational tool that accomplishes some of those goals, describing how this dynamic device can be used in the classroom when teaching the first approach of the first-order Ordinary Differential Equations (ODEs).

Keywords: Ordinary Differential Equations, Modelling, Growth and Decay, Computable Document Format.

1. INTRODUCTION

Over the last decades, we witnessed a huge development in the power of computation, simultaneously the electronic devices that perform numerical and symbolic programming evolved in power as they inversely evolved in size, making them so light and cheap that is possible nowadays for every student to carry his own laptop to the classrooms. This reality opens the possibility to create new approaches that might help them to understand the concepts associated with the subjects intended to teach in a more effective and fashion way.

We decided that would be a good idea to show and explore the interaction using both the symbolic programming capacity of *Mathematica*[®] and the graphical capacity. To reach our goals we take advantage of a tool recently developed by Wolfram Research, the Computable Document Format (CDF)¹, which enables the interaction between the digital document and the reader.

The appearance of this tool provides a complementary way of how to teach the mathematical concepts and, in our opinion, increases the probability of our success. In this context, we pretend to use this tool to tackle some applications of the first-order differential equations – rate problems, following the ideas presented in (Coelho & Marreiros, 2013) and (Conceição, Pereira, Silva, & Simão, 2012).

In the section 2 we recall the most basic concepts of the theory of the first-order differential equations (see, for instance, Ross, 1998), as well as we present a description of the software created by us, showing the results obtained when applied to solve its most common applications in the section 3. Among the applications to these equations we choose the, so-called, rate problems (population growth, radioactive nuclei decay). Additional information about the construction and use of CDF file type can be found in (Ruskeepää, 2009) and (Wolfram, 1999).

2. MODEL

2.1 Basic theory

A first-order ODE solved for the derivative is an equation connecting an independent variable x , a sought-for function $y=y(x)$ and its first derivative, that can be written in the form

$$y' = f(x, y), \quad (1)$$

¹ This type of document runs with CDF-Player, which is a free software program that can be downloaded from <http://www.wolfram.com/cdf-player>.

where f is a real continuous function in some domain D of the x o y plane.

The general solution of the differential equation (1) is a function

$$y = \varphi(x, C) \quad (2)$$

depending on one arbitrary constant C and such that (2) satisfies the equation (1) with any allowed value of C .

A particular solution of the differential equation (1) is a solution obtained from the general solution (2) with some defined value of the constant C .

2.2 Growth and decay rate problems

Let $y=y(t)$ denote the quantity of a substance at a time t , and suppose the rate, i.e., the derivative, $y' \equiv dy/dt$, at which the quantity changes are proportional to the amount of the quantity present at time t ; i.e., we have

$$y' = ky, \quad (3)$$

where k is a constant of proportionality.

The differential equation (3) is an equation with variables separable; separating variables, integrating, and simplifying, we have that

$$y(t) = Ce^{kt} \quad (4)$$

is the general solution of the differential equation (3).

Usually, in this so-called “rate problems”, there are given two initial conditions, which allow us to obtain the value of C and the constant of proportionality k . Let the following conditions be given

$$y(0) = y_0, \quad y(t_1) = y_1, \quad (5)$$

i.e., y_0 is the amount initially present and y_1 is the amount present at time t_1 ; $y_0, y_1 > 0$. Computing the constants C and k :

$$\begin{cases} y(0) = y_0 \\ y(t_1) = y_1 \end{cases} \Leftrightarrow \begin{cases} y_0 = C \\ y_1 = y_0 e^{kt_1} \end{cases} \Leftrightarrow \begin{cases} C = y_0 \\ k = \frac{\ln(y_1/y_0)}{t_1} \end{cases} \quad (6)$$

and inserting their values in (3) we get

$$y(t) = y_0 e^{\frac{\ln(y_1/y_0)}{t_1} t}. \quad (7)$$

Note that if the quantity $y(t)$ grows, i.e., $y_1 > y_0$, then $k > 0$ (in this case, k is the, so-called, growth constant); if the quantity $y(t)$ decreases, i.e., $y_1 < y_0$, then $k < 0$ (in this case, k is the, so-called, decay constant).

2.2 Implemented software

The figure below shows the initial status of the layout of the implemented software.

Figure 1. Structure of the software developed

Analyzing the Figure 1 we see that the software is divided in two parts, the one at the top corresponds to the definition of the problem, where we found a list of radio buttons that enables the choice of the type of problem we intend to solve, followed by a region of input fields where the user defines the initial state of the population, that is, the number of individuals present at time t_0 , P_0 , a ulterior time, t_1 , where a new information about the population is collected, as well as the number of individuals present, P_1 . Notice that to get the answers to the questions asked it will be obligatory to grab the mouse and move the pointer over the plot to the left or to the right until we stabilize it over the point where we want to collect the information we seek. Sometimes it will be difficult, or even impossible, to get the exact coordinates of the point, what forces the teacher to be careful when choosing the question and the user when giving the answer, that is, if the answer has to be an overestimation or an underestimation.

One of the most important targets to reach constructing this software is the simplicity of its use. We want this software to be very easy to use, so, to change the fields in the input area, the user just needs to press TAB key (or use mouse) to jump automatically to the next input field. As the user changes the input field the output will be automatically updated, both graphical and analytical.

3. RESULTS

3.1 Population growth and decay

3.1.1 Example 1 (e-coli population growth)

A culture of bacteria (e-coli) has initially $P_0=3$ individuals. After 20 minutes the population is twice the original value. If the rate growth is proportional to the number of bacteria $P(t)$ present in the population at time t :

- find the number of bacteria $P(t)$ present in the population after 61 minutes;
- what will be the time necessary to guarantee a population 5 times bigger than the initial population?

Figure 2. Tool application to solve a problem of population dynamics using a growth rate in e-coli growth population problem

Figure 1 shows how to apply our tool to solve the questions exhibited in example presented before. If we attend to the input fields present in the software we see that, to get the solution to our problem, we have to input the number of individuals that are initially in the population, P_0 , and the number that constitute the population after a certain elapsed time, t_p , denoted by P_p .

3.1.2 Example 2 (radioactive nuclei decay)

Consider an initial mass of the radium element, $M_0 = 100$ g, that is reduced in 1% after 23 year. If the rate decay is proportional to the amount present at time t :

- find the mass present after 2020 years;
- what will be the time necessary to guarantee one half of the initial mass?

Figure 3. Tool application to solve the problem of radioactive nuclei decay presented in example 2

The problem presented in example 2 is similar to the one shown in example 1, but in this case, it is associated to a decay rate. In which concerns to the application of the tool it will be necessary to notice that to say that after years the mass decreases is equivalent to say that of the mass is present after years, as well as the fact that time here is counted in years. There are some subtle aspects, like the ones stated before, that require an additional attention of the user.

3.2 Half-life

This concept is often applied in Physics and provides a measure of the stability of a radioactive substance, corresponding to the time it takes for one-half of the atoms initially present in an amount of A_0 to disintegrate, or transmute, into the atoms of another element. The stability of a substance is directly related to the value of its half-life, that is, the larger the value of the half-life is, the more stable the substance is.

3.2.1 Example 3 (Half-life of plutonium)

A breeder reactor converts relatively stable uranium-228 into the isotope plutonium-239. After years, it is determined that of the initial amount of plutonium, A_0 , has disintegrated. Find the half-life of this isotope if the rate of disintegration is proportional to the amount remaining.

Figure 4. Tool application to solve the problem of radioactive nuclei decay presented in example 3

Looking at Figure 4 we notice some slight differences between the layouts of the software in this case and the other two presented before. In fact, here we don't need to introduce the initial state because we are assuming that the percentage in that stage is 100%. Due to this assumption, the user only need to give the time elapsed, t_1 , and the percentage of the isotope that has been disintegrated after that period of time, P_1 . In what concerns to the output we verify that there are also some differences worth mentioning. In the graphical solution, the half-life of the isotope, which represents the answer to our problem, is automatically marked with a blue dot. The usage of additional dashed lines is made to give a more precise idea of the location of this point. Since the objective of this type of problems is to give the value of the half-life of the isotope it makes no sense to give freedom to move the cursor over the plot. This originates another subtle difference in the analytical output. Instead of showing the point over the curve, we present the value of the half-life of the isotope.

3.3 Carbon dating

The American physical chemist Willard F. Libby was the first to develop a theory of carbon dating. During the 50's Libby led a team of scientists at the University of Chicago, and, as recognition of the importance of this work, was awarded the Nobel Prize for Chemistry in 1960. Carbon dating is a particular type of radioactive dating, applicable in cases for which the matter to be dated was once living. The radioactive isotope carbon-14 (C^{14}) is produced at a relatively constant rate in the atmosphere, and like stable carbon-12 (C^{12}), combines with oxygen to form carbon dioxide, which is incorporated into all living things. When a living organism dies, its level of C^{12} remains relatively constant, but its level of C^{14} begins to decay with the rate

$$\frac{d[C^{14}]}{dt} = -k[C^{14}], \quad (8)$$

where the decay rate is given by $k = 1.2097 \times 10^{-4} \text{ yr}^{-1}$. This rate corresponds with the commonly quoted fact that C^{14} has a half-life of 5730 years. Since the fraction of C^{12} to C^{14} remains relatively constant in living organisms, at the same level as it occurs in the atmosphere, roughly

$$\frac{[C^{14}]}{[C^{12}]} \cong 1.3 \times 10^{-12}, \quad (8)$$

we can determine how long an organism has been dead by measuring this ratio and determining how much C^{14} has radiated away. In practice, scientists measure this ratio of C^{14} to C^{12} in units called modern carbons, in which the living ratio that corresponds to the ratio of C^{14} to C^{12} in a living organism is defined to be 1 modern carbon. As it was mentioned this method is based on the knowledge of the half-life of C^{14} , which, in Libby's experiments was fixed in approximately 5600 years, while nowadays it is commonly accepted that this value is approximately 5730 years. This method has been used to date numerous things, being one of the latest the dating of fragments of woolen trousers excavated at Yanghai cemetery in western China, published just a few months ago, (Beck, Wagner, Li, Durkin-Meisterernst, & Tarasov, 2014).

3.3.1 Example 4 (Age of a fossil)

A fossilized bone is found to contain 20% of its original amount of C^{14} . Determine the age of the fossil.

Figure 5. Tool application to solve the problem of carbon dating presented in example 4

Concerning to Figure 5 there are three observations to be made. Since we are interested in the percentage of C^{14} that is present in the object that is to be dated, the problem to be solved is always the one stated in the analytical output panel. This means that this type of problem has always the same solution. Due to this characteristic, the only input that should be given is the percentage of C^{14} that is measured in the object. And, finally, since we pretend to know the age of the object, we just need to solve the equation to find the value of t that corresponds to the percentage given. The answer to the problem is stated in the last line of the analytical output panel and marked with a green dot over the curve in the plot on the graphical output panel.

4. CONCLUSIONS

As we all know, most part of the students reveals strong difficulties to learn mathematical concepts, being one of the pertinent questions: "Where can we apply this?" For us, teachers, the introduction of new digital technologies represent a huge step on how we can help in answering this question. This kind of technologies can also be explored to explain, in a more appealing way, the mathematical concepts. The possibility of interaction with the software enables the test and enumerable number data sets, which, in most part of applications, is important to understand the behaviour of the solution

of the problem that is being solved. This intrinsic characteristic of the software represents a great advantage because different teachers with different sets of data can use it.

In the future, we intend to use this software in the classroom testing it with our students and collecting the feedback of their use, hoping that their feedback will be important to develop this kind of software to other application cases to ODEs as well as other subjects. Other future goal is to present this software in workshops, for other teachers, and in seminars, for a more general audience.

ABSTRACT

Differential equations constitute an area of great theoretical research and applications in several branches of science and technology. The scope of this work is to present new software that is able to show all the steps in the process of solving a linear second-order ordinary differential equation with constant coefficients.

Keywords: Linear Ordinary Differential Equations, Symbolic Computation, Wolfram Mathematica, Computable Document Format.

1. INTRODUCTION

In the present work, we present interactive software that can be used to aid in the process of teaching linear second-order ordinary differential equations (ODEs) with constant coefficients. This work can be seen as a natural complement to our previous work (Coelho & Marreiros, 2013). In (Coelho & Marreiros, 2013) we studied the second-order linear differential equations with constant coefficients. In what relates to the implementation of the computational tool, in (Coelho & Marreiros, 2013) we started with the homogeneous case and then extended it to the construction of a particular solution by using the variation of parameters method (the “general method”) in the nonhomogeneous case. In the present work, we also consider the undetermined coefficients method to construct a particular solution for the same type of equations. As we see below, this method can only be applied to a special form that the right-hand side (rhs) of the equation can assume.

This work is organized as follows. We begin shortly recalling the basic concepts of the theory of the second-order linear ODE; for references we address the reader to our cited work (Coelho & Marreiros, 2013), and, for instance, (Ross, 1984), (Krasnov, Kiselev, & Makarenko, 1981) and (Marreiros, 2012). Then follows the main section where we describe the implementation and the use of the software.

2. BASIC CONCEPTS

2.1 Basic theory

Below we recall the basic concepts of the theory of the second-order linear differential equation.

Definition 1. A second-order linear ordinary differential equation in the dependent variable y and the independent variable x is an equation that can be written in the form

$$y'' + ay' + by = f, \quad (1)$$

where a , b and f are continuous real functions on a real interval I , i.e., $x \in I \subset \mathbb{R}$.

If f is not identically zero on I , then the equation (1) is said to be nonhomogeneous.

If f is identically zero on I , then we obtain the so called corresponding homogeneous equation to (1), being its form naturally given by

$$y'' + ay' + by = 0. \quad (2)$$

The following result takes place.

Theorem 1. Let y_1 and y_2 be two linearly independent solutions of the homogeneous equation (2) on an interval I . Then the general solution of (2) is given by

$$y = C_1 y_1 + C_2 y_2$$

where $C_1, C_2 \in \mathbb{R}$.

The general solution of the nonhomogeneous equation (1) is given in the next theorem.

Theorem 2. Let y be the general solution of the nonhomogeneous equation (1), y_h be the general solution of the homogeneous equation (2) and y_p a particular solution of the nonhomogeneous equation (1). Then

$$y = y_h + y_p.$$

First, let us consider the homogeneous equation with constant coefficients, i.e.,

$$y'' + ay' + by = 0, \quad (3)$$

where $a, b \in \mathbb{R}$. Associated to the equation (3) we define the characteristic equation,

$$r^2 + ar + b = 0. \quad (4)$$

We know that the roots of (4) have to fall into one of the following three cases: two real distinct roots; one real root with multiplicity two; or two complex conjugate roots. Let r_1, r_2 be the roots of (4) and $C_1, C_2 \in \mathbb{R}$; according to each case, the general solution of the equation (3) is written in one of the following forms.

Case 1. Distinct real roots, $r_1 \neq r_2$; then

$$y(x) = C_1 e^{r_1 x} + C_2 e^{r_2 x}.$$

Case 2. Repeated real roots, $r_1 = r_2 = r$; then

$$y(x) = (C_1 + C_2 x) e^{rx}.$$

Case 3. Complex conjugate roots, $r_1 = \alpha + i\beta, r_2 = \alpha - i\beta, \alpha, \beta \in \mathbb{R}, \beta \neq 0$; then

$$y(x) = (C_1 \cos(\beta x) + C_2 \sin(\beta x)) e^{\alpha x}.$$

Next, we consider the nonhomogeneous equation with constant coefficients, i.e.,

$$y'' + ay' + by = f, \quad (5)$$

where $f(x) \neq 0$ and $a, b \in \mathbb{R}$. By theorem 2 we know that the general solution of this equation is given by $y = y_h + y_p$, where y_h is the general solution of the associated homogeneous equation and y_p is a particular solution of the given nonhomogeneous equation. The process to obtain y_p was explained for equation (3); therefore, we only need to know how to obtain one particular solution for (5). There are two methods to perform this task: the undetermined coefficients method and the variation of parameters method.

The undetermined coefficients method. This method can only be applied to a special form that the function on the rhs of the equation (5) can assume; the general form of f allowing the use of this method is

$$f(x) = (P_m(x) \cos(\beta x) + Q_n(x) \sin(\beta x)) e^{\alpha x},$$

where $P_m(x)$ and $Q_n(x)$ are polynomials of degree m and n , respectively.

In this case, a particular solution $y_p(x)$ of the equation (5) is sought in the form

$$y_p(x) = x^s (A_k(x) \cos(\beta x) + B_k(x) \sin(\beta x)) e^{\alpha x},$$

where $k = \max\{m, n\}$, A_k and B_k are polynomials of degree k of the general form with undetermined coefficients, and s is the multiplicity of the root $r = \alpha \pm i\beta$ of the characteristic equation of the corresponding homogeneous differential equation to (5) (if $\alpha \pm i\beta$ is not a root of the characteristic equation, then $s = 0$). Let us briefly explain the use of this method.

Depending on the function f we seek a particular solution $y_p(x)$ of the equation (5) in a similar form with undetermined coefficients. Then we substitute the expression for y_p in the given equation. Equating coefficients of the similar terms of the first and the second member of (5), we obtain a linear system of equations, to find the undetermined coefficients. Solving this system, we get the particular solution sought $y_p(x)$.

The variation of parameters method. For sake of self-contained present work, we briefly recall this “general method” (see our previous work (Coelho & Marreiros, 2013)) that we have to use in the general case. Consider the nonhomogeneous linear differential equation

$$y'' + ay' + by = f,$$

where a, b and f are continuous functions on some interval I . Let y_1 and y_2 be two linearly independent solutions of the corresponding homogeneous equation

$$y'' + ay' + by = 0,$$

on the interval I . Then a particular solution of the nonhomogeneous equation is given by

$$y_p = uy_1 + vy_2,$$

provided that u and v are functions that satisfy the following conditions

$$\begin{cases} u'y_1 + v'y_2 = 0, \\ u'y'_1 + v'y'_2 = f. \end{cases}$$

These conditions represent a linear algebraic system of equations for the unknowns u' and v' . Note that this system has a unique solution because,

$$W = y_1 y'_2 - y'_1 y_2 \neq 0,$$

since y_1 and y_2 are two linearly independent solutions of the corresponding homogeneous differential equation. Therefore, applying Cramer's rule, we can write,

$$u' = \frac{\begin{vmatrix} 0 & y_2 \\ f & y'_2 \end{vmatrix}}{W} = -\frac{f y_2}{W}, \quad v' = \frac{\begin{vmatrix} y_1 & 0 \\ y'_1 & f \end{vmatrix}}{W} = \frac{f y_1}{W}.$$

Performing the integration, we obtain

$$u = -\int \frac{f y_2}{W} dx, \quad v = \int \frac{f y_1}{W} dx.$$

The superposition principle. It is convenient to use the following result when the rhs $f(x)$ of the nonhomogeneous equation is given by a sum of several functions. If $y_{pk}(x)$ is a solution of the equation

$$y'' + ay' + by = f_k(x), \quad k = 1, \dots, n,$$

then the function

$$y_p(x) = \sum_{k=1}^n y_{pk}(x)$$

is a solution of the following equation

$$y'' + ay' + by = \sum_{k=1}^n f_k(x).$$

3. SOFTWARE IMPLEMENTATION AND USE

This section is used to show the outlook as well as to present a brief description of the software developed to solve second-order ODEs using the undetermined coefficient method and the variation of parameter method, according to the works (Coelho & Marreiros, 2013) and (Coelho & Marreiros, 2015) respectively. First, we decided to create the one using the variation of parameter, but, due to user input restrictions, we were forced to return to this problem and create one tool that can be used by students when learning the linear second-order ODEs with constant coefficients without having to pay any license. In both situations, it was used the Wolfram's software, more precisely we implement the code to create the Computable Document Format (CDF) file with the program Mathematica® following the references (Torrence & Torrence, 2009), (Ruskeepää, 2009), (Trott, 2006) and (Wolfram, 2003).

The CDF file type is a type of file that, as the name itself indicates, has the ability of doing calculus within the document. It is worth mentioning that this type of file requires a previous installation of the CDF Player program that can be downloaded from Wolfram's webpage¹. This intrinsic characteristic of the file gives the programmer the chance to create files for an incredible wide set of applications that can be used to teach or to present any subject that involves any type of calculus.

In what concerns to the outlook, we can see it as two main areas, one of input and another of output results. In figure 1 the regions that correspond to input conditions are signalized as regions 1 and 2. Region 1 is not exactly an input region but is directly related with the input region marked as region 2. Figure 2 shows the changes that occur when the user chooses one of the types presented to define the function on the rhs of the ODE. When the function on the rhs has the form of a product between a polynomial and an exponential, the user is compelled to choose the first option. This way it will be necessary to define the coefficients of the polynomial as well as the exponent constant coefficient. Since this was created to be a didactical tool we limited the degree of the polynomial to a maximum of two. So, in this case, the user has to give the program the coefficients of the ODE, the coefficients of the polynomial, and the exponent coefficient, that is, the user has to define six input values. The other option to define the function on the rhs includes trigonometric functions. This is actually the general case of the function that we can have on the rhs of the ODE when using the undetermined coefficients method to solve the type of ODEs covered in this work. Attending to figure 2 we notice a substantial increment in the number of input fields in this case. In fact, we have to define the coefficients of another polynomial, that will have, again, a maximum degree of two, and the constant coefficient in the argument of the trigonometric functions, which sums up to ten input values. To deal with the trigonometric functions the user must be a little bit more careful, because sometimes the function on the rhs of the ODE depends only on a cosine function, case that will be accomplished by setting the coefficient β equal to 0, but in other occasions the function defined on the rhs depends only on a sine function. In this situation, the manipulation is slightly different, because the choice of a coefficient β that eliminates the first part of the function is not the easiest way to solve the problem. Therefore, in this case, the user must set all the coefficients of the polynomial equal to zero. Other situation that is important to emphasize is the one that happens when the function on the rhs depends simultaneously on sine and cosine functions. In this case, additional caution must be taken, because if the constant coefficients in the arguments of the trigonometric functions are not the same the problem can't be solved by a solely application of the program. To clarify this situation, when the constant coefficients in the arguments of the trigonometric functions are exactly the same the user can define the function on the rhs in one application of the program, in any other situation it will be necessary to apply the principle of superposition described in the first section. In fact, this principle has to be applied in all situations that occur when the user is confronted with the impossibility of defining the rhs function in the way that the program exhibits. Turning to the output area we may divide it in two regions, one where the user sets the part of the solution he wants to see or analyse, if the idea is to see the process of obtaining the solution. In figure 1 this is marked as region 3. By clicking on one of the three options available, the user will see the general solution, the process to obtain the solution to the homogeneous associated ODE, or the process to obtain the particular solution to the ODE defined in the input area. The result of the choice in region 3 will be displayed in the region marked as region 4 in figure 1.

Figure 2. Outlook of the software - choices available for f in the ODE: $y''+ay'+by=f$.

In which concerns to the software developed to solve the problem with the method of variation of parameters, printed in figure 3, we easily see that its structure is exactly the same as the one described above, with one slight difference worth mentioning. Since this is the general method we do not have restrictions to the form of the function to be used in the rhs of the ODE, so, to define it, the user has an input field where he has to define the analytical expression of the function to use. Note that the input has to be done using the syntax of the programming language that is being used, more precisely the one used when programming with Mathematica®. The possibility of inputting analytical expressions is what implies the buying of a license to run the CDF player.

Figure 3. Outlook of the software: method of variation of parameters.

To end this section, we describe in a very briefly way the most important commands used to create the software presented here. As the list of commands used to implement the software is vast, it will be impossible point and explain all of them. The central command used to construct this type of files is the Manipulate command (see figure 4), used to enable interactive manipulation.

Figure 4. Command Manipulate

```
Manipulate[
  TabView[{
    {"op1", "General Solution" → Column[
```

Another important command used is the InputField command, presented in figure 5, which is used to represent an editable input field that, in our case, contains the values the user wants to attribute to the constant coefficients of the ODE, the polynomial and also to the trigonometric constant arguments.

Figure 5. Command InputField

```
{ {alfa, 0, alfaL}, -10, 10}, Alignment → Center, ControlPlacement → Left, ControlType → InputField
], {+end manipulate+}
```

Analysing figure 4 we notice the existence of another command, also with greater importance, used to manipulate the output. The command TabView provides the possibility to choose, by clicking, the type of output.

Figure 6. Command DSolve

```
"y(x) =" FullSimplify[y[x] /. DSolve[y''[x] + a y'[x] + b y[x] = 0, y[x], x,
  GeneratedParameters → (Subscript[C, #] &)]][[1]]],
```

Sometimes, due to the specificity of the problem, we also used commands that are intrinsic to Mathematica® and enable the user to perform symbolic calculus, such as DSolve (see figure 6).

EXAMPLES

The examples we decide to show here were chosen from the references (Braun, 1983), (Vrabie, 2004), and (Demidovich, 1978). Our choice was performed in a constructive way, which is building new cases upon the ones already solved by using the software. In what follows, we decided to state the problem we want to solve and give the main direction guidelines to obtain its solution. This way the user can see the correspondence between the process of obtaining the solution and the results provided by the software.

The homogeneous case

Since in all the situations we have to start the process by solving the associated homogeneous ODE we start this section by presenting the procedure when having a homogeneous ODE.

Example 1. Find the general solution of the ODE
 $y'' - 2y' + y = 0$.

Using the theory presented in the first section we solve this type of ODE by constructing and solving the characteristic equation
 $r^2 - 2r + 1 = 0 \Leftrightarrow (r - 1)^2 = 0$.

Since it has only one solution with multiplicity 2, $r = 1$, the general solution of the ODE presented in example 1 will be
 $y(x) = C_1 e^x + C_2 x e^x = (C_1 + C_2 x) e^x$,

with $C_1, C_2 \in \mathbb{R}$.

The results we get by applying our software are shown in figure 7. Note that in this case the particular solution has to be $y_p(x) = 0$, which means that the general solution of the ODE is equal to the solution of the homogeneous associated ODE.

Figure 7. Results obtained by using the software when solving example 1.

The nonhomogeneous case

To start the analysis of the application of our software to the nonhomogeneous case assume that the coefficients of the ODE are exactly the same as the ones used in example 1, meaning that the solution of the homogeneous associated equation is the general solution obtained to the ODE defined in example 1. First, we will turn our focus to examples that can be solved by using the undetermined coefficients method, presenting, at the end of the section, an example that can't be solved with the undetermined coefficients method, that is, that has to be solved by using the method of variation of parameters.

The method of undetermined coefficients. To start the exemplification of the application of the software developed for this method consider a function on the rhs that is the result of a product between a polynomial and an exponential.

Example 2. Find the general solution of the ODE

$$y'' - 2y' + y = 6xe^x.$$

From example 1 the solution of the homogeneous associated ODE is given by

$$y_h(x) = C_1 e^x + C_2 x e^x,$$

where $C_k, k=1,2$ are arbitrary real constants. The characteristic equation, $r^2 - 2r + 1 = 0$, has a unique solution with multiplicity two, $r = 1$. This implies that we need to look for a particular solution that has the following form,

$$y_p(x) = x^2 (A_0 + A_1 x) e^x = (A_0 x^2 + A_1 x^3) e^x.$$

In this situation, we need to multiply by x^2 because the associated homogeneous ODE has a solution that already is a linear combination of the functions in the set $\{e^x, x e^x\}$. This means that we need to look for a solution that is a linear combination of $x^2 e^x$ and $x^3 e^x$. The application of the undetermined coefficient method to this case yields,

$$y_p(x) = x^3 e^x.$$

Which leads us to conclude that

$$y(x) = y_h(x) + y_p(x) = C_1 e^x + C_2 x e^x + x^3 e^x,$$

with $C_1, C_2 \in \mathbb{R}$.

In figure 8 we present the results obtained by our software when it is applied to example 2.

Figure 8. Results obtained by using the software when solving example 2.

As a third example for the application of this software we will consider a function on the rhs of the ODE that is the result of a product between a polynomial and a trigonometric function. Note that when it is mentioned a trigonometric function we are considering only the sine and/or cosine functions.

Example 3. Find the general solution of the ODE
 $y'' - 2y' + y = 4 \sin x$.

In what concerns to the homogeneous associated ODE we already know its solution, since is the same of the ODE presented in example 1. According to the form of the function on the rhs of the ODE we need to search for a particular solution in the form,

$$y_p(x) = A_0 \sin x + B_0 \cos x.$$

Applying the method described in the first section we obtain
 $2B_0 \sin x - 2A_0 \cos x = 4 \sin x$,

which leads to the following system of linear equations,

$$\begin{cases} -2A_0 = 0 \\ 2B_0 = 4 \end{cases} \Leftrightarrow \begin{cases} A_0 = 0, \\ B_0 = 2, \end{cases}$$

and, consequently,

$$y_p(x) = 2 \cos x.$$

Therefore, the general solution of the ODE is given by
 $y(x) = y_h(x) + y_p(x) = C_1 e^x + C_2 x e^x + 2 \cos x$,

with $C_1, C_2 \in \mathbb{R}$.

Figure 9 shows the results obtained with our software.

Figure 9. Results obtained by using the software when solving example 3.

The method of variation of parameters. The real importance of considering this method it's because it can be applied in all situations in particular when the function on the rhs of the ODE doesn't meet the form that can be used to apply the method of undetermined constants.

Example 4. Find the general solution of the ODE
 $y'' - 2y' + y = e^x \ln x$,

with $x > 0$.

The major difference between the software that uses the undetermined coefficients method and the one that uses the method of variation of parameters resides in the way that user inputs the data, more precisely the form allowed to define the analytical expression of the function present in the rhs of the ODE. In this method, the choice for the analytical expression of the function to be used in the rhs is free. However, to input the analytical expression the user must follow the syntax used when programming with Mathematica®. For instance, in the example 4 the user must write `Exp[x]*Log[x]` in the field that corresponds to f . After inputting the data that defines the equation in the correspondent fields, the software will generate three tabs of results. The first one, appearing by default, is the one that corresponds to the general solution of the ODE defined, see figure 10 (left side). Clicking on the second tab the user can inspect the procedure used to obtain the general solution of the corresponding homogeneous differential equation, see figure 10 (middle). Finally, clicking on the third tab the user will find the procedure applied to obtain the particular solution using the method of variation of parameters, see figure 10 (right side). Relating the results obtained with this program with the ones given by the one that uses the method

of undetermined coefficients method we discover that the only difference is the tab that shows the process of obtaining the particular solution, the other two tabs show exactly the same results.

Figure 10. Results obtained by using the software when solving example 4.

The superposition theorem

To end the section dedicated to examples let us explain how to use the software implemented for the method of the undetermined coefficients when a single application of it does not solve the problem. This situation occurs when the rhs of the equation is defined as a sum of functions that can be used with this method. For example, suppose that the rhs of the ODE corresponds to the sum of the function

$$f(x)=6xe^x$$

with the function

$$g(x)=4\sin x$$

i.e., the ODE to solve is given by

$$y'' - 2y' + y = f(x) + g(x) \Leftrightarrow y'' - 2y' + y = 6xe^x + 4\sin x. \quad (6)$$

In this type of situations, the user must run the application twice, one to obtain the particular solution to the ODE

$$y'' - 2y' + y = f(x) + g(x) \Leftrightarrow y'' - 2y' + y = 6xe^x. \quad (7)$$

which corresponds to the one obtained in example 4.2, and another to obtain the particular solution to the ODE

$$y'' - 2y' + y = f(x) + g(x) \Leftrightarrow y'' - 2y' + y = 4\sin x. \quad (8)$$

which corresponds to the one obtained in example 3. Denoting the particular solutions to the ODE (7) and (8) by y_{pf} and y_{pg} , respectively, the application of the superposition principle presented at the end of the first section allow us to conclude that the particular solution to the ODE (6) is given by

$$y_p(x)=y_{pf}(x)+y_{pg}(x).$$

4. FINAL REMARKS

In (Coelho & Marreiros, 2013) we presented software that could be used to solve this type of ODEs, but, due to the way that we choose to create it, the user can only apply it freely when the function on the rhs of the equation is constant. In any other case the user is obliged to buy a license for Mathematica® or CDF Player. As a consequence of this fact, we can assure that one of most important conclusions of this work is that the software developed using the method of undetermined coefficients can be used without the necessity of buying any license. This feature allows us to share it with our students, so they can use it at home, or anywhere else, when studying linear second-order ODEs with constant coefficients. This may be the most important conclusion of this work, but we may draw other minor considerations about it, such as the importance it represents as a complement in studying this subject and the simplicity of its use, whether we use the program built with the undetermined coefficients method or the method of variation of parameters.

We should point out that in the last couple of years there has been a little revolution in the publication and distribution of this type of applications, as we can see in Wolfram's webpage, but in our humble opinion the one we present in this is more complete and give a more concise approach about the process of how we should obtain the particular solution.

BILINGUAL TEACHING IN ALGARVE AND ITS ADVANTAGES

Rui Rego

University of Algarve; Vale Verde International School-Algarve
(profdeciencias@gmail.com)

Jorge Andrez Malveiro

University of Algarve
(jamalveiro@ualg.pt)

ABSTRACT

Surprising recent studies connecting cognitive advantages of being bilingual might influence the future of education. In Algarve, we could find two schools that offer bilingual teaching. These schools provide at early stages for 50% of teaching in English and the rest conducted in Portuguese. These schools strongly believe that this bilingual approach will enrich students' lives in Portugal, and enhance their capacity for learning additional languages. This unique approach provides progressive building blocks for non-native speakers in both languages if they start in this system at an early stage (Esposito, 2014). This ensures that by the end of the Primary Years Program, students should be well prepared for a Portuguese or English tuition. This type of program has proved very successful (academic success) and is evident in the high pass rate of students at these schools, being significantly higher than in England, Wales or Northern Ireland (according to the results released by the Department of Education of UK for 2016).

Speaking two languages has obvious practical benefits in an increasingly globalised world. According to Theresa Deussen (2014), research is pointing out several benefits (Cultural, Social, Cognitive, Economic, and Academic) related to bilingualism.

The most recent discoveries connect bilingualism to increased brain efficiency, faster responses to stimuli and it could delay the symptoms associated with Alzheimer and other frontotemporal dementia diseases. Evidence supports an array of benefits of growing up to become proficient in more than one language and the effectiveness of bilingual programs in schools. In a world that globalisation is a challenging reality; we need to be ready for present and future multicultural changes.

Keywords: Bilingual, International School, Academic, Cognitive.

In Algarve, you can access a high-quality public and private education systems. Surprising recent studies connecting cognitive advantages of being bilingual might influence the future of education. At the moment, parents don't need to wait until the system changes, because there are some schools in Algarve that follow a fully bilingual program for their children.

International schools attended by Portuguese and foreign students can be found all over the country. At these schools, students may study international programs such as the International Baccalaureate, or the British IGCSE, or even the Portuguese system. Through the combination of cultural excursions, curriculum inclusion and with the privilege of having a diverse body of multinational students and teachers, these schools provide an optimal environment to develop multicultural education. Even with a multicultural education, not all schools offer a true bilingual education.

In Algarve, we could find 5 international school groups that could offer an international education up to A-level: -The Nobel International School; International College of Vilamoura; Vale Verde International School (VVIS); Aljezur International School; and Colégio Santiago International (CSI).

From this list of schools, only two are offering a true bilingual education: - CSI, and VVIS.

The first school adopting a fully bilingual program was VVIS. At 2002 following the completion of a Masters Research Degree by the School Director investigating the effective implementation of bilingual education, a pilot scheme program was launched in 2008 to introduce Algarve's first fully bilingual primary school. This project provides at early stages for 50% of teaching in English and 50% of lessons being conducted in Portuguese. This ratio fades out as the students' progress on their studies favouring the English teaching. The pilot program was a great success and is running since then up to year 6. VVIS students are now able to communicate in both languages. Preschool following the bilingual International Preschool Curriculum commenced in September 2013 and ran for about 2 years. It followed the International Preschool Curriculum taught mainly in Portuguese, with some themes being taught in English.

The school divides the teaching so that some subjects are taught in English and others are taught in Portuguese. Bilingual teaching becomes a natural event in the school grounds. The school embraces several subjects taught in Portuguese that are introduced by the Ministry of Education in Portugal such as "Língua Portuguesa" (Portuguese Language), "Estudo do Meio" (Environmental Studies), "História e Geografia de Portugal" (History and Geography of Portugal), "Educação Física" (Physical Education), "Educação Visual e tecnológica" (Visual and Technological Education), "Formação Pessoal e Social ou Educação Religiosa" (Personal and Social Education or Religious Education).

CSI started its bilingual program at around 2012 and expanded to A-level in the same way as VVIS. These schools strongly believe that this bilingual approach will enrich students' lives in Portugal, and enhance their capacity for learning additional languages. This unique approach provides progressive building blocks for non-native speakers in both languages

if they start in this system at an early stage. This ensures that by the end of the Primary Years Program, the student should be well prepared for a Portuguese or English tuition.

Besides the bilingual approach, the advantage of VVIS compared to other international schools in the area is that their intake is limited to eighteen students per class in the secondary. This low pupil ratio per teacher provides ample opportunity for students to receive individual attention, which has proved very successful and is evident in the high pass rate of students at that school.

According to the Department of Education of UK, in England, the A*- C pass rate dropped from 68.8% in 2015 to 66.6% in 2016. In 2016 Wales shows a similar percentage and Northern Ireland with a higher result 79.1%. With the following percentage data, we could compare the results of the bilingual schools of the Algarve with England, Wales, and Northern Ireland. Results for 2016 were as follows on Percentage of A*- C results (2016):

- VVIS = 91%;
- CSI = 87.5%;
- Northern Ireland = 79.1%;
- Wales = 66.6%;
- England = 66.6%.

Both schools clearly scored above any of the compared countries. VVIS with the best results scored 11.9% above Northern Ireland and 24.4% above Wales and England.

Comparing the results of these two bilingual schools in Algarve, with the UK panorama, we could clearly see that these schools are outperforming England, Wales and Northern Ireland.

At years 7, 8 and 9, the curriculum in these bilingual schools is totally based on the British curriculum guidelines. Subjects from year 7 to year 9 are taught according to the program of study for key stage 3 and attainment targets.

They follow a common curriculum of English, Mathematics, General Science, French, Portuguese, Geography, History, Information Computer Technology, Music, Drama, Art, and Design. PSHE and Physical Education programs are adapted according to the year and the group being taught.

Subjects from year 10 to 13 follow programs from Cambridge International Examinations or the from Pearson.

The syllabuses are international in outlook but retain a local relevance. They have been created specifically for an international student body with content to suit a wide variety of schools and avoid cultural bias. This curriculum allows university entry in more than 145 countries. The Universities and Colleges Admissions Service (UCAS) is a UK-based organisation that recognises their qualifications.

At 2011 the British Council started working with the Portuguese Ministry of Education in order to assist a program (Bilingual Schools Project) that follows a bilingual form of teaching in 3 primary public schools (none in the Algarve). Some lessons such as “Estudo do Meio” (Environmental Studies) and “Expressões Artísticas” (Artistic Expressions) were taught partly in English.

At 2014 the Ministry of Education, through the General Directorate of Education – “Direção Geral de Educação” (DGE) made a formal assessment of this project that they considered successful and decided to invite other schools to adhere and to expand the model up to year 6. The assessment identified several advantages that are summarised in the following table.

Table 1- Summary of the advantages of the Bilingual Schools Project according to the DGE 2014 assessment

Advantages for the students	Advantages for the teachers and the school
Increases the chances of having fully bilingual students at the end of their schooling	An innovative curriculum might reduce student dropout
Improves the ability to communicate in different environmental contexts	Might increase staff motivation and the sense of belonging to a common community
Promotes a more flexible chain of thought	Teachers develop their skills through in-service training
Improves the chances of learning and understanding other languages	
Improves their future chance of finding a suitable job in this increasingly globalised world.	

Probably the biggest challenge of this program, and also identified on the assessment, is the lack of preparation and low language skills that some Portuguese primary teachers have at the beginning of this new educational model.

Speaking two languages has obvious practical benefits in an increasingly globalised world (Baker, 2011). Most children have the capacity to learn more than one language. Researchers say that there are advantages to being bilingual. However, some people might argue that learning one language might be hard enough but several studies show clear advantages of learning two or more languages and even more advantages if you fully become bilingual and biliterate.

Children who are learning to speak two languages tend to follow patterns of learning as any other person learning their first language. The sounds of the first language can influence how children learn and use a second language. As a rule, over time, the more difficult sounds and words will be eventually learned (Baker, 2011).

Initially, it was thought that learning two languages could increase or highlight speech or language problems. Today experts such as Corey Heller (founder of Multilingual Living and the Editor-In-Chief/Publisher of Multilingual Living Magazine) know that it is not true and any speech or language problem will show up in both languages. However, these problems are not caused by learning two languages and learning two languages could even reduce some of the problems previously identified, therefore acting as an advantage.

Research is pointing out several benefits related to bilingualism that could be ordered in two groups: *Cultural and Cognitive* in one hand, and *Economic and Academic* on the other hand.

There might be other advantages such as an increased level of well-being but it is not fully studied yet to be sure.

There are strong **Cultural** benefits of being bilingual (Gaia Vince, 2016). This tends to be more important in immigrant communities. Preserving important relationships, traditions, and identity of the community of origin and at the same time participate fully in the local society proves to be the best way to promote their successful integration during the acculturation process. Developing a high level of proficiency in another language opens doors to other ways of thinking about the world and possibility of relationships with people in other communities and other countries. This means that as an adult the job market is considerably expanded and it also helps to promote social interaction. The following table summarises some key points.

Table 2- Summary of the main cultural benefits of being bilingual

Cultural benefits
Preserves important relationships
Keeps traditions alive
Identity of the community is preserved
Promotes social integration with the host community
Increases the chances of acculturation by integration
Increases social interaction with the host and native communities

Recently some researchers are identifying **Cognitive** benefits; Ellen Bialystok and Michelle Martin-Rhee at York University in Toronto identified a superior ability to deal with conflicting visual and verbal information. In their study, young bilingual children show more awareness of how language works and have better social interaction skills. Also, Alena Esposito and Lynn Baker-Warda compared classroom responses of ethnically diverse children in bilingual and traditional classrooms. They observed more successful classroom responses from kids in a bilingual class.

Furthermore, some researchers hypothesise that the cognitive multitasking involved in bilingual speech may act as a protection against dementia. Some researchers indicate that learning two languages could interfere with each other: this idea is not completely unreasonable as there is evidence that in a bilingual's brain both language systems are stored in different areas and they could be active and processing at the same time (even when using only one language). This could create situations in which one system obstructs the other. But this interference could also be a good thing. Researchers found that this situation forces the brain to resolve internal conflicts, strengthening the cognitive muscles and possibly delaying dementia. Further studies are needed but they have an interesting hypothesis that seems acceptable.

A 2004 study developed by Ellen Bialystok and Michelle Martin-Rhee compared bilingual with monolingual preschoolers in a competition with a digital mental puzzle. The tasks consisted of identifying and sorting objects according to their colour and then reorganise them according to their shape. Bilinguals were significantly quicker at performing this task.

In this field, some studies don't suggest a heightened cognitive ability by bilinguals but instead a more efficient use of the brain. According to Albert Costa from the University of Pompeu Fabra-Spain, as bilinguals need to switch languages quite often, this is training the brain to focus on the essential on a given moment. This researcher compared German-Italian bilinguals with Italian monolinguals during a pre-set task. He found that the bilingual subjects not only performed faster, but they also did so with less activity in parts of the brain showing a higher efficiency.

In 2009 Agnes Kovacs conducted a study in Italy with 7-month old babies. Part of the sample was exposed to two languages and the other half to only one language since birth.

Kovacs conducted an experiment that consisted of repeating a sound before they were shown a puppet. Initially, the puppet was always shown on one side, so babies learned to anticipate this fact. On a later set of trials, the puppet was shown on the opposite side. The babies exposed to a bilingual environment learned quicker to switch their anticipatory gaze in the new direction.

Another interesting study was conducted by the University of California-San Diego. The neuropsychologist Tamar Gollan studied 44 elderly Spanish-English bilinguals. He measured the degree of proficiency in each language and concluded that the higher the degree of bilingualism, the later the appearance of the symptoms of dementia or Alzheimer's.

Since then, more studies have been conducted and with bigger samples. In the largest study to date, relating dementia and bilingualism, (almost 650 patients) in India, of whom 60 percent were bilingual, had been diagnosed with the condition. On average, bilinguals developed dementia 4.5 years later than those who did not. The delay ranged from three years for Alzheimer's disease to six years for frontotemporal dementia. Table 3 explores cognitive benefits that are still being studied.

Table 3- Summary of some cognitive benefits being studied

Cognitive benefits
Increases the brain efficiency
Promotes faster responses to stimuli
Might delay of symptoms associated with Alzheimer and other frontotemporal dementia diseases

Other promising results have also been achieved as happened in the studies developed at the University of Florida, where some of its researchers found some evidence that suggests possible Economic benefits of bilingualism. Other studies found more modest benefits to individuals' incomes, however, that study shows that fully bilingual immigrants in the USA (2003/2004) earn an average of nearly \$7,000 more per year than immigrants who speak only English. The following table summarises some possible benefits.

Table 4- Summary of some economic benefits of being bilingual

Economic benefits
More job opportunities
Access to more responsibilities and therefore more bonuses or higher salary
Higher average salary
Higher chances of promotion
Reduced time between jobs

There also seem to be some **Academic** benefits by studying in a bilingual environment. Studies in the US show that students that started in a bilingual school at kindergarten show initially weaker results but at roughly by the fifth grade, they are likely to read as well or better in English than those in regular programs and also read better in the second language. In this case, the advantages are clear and start being noticeable after the fifth grade. The following table will identify some academic benefits.

Table 5- Summary of academic advantages of being bilingual

Academic benefits
After the fifth year at a bilingual system, students show similar or better results at one language and clearly better results at the second language compared to systems following a monolingual teaching.
Reading and writing becomes easier
The interpretation of instructions is clearer

Evidence supports an array of benefits of growing up to become proficient in more than one language and the effectiveness of bilingual programs in schools. In a world that globalisation is a reality, we need to be ready for future changes. I believe that the combination of these benefits also contributes to an increase in well-being. At the moment there is only one study that connects bilinguals with well-being and they postulate that it might have a positive effect.

ABSTRACT

Purpose – to highlight the controversial and potentially rich dilemmas of contemporaneity in organizational settings, including the context of the knowledge economy, the need to promote knowledge management, the structuring role of organizational learning, and the enabling and powerful framing, which emerges from the ethical, gender and citizenship dimensions.

Design – an exploratory theoretical inquiry, which acknowledges the importance of capturing the philosophical argumentation behind different epistemic options and schools of thought, including the possibility to understand the empowering potential of concepts such as social innovation.

Findings – the acknowledgement of the role of signification is highlighted in a crucial way: according to the social tradition perspective, there are two central items that illustrate the process through which meaning-making emerges spontaneously in human spheres of action, the first one is language use and the second one is the participation in social practices.

Practical Implications – ethics, gender and citizenship are direct entry spaces for the understanding of the complexity of how humans organise themselves and create and share knowledge in order to optimise their action.

Originality – the full power of human thought and action is achieved when there is enough individual and social motivational alignment in order to promote the best options available; such options do emerge and succeed as a matter-of-fact evidence of the creative and interpretative capacity, which finds in organisations one of the best instances for such human development.

Keywords: Organizational Learning, Ethics, Gender, Citizenship, Social Innovation.

JEL Classification: O35

1. INTRODUCTION

The rationale behind the emergence of Organisational Learning, in the last quarter of the twentieth century, was that a new transitional phase was under way, corresponding to a change from an industrial society, based on rigid settings dating from the nineteenth century, namely the command and control paradigm, to a post-industrial society, focused on collaboration and cooperation, which gains new relevance in the turbulent first decades of the twentieth first century. A transition implies that there have to be new solutions to new problems and also that the very idea of problem and solution is changed.

The post-industrial era has acquired many different designations, from knowledge economy, to digital economy or information economy. Broader still, the societal context, also acquires a new terminology, namely the network society (Castells, 2011), the programmed society (Touraine, 1971) or the digital age. If knowledge is important, then learning becomes crucial and organisations become a fundamental setting within which learning and knowledge creation and sharing may occur.

The links between a new technological enabled environment, related to the digital and information technology revolution, and the need to promote learning in organisational settings, is straightforward. However, the transition phase holds a myriad of different layers, like the skin of an onion. Therefore, there are philosophically based concerns that may take the form of epistemological, anthropologic and ethnographic inquiries. Not only one ascertains that learning at organisational level is crucial within the changing societal environment, but also that the methods, approaches and models being used in order to capture this changing reality have to evolve too.

The social tradition on Organisational Learning, in contrast to the dominant cognitivist perspective, brings in a widely diversified and heterodox set of contributions, ranging from history, the arts, psychoanalysis, to semiotics. The message that it holds is that complexity must be dealt with from novel perspectives, including transdisciplinary inputs. More importantly, new starting points of analysis should be put forward, namely those that may enable new and powerful perspectives and worldviews to emerge. Consequently, addressing issues such as ethics, genre and citizenship, perform this role of working as a new reality test in relation to current organisational and societal challenges.

In short, ethics refers to how each society defines and distinguishes good from bad, desirable from undesirable behaviour. Gender issues relate to the importance of recognising the inheritance from a male dominance society and the role of feminism in promoting a more balanced society. It is crucial to highlight that inclusion and equality issues, within the human's rights settings, are primarily related to the rights of the minorities. However, gender equality is a cause that represents half of humanity, meaning that it is hard to hide. Finally, citizenship refers to the possibility, capacity and ability of individuals to promote common good and contribute to the societies to which they belong. These three dimensions enable a critical and constructive angle of analysis of current reality.

Identifying core items in the present change and transitional phase and enabling the creation of an effective organisational agenda, which may address such items in a gratifying and effective way, that is an open goal to be attained. Such organisational agenda for change may represent strong opportunities for groups of individuals to work together towards a common objective. No matter the geographical setting or the historical age, these elements are constitutive of that which signifies being human, that is, to imagine, design and work towards a common goal, this has always been present in the history of humanity.

Although the social tradition perspective has always been present in organisational and management studies, its heterodox and marginal role, when confronted with the dominant position of the cognitivist perspective, makes it hard to be fair and objective regarding its ability to capture, to decode and to deconstruct the fine lines of meaning that are present in human settings.

Organisations are human laboratories for social innovation and organisational communities may host radical and revolutionary lessons for society as a whole, as microcosms of how a differentiated unity enables humans to work together for common good, creating something that is larger than the sum of its parts. Social innovation is part of the process of change and transition, and it is understood to be an integral and dynamic process, which overlaps individual and organizational scales in order to focus on the cultural, political and historical process of change, evolution and human development.

The present work uses the importance of interdisciplinary studies as a gateway for organisational complexity. The argument is that organisational learning and social innovation are framed by contemporary challenges that may be better grasped through three main theoretical constructs: ethics, gender and citizenship. Consequently, the structure of the current paper is to highlight the contributions of several authors to these different fields of study, so that each will form one of the sections below.

2. THE RELEVANCE OF INTERDISCIPLINARY STUDIES

Complexity and the autopoietic capacity of complex systems are considered to be core requisites for the relevance and emergence of interdisciplinary studies. Certain authors, namely Newell *et al.* (2001) argue that “an examination of complex systems yields new insights into the practice of interdisciplinary study and confirms widely accepted principles for the conduct of interdisciplinary inquiry”. As they explain: “Interdisciplinarity is necessitated by complexity, specifically by the structure and behavior of complex systems. The nature of complex systems provides a rationale for interdisciplinary study.” (Newell *et al.*, 2001). Even more strongly: “Most importantly, the distinguishing but elusive characteristic of interdisciplinary studies—synthesis or integration—is at last explained in terms of the unique self-organizing pattern of a complex system.” (Newell *et al.*, 2001).

The need to use an interdisciplinary perspective in research is often related to the need to come closer to real life problems and to practical and hands-on solutions to such problems. Robson and McCartan (2016) stress the importance of such approaches in “projects for which social research methods can be used”. Moreover, they consider the challenge that is posed to researchers, departments and university institutions and research centres: to make proof of the “ability to obtain funding for research and complete projects with measurable impact” (Robson and McCartan, 2016). These authors identify three characteristics in current research: “An increased emphasis on ethical considerations when carrying on research involving people; the mighty bandwagon of evidence-based everything; the all-pervading Internet, particularly the rise of social media” (Robson and McCartan, 2016). Again, these characteristics point towards the need and justification for the use of interdisciplinary perspectives.

In an educational setting, Jones (2010) discusses the benefits of interdisciplinary studies and how and why new curricula are needed. He contrasts the following concepts: “The interdisciplinary approach is uniquely different from a multidisciplinary approach, which is the teaching of topics from more than one discipline in parallel to the other, nor is it a cross-disciplinary approach, where one discipline is crossed with the subject matter of another. Interdisciplinary techniques go beyond these two techniques by allowing students to see different perspectives, work in groups, and make the synthesizing of disciplines the ultimate goal (Jones, 2010).

This author argues that interdisciplinary curricula, though being time consuming, has the advantage of promoting collaborative team work: “the interdisciplinary approach continues to synthesize the characteristics and methods of multiple disciplines while developing lifelong learning skills” (Jones, 2010). Further, this author highlights: “Students and their teachers will advance in critical thinking, communication, creativity, pedagogy, and essential academia with the use interdisciplinary techniques (Jones, 2010).

Klein (2005) highlights the links between interdisciplinary studies and integrative learning. Under his perspective ““Interdisciplinary” studies is a subset of integrative learning that fosters connections among disciplines and interdisciplinary fields”. This author argues that this is intrinsically a constructivist approach and he explains why. “Students are engaged in “making meaning.” Application of knowledge takes precedence over acquisition and mastery of facts alone, activating a dynamic process of question posing, problem posing and solving, decision making, higher-order critical thinking, and reflexivity.” (Klein, 2005). Furthermore, he stresses four main characteristics, as “a set of core capacities that emerge from the intersection of the two concepts”, interdisciplinary studies and integrative learning. These are: “the ability to ask meaningful questions about complex issues and problems; the ability to locate multiple sources of knowledge, information, and perspectives; the ability to compare and contrast them to reveal patterns and connections; the ability to create an integrative framework and a more holistic understanding”(Klein, 2005). Equally important, this author is able to connect complexity and paradox, arguing that there is a certain compromise in the acceptance of the frontiers of knowledge. “Contextuality, conflict, and change are the defining parameters of this kind of learning. Contextuality is a different metaphor of knowledge and education than unity, which assumed consistent, logical relations within a linear framework with the expectation of achieving certainty and universality. Contextuality accepts the contingent character of knowledge and action. Students need to tolerate ambiguity and paradox if they are to take grounded stands in the face of multiple and sometimes conflicting perspectives.” (Klein, 2005)

3. ETHICS

Ethics has traditionally been related to moral and to prescriptive modes of distinguishing right from wrong. The idea that some kind of behavior would not fit a certain social context could be assumed to be against the moral and ethics of such context.

Ethics is an important branch of philosophy. Practical and applied philosophy has increased its importance as the complexity of social settings rises. Such is the case of organizational contexts, where management problems often have ethical related implications.

The rationale that sustains the importance of ethics when discussing organizational phenomena is that it may capture the subtleties of human interaction. Ethics of care, ethics of alterity and ethics of the other, all refer to the same empathic involvement between people. Under this perspective, the other, the different, is an unavoidable and irrefutable experience, which all human beings may share.

Moreover, it is through this confrontation with a different other, the child and the mother, or the employer and the employee, that each individual may acknowledge hers or his own interior reality. Without a personal contact with a different other there could not be a healthy development of individual human beings.

Nilo R. Júnior (2009) develops a rich interpretation of the relationship between ethics and alterity, the different other. According to this author: the millenary long history of human development and of the face to face encounters, as the face of the different other “inaugurates a wisdom that is older and more original than the wisdom obtained by means of reason, i.e., by knowing or thinking” (Júnior, 2009). From this encounter, this author develops the links to the role of education and of peace building: “peace asserts itself as care and responsibility towards the other, and also as justice and equity towards the third one” (Júnior, 2009). And also: “peace is built up as solidarity against the exacerbation of individualism”.

Nel Noddings (2002) addresses the concept of ethics of care within a broad philosophical framework: “The ethics of care can be seen as fundamentally relational, not individual-agent-based in the way of virtue ethics, and the ethics of care is more indirect than character education.” (Noddings, 2002). This author argues: “An alternative to character education is care ethics”. In other words, the fundamental issue is not the definition of a specific set of virtues, which ought to be promoted as a process of educating one’s character, but rather the experiential involvement in a one-to-one relationship where caring for someone and being cared by someone are structuring and signifying experiences.

Virginia Held (2006) addresses the perspective of the ethics of care as a novel approach to ethics. Traditionally, for the last two-hundred years, ethics has been majorly restrained to moral theory. The development in the last few decades of ethics of care offers promising potential for applied research, namely in the civil rights and social movements areas. This author addresses the relations of ethics and power, and the reach of law, stressing the understanding of “care as a practice and as a value”. The argument is that the abundance of normative perspectives forces the need for alternative options. The advantaged of the ethics of care perspective is that it does not need to “rely on dubious claims of universal norms of reason”, which form moral normative standards. According to this author, the development of this perspective is itself an open on-going and cooperative process.

Maurice Hamington (2004) addresses the ethics of care, or care ethics, as he refers, from the perspective of the body, of corporality, highlighting the practical and concrete nature of care. This embodied care is also linked to the area of feminist ethics and to the work on the body developed by the philosopher Merleau-Ponty.

The author Michael Slote (2007) stresses the role of empathy in defining the ethics of care. This author argues that care ethics “present an important challenge to other ethical traditions”. Namely the conventional understanding of ethics as a rigid set of norms and not as a dynamic and open process of reflective critique.

Within an organisational setting, Alexander Styhre (2001) argues: “Thinking of work as ethically embedded rather than determined by the degree of distribution of the empowering resources in organizations paves the way for opportunities to conduct more sensitive analyses of how managerial techniques operate in practice.” (Styhre, 2001). This author highlights the importance of empowerment, offering a critique of its often too idealised view: “Empowerment is depicted by its proponents as the common denominator for recent managerial techniques and activities that acknowledge the individual

employee as an intelligent, accountable, creative being, and therefore a productive resource for the company.” In an innovative way, this author argues: the importance of the “notion of ethics, and more specifically what Foucault calls *technologies of the self*, provides possibilities for analysing how employees constitute themselves as ethical, productive, and legitimate members of society through the use of management techniques” (Styhre, 2001).

Different authors discuss the paradoxes around ethics in organizational contexts. Sheldene Simola (2003) argues: “Despite the importance of ethics in corporate crisis management, they have received limited attention in the academic literature.” This author addresses ethics of justice and ethics of care as complementary perspectives.

Regina Scheyvens and Helen Leslie (2000) address the ethical concerns involved in conducting applied research and fieldwork. In particular, these authors stress the “ethical issues regarding the validity and effectiveness of cross-cultural and cross-gendered fieldwork”, in particular in developing countries. They offer a “critical discussion concerning whether there is potential for the fieldwork process to be empowering for research participants” (Scheyvens and Leslie, 2000).

4. GENDER

In their work on transdisciplinarity in women’s and gender studies, Irene Dölling and Sabine Hark (2000) argue that this area is undertaking a movement towards a needed “higher level of self-reflexivity”. As they explain, “the increasing institutionalization carries with it the threat of a loss of critical potential, especially the capacity to reflect upon its own modes of knowledge production”. This normalization occurs in all disciplines and transdisciplinarity is the answer. “Transdisciplinarity, understood as a critical evaluation of terms, concepts, and methods that transgresses disciplinary boundaries, can be a means to this higher level of reflexivity”. They situate this account in the following manner: “caught between a visible trend toward normalization and a renewed struggle over the legitimacy of women’s and gender studies, feminism is undergoing a critical reexamination as women’s studies own disciplinary location brings renewed attention to the necessary role of transdisciplinarity in women’s and gender studies.”

Working in the field of gender studies, Mary Bucholtz (2003) calls attention to the critical role of the relationship between language and gender, in particular to the centrality of discourse, that is, “the interdisciplinary investigations of discourse-level phenomena”. As she explains: “The study of language and gender has increasingly become the study of discourse and gender”. This author stresses that: “Discourse is language in context”. And, as happens in discourse-oriented research, the language use in social practices is the centre of attention. “Language as it is put to use in social situations and not the more idealised and abstract linguistic forms that are the central concern of linguistic theory.” (Bucholtz, 2003). This social tradition interpretation of language is critical to the understanding of complex phenomena such as gender unbalances and sexual discrimination.

Interestingly, Bucholtz stresses the rich and positively slippery nature of both discourse and gender studies, as they necessarily respond to the complexity and to the diversity of social contexts: “Hence there is no well-defined approach to discourse that can be labelled “feminist discourse analysis”. Indeed, not all approaches to gender and discourse are feminist in their orientation, nor is there a single form of feminism to which all feminist scholars subscribe.” (Bucholtz, 2003).

In organizational contexts, gender biases are critical and they help to explain the inequality of gender balance in top management positions. Gary Powell, Anthony Butterfield and Jane Parent (2002) stress that, besides some positive evolution, nevertheless “a good manager is still perceived as predominantly masculine”. Though “there has been a considerable increase in the proportion of women managers in recent years, and a call for “feminine leadership” to capitalize on this increase”. Their study focuses on the following question: “whether there has been a corresponding change in men’s and women’s stereotypes of managers such that less emphasis is placed on managers’ possessing masculine characteristics”. As has been said, they conclude that this is not the case, as management performativity is still strongly connected to male stereotyped characteristics.

Deborah Prentice and Erica Carranza (2002) address the issue of “reactions to gender stereotype deviants and sex discrimination” in organizational contexts. They create a framework to “characterize the contents of prescriptive gender stereotypes”. They call attention to the double effect of past and future determinations; whereas prescriptive biases are fixed in the past, proscriptive ones project such biases into the future, in a self-strengthening manner. “The framework distinguishes between prescriptions and proscriptions that are intensified by virtue of one’s gender, and those that are relaxed by virtue of one’s gender” (Prentice and Carranza, 2002). They addressed both American society in general and highly masculine contexts in particular, with interesting results. “The results demonstrated the persistence of traditional gender prescriptions in both contexts, but also revealed distinct areas of societal vigilance and leeway for each gender. In addition, they showed that women are seen more positively, relative to societal standards, than are men.” (Prentice and Carranza, 2002).

In organizational contexts, the work of Madeline Heilman (2001) addresses the gender inequality in top management jobs. This author argues that gender unbalance is key: “Because of gender bias and the way in which it influences evaluations in work settings, it is argued that being competent does not ensure that a woman will advance to the same organizational level as an equivalently performing man.” (Heilman, 2001). As this author explains, “the scarcity of women at the upper levels of organizations is a consequence of gender bias in evaluations”. In this work the author addresses the “processes giving rise to these outcomes” and identifies the “procedures that are likely to encourage them”.

Using blunt terms and plain language, this author highlights the profound injustice that occurs in organizational settings related to gender unbalances, including being penalized for being effective: “It is proposed that gender stereotypes and the expectations they produce about both what women are like (descriptive) and how they should behave (prescriptive) can result in devaluation of their performance, denial of credit to them for their successes, or their penalization for being competent” (Heilman, 2001).

Agency is critical in women's studies as it relates to the capacity of individual female members of a society or organisation to go beyond and to transgress previously defined prescriptive gender biases. Agency is empowerment and the denial and refusal to remain enslaved in previous societal prejudices.

Laurie Rudman and Peter Glick (2001) develop an interesting study where women's perceived niceness is key. They carried on from previous research, taken in late 1990s, in order to design the following setting: "In an experiment, job description and applicants' attributes were examined as moderators of the backlash effect, the negative evaluation of agentic women for violating prescriptions of feminine niceness. (...) students made hiring decisions for a masculine or "feminized" managerial job. Applicants were presented as either agentic or androgynous." (Rudman and Glick, 2001). The results are close to an anecdote: "a feminized job description promoted hiring discrimination against an agentic female because she was perceived as insufficiently nice. Unique to the present research, this perception was related to participants' possession of an implicit (but not explicit) agency-communality stereotype. By contrast, androgynous female applicants were not discriminated against." (Rudman and Glick, 2001). As they conclude: "The findings suggest that the prescription for female niceness is an implicit belief that penalizes women unless they temper their agency with niceness." (Rudman and Glick, 2001).

5. CITIZENSHIP

The identification of the frontiers of research of citizenship studies is a complex task as it is a dynamic construct, following the changes that occur within society itself. Jopke (2007) analysis such changes under three dimensions: status, rights, and identity. "With respect to status, it is argued that access to citizenship has been liberalized. On the rights dimension, there has been a weakening of social rights and rise of minority rights. Citizenship identities today are universalistic, which limits states' attempts to counter the centrifugal dynamics of ethnically diversifying societies with unity and integration campaigns." (Jopke, 2007).

Isin and Turner (2007) argue in favor of an agenda for citizenship studies in the following terms: "not so much a dogmatic sequence of principles as an ethos toward conceiving democratic citizenship as a cosmopolitan virtue", understood as a concrete and practical expression of what it means to belong to a certain society.

Indeed, the idea of global citizenship is universalistic and it connects to the notion of cosmopolitanism, which other authors highlight as a key component of current notions of citizenship.

The context of the new economy brings forward novel perspectives on citizenship. Bennett *et al.* (2009) address the need to consider the "changing political identifications and practices of new generations of citizens". Their focus is "in different post-industrial democracies with the aim of deriving a set of core learning categories that offer a starting point for thinking about how to address changing citizen identity styles and learning opportunities in various online and offline environments." These authors challenge traditional paradigms of what they call "dutiful citizenship". They expand such notion by "identifying additional civic learning opportunities that reflect more self-actualizing styles of civic participation common among recent generations of youth who have been termed digital natives." According to these authors, self-actualization is key and it works through specific learning styles, which favor "interactive, networked activities often communicated through participatory media such as videos shared across online networks" (Bennett *et al.*, 2009). Under this perspective the emerging online environments represent new communities of learning, which create new digital ecosystems, again that fuel novel forms of citizen engagement.

Citizenry is a powerful concept because it may be reframed within a smaller scale, such as the dimension of an organization instead of a society. Indeed, organizational citizenship illustrates the importance of promoting forms of behavior that favor the benefit of all the stakeholders involved in a specific organizational setting, in other words, to work towards the benefit of the organization as a whole. Different dimensions of such organizational citizenship behavior have been analyzed through factor analysis and under meta-analysis (e.g., Walumbwa *et al.*, 2010). These authors highlight the following predictors of organizational citizenship behavior: job satisfaction, organizational commitment, fairness, trait conscientiousness, and leader support.

Previous research started in the 1980s and it influenced this field of study. Namely, Organ and Ryan (1995) were pioneers and they address attitudinal and dispositional dimensions of organizational citizenship behavior. Attitudinal measures include job satisfaction, perceived fairness, organizational commitment and leader supportiveness. The degree of conscientiousness is relevant as a dispositional dimension.

Other authors address the role of leadership in promoting citizenship in an organizational setting, in particular transformational and transactional leadership. Nguni *et al.* (2006) focus on "the effects of transformational and transactional leadership on job satisfaction, organizational commitment, and organizational citizenship behavior" and they comment on the potential for accumulated effects, the so-called add-on effects, emerging from the interaction between the different dimensions.

6. CONCLUSIONS

Empowerment, appropriation and capacitation stand for enabling mechanisms through which it is possible to foster, nurture and promote the best potential for human thought and action. No matter the scale, from groups to organisations and to social movements, there is a common factor that is a precondition for success, which is the capacity to work together towards a common goal. In other words, the capacity to engage, attract and mobilise individual efforts is a multidimensional phenomenon, which directly depends from the narrative, discursive and argumentative logical reasoning that may justify such engagement, attraction and mobilisation. The power of narratives to unleash the imagination and the desire to achieve

previously unthoughtful alternatives and future ideals has been present throughout the history of humankind. The pipeline for human ingenuity and creativity has been the capacity to aim at achieving that which may have seemed impossible in the past. No matter the context or the historical era, the structuring conditions of human development remain focused in a few essential elements, namely the possibility to remain open to the unknown, the capacity to trust in oneself and in others, and the opportunity to experiment deep forms of transformative learning. In other words, the possibility to profit from trusting and empowering environments and to experiment open and diversified cultures, enables the widening of horizons and the unleashing of creativity through an authentic, rich and dense living experience. It is not possible to underestimate the potential of humans to overcome adversity, vulnerability and frailty. Why? How? Precisely by uniting efforts in strong community building and sense-making efforts of collective engagement towards the achievement of common goals, because that is what makes humans human. Unless these anthropological and ethnographic assumptions are stated upfront and assumed as a precondition for success, it is not possible to understand the potential for action of organised groups of individuals, such as institutions or social movements. Ethics, gender and citizenship dimensions are present implicitly in every organisation. The quality, fairness and democratic intensity of the relationships regarding the organisation stakeholders, will be reflected upon the organisational effectiveness and potential for excellency. Motivation, work satisfaction, performativity and an inclusive and challenging organisational culture, are indeed consequences of the invisible, informal and implicit power of the organisational community and of its meaning-making potential.

Universidade de São Paulo – USP; Universidade Presbiteriana Mackenzie, São Paulo/SP

RESUMO

A sustentabilidade no turismo, com foco na hotelaria, destaca-se como um paradigma recente, porém sua definição se apresenta de forma normativa, imprecisa e de difícil operacionalização. Hotelaria sustentável pode ser entendida como capacidade de reconhecer e gerenciar os impactos por ela causados. A hotelaria gerenciada de forma sustentável se torna uma força nas dimensões econômica e ambiental, contudo, se for gerenciada de forma inadequada, produz conflitos decorrentes do pagamento de baixos salários, empregos sazonais, deterioração de recursos naturais e culturais. Este artigo tem como objetivos mapear e promover reflexão sobre a sustentabilidade no segmento hoteleiro e suas práticas. Para realização da pesquisa, foram considerados artigos teóricos e empíricos que abordam ações, políticas e estratégias sobre o tema. Definir sustentabilidade na hotelaria é um desafio, envolve considerar impactos locais e globais. É relevante observar que há muitos conceitos que se entrelaçam, como pode ser constatado com relação à sustentabilidade e responsabilidade social corporativa, sendo que, em alguns casos, a primeira está inserida na segunda e, em outros, a sustentabilidade se insere no contexto da gestão ambiental. Como consequência deste entrelaçamento, corre-se o risco de não haver investimento adequado na formação de profissionais para sustentabilidade bem como não fica claro, no escopo da organização, quem são os responsáveis pelas práticas sustentáveis, tornando-as pouco efetivas. Considerando a sustentabilidade como uma ideia força que contempla temas como qualidade de vida, diversidade, redução da pobreza, atração e retenção de profissionais, etc., é fundamental que os hoteleiros e/ou profissionais que atuam no setor cada vez mais agreguem conhecimentos relevantes quanto ao tema, para efetivamente promover seu desenvolvimento.

Palavras-chave: Sustentabilidade, Hotelaria, Práticas, Turismo.

1. INTRODUÇÃO

Os discursos de gestores e empresários quanto à sustentabilidade dirigem-se aos funcionários, fornecedores, consumidores, enfim, a todos os *stakeholders* envolvidos com a organização. O objetivo desses discursos é relacionar as práticas ambientais, econômicas e sociais à imagem da empresa, com a finalidade de fortalecê-la. Na prática, de forma geral, as organizações têm dificuldades em efetivar plenamente seus discursos, pois as ações acabam se direcionando para um ou dois pilares do tripé (Claro, Claro, Amancio, 2008; Junqueira, Maior, Pinheiro, 2011), o que, de acordo com Elkington (2012), gera um desequilíbrio que terá como consequência resultados pouco significativos.

A hotelaria, cenário deste artigo, está inserida no segmento de Turismo, sendo que este, por sua vez, faz parte do campo de estudos das Ciências Sociais Aplicadas.

Para Saarinen (2006), o turismo pode ser entendido como um sistema amplo em que há circulação de pessoas, produtos e serviços nos destinos que se relacionam aos roteiros e regiões. Envolve aspectos sociais e culturais, movimentando a economia global. Questões quanto à sustentabilidade no turismo têm gerado preocupações, uma vez que seus impactos tanto podem ser benéficos como prejudiciais. O desenvolvimento turístico tende a promover melhorias quanto a aspectos sociais, culturais e econômicos no local e seu entorno, porém, quando seu desenvolvimento não é planejado, há impactos negativos (Saarinen, 2006; Claver-Cortés *et al.*, 2007; Hsieh, 2010).

A ideia de sustentabilidade no turismo se destaca como um paradigma recente, porém a definição de sustentabilidade para tal tem se apresentado de forma normativa, imprecisa e de difícil operacionalização. Turismo sustentável pode ser entendido como capacidade de reconhecer e gerenciar os impactos por ele causado (Saarinen, 2006). Pérez e Bosque (2015) complementam que, se o turismo for gerenciado de forma adequada e sustentável, pode se tornar uma força na geração de empregos e desenvolvimento econômico, por outro lado, se for gerenciado de forma inadequada, pode produzir conflitos decorrentes de pagamento de baixos salários, empregos sazonais, deterioração de recursos naturais e culturais, entre outros.

O ponto em comum das análises e reflexões sobre responsabilidade social corporativa (RSC) e sustentabilidade é que, para terem eficiência e eficácia, é importante que componham a estratégia da organização. A preocupação do segmento do turismo e hotelaria com este assunto data da década de 1990, decorrentes das demandas da agenda 21, que destaca código de ética para o turismo sustentável (Saarinen, 2006; Holcomb, Upchurch, Okumus, 2007). Pérez e Bosque (2015) acrescentam que as pesquisas e ações sobre o tema focam em questões ambientais, sociais e econômicas.

Melissen (2013), destaca que os desafios para o segmento do Turismo se tornam os mesmos para hospitalidade, dessa forma, para a hotelaria, que está inserida neste contexto.

Relacionando o turismo e a hotelaria, pode-se afirmar que cuidar do entorno no qual o hotel está inserido gera vantagem competitiva, porém o nível de investimento para a atividade ambiental se relaciona à expectativa quanto ao retorno econômico

frente às ações adotadas (Claver-Cortés *et al.*, 2007) e a capacidade financeira do empreendimento, o que, muitas vezes, gera investimentos tímidos e pouco expressivos nas ações ambientais.

Apesar da hotelaria não ter recebido atenção imediata quanto às questões relacionadas à sustentabilidade, há uma crescente preocupação com os impactos negativos gerados, pois, como parte do segmento do Turismo, a hotelaria proporciona benefícios sociais e econômicos em função do apoio ao lazer, geração de empregos, desenvolvimento do entorno, etc. No entanto, a hotelaria também gera impactos sobre o ambiente, pois, mesmo variando de porte, os hotéis consomem água e energia, produzem resíduos, geram poluição sonora, poluição do ar, e impacto na biodiversidade (Bohdanowicz, 2006; Hsieh, 2012; Grosbois, 2012). Hsieh (2012) complementa, informando que os hotéis engajados com as questões ambientais adotam em suas práticas a reciclagem e gestão de resíduos, melhor aproveitamento da energia e da água, construções mais ecológicas, compras verdes, entre outras.

Frente ao exposto, com este artigo objetiva-se mapear e promover uma reflexão quanto as práticas orientadas para sustentabilidade adotadas pela hotelaria e seus impactos para a gestão. Para tal, propõem-se as seguintes questões: Quais são as práticas orientadas para sustentabilidade que a hotelaria vem adotando? Qual papel e contribuição dessas práticas para o empreendimento?

Para realização da pesquisa, foram considerados artigos teóricos e empíricos disponíveis nas bases de dados brasileiras e internacionais, que discutem a sustentabilidade no turismo, com foco na hotelaria e hospitalidade. Para tanto, serão considerados conceitos e reflexões sobre sustentabilidade no turismo e hotelaria (Ruschmann, 2003; Saarinen, 2006; Hsieh, 2010; Grosbois, 2012; Perez, Bosque, 2015; entre outros); quanto às práticas adotadas na hotelaria (Kirk, 1995; Tzschentke, Kirk, Lynch, 2008; Coelho, Gosling, Gonçalves, 2013; Melissen, 2013; Barber, 2014; entre outros).

Este artigo está estruturado em três seções que se propõem a: refletir sobre sustentabilidade no turismo e hotelaria, apresentar as práticas adotadas pelo setor hoteleiro e as considerações finais, que retomam as questões norteadoras e buscam direcionar futuras reflexões.

2. SUSTENTABILIDADE NO TURISMO

Para contextualizar o campo do artigo de forma abrangente, torna-se relevante considerar as questões voltadas à sustentabilidade e responsabilidade social corporativa (RSC) no Turismo. Cabe ainda destacar que sustentabilidade, na maioria dos artigos internacionais e nacionais apresentados, está inserida no escopo de ações, relatórios e reflexões relacionadas à RSC, e que suas discussões possuem maior ênfase na dimensão ambiental.

Para Pérez e Bosque (2015), o conceito do *Tripple Botom Line* de Elkington (2012) é o que melhor atende às demandas da RSC para o turismo, e estabelece a seguinte relação:

- Dimensão econômica: garantia atividades econômicas de longo prazo, de forma que as partes envolvidas se beneficiem;
- Dimensão social: “respeito pela autenticidade dos valores tradicionais dos destinos turísticos, bem como a contribuição das empresas quanto a compreensão e tolerância intercultural” (Perez, Bosque, 2015, p. 318);
- Dimensão ambiental: utilização adequada, proteção e conservação do meio ambiente e da biodiversidade dos destinos turísticos.

Em consonância com Sachs (2002), Perez e Bosque (2015) propõem, ainda, considerar mais uma dimensão, que se vincula a aspectos culturais, uma vez que muitos hotéis se localizam em centros urbanos, atraindo turistas e impactando no ambiente cultural (Grosbois, 2012), bem como relações sociais e culturais são desenvolvidas entre os turistas e moradores dos locais visitados.

Outro conceito relevante para o turismo sustentável é de capacidade de carga: que se relaciona ao quanto um destino turístico suporta de turistas e movimentação sem gerar impactos nocivos ao ambiente, bem como sem prejudicar a experiência turística, ou seja, capacidade de absorção de turistas. O conceito considera as questões físicas, sociais e culturais (Saarinen, 2006; Hsieh, 2010).

Saarinen (2006) explica que essa capacidade de absorção é discutida e tratada por correntes teóricas, as quais ele denomina tradição. São elas:

- Tradição baseada em recursos: considera que o turismo gera impactos, dessa forma seu desenvolvimento necessita de gerenciamento quanto aos recursos envolvidos; os limites para crescimento e impactos são avaliados a partir dos recursos utilizados; baseia-se na noção de um espaço estático, pode tornar-se restritiva para o crescimento do setor.
- Tradição de atividades: turismo caracterizado como atividade dinâmica, que produz impacto devido à amplitude de interesses e/ou atividades; relaciona-se à mudança do ambiente para garantir o desenvolvimento e crescimento do turismo; é gerenciado como atividade econômica; adota o conceito de produto e ciclo de vida.
- Tradição de base comunitária: envolve participação, negociação e fixação de limites dos envolvidos na relação de sustentabilidade e turismo; tem foco na contribuição para o desenvolvimento local, envolve percepção e significados atribuídos.

Pode-se observar que definir sustentabilidade no turismo é um desafio. As três tradições descritas representam diferentes aspectos e possuem elementos distintos para seu entendimento, bem como pontos positivos e negativos. A sustentabilidade não se trata de uma via de mão única na relação entre impactos locais e globais, trata-se tanto de responsabilidade global como local. Há ênfase nas relações humanas e éticas, sem as quais o turismo sustentável pode se tornar algo sem sentido, somente um termo usado para causar efeito (Saarinen, 2006).

Ruschmann (2003) aborda os impactos do turismo em relação à sustentabilidade, os quais também podem ser compreendidos para a Hotelaria, uma vez que esta faz parte do campo de estudos do Turismo. O quadro a seguir sintetiza os impactos descritos pela autora.

Quadro 1: Impactos do Turismo relacionados à sustentabilidade

Impacto	Natureza do impacto
Econômico	Positiva: - Geração de renda - Aumento na oferta de emprego - Elevação do consumo no entorno - Atração de mão de obra de outras localidades
	Negativa: - Inflação - Especulação imobiliária - Sazonalidade da demanda
Cultural	Positiva: - Elevação do nível cultural da sociedade - Valorização do artesanato local - Valorização e preservação do patrimônio histórico - Valorização da herança cultural
	Negativa: - Descaracterização do artesanato por ser produzido somente para consumo - Vulgarização e adaptações mercadológicas das manifestações culturais - Destruição do patrimônio histórico
Social	Positiva: - Elevação do nível profissional da população
	Negativa: - Crescimento da prostituição no entorno - Estímulo ao consumo de drogas e bebidas alcoólicas
Ambiental	Positiva: - Implantação de programas ou políticas voltadas ao cuidado com os recursos naturais - Utilização mais racional dos espaços - Adoção de medidas voltadas a preservação do meio ambiente
	Negativa: - Ocupação de áreas naturais - Poluição do ar e água - Poluição sonora - Degradação da paisagem

Fonte: Autora (2017) adaptado de Ruschmann (2003)

Os impactos econômicos são mais fáceis de mensurar do que os ambientais e socioculturais, uma vez que possuem menos aspectos intangíveis e subjetivos. Para mensurar os impactos econômicos, considera-se local, regional e nacional. Informa ainda que há uma relação estreita entre impactos sociais e culturais, dificultando, dessa forma, a distinção entre eles (Ruschmann, 2003).

Em 2002, o Instituto Brasileiro de Turismo- Embratur - e a Associação Brasileira da Indústria de Hotéis (ABIH) assinaram um acordo criando um sistema de classificação para os hotéis, o qual incorporou os conceitos de gestão ambiental e responsabilidade social como critérios. Gonçalves (2004) explica que a ABIH desenvolveu um projeto denominado Hóspedes da Natureza, voltado à introdução e fomento da gestão ambiental nos empreendimentos hoteleiros. As ações ambientais propostas são norteadas por princípios relacionados a adaptação, identificação e aplicação dos conceitos e práticas de gestão ambiental condizentes à realidade brasileira. O objetivo da ABIH é tornar o projeto um instrumento de disseminação dos conceitos e práticas referentes ao tema, e promover a integração da gestão ambiental aos negócios relacionados à hotelaria (Gonçalves, 2004).

Com vistas à regulamentação das práticas e normalização da sustentabilidade no turismo, a Associação Brasileira de Normas Técnicas (ABNT), em parceria com o Ministério do Turismo, implantou a ABNT NBR 15401:2006. Esta norma estabelece definições e princípios, os requisitos ambientais, socioculturais, e econômicos para o turismo sustentável, com o objetivo de fornecer diretrizes para certificação ambiental.

Deve-se levar em conta que a indústria da hospitalidade, na qual se incluem os hotéis, não é causadora de impactos ambientais considerados de grande porte, bem como não consome quantidades elevadas de produtos não renováveis; dessa forma, a preocupação com sustentabilidade com foco ambiental pode ficar à margem das estratégias organizacionais (Kirk, 1995). Essa afirmação se torna significativa quando considerado o impacto de forma individual, ou seja, de um hotel. Porém, se a indústria hoteleira for considerada de forma global, este cenário muda, pois, o impacto será considerado como a somatória de todos os empreendimentos instalados em uma localidade (Kirk, 1995; Tzschentke, Kirk, Lynch, 2008).

Refletindo sobre a capacidade de impacto da hotelaria quanto a sustentabilidade, que pode ser tanto nocivo como positivo, torna-se relevante identificar as práticas que têm sido adotadas pelo segmento.

3. PRÁTICAS ORIENTADAS PARA SUSTENTÁVEIS NA HOTELARIA

Estudar sustentabilidade e responsabilidade social corporativa (RSC) na hotelaria se deve ao impacto e transformações que os hotéis geram no meio em que operam e pela sua relação com a competitividade organizacional. Pode-se considerar que o que motiva um hotel a assumir ações sustentáveis se relaciona à legislação, pressão do grupo de consumidores e possível gestão de custos (Kirk, 1995).

Mesmo consciente da amplitude da sustentabilidade na hotelaria, principalmente se considerando os aspectos referentes ao turismo, os estudos e as preocupações quanto ao tema dizem respeito à “gestão ambiental e está intimamente conectada à responsabilidade social corporativa” (Coelho, Gosling, Gonçalves, 2013, p. 653), o que corrobora com a questão das pesquisas e relatórios sobre sustentabilidade na hotelaria estarem inseridos nos relatórios que tratam de RSC.

As pesquisas se direcionam para identificar as práticas relacionadas à sustentabilidade, buscando compreender como as informações sobre o tema são transmitidas, a relação entre sustentabilidade e retorno para o empreendimento, entre outras. Como metodologia, observa-se maior ênfase em pesquisas qualitativas.

As ações ambientais aplicadas à hotelaria se direcionam a: utilização de dispositivos economizadores de energia nas unidades habitacionais (UH); sensores de lâmpadas; lâmpadas econômicas; redutores de vazão de água nas torneiras; utilização de torneiras automáticas; coleta seletiva de lixo; redução da lavagem de roupa por meio da redução de troca de enxovais nas UHS (quartos); diminuição do descarte de resíduos; melhor planejamento arquitetônico; entre outras (Kirk, 1995; Hsieh, 2010; Coelho, Gosling, Gonçalves, 2013). Observa-se ênfase nas ações com foco ambiental que ao longo do tempo oferecem retorno financeiro na medida em que geram redução de despesas. O desafio na relação sustentabilidade e hotelaria se encontra na medida em que as ações citadas não podem impactar nos serviços e conforto oferecidos aos hóspedes (Hsieh, 2010). Observa-se, pelas ações descritas, uma carência de efetividade quanto a transformação e desenvolvimento do entorno, formação dos funcionários, pois tratam-se de ações de caráter pontual, especialmente envolvendo redução de custos.

Para Kirk (1995), refletir sobre sustentabilidade e políticas ambientais torna-se relevante, pois, no contexto da hotelaria, há situações de conflito, sendo que muitos hotéis estão em áreas naturais, de equilíbrio ecológico e locais históricos. Outro ponto refere-se ao hóspede, que busca, ao se hospedar no hotel, um tratamento diferenciado e serviços como, por exemplo, lençóis e toalhas trocados diariamente, sauna, piscina, transporte para passeios, etc.

A relação entre sustentabilidade e prestação de serviços diferenciadas é paradoxal, pois de um lado, o hotel necessita de uma gestão focada nas questões sustentáveis para realizar suas operações, por outro lado, estas ações, ao serem implantadas, não podem impactar no nível e qualidade dos serviços prestados (Kirk, 1995), bem como devem ser compartilhadas pelos hóspedes, na medida em que estes incorporam essa cultura em suas hospedagens.

Kirk (1995) resume alguns aspectos relevantes em relação à sustentabilidade na hotelaria, dentre eles: o indivíduo, ao se hospedar em um hotel de luxo, possui expectativas que são coerentes com a proposta do meio de hospedagem, como conforto e “mimos” relacionados às toalhas, instalações, produtos de higiene oferecidos, entre outros. As adoções de algumas ações voltadas à sustentabilidade podem frustrar essas expectativas, como, por exemplo, troca de toalhas ou tipo de iluminação. O negócio deve se alinhar ao local em que está implantado e possuir relação com a comunidade, compondo, dessa forma, os atrativos turísticos do destino. Não se trata de um segmento que gera fortes danos ao meio ambiente e entorno, no entanto, gera impactos, uma vez que consome e/ou desperdiça energia, água, alimentos, emite CO₂, gera barulhos, produz fumaça, etc.

Em pesquisa realizada, Houdré (2008) informa que parte dos empreendimentos hoteleiros de porte global não haviam aderido e/ou definido estratégias relacionadas à sustentabilidade, porém, mesmo não integrando o *core business*, os empreendimentos mencionavam preocupação com questões sobre RSC em sua missão. Para melhor apresentar o status das ações de algumas redes hoteleiras, apresenta-se o quadro a seguir:

Quadro 2: Ações com foco em sustentabilidade – principais redes hoteleiras

Rede Accor	- Em 1994, início das estratégias voltadas ao meio ambiente; - Em 2002, o desenvolvimento sustentável torna-se parte da estratégia da rede; - Os critérios para desenvolvimento sustentável envolvem: biodiversidade, integração arquitetônica e filantropia empresarial (como exemplo: auxílio às comunidades locais) - Ideia central: Funcionário pode fazer a diferença, com a publicação de um guia para gestores dos hotéis treinarem seus funcionários; - Plantação de árvores (investimento de 50% dos valores referentes à redução de custos com lavanderia) – mensagem junto aos hóspedes, “aqui suas toalhas plantam árvores”.
Hilton Hotels Corporation	Metas para concretização até 2014: - Redução de 20% de consumo de energia; - Redução de 20% a emissão de CO₂; - Redução de 20% a produção de resíduos; - Redução de 10% do consumo de água.

Marriott	- Envolvimento com a comunidade a partir do espírito de servir, oferecendo oportunidade de carreira para jovens e pessoas com deficiência; - Em 2008, inserção de 10.000 jovens e adultos com deficiência em postos de trabalho nos Estados Unidos; - Preservação do meio ambiente; programas voltados à redução-reutilização-reciclagem em hospitais infantis; - Acordo com o estado do Amazonas visando proteger milhões de acres da floresta tropical brasileira.
InterContinental Hotels Group IHG	- Há bases na mudança estratégica para desenvolvimento sustentável que podem tornar o grupo referência; - Possui todos os componentes de Desenvolvimento Sustentável e é possível observar a aplicação destes na governança corporativa e expressos na missão da organização; - Focos e objetivos do programa: incorporação na cultura e estratégia da organização; engajamento dos funcionários; Desenvolvimento Sustentável como integrante dos programas de RH; busca de prêmios voltados ao tema; ser ativo nas atividades do segmento que envolvam sustentabilidade, entre outras.

Fonte: Elaborado pela autora com base em Houdré (2008)

Pode-se observar, a partir da análise do quadro, que as práticas ou estratégias relacionadas à sustentabilidade apresentam preocupações ambientais, gestão de água e energia, cuidado com o entorno e meio ambiente com plantio de árvores, engajamento de funcionários, entre outros, abordando, dessa forma, as dimensões ambiental e econômica, porém essas ações são apresentadas nos relatórios sobre RSC, o que demonstra falta de clareza, pelo menos quanto a comunicação das ações e resultados relacionados ao tema.

O quadro apresentado enfatiza a importância da sustentabilidade e desenvolvimento sustentável na hotelaria, tal associação é reforçada pela estreita relação entre o hotel e a comunidade do entorno no qual está localizado (Melissen, 2013). Barber (2014) complementa que o processo de transformação do hotel em verde, ou seja, incorporação de ações que atendam a sustentabilidade por meio da gestão ambiental e RSC, pode gerar vantagem competitiva, porém, além de serem ativos quanto às práticas sustentáveis, necessitam comunicar suas ações. Ao tornar-se verde, o hotel pode influenciar seus fornecedores e hóspedes, bem como gerar uma oportunidade de desenvolvimento e formação de seus funcionários, ou seja, promover o desenvolvimento de competências (Rahman, Reynolds, Svaren, 2012).

De acordo com Grosbois (2012), a organização pode adotar quatro maneiras para comunicar suas práticas orientadas para sustentabilidade: (1) relatórios sobre RSC com seção dedicada à sustentabilidade; (2) *sites* dedicados à sustentabilidade; (3) não há relatório ou seção explícita sobre o tema, mas fornecem algumas informações no *site* e (4) nenhuma informação sobre o assunto. Ressalta que as organizações que se enquadram no item (2) tendem a considerar o tema relevante. No que diz respeito à hotelaria em relação às pesquisas realizadas pela autora, destaca-se que a mesma se enquadra mais no item (1), ou seja, sustentabilidade é considerada um item da RSC. A autora enfatiza que a comunicação das ações junto aos *stakeholders* pode oferecer diversos benefícios, como a melhoria da imagem, elevação da credibilidade do empreendimento, vantagem competitiva; destaca-se que esses pontos são apresentados ao longo da seção.

Holcomb, Upchurch e Okumus (2007), Grosbois (2012), Hsieh (2012) e Jones, Hillier e Comfort (2014) realizaram pesquisas sobre o material divulgado com relação ao referido tema, tanto pelas redes hoteleiras, como por hotéis independentes, relacionando e discutindo as informações, qualidade e abrangência dos conteúdos divulgados em meios de comunicação públicos. Como fonte de informações, utilizaram os relatórios relacionados à RSC, sendo que a sustentabilidade se encontra nestes relatórios. Grosbois (2012) destaca a relevância deste tipo de pesquisa e análise, uma vez que há crescente interesse na avaliação dos relatórios relacionados à RSC; aponta, também, que o número de informações é crescente, todavia, a qualidade das mesmas varia de segmento para segmento. No caso da hotelaria, as informações variam em detalhes e qualidade, e que há o reconhecimento da importância do tema por parte das redes hoteleiras (Jones, Hillier, Comfort, 2014).

Holcomb, Upchurch e Okumus (2007), analisaram as informações divulgadas por meios de comunicação de domínio público, como revistas, *websites* e relatórios anuais de hotéis, destacados como Top 10 da revista *Hotels* (Marriott International; Extended Stay Hotels; Accor; InterContinental Hotels Group; Tharaldson Enterprises; Global Hyatt Corp, entre outros) e identificaram cinco categorias presentes nos conteúdos: comunidade, ambiente, visão e valores, mercado e força de trabalho.

Concluíram que todos os hotéis mantêm *websites* com informações sobre questões referentes a RSC. Dos hotéis estudados, a Hilton Corporation fornece o maior número de informações, que abordam igualdade de oportunidades, diversidade, direitos humanos, saúde e segurança, ambiente e sustentabilidade. Contudo, apontam que os relatórios podem ser melhorados. Os autores destacam ainda que fornecimento de informações detalhadas na internet pode contribuir para a melhoria da imagem do hotel, bem como oferecer informações para hóspedes em potencial.

Em especial, destaca-se o conteúdo do InterContinental Hotels Group (IHG), tal grupo apresentava, na época da pesquisa, em seu *site*, as ações de RSC que se relacionavam a educação, crianças, participação do empregado e apoio aos esforços humanitários, ações que estão além das práticas ambientais descritas como mais frequentes no segmento, sendo caracterizadas, ainda, pelos autores, como documentos de fácil leitura. Ressalta-se que as análises foram realizadas em 2005.

Em sua pesquisa, Grosbois (2012), avalia e relata os métodos de comunicação e as informações que são repassadas sobre as práticas de RSC, com foco em sustentabilidade. As bases para análise foram os relatórios *on-line* e *websites* dos hotéis e redes hoteleiras consideradas Top 150, no ano de 2010, identificadas na lista *Corporate 300*, da revista *Hotel*. Dos 150 hotéis pesquisados, 46 não possuíam informações sobre o tema. Como resultados, constata-se que nos relatórios aparecem muitas informações e metas, porém há menor número de informações detalhando ações específicas. Como desafio, aponta a dificuldade de análise devido à falta de clareza nos relatórios e as diferentes métricas adotadas para acompanhar o desempenho das ações.

Quanto aos principais temas relacionados à sustentabilidade, Grosbois (2012) identificou que são considerados ambiente, qualidade de emprego, diversidade e acessibilidade, bem-estar da comunidade e prosperidade econômica. Destaca, ainda, que se torna difícil identificar se a ação descrita no documento analisado ocorre no âmbito da rede ou da unidade, sugere, dessa

forma, padronização e validação na forma de apresentar as informações e resultados, o que permitirá análise e comparação entre os hotéis e redes pesquisadas.

Também em 2012, Hsieh desenvolveu uma pesquisa por meio da análise do conteúdo dos *sites* dos hotéis identificados como Top 50 da revista *Hotels* de 2009. A pesquisa focou nas práticas ambientais das redes, não considerando as outras dimensões já discutidas. Como resultados, o autor aponta que 23 (46%) redes possuem em seus *sites* informações referentes às políticas e práticas ambientais. Destaca que as redes com maior número de unidades hoteleiras possuem *sites* com mais informações, o que demonstra, na análise do autor, engajamento das grandes redes nas questões ambientais, bem como possibilidade de o tema ser relacionado à vantagem competitiva. Quanto às informações, 9 redes das 23 tinham em seus sites títulos específicos relacionados às questões ambientais.

Hsieh (2012) compara os resultados obtidos na hotelaria com outros segmentos, e destaca que o número encontrado é pouco significativo, porém deve-se ao fato de o setor não causar impactos drásticos ou imediatos ao meio ambiente, o que pode gerar desinteresse ou mesmo falta de motivação para divulgar as ações. Cabe lembrar que, se considerados para análise todos os hotéis localizados em uma mesma região, essa afirmação se enfraquece, pois, a somatória de impactos pode tornar-se drástica.

Com a mesma metodologia de Holcomb, Upchurch e Okumus (2007), Grosbois (2012) e Hsieh (2012), Jones, Hillier e Comfort (2014) realizaram pesquisa com o objetivo de apresentar uma visão de como a hotelaria global comunica para o mercado sua postura em relação à sustentabilidade. A fonte das informações foram os *sites* corporativos das redes hoteleiras.

Jones, Hillier e Comfort (2014) pesquisaram as redes consideradas Top 10 no mundo: Marriott, Best Western, Iberostar, Hilton, Relais Chateaux, Ramada, IHG (representada pela marca Holiday Inn), Ritz Carlton e Jumeirah. Os autores destacam que essas redes podem ser consideradas representantes de uma abordagem atual quanto à sustentabilidade, bem como buscam divulgar suas ações de forma ampla e que atinjam vasto número de pessoas.

O processo de busca adotado pelos autores corrobora com Grosbois (2012) quanto a pouca visibilidade dada à sustentabilidade nos relatórios, pois, para localizar informações sobre o tema, utilizaram inicialmente a expressão “relatório anual de sustentabilidade”, no entanto não resultou em informações. Na sequência, foi utilizada a palavra sustentabilidade, no *site* de cada uma das redes, o que resultou em informações para pesquisa.

A partir da análise dos relatórios, considerando as dimensões econômica, social e ambiental, Jones, Hillier e Comfort (2014) concluíram que os compromissos apresentados pelas redes englobam as três dimensões, demonstrando preocupação com a sustentabilidade e uma forma de apresentar diferencial competitivo. Concordando com Grosbois (2012), apontam a necessidade de validação das informações, podendo, dessa forma, torná-las mais consistentes.

Perez e Bosque (2015), da mesma forma que os autores supracitados, desenvolveram pesquisa analisando informações divulgadas pela internet do setor hoteleiro da Espanha, com objetivo de identificar se há falhas. Analisaram 170 organizações do setor, amostra composta desde redes hoteleiras até pequenos hotéis de gestão independente. Ressaltam que as informações são analisadas pela ótica do desenvolvimento sustentável e grupos de interesses ou *stakeholders*. Para análise, foram consideradas as quatro dimensões já descritas: ambiental, social, econômica e cultural (Elkington, 1994, 2012; Sachs, 2002), relacionando-as a seis grupos de interesse: clientes (hóspede e turista), fornecedores, funcionários, acionistas/investidores, sociedade e meio ambiente.

As principais conclusões de Perez e Bosque (2015) se relacionam a: utilização das páginas da internet com maior foco comercial; o grupo de interesse que possui maior direcionamento de informação são os clientes; vasta informação relacionada aos recursos naturais e patrimônio cultural que são atrativos para turistas; poucas informações econômicas. Destacam que os fornecedores não recebem muita atenção relacionada às informações referentes à operação do hotel, o que, segundo os autores, pode, ao longo do tempo, prejudicar as relações comerciais.

A partir das análises realizadas, depreende-se que as contribuições que os autores oferecem se relacionam à melhoria quanto à apresentação das informações, clareza e dispersão das informações concordando com Grosbois (2012) e Jones, Hillier e Comfort (2014). Recomendam que as informações culturais devem ser mais valorizadas, pois trata-se de uma componente chave no segmento hoteleiro. Para concluir, Perez e Bosque (2015) informam que encontraram dificuldade na comparação das informações, pois não há dados suficientes que expliquem as métricas consideradas para a obtenção das informações apresentadas nos relatórios, sugerem a padronização, concordando novamente com as considerações de Grosbois (2012).

Font *et al.* (2012) complementam as pesquisas de Holcomb, Upchurch, Okumus (2007), Grosbois (2012), Hsieh (2012), Jones, Hillier e Comfort (2014) e Perez e Bosque (2015), estudando a lacuna entre o discurso e a prática com relação às ações ligadas a Sustentabilidade e RSC descritas pelos hotéis. Para a pesquisa, consideraram dez redes hoteleiras, responsáveis por 64 marcas, dentre elas: Accor, Barcelo Hoteis e Resorts, Hilton, Iberostar, Intercontinental Hotels Group (IHG), Marriott International, Sol Meliá, entre outros. Os autores analisaram as informações publicadas em *sites*, realizaram visitas técnicas em mais de um hotel das redes e aplicaram questionários.

Os temas considerados pelos autores foram: políticas corporativas, assuntos trabalhistas, questões socioeconômicas, ações ambientais, engajamento dos clientes e transparência. Observou-se que a maioria das redes possui um profissional responsável em cada hotel, como, por exemplo, engenheiro-chefe ou o próprio gerente geral, entretanto, não citam a existência de uma área ou equipe responsável pelo tema. Como prática mais consolidada, destacam-se as ações de caridade ou assistenciais.

Quanto à relação entre discurso e prática, a maior divergência foi observada nas questões ambientais e envolvimento com os clientes. Nas visitas, observou-se que algumas políticas descritas não eram cumpridas, porém, outras excediam o explícito. Foram observadas práticas individuais que extrapolavam as práticas implantadas nos hotéis (Font *et al.*, 2012).

Como conclusão, os autores destacam que há diferenças entre o discurso e a prática. Há ações ou práticas com níveis de adesão distintos. A maior ênfase se relaciona à questão ambiental como gestão da energia e água, pois o retorno em termos

de redução de custos se torna mais imediato. Outro achado foi relacionado a uma preocupação maior com aspectos internos, contradizendo a relevância de cuidar do entorno, destacada por Kirk (1995) e Saarinen (2006).

Uma justificativa para o descompasso entre discurso e prática encontrado pelos autores se deve à maturidade das redes no que tange à incorporação e gestão das políticas de RSC. Apontam, ainda, que as redes que se destacam, como Accor, IHG e Marriott podem se encontrar num processo de desenvolvimento de uma competência difícil de ser imitada, que integra saberes e agrega valor, denominada competência essencial por Prahalad e Hamel (2000).

Font *et al.* (2012) estabelecem uma crítica considerando a efetividade das ações que podem se tratar de *greenwashing*, visando, dessa forma, criar uma imagem positiva do hotel para com seus fornecedores, clientes e comunidade.

Quanto ao crescimento de pesquisas, Kang, Lee e Huh (2010) corroboram as conclusões de Holcomb, Upchurch, Okumus (2007), destacando que, no *site Hospitality Net3*, houve um crescimento nas publicações referentes ao tema: de 69 publicações em 1999, para 139 em 2007. Reforçam, ainda, que organizações do segmento de hospitalidade como Hilton, Starwood, Starbucks e McDonalds passaram a disponibilizar relatórios sobre as ações relacionadas a sustentabilidade e RSC (responsabilidade social corporativa), com intuito de agir de forma transparente frente ao tema e criar uma boa imagem no mercado.

Pesquisas foram realizadas considerando sustentabilidade ao retorno financeiro do empreendimento. Bader (2005) aponta que ações relacionadas à sustentabilidade podem contribuir financeiramente com o hotel, contrapondo questões apresentadas por Orsato (2006) e Porter e Kramer (2011). A autora destaca que há vantagens para o negócio, entre elas: promove a redução de custos e geração de receita adicional, melhora a estabilidade financeira a longo prazo, melhora a imagem e a gestão financeira promovendo credibilidade junto às entidades financiadoras e investimentos.

Contrapondo Bader (2005), Kang, Lee e Huh (2010) destacam que há poucos estudos sobre a realidade da hotelaria e RSC relacionada ao desempenho financeiro, especificamente a análise dos impactos positivos e negativos. Os autores analisaram, o desempenho de organizações do segmento de hospitalidade de capital aberto, estabelecidas no mercado norte americano, dentre elas hotel, cassino, restaurante e companhia aérea.

Os resultados demonstram que, na hotelaria, a relação com RSC apresenta impacto positivo sobre o valor da organização (olhar de longo prazo), no entanto, não revelou impacto sobre a rentabilidade. Dessa forma, observa-se que o investimento em RSC deve ser considerado para o longo prazo, o que, para alguns empreendimentos, pode se tornar um obstáculo.

Também com foco na relação entre gestão ambiental e desempenho financeiro, Claver-Cortés *et al.* (2007) desenvolveram uma pesquisa com objetivos de identificar as práticas ambientais dos hotéis e apontar uma possível relação entre essas práticas e retorno econômico, bem como o nível de comprometimento ambiental do empreendimento. Como objeto, a pesquisa contou com hotéis de 3 a 5 estrelas, independentes ou de redes, localizados em Alicante no sudeste da Espanha.

Quanto aos itens pesquisados por Claver-Cortés *et al.* (2007), destacam-se: quantificação de custos ambientais e economia; treinamento e desenvolvimento de funcionários no tema; compras sustentáveis; argumentos sustentáveis abordados nas campanhas de marketing e adoção de medidas para consumo adequado de energia e água. De forma geral, nas respostas, os itens relacionados à energia e água são os mais valorizados, o que reflete preocupação com redução de custos e despesas e pouca diversificação e abrangência das práticas. A partir da análise dos resultados, foram identificados três grupos:

- Grupo 1: caracterizados como hotéis proativos ambientalmente, com as melhores pontuações em todas as categorias pesquisadas. Quanto ao porte dos empreendimentos, são os maiores, mais luxuosos e de rede, e os que possuem maior número de certificações, ou seja, aqueles que têm maiores recursos financeiros, corroborando com as considerações de Hsieh (2012) e Rahman, Reynolds e Svaren (2012).
- Grupo 2: caracterizam-se por possuírem ações e pontuações intermediárias.
- Grupo 3: caracterizados como ambientalmente reativos, o que leva à hipótese de que esses empreendimentos não apresentam interesse nas questões relacionadas à sustentabilidade. Na avaliação, os principais itens pontuados foram gestão da energia e água. Os hotéis desse grupo são os de categoria mais baixa e de menor tamanho, bem como possuidores de menor número de certificações, levando à hipótese de que possuem menos recursos financeiros.

Claver-Cortés *et al.* (2007) concluem que há uma relação entre comprometimento com a gestão ambiental e número de certificações, tamanho do hotel e pertencimento ou não a redes. Sugerem, por fim, que os hotéis devem investir em ações com foco na formação dos gestores, enfatizando, principalmente, a relevância da gestão ambiental.

Quanto a implementação da Gestão Ambiental, os autores destacam que esta pode gerar impactos diretos, relacionados à gestão do hotel, como a redução de custos e aumento de receitas. Já os impactos indiretos tendem a melhorar a competitividade do empreendimento por meio da conservação dos destinos no seu desenvolvimento a longo prazo.

Relacionando a importância e a existência de sistemas de gestão ambiental (ISO's), Rodriguez-Antón *et al.* (2012) analisaram a hotelaria da Espanha. Para tanto, foram pesquisados 294 hotéis de 3 a 5 estrelas que adotam necessariamente o sistema. A pesquisa evidenciou que, em função da existência de poucas normas na Espanha, a preferência é pela adoção das normas internacionais. O perfil do cliente aparece como relevante na pesquisa, sendo que o turista de lazer demonstra mais preocupação com o meio ambiente, elevando a preocupação e investimento na Gestão Ambiental, neste segmento.

Ainda considerando práticas ambientais, mas no contexto Americano, Rahman, Reynolds e Svaren (2012) realizaram pesquisa analisando o que eles denominam “práticas verdes ou ambientalmente amigáveis” (p. 720), as quais não envolvem custos ou são de baixo custo. A pesquisa foi realizada em 166 hotéis identificados por meio da *American Hotel & Lodging Association*. A análise envolve as práticas ambientais e estuda as diferenças relacionadas ao porte do empreendimento (se pertence a alguma rede e sua localização geográfica). Apresentam hipóteses que conectam adoção de práticas sustentáveis e a relação entre pertencer ou não às redes hoteleiras; se os hotéis maiores são mais propensos a adotar práticas sustentáveis e se hotéis localizados no Nordeste dos Estados Unidos tendem a adotar, de forma mais intensa, práticas ambientais. As práticas pesquisadas foram gestão de energia, redução de resíduos, reciclagem, educação dos funcionários e negócios verdes.

Após a análise, Rahman, Reynolds e Svaren (2012) concluem que pertencer a redes proporciona adoção de práticas sustentáveis mais consistentes, confirmando novamente as considerações de Hsieh (2012). Com relação ao porte do hotel, os autores apontam que não há consistência, talvez decorrente da forma arbitrária na concepção da distribuição do questionário; a hipótese relacionada à localização geográfica também não foi confirmada.

Na busca de comparações entre práticas sustentáveis, Bohdanowicz (2006) realizou pesquisa no contexto europeu, visando comparar as práticas relacionadas à sustentabilidade em dois países, Polônia e Suécia. Como hipótese, a autora aponta que questões geopolíticas relacionadas ao desenvolvimento do país podem interferir na preocupação, desenvolvimento, desempenho e adoção das práticas relacionadas à sustentabilidade.

A pesquisa demonstrou que há maior preocupação com sustentabilidade na Suécia (94,7%) do que na Polônia (82,3%), sendo que as principais ações retratadas foram direcionadas na seguinte ordem: gestão da água (reutilização de toalhas e tratamento de águas residuais), gestão de resíduos e gestão de energia. Já na Suécia, a prioridade identificada foi: gestão de resíduos, compras verdes (por exemplo, detergentes biodegradáveis), gestão da água e da energia. Bohdanowicz (2006) destaca que as diferenças na hierarquização talvez sejam decorrentes de legislação e da realidade de cada país.

O resultado da pesquisa denota que, neste cenário, a sustentabilidade está ligada à melhoria do negócio, ao retorno financeiro ou à redução de custos, demonstrando que o tema muitas vezes não consta nas principais pautas de planejamento, ou, como já mencionado, no *core business*. A diferença de resultados entre os dois países pesquisados possibilita a conclusão de que os fatores geopolíticos, econômicos e culturais interferem nas práticas que se tratam de sustentabilidade (Bohdanowicz, 2006).

Relacionando pequenos empreendimentos e práticas ambientais, Tzschenke, Kirk e Lynch (2008) realizaram pesquisa na Escócia, com o objetivo de identificar fatores que promovem a adoção de práticas ambientais em pequenos hotéis.

Os autores utilizam o termo verde para designar empreendimentos que adotam ações com vistas a minimizar o impacto negativo no meio ambiente e recursos naturais, bem como poluição. Como principais exemplos, são citados: reciclagem, treinamento sobre questões ambientais, gestão de energia e água, gestão da troca de toalhas e roupas de cama, envolvimento dos hóspedes nas ações, entre outros.

As análises das entrevistas permitiram algumas considerações: os gestores que focaram na gestão de custo observaram na gestão ambiental uma oportunidade de melhoria; outros gestores identificaram a sustentabilidade como uma evolução do negócio. Observou-se, também, que a vivência decorrente do envelhecimento do gestor e valores pessoais contribuem para que as questões ambientais sejam valorizadas (Tzschenke, Kirk, Lynch, 2008).

Interligando sustentabilidade e atratividade em relação aos hóspedes, Berezan *et al.* (2013) desenvolveram um estudo com hóspedes de diferentes nacionalidades, no cenário de San Miguel de Allende, México. O objetivo foi identificar de que forma as práticas sustentáveis podem elevar a satisfação do hóspede e fazer que com ele retorne. As hipóteses trabalhadas se relacionam a satisfação do cliente, retorno do hóspede e diferenças na satisfação do hóspede em relação à nacionalidade.

Quanto aos resultados, os autores supracitados apontam que as práticas sustentáveis promovem impacto positivo junto aos hóspedes e acarretam no retorno dos mesmos, todavia, constataram que as políticas de reciclagem causam impacto negativo sobre estes, gerando constrangimento e insatisfação, também influenciando na intenção de retorno. Destacam, também, que a nacionalidade influencia na percepção das práticas sustentáveis, o que, a longo prazo, segundo os autores, pode também impactar nas intenções de retorno.

Considerando a relação hóspede e sustentabilidade, Barber (2014) realizou uma pesquisa com objetivo de identificar a preferência dos hóspedes por hotéis “verdes” (que se preocupam e atuam a favor da sustentabilidade) e se esses hotéis se diferenciam dos demais. Para verificação dos objetivos, foram elaboradas hipóteses relacionadas aos produtos oferecidos pelo hotel e as preferências dos hóspedes.

Como conclusão, o autor destaca que há diferentes níveis de comprometimento e interesse quanto à sustentabilidade em relação aos hóspedes, o que indica diferentes padrões de comportamento quanto à escolha da hospedagem. Aponta, ainda, que a pesquisa indica que a adoção da sustentabilidade pode se tornar uma ferramenta de atração de hóspedes.

Quanto à relação entre gestão ambiental e posicionamento gerencial, Kirk (1995) realizou pesquisa nos hotéis de Edimburgo, visando identificar a postura gerencial em relação ao tema, bem como o equilíbrio entre política global e ação local, retomando o paradoxo do impacto gerado por um hotel ou uma rede, ou mesmo um grupo de hotéis em um destino turístico.

O autor informa que dezenove hotéis apresentavam declarações escritas sobre gestão ambiental, destacando-se que não houve diferença nas respostas quanto ao hotel ser ou não pertencente à rede. Dos hotéis que expressaram políticas relacionadas à sustentabilidade, as mais frequentes foram: reciclagem de garrafas e latas, utilização de detergentes biodegradáveis, política de troca de toalhas e adoção de lâmpadas de baixo consumo. Destaca-se que os achados da pesquisa de Kirk (1995) demonstram concordância com as colocações de Hsieh (2010) e Coelho, Gosling e Gonçalves (2013), bem como pouca evolução nas práticas e/ou considerações quanto à sustentabilidade (considerando o intervalo entre as pesquisas), denotando, ainda, uma limitação e uma relação direta entre sustentabilidade e práticas ambientais.

Quanto aos efeitos das políticas ambientais, as respostas mais frequentes foram sobre aumento da rentabilidade, elevação da satisfação do cliente, melhoria nas relações com a comunidade e sob a ótica do marketing, vantagem frente aos concorrentes (Kirk, 1995). No entanto, o autor alerta que esses efeitos devem ser considerados como indicativos, pois, devido à amostra, não é possível generalizar os resultados.

No Brasil, as pesquisas caminham para identificar as práticas relacionadas à sustentabilidade, buscando entender relação com *stakeholders*, gestão ambiental e RSC. Como metodologia, observa-se, a partir das leituras realizadas, a predominância de pesquisas qualitativas, concordando com os resultados apresentados por Junqueira, Maior e Pinheiro (2011). Como cenário, encontram-se pesquisas focadas em cidades, estados ou regiões. Também há a distinção entre hotéis pertencentes a redes ou independentes. O foco principal da pesquisa é a gestão ambiental.

Viera e Hoffmann (2010) apresentam pesquisa cuja proposta é descrever a relação entre os *stakeholders* e sua influência no desenvolvimento de práticas ambientalmente sustentáveis, em três hotéis localizados no Balneário de Camboriú (SC).

Quanto à relação com os *stakeholders*, o hotel A possuía os clientes como os mais focados nas questões ambientais, já o hotel B apresentou os acionistas/dono e funcionários como os que tinham maior preocupação com o meio ambiente e, no hotel C, os mais interessados no meio ambiente foram os funcionários e a comunidade (Viera, Hoffmann, 2010).

Quanto às práticas de sustentabilidade, os hotéis A e C apresentaram similaridades, enquanto o B apresentava ações mais efetivas. Como ações presentes nos três empreendimentos, direcionavam-se às questões ambientais como: separação do lixo, redução do consumo de água e energia, práticas de reciclagem e reaproveitamento de material, por exemplo, papel. O hotel B apresentava outras práticas, porém ainda com foco ambiental como: educação de funcionários e gestores sobre as questões ambientais; participação dos clientes nas campanhas de proteção ambiental e compra de produtos ecológicos (Viera, Hoffmann, 2010).

Como obstáculo para implantação de ações voltadas à dimensão ambiental da sustentabilidade, foi apontada pelos três hotéis a falta de cultura organizacional que valorize e incentive essas ações (Viera, Hoffmann, 2010), reforçando que sustentabilidade requer transformação e ressignificação dos valores da organização e, conseqüentemente, mudança de cultura.

Coelho, Gosling e Gonçalves (2013), buscaram identificar “Quais fatores poderiam contribuir para o desempenho da hotelaria, considerando a sustentabilidade e a responsabilidade social corporativa?” (p. 649).

Após a análise, os autores observaram que as dimensões social e ambiental tinham maior ênfase nas ações hoteleiras. No âmbito ambiental, o foco estava na economia de água e luz, reutilização de papel e reciclagem. No econômico, observou-se pouca ênfase, com citação da absorção da mão de obra local e qualificação de profissionais. No âmbito social, houve destaque para proteção à criança, doações para instituições de caridade, ligado a caráter assistencialista e filantrópico. Por fim, no âmbito cultural, foram citadas a conservação do prédio e objetos de época e o apoio a entidades culturais (Coelho, Gosling, Gonçalves, 2013).

O resultado da pesquisa demonstra que a gestão hoteleira em estudo (hotéis em Belo Horizonte) não adotou de forma consistente ações voltadas à sustentabilidade. Da mesma forma, as ações relacionadas à RSC não estavam evidentes para os clientes, o que pode dificultar a escolha do hóspede por um hotel utilizando o critério das práticas sustentáveis (Coelho, Gosling, Gonçalves, 2013).

Quanto às redes, os autores apontam que a RSC possui um caráter mais estruturado e profissional, o qual pode resultar em benefícios para o empreendimento. Para os autores, os hotéis que possuem mais ações ou investimentos efetivos em sustentabilidade e RSC são aqueles que diversificam suas ações e abrangem maior número de dimensões (econômica, social, cultural e ambiental).

Malta, Mariani e Arruda (2013) desenvolveram uma pesquisa na cidade de Campo Grande (MS), tanto em hotéis de redes como independentes. O objetivo da pesquisa foi identificar como as práticas sustentáveis são apresentadas na cidade. A análise dos hotéis contemplou as dimensões econômica, social e ambiental (Elkington, 2012). Foram analisados seis hotéis, três de rede e três independentes, de categorias similares, padrão mais elevado e com número de Uhs (unidades habitacionais designa os quartos no hotel) variando de 80 a 140.

Os autores concluem que as práticas relacionadas à sustentabilidade são mais evidentes nos hotéis pertencentes às redes, corroborando com Claver-Cortés *et al.* (2007), Hsieh (2012), Rahman, Reynolds e Svaren (2012), porém, ações relacionadas à sustentabilidade no setor hoteleiro da cidade de Campo Grande são pouco expressivas. Destacam que os gestores entrevistados não apresentaram respostas completas sobre o tema, além de que as ações se limitam às exigências legais ou que gerem economia, como caso de consumo de água e energia.

De forma geral, pode-se destacar como práticas no segmento: transparência das ações do hotel; economia de energia; racionalização do consumo de água; reciclagem e aquisição de produtos ecologicamente corretos; remuneração condizente com o mercado e capacitação profissional (Malta, Mariani, Arruda, 2013).

Sperb e Teixeira (2008), analisaram o perfil do empreendedor e das pousadas instaladas na Ilha do Mel e as ações adotadas com relação à Gestão Ambiental. Os pontos pesquisados se relacionam a água, energia e resíduos.

Relacionando as práticas sustentáveis nos itens pesquisados, Sperb e Teixeira (2008) concluem que a prática mais efetiva é a economia de energia elétrica, talvez devido ao impacto financeiro dessa ação. Já as práticas relacionadas a água e resíduos são incipientes e pouco eficazes, como, por exemplo, fossas inadequadas e separação e utilização de resíduos de forma pouco organizada. Por fim, os autores concluem que a Gestão Ambiental na Ilha ocorre de forma a atender os interesses e direcionamento dos proprietários das pousadas, sem a devida preocupação com o meio ambiente.

Sob a ótica da sustentabilidade como vantagem competitiva, Töpke, Vidal e Soares (2011) desenvolveram uma pesquisa relacionando o marketing ambiental e as ações de sustentabilidade. A pesquisa foi realizada no Rio de Janeiro – Região Turística da Serra Verde Imperial, em dois hotéis que constam no Guia Quatro Rodas e são indicados como sustentáveis. O hotel A faz parte do roteiro do charme e adota o Código Voluntário de Ética e de Conduta Ambiental (Agenda 21) e possui ações que visam reduzir o impacto no meio ambiente (uso de energia solar, separação e utilização corretas do lixo orgânico e inorgânico, filtragem de água por processo natural, aproveitamento da lenha, entre outros), bem como desenvolve programas para conscientização de funcionários e hóspedes, enquadrando-se, dessa forma, no Sistema de Gestão Ambiental descrito pela ABIH. O hotel B caracteriza-se como pousada, e não atinge as premissas propostas para Gestão Ambiental, uma vez que somente possui horta, reaproveitamento da lenha e reciclagem. Por fim, Töpke, Vidal e Soares (2011) recomendam uma melhor adoção de ações ambientais, principalmente as voltadas para educação e conscientização ambiental.

Cabe ressaltar que os autores apontam que sustentabilidade pode se tornar uma vantagem competitiva, o que pode ser questionável pelas reflexões de Orsato (2006) e Porter e Kramer (2011). Dessa forma, podemos considerar que a sustentabilidade é um diferencial, na medida em que hóspedes escolham o hotel por suas ações, porém não é possível relacionar de forma direta a vantagem competitiva e retorno financeiro.

Com o objetivo de entender a maneira pela qual as redes têm desenvolvido ações sustentáveis de forma cooperativa com seus associados, Silva, Agostin e Langoski (2015), realizaram estudo de caso em uma rede sediada em Porto Alegre. Tal rede abrange 22 empreendimentos situados no Rio Grande do Sul, Paraná e Amazonas.

Apesar dos hotéis adotarem algumas ações com vistas à gestão dos custos, como utilização de lâmpadas fluorescentes, conscientização dos clientes quanto à troca de toalhas, chuveiros e vaso sanitário com baixo fluxo de água, reciclagem de lixo, entre outros, Silva, Agostin e Langoski (2015) concluem que as ações voltadas à sustentabilidade na rede ainda são pouco estruturadas, porém, há demanda dos associados e a ocorrência de ações de forma isolada. Identificaram, também, que as ações relacionadas à redução de custos são aceitas de forma mais favorável.

Pelas pesquisas apresentadas pode-se considerar que o tema sustentabilidade é ponto de interesse do segmento hoteleiro, porém mantém-se associado à RSC e carece de mais desenvolvimento.

4. CONSIDERAÇÕES FINAIS

Temas como a sustentabilidade e a responsabilidade social corporativa, tornam-se cada vez mais um desafio para a sociedade, organizações e indivíduos. Na prática, ser verde relaciona-se muito mais às ações corretivas do que preventivas.

Pode-se observar, pelo exposto, que as ações dos hotéis frente à sustentabilidade estão em fase embrionária e com medidas mais enfáticas no que diz respeito à gestão ambiental, principalmente àquelas que promovam algum tipo de retorno financeiro, contudo, deve-se considerar que alterações mais abrangentes são necessárias à longo prazo (Bader, 2005), porém para que a hotelaria desponte em suas ações, faz-se necessário que os hotéis incorporem em sua cultura organizacional e *core business* a sustentabilidade como um valor organizacional.

Cabe concordar que a gestão ambiental no Turismo, mais especificamente na hotelaria, é uma meta complexa de ser atingida, pois, como já exposto, os impactos que esta pode gerar no ambiente, na cultura, na sociedade e na economia, se analisados de forma isolada, podem não ser considerados significativos, conforme apontam Rahman, Reynolds e Svaren (2012).

É também relevante observar que há muitos conceitos que se entrelaçam nas pesquisas, ou muitas vezes se misturam, como pode ser observado com relação à sustentabilidade e responsabilidade social corporativa (RSC), sendo que, em alguns casos, a primeira está inserida na segunda e, em outros, a sustentabilidade se insere no contexto da gestão ambiental. Como consequência deste entrelaçamento, corre-se o risco de não haver investimento adequado na formação de profissionais para sustentabilidade e consequente desenvolvimento de práticas orientadas para o referido tema, bem como não fica claro, no escopo da organização, quem são os responsáveis pelas práticas sustentáveis, fazendo, dessa forma, com que as pesquisas se direcionem mais aos Gerentes Gerais e proprietários dos empreendimentos, deixando uma lacuna com relação aos outros níveis de organização.

As pesquisas relacionadas ao material de divulgação indicam pontos relevantes quanto ao olhar do empreendimento, por meio de seus gestores para as práticas orientadas para sustentabilidade: (a) as informações sobre o tema direcionam-se aos clientes, caracterizando um foco comercial (Perez, Bosque, 2015); (b) as informações variam em detalhes e qualidade, bem como há reconhecimento da importância do tema quanto sua incorporação ao *core business* (Jones, Hillier, Comfort, 2014); (c) há falta de padronização e clareza nas informações, bem como validação das informações (Grosbois, 2012).

Considerando o exposto referente às práticas orientadas para sustentabilidade realizadas, observa-se que as mesmas se direcionam com mais ênfase às questões ambientais, caracterizando um “olhar” unidimensional, com práticas na sua maioria voltadas à consumo de energia e água, coleta seletiva, redução de resíduos, reciclagem, lavagem de toalhas, troca de roupa de cama, utilização de produtos biodegradáveis, adoção de lâmpadas de baixo consumo e plantio de árvores (Bohdanowicz, 2006; Rahman, Reynolds, Svaren, 2012; entre outros). Na dimensão econômica há ênfase para práticas que proporcionam redução de custos, tais como: gestão de energia e água (Claver-Cortéz *et al.*, 2007) e utilização de lâmpadas de baixo consumo (Kirk, 1995). Quanto à dimensão social, as práticas citadas se relacionam à formação e treinamento de funcionários, envolvimento dos hóspedes (Tzschentke, Kirk, Lynch, 2008), remuneração condizente com mercado (Malta, Mariani, Arruda, 2013) e ações de caridade ou assistenciais (Font *et al.*, 2012). A dimensão cultural não foi citada, o que conota a necessidade de mais investimentos e adoção de práticas.

As pesquisas apresentadas apontam, como consequência da adoção de práticas orientadas para sustentabilidade, redução de custos, gestão financeira mais adequada, melhoria da imagem do empreendimento (Kirk, 1995; Bader, 2005; Claver-Cortéz *et al.*, 2007; Bohdanowicz, 2006), bem como um descompasso entre o discurso e a prática, no qual o discurso tem se apresentado mais abrangente do que a efetiva prática (Font *et al.*, 2012).

Considerando a sustentabilidade como um conceito amplo que cada vez mais abraça temas como qualidade de vida, diversidade, redução da pobreza, atração e retenção de profissionais, entre outros, é fundamental que os hoteleiros e/ou profissionais que atuam no setor cada vez mais agreguem conhecimentos relevantes quanto ao tema (Hsieh, 2012). Os treinamentos e as práticas na hotelaria devem incorporar, em seu contexto, os temas relacionados às dimensões da sustentabilidade, para que, dessa forma, seja promovido a adoção de práticas efetivas que contemple além de aspectos corretivos, considerem também o planejamento e a prevenção.

ABSTRACT

Literacy in diabetes appears to be one of the key tools to combat the increasing prevalence of this chronic disease that has grown exponentially over the years and globally at national level. This study aimed to evaluate the level of literacy in diabetes among students and provide guidelines for proposing an intervention project among this community. The specific objectives were: validate the Diabetes Knowledge Questionnaire (DKQ); and relate the levels of knowledge about diabetes with the socio-demographic and clinical variables. The sample comprises 432 higher education students who replied to the questionnaire in the period between February 15 and March 18, 2016. It was found that the DKQ (Sousa, 2003) that evaluates the knowledge of people about diabetes and its treatment seems to be acceptable for the general population and the two-dimensional model obtained from the confirmatory factor analysis revealed good levels of adjustment (CMIN/DF=1.645, CFI=0.983, NFI=0.959, TLI=0.979, PCFI=0.803, RMSEA=0.039). The results showed a low level of literacy about diabetes and that there is a need for investment in community education projects to increase literacy about diabetes.

Keywords: Diabetes, Health Literacy, Knowledge, Intervention.

JEL Classification: C93, Y90

1. INTRODUCTION

The aging of the world population has brought with it an increase in the incidence of chronic diseases, associated to an increase in demands and costs in health. Among these diseases diabetes mellitus (DM) has been highlighted for its exponential increase over the years.

In 2008, according to the World Health Organization (WHO), 58 million deaths worldwide were due to non-communicable diseases, with DM being responsible for 3.5% of these deaths, with the associated behavioural risks of four metabolic and psychological changes: increased blood pressure, obesity, hyperglycaemia and hyperlipaemia (WHO, 2012).

According to Nurse, Dorey, Yao, Sigfrid and Yfantopolous (2014), one of the most cost-effective human-based interventions is the preventive diabetes lifestyle program, which promotes Literacy in DM as an engine for adopting healthier lifestyles and concomitantly, preventing their onset.

Thus, given the current challenge of a society in a continuous process of demographic aging, with the increase of chronic non-communicable diseases closely related to the lifestyle adopted, the theme related to the level of health literacy and DM, as a relevant factor for the control and prevention of diabetes highlights the pertinence of the present study.

Diabetes is a metabolic disease that affects a large number of people both globally and nationally, conferring it pandemic characteristics (Correia, 2010). This notion is reinforced by Whiting, Guariguat, Weil and Shaw (2011), who consider diabetes as one of the chronic diseases whose incidence and prevalence has increased exponentially over the years.

According to Beaglehole and Lefèbvre (2004,) “the world is facing an increasing epidemic of diabetes with potentially devastating proportions. Its impact will be felt more severely in developing countries.”

Unwin and Marlin (2004) point out that “awareness among policymakers at international and national level about the importance of diabetes at the clinical and public health levels remains low.”

The International Diabetes Federation (2013) points out that diabetes is currently a major cause of chronic morbidity and loss of quality of life and is responsible for a high frequency of consultations and urgent care, having in 2013 been responsible for 5, 1 million deaths. According to Feudtner (2011) type 2 diabetes can be considered a “disease of civilisation”, a “product of modern technology”.

2. LITERACY IN HEALTH AND PREVENTION

Health literacy is defined by DeWalt, Berkman, Sheridan, Lohr, and Pignone (2004) as the “degree to which individuals can obtain, process, and understand the basic health information and services they need to make appropriate health decisions,

which includes adequate interpretation of documents, reading and writing quantitative information, and the ability to listen effectively in a health care setting". For Nutbeam (2008) the relationship between illiteracy and health status is currently well recognized and understood. According to this author, the interest in this relationship contributed to the emergence of the concept of health literacy, with two different roots - public care and public health. This concept is simultaneously a challenge, leading to the development of new intervention strategies in clinical practice and consequently to a change in health organizations as well as an based on educational research for literacy, concepts of adult education and health promotion, with a view to develop skills and abilities aimed at the acquisition by the patient / client of the health service of greater control over their Health and the factors that influence it, being this notion corroborated by Freedman *et al.* (2009).

According to Heide, Heijmans, Shuit and Rademakers (2015) initiatives should be developed to strengthen and improve the role of patients in health care, focusing attention on patients ("specifically functional and interactive health literacy"). These authors developed a study to examine the extent to which functional, interactive and critical health literacy is associated with the control of patients' perceptions of health care and the frequency of visits to primary health care institutions. The study of control of care was associated with the perceived ability to organise care, interact with suppliers, and to perform self-care through multiple linear regression analysis and logistic regression analysis and identified relations between health literacy and perceived control over care and, subsequently, visits to primary health care. The results suggest that some patients may be less able to exercise control over their care because of poor health literacy. Functional, interactive and critical health literacy varies according to the patients' ability to exercise control. For Chinn and McCarthy (2013) health literacy is a complex and evolving construction. The authors carried out research to develop a tool to measure health literacy in primary health care, encompassing functional, communicative and critical health literacy, after consulting 146 health professionals and health care users. The results of the study indicated that the Health Literacy Scale provides health professionals with relevant information on health literacy needs as well as on the capacity of understanding by health service users.

Merkur, Sassi and McDaid (2013) report that controlled observational studies highlight evidence on the effectiveness of health promotion and disease prevention interventions to reduce risk factors by intervening in health determinants such as: risk of tobacco and alcohol consumption, increased physical activity, adoption of a healthy diet, psychological protection and emotional well-being, reduction of environmental damage, and increased environmental safety. According to the authors, this effectiveness culminates in increased cost-benefit whenever interventions in different health determinants are streamlined simultaneously as already outlined by Rosales, Coe, Stroupe, Hackman and Zapien (2010), when they stated that public and social health services, in order to solve complex health and social issues, such as diabetes, increasingly use collaborative and community-based approaches. Merkur *et al.* (2013) warn of the need for caution on the part of policymakers as to the assumptions made about the persistence of the effect of health promotion interventions on long-term behavioural changes. They also add that interventions aimed at children are more likely to be more effective and profitable.

3. DIABETES LITERACY AND PREVENTION

Success in addressing diabetes requires competencies to increase adherence and compliance that supersede the person's prior positions of blame in a "what-should-do" system, based on an educational biomedical model (Beaser & Brown, 2013, p. 399).

In partnership with the American institutions of health and higher education, Vojta, Koehler, Longjohn, Lever and Caputo (2013) implemented a National Diabetes Prevention Program in the United States of America, whose intervention lasted from July 2010 to December of 2011, whose data were analysed in February 2012. They designed a model of group intervention, consisting of 16 sessions with monthly follow-up, conducted by educators in lifestyle training. The results were evaluated in the following items: infrastructure (communities involved and trained personnel), involvement (evaluation and involvement of people with pre-diabetes), program results (attendance and weight loss) and cost of intervention. The program was implemented in less than two years in 46 communities in 23 states, with more than 500 lifestyle coaches trained.

Shue, O'Hara, Marini, McKenzie, and Schreiner (2010) reported that patients with diabetes, with poor health literacy, often struggle with poor health management. They proposed to develop a video with a multidisciplinary group to help these patients better understand their disease (increase in diabetes literacy) and improve the communicational process with health professionals. The results indicated that the patients evaluated the intervention as useful and informative, leading them to consider a behavioural change, also indicating an improvement in the communication process with the attending physician.

Diabetes Mellitus is a health condition that is complex in the long term (Stiles, 2011). To achieve better results, diabetic people should have a good understanding of their condition, as well as adopt a vigilant self-care approach (Stiles, 2011). However, according to the author, this may be difficult for patients with low health literacy, because they may have difficulties in obtaining, understanding and applying health information (Stiles, 2011). Health literacy encompasses factors such as culture, empowerment, motivation and the quality of individual exchanges with the health system. Nurses' understanding of health literacy (as a concept) is critical to helping patients achieve self-management of their long-term condition (Stiles, 2011). Health literacy strategies should focus on providing information in a variety of formats, as well as trying to improve patient access to health services (Stiles, 2011).

Based on the premise that cognitive impairment is common in older adults with diabetes, the authors developed a study of 537 African-American, Indian-American, and Caucasian individuals, including men and women aged over 60 years, hypothesizing the association of health literacy with cognitive function, indicating that it is independent of education. In the study, the measures of cognitive function included the Mini-Mental State Exam (MMSE), Verbal Fluency, brief attention and Digit Span tests were applied. Health literacy was assessed using S-TOFHLA. The results indicated that cognitive functions were associated with health literacy, regardless of other factors of education. Each unit increase in MMSE, Digits

Backward, Verbal Fluency or Brief Attention has been associated with an increased assumption of adequate health literacy, respectively. The authors add that deficient cognitive function may undermine health literacy and increased literacy is a factor in maintaining cognitive function.

4. METHOD

We established three specific objectives for this study: (a) identify the levels of knowledge that higher education students have about diabetes; (b) relate the levels of knowledge about diabetes with socio-demographic and clinical variables; and (c) validate the Diabetes Knowledge (DKQ) questionnaire for a general public of higher education students.

4.1 Participants

Our sample consisted of 432 students, of a total of approximately 700, of the School of Communication, Administration and Tourism of Mirandela (unit belonging to the Polytechnic Institute of Bragança).

4.2 Material

A questionnaire was given out, composed of a first part with socio-demographic and clinical information of the respondents and a second part composed of the 35-item Diabetes Knowledge Questionnaire – DKQ (Sousa, 2003). The original DKQ is divided into 7 dimensions: Identity, Causes, Duration, Treatment, Limitations, Control and Complications.

4.3 Procedures

After formulating the formal request to the Direction of the Polytechnic Institute of Bragança (IPB) and the respective authorisation, the questionnaires were applied to the 432 students of our sample, between February 15, 2016 and March 18, 2016. Students were asked for legal consent. A cross-sectional observational study, using quantitative methods, was performed.

Statistical operations were performed using SPSS v23 for OSX and the modelling of structural equations was done using AMOS v.22.

5. RESULTS

Table 1 shows that the distribution by gender is almost uniform (51.2% of males), that the majority is moved from outside the District of Bragança (53.9%) to study, the majority attend the first year of an undergraduate course (44.7%) and most have relatives with diabetes (52.3%). None of the respondents have diabetes themselves.

Table 1 - Socio-demographic data

		N	%
Gender	Female	211	48,8%
	Male	221	51,2%
	Total	432	100,0%
Residence	Moved from outside the district	229	53,9%
	Moved from inside the district	45	10,6%
	From the municipality	151	35,5%
Study year	First undergraduate	193	44,7%
	Second undergraduate	136	31,5%
	Third undergraduate	76	17,6%
	Fourth undergraduate	0	0,0%
	Masters	27	6,3%
Relatives with diabetes	Yes	226	52,3%
	No	128	29,6%
	Don't know	78	18,1%

Source: Research team (2016)

In terms of knowledge about diabetes, Table 2 shows that the mean number of correct answers is 11.27 out of a possible 35 and that none of the respondents scored on more than 29 questions. In terms of gender, female respondents achieve an average of just over 1 point higher.

Table 2 - Mean scores by gender

Gender	Mean	N	SD	Min.	Max.
Female	11,8863	211	5,56403	,00	29,00
Male	10,6833	221	5,58400	,00	29,00
Total	11,2708	432	5,60024	,00	29,00

Source: Research team (2016)

This information led us to conclude that the average knowledge about diabetes is low and far under the 50% of correct answers. As such, the first objective outlined in our study was achieved.

To find answers for the second objective, i.e. if there is a relationship between socio-demographic and clinical data and knowledge about diabetes, Mann-Whitney and Kruskal-Wallis tests were performed, as our data had a non-normal distribution according to the Shapiro-Wilk tests performed ($p < 0.001$).

From the tests carried out, it was concluded that only for the independent variable “Course” a statistically significant relation existed ($p < 0.001$), being that, as can be observed through Tables 3 and 4, course “14” (undergraduate course in Marketing) has the highest mean rank.

Table 3 - Kruskal-Wallis test results – Mean rank of correct answers per course

Course	N	Mean Rank
1	1	16.00
3	10	227.70
4	13	246.69
5	14	184.50
6	13	120.04
7	74	202.35

Performing pairwise comparisons, including the Bonferonni correction, only the pairs that included course 14 (undergraduate course in Marketing), showed statistical significant differences (p , as can be observed in Table 5. The remaining pairs did not show any statistical difference ($p=1$).

Table 5 - Dunn-Bonferroni pairwise comparisons and Bonferroni correction (Adj. Sig.)

Sample 1-Sample 2	Test Statistic	Std. Error	Std. Test Statistic	Sig.	Adj. Sig.
1-14	-403.860	125.827	-3.210	.001	.140

Each row tests the null hypothesis that the Sample 1 and Sample 2 distributions are the same. Asymptotic significances (2-sided tests) are displayed. The significance level is .05.					

Source: Research team (2016)

As such, from the socio-demographic comparisons, only attending or not the undergraduate course in Marketing makes a statistical significant difference when it comes to knowledge about literacy with a clear superior knowledge by the population from this course, when compared to all other groups. With this step we concluded the research for our second objective.

To achieve our third objective, validate the Diabetes Knowledge Questionnaire for a general public of higher education students, we submitted our data to a Principal Component Analysis to analyse the validity of the theoretical construct for the studied population. The first results, after extracting components with an eigenvalue equal or above 1, resulted in 7 factors, not presenting, however, theoretical coherence. Sousa, McIntyre, Martins and Silva (2015) initially obtained 13 components, but as verified in their study it was necessary to reduce to 3 components and items from 35 to 20. With our sample the same type of reductions were necessary. However, the grouping of the items per component in our sample did not follow the same distribution as with the study of Sousa *et al.* (2015), nor did the elimination of certain items coincide with the ones eliminated in that study. We did however follow the same methodology of eliminating items with loading factors under 0.40 and/or items that didn't have theoretical consistency with the remaining items of the same component. This led to the results shown in Table 6, with a 19 items questionnaire loading to three components.

Source: Research team (2016)

Notwithstanding ending with 3 components as in the study of Sousa *et al.* (2015), our 19 items loaded to 3 components that could be best described as measuring knowledge about diabetes in the areas of: Causes, Treatment and Control of Diabetes, explaining 37.40% of the total variance; Duration of Diabetes, explaining 13.84% of the total variance; and Limitations Originated by Diabetes, explaining 6.04% of the total variance.

Although the item Incl_Q5bRC loaded to two factors we considered it belonging to component 3, given relation and consistency of the question with the remaining two questions of the same component.

Notwithstanding the differences of measured knowledge between our results and the ones from Sousa *et al.* (2015), we have to bear in mind that our sample was composed out of individuals not carrying diabetes, contrary to the other study, and therefore differences in interpretation were expected.

Finally, to validate the questionnaire, we performed Structural Equation Modelling, resulting initially in a non-acceptable result. A further analysis to the fit indices and data, led us to eliminate the third component, as the statistics showed contradictory results and low reliability of the data. As a result, we ended with a two-dimensional model measuring knowledge about: Causes, Treatment and Control of Diabetes; and knowledge about Duration of Diabetes, as depicted in Figure 1.

Figure 1 - AFC generated bifactorial model - standardised factorial weights

Source: Research team (2016)

After eliminating the third group, the results indicated a good quality of adjustment of the model supporting the factorial validity of the questionnaire, with: CMIN/DF=1.645; CFI=0.983; TLI=0.979; PCFI=0.803; RMSEA=0.039. According to the literature, the aforementioned indices are recommended for acceptance when: CMIN/DF < 2 (Ullman, 2001), CFI ≥ 0.95, TLI ≥ 0.95 and RMSEA < 0.6 (Hu and Bentler, 1999), being it that all our indices are within the consensual area of “good fit”.

From the result of the confirmatory factor analysis, we can conclude that the questionnaire is validated for the studied population, measuring in a statistically significant way the knowledge about the causes, treatment, control and duration of diabetes, for a public of higher education students not carrying diabetes.

6. DISCUSSION OF RESULTS

The diabetes knowledge questionnaire (Sousa, 2003), which evaluates people’s knowledge about diabetes and its treatment, was applied by the authors on a population of people with diabetes (239 participants). In our study we intended to validate the scale for a population of public higher education, so the original version (Sousa, 2003) was applied to higher education students (432 participants).

From the statistical treatment performed and the Confirmatory Factor Analysis with good results, we can conclude that the objectives we set ourselves were reached, and can even affirm that validation for a non-diabetic population of higher education students was achieved.

Sousa *et al.* (2015) performed a CFA on a sample of people carrying diabetes, reducing the initial questionnaire (Sousa, 2003), from 35 to 20 items, obtaining results consistent with a “good fit”. Our analysis, on a population of higher education students, showed also consistent results and even higher than the ones obtained by Sousa *et al.* (2015), as depicted in Table 7.

Table 7 - Comparison between studies

Study	CFI	PCFI	TLI	RMSEA
Sousa <i>et al.</i> (2015)	0.908	0.774	0.892	0.052
Our	0.983	0.803	0.979	0.039

Source: Our: Research team (2016); Sousa *et al.* (2015)

This leads us to consider that the results obtained statistically are valid both in statistical terms and in terms of their theoretical construct, concluding our third objective.

Our participants responded correctly to 21,61% of the answers, showing a low knowledge about diabetes, being it that these results are in line with other studies like the one performed by Okoh and Jaja (2014), whose results made the authors conclude that the awareness and knowledge shown by adolescents was extremely reduced and possibly representative of the general knowledge of the Nigerian population. Also the results of the research carried out by Al-Sarayra and Khalidi (2012) led the authors to the conclusion that there is a low level of consciousness and knowledge among university students. The same type of conclusions were obtained in the research carried out by Shin and Schlenker (2012), concluding the level of knowledge among American students was low, just as the research from Khan, Gomathi, Shechnaz and Muttappallymyalil (2012), evidencing an inadequate knowledge about diabetes among university students from the United Arab Emirates, notwithstanding being exposed to information from several sources.

The results obtained in our research reinforce the results of the European study about health literacy performed in several countries like Portugal, Poland, The Netherlands, Ireland, Spain, Greece, and Germany, amongst others, where Portugal appeared as the second country with the most inadequate knowledge about health and also as the second highest in health (Escobal, 2016).

The results of our analysis lead us to conclude that the level of literacy on diabetes in the population is very low, and this fact is worrying when we consider that diabetes is a disease with great incidence in Portugal. These results are even more worrying when we consider that 52.3% of the sample has relatives with diabetes, leading us to suppose that at least this group had a higher level of knowledge.

Low levels of literacy have confirmed that reduced awareness of common and serious diseases, such as diabetes, is worrying, leading to questions about what measures should be implemented in terms of information dissemination and public awareness of the risks of these same diseases.

Finally, we can’t fail to mention the surprising result of the undergraduate students in marketing who scored, on average, almost twice as much as the second highest average course. Although it was first suspected that there might have been some kind of concerted action in the production of the answers in the classroom, this possibility was discarded since the high average occurs among the students of the several years of this degree, but it was not possible to identify the reason for this discrepancy with the remaining sample.

7. CONCLUSIONS

Health literacy is a field of research whose objectives are to explore the existing disparities in this area. Some economists estimate that a low level of health literacy could cost the US health care system more than \$73 billion a year and the Swiss

system \$1.5 billion a year, with no estimates for the Portuguese reality. Assessing health literacy to introduce measures to promote it is therefore crucial to strengthening resilience in the face of adversity (Saboga-Nunes *et al.*, 2014).

To achieve an adequate level of health knowledge, it becomes necessary to identify and satisfy basic needs in order to adopt behavioural changes, practices and attitudes that aim at the maintenance of health promoting lifestyles (Silva, Pereira, Lima, Machado de Matos & Martins, 2014).

It is highlighted that there is a high level of illiteracy in diabetes, and that their ignorance is associated with myths and false concepts rather than uncertainty. This fact becomes relevant because it may influence the general public in the search decision, and even avoids the search for more knowledge about the pathology, since there seems to be an awareness of knowledge based on false conceptualisations.

We conclude, therefore, that the initiatives that currently exist with regard to the dissemination of information must be re-equated in order to achieve a greater degree of literacy.

ABSTRACT

Sleep disturbance has consequences on cognitive level as well as on the metabolic balance of youth. The improvement of literacy levels on sleep habits and rest promotes their suitability.

This study aimed to evaluate the mental health levels (anxiety, depression and stress) and sleep quality of higher education students through a descriptive and correlational study, quantitative and transversal in nature, on a non-probabilistic and by convenience sample of 510 higher education students. The Pittsburgh Sleep Quality Index and the Depression, Anxiety and Stress Scale were used.

Among the results we underline a poor quality of sleep in most of the sample as well as a statistically significant correlation between sleep quality and mental health in the analysed aspects, noting also the statistically significant poorer quality of sleep among female students and higher levels of depression and anxiety among male students.

We conclude that the Sleep Hygiene Consultations performed by the clinical office of the Polytechnic Institute of Bragança, are appropriate and timely to improve the literacy levels about sleep and rest habits, and to promote its fitness in the course of academic activities, contributing to a healthy development with less risk of anxiety, depression, stress and other risk behaviours.

Keywords: Sleep Quality, Mental Health, Higher Education Students.

1. INTRODUCTION

Today's society adopts inadequate lifestyles, motivated by changes in the pace of work, which in many cases extends beyond 8 hours a day, and by work schedules that involve shifts in various professional groups. Globalization and new information / communication technologies, as well as increased competitiveness, have created a 24-hour online society where the day goes on for the night, affecting sleep quality and increasing stress levels (Paiva & Penzel, 2011).

According to the National Mental Health Plan 2007-2016 (2008), mental health problems are currently the main cause of disability and one of the most important causes of morbidity in our societies. Indeed, mental health needs are of such magnitude that they require timely and creative responses from health services, with the involvement of other public structures and community bodies, within the framework of a clear, dynamic and Requirement of our day.

According to the WHO (2011), one in five children has evidence of mental problems and of these, about half have a psychiatric disorder.

It is equally important to be aware of sleep and rest habits, as well as recommended sleep practices and the consequence of lack of rest in behaviour, learning and development of young people, but also of their impact on performance.

Mental health and socio-emotional skills are the common pillars for promoting a healthy lifestyle and the prevention of risky behaviours.

Risk behaviours, such as psychoactive substance use, anxiety, depression, suicide risk, and self-inflicted injuries, among others, emerge and require specific interventions at the level of assessment and treatment.

At present, lifestyles show marked influence on sleep hygiene. There are several factors that contribute to both its maintenance and its failure. From the Latin "somnus", sleep is one of the most important biological needs of our body and a fundamental element for the cognitive functions. It is defined as a behavioural state characterized by physiological, periodic and reversible rest, immobility and relative abolition of sensitivity to external stimuli, with temporary withdrawal of consciousness.

The transition to higher education is a factor of change of habits and lifestyle for students, with particular impact on changing sleep habits, not always for the better. Irregularities between social and academic hours may promote variation in sleep schedules and constitute a predisposing factor for making sleeping more difficult. Studies show that college students

sleep on average less than 7 hours a night, take more than 30 minutes to fall asleep and that most show low sleep quality. It is also described that the students of more advanced years in their courses have more hours of sleep than the students of the first years. Stress is the most pointed factor as a justification for poor sleep quality and difficulty in initiating sleep, followed by anxiety and emotional factors. Excessive daytime drowsiness, as a non-restorative measure of sleep at night, has a negative impact on students' academic and psychomotor performance, with consequences on learning and memory consolidation, as well as mood, triggering feelings of anxiety, fatigue and irritability. As such, the population of higher education students is at particular risk to evidence a decrease in sleep quality.

Caetano and Thomaz (2012) analysed the responses of youngsters and found that sleep habits and disturbances, negatively influencing quality of life, also generate stress, impatience and unavailability, irritability, aggressiveness, distractions and apathy, or on the contrary, to situations of hyperactivity, discomfort, difficulty of interaction, sadness, isolation, lack of mood and energy. Paiva (2015) states that those who sleep well have a great ability to adapt to adverse circumstances, such as stress.

The National School Health Programme 2015, in Axis 1 - Training, covers the following areas of intervention: mental health and social-emotional skills, affection and sexuality education, healthy eating and physical activity, body hygiene and oral health, sleep and rest, postural education, prevention of tobacco consumption, alcoholic beverages and other psychoactive substances, as well as other substance independent additive behaviours.

Sleep and rest habits are the basic biological rhythm of the human species and are fundamental for good health and quality of life, with special significance in children and young people. Primary sleep disturbances may be due to changes in the quantity or quality of sleep (dysphonia), or to abnormal behavioural or physiological events associated with sleep (nocturnal terrors, nightmares, somnambulism, etc.). Sleep disturbances have cognitive consequences on the metabolic balance of children and young people. Improving literacy about sleep and resting habits promotes their adequacy throughout their academic journey.

In general, sleep among young people assumes itself as an obstacle, that is, with increasing responsibilities due to social paradigms centred on "having" and "success", society has changed and developed new habits of life, occupying less time to sleep and more time for leisure and work. Higher education students sleep less and less every night, and they find that they sleep a few hours during the week and compensate at the weekend, which indicates an obvious disturbance of sleep (Paiva, 2015).

Coelho, Lorenzini, Suda, Rossini and Reimão (2010), in a sample of 49 university students revealed a statistically positive correlation between the scores that assessed sleep quality and depression, that is, the greater the loss in sleep, the higher the levels of depression. Prior and Ribeiro (2011) related sleep pattern and depression, and inferred that this is influenced only by insomnia, and that this relationship was statistically significant.

In a study by Chang, Ford, Mead, Cooper-Patrick, and Klag (1997), conducted among university students, it was found that the risk of developing depression was higher among students who complained of insomnia during college time compared to those who did not report sleep problems. In a similar study, Pinto *et al.* (2012), covering a sample of 1613 youngsters between 12 and 18 years of age, concluded that daytime sleepiness (a sign of insufficient or poor sleep) is correlated with anxiety symptoms ($R_s = 0.371$), depression ($R_s = 0.327$) and stress ($R_s = 0.405$).

Clark and Watson (1991) defined the tripartite model in which the symptoms of anxiety and depression come together in three basic structures. The practical use of this model has led to the construction of several measures, such as Lovibond and Lovibond's Depression, Anxiety and Stress Scale (DASS) (1995), whose objective is to discriminate these three dimensions.

Stress is related to sleep on a bilateral basis (Sahed & Gruber, 2002), that is, an excessively stressful life can disturb the wake-sleep cycle, and sometimes sleep itself is a "stressing" factor for the teenager who attaches greater importance to other areas of his life and has little time to sleep. On the other hand, the anxiety symptoms increase with the irregularity of adopted sleep schedules. There seem to be greater sleep difficulties, namely early awakenings, among students with higher levels of anxiety (Almondes & Araújo, 2003). Also, Dahl (2002) relates the personal regulation of the sleep-wake cycle in adolescents' lives with affective and cognitive processes, confirming the close connection between sleep deprivation and emotional changes.

Given the aforementioned, various studies indicate a significant relationship between the quality of mental health and the quality of healthy sleep habits.

2. METHOD

To assess mental health (levels of anxiety, depression and stress) and the quality of sleep of higher education students, we performed a descriptive-correlational, quantitative and transversal study on a sample of 510 higher education students.

A three-part questionnaire was applied to the students in the sample. The first part consisted of a socio-demographic questionnaire about the respondents as well as about substance use habits. The second part of the questionnaire consisted of the 19 questions from the Pittsburgh Sleep Quality Index (Portuguese version adapted by Ramalho, 2008), focusing on 7 components of sleep quality: subjective quality; latency; duration; usual efficiency; disorders; use of hypnotic medication; and diurnal dysfunction. Responses to the questions were given on a Likert scale of 0 to 3 points, with 0 meaning "Very Good" and 3 meaning "Very Poor". The overall score is obtained by adding each component by its relative weight and a total score equal or above 5 is considered to indicate a poor quality of sleep.

The final part of the questionnaire consisted of a set of 21 questions, the Anxiety Depression and Stress Scale - DASS (Portuguese version adapted by Ribeiro, Horado, & Leal, 2004). Each of the three dimensions is measured by a set of 7 items and answers given on a Likert scale of 0 to 3 points where 0 means "Nothing" and 3 "Most of the time." According to

the authors of the original scale (Lovibond & Lovibond, 1995), the several levels for the three dimensions can be classified according to Table 1 (scorings obtained from the DASS subscales have to be multiplied by 2 to compare with the table according to the authors):

Table 1 - Levels of Anxiety, Depression and Stress

	Depression	Anxiety	Stress
Normal	0-9	0-7	0-14
Low	10-13	8-9	15-18
Moderate	14-20	10-14	19-25
Severe	21-27	15-19	26-33
Extremely severe	>27	>19	>33

Source: Lovibond & Lovibond (1995)

3. ANALYSIS OF RESULTS

From the answers to the socio-demographic questions, of the 510 respondents, 364 (71.4%) are female, the most represented students are the undergraduate nursing students (81; 15.9%), 181 (35.5%) attend the second year of their respective course and 404 (79.5%) of the students are displaced, that is, they are not from the city where they study.

In terms of the variables measured, sleep quality, level of depression, level of anxiety and level of stress, the average values obtained by gender and in total are those that are presented in Table 2.

Table 2 - Average scores and Standard Deviations of the PSQI and the DASS subscales

Gender		PSQI	Depression	Anxiety	Stress
Male	Mean	9.2466	7.9247	6.2260	10.0000
	N	146	146	146	146
	SD	4.58718	3.52349	2.51004	4.51052
Female	Mean	7.8214	6.5110	6.9835	9.6896
	N	364	364	364	364
	SD	5.23797	4.09964	2.81275	5.55660
Total	Mean	8.2294	6.9157	6.7667	9.7784
	N	510	510	510	510
	SD	5.09674	3.99149	2.74854	5.27588

Source: Authors (2017)

From Table 2, we can conclude that, on average, male respondents have a relative better quality of sleep although presenting levels of depression, anxiety and stress above those of their female colleagues.

We emphasise that both genders have a PSQI score above 5, meaning poor sleep quality levels. In terms of stress, anxiety and depression, according to the classification made by Lovibond and Lovibond (1997), the three dimensions are at the “moderate” level, which is a worrying factor since it is the third step in a total of 5, and anxiety among male respondents is even on severe levels.

In terms of the internal consistency of the scales used for the 4 dimensions, the Cronbach alphas were calculated and we concluded that the one of the PSQI is weak ($\alpha = 0.584$), the internal consistency of the subscale to measure anxiety is good ($\alpha = 0.866$) and that the internal consistencies of the subscales for measuring stress and depression is excellent ($\alpha = 0.917$ for stress and $\alpha = 0.922$ for depression).

We also conducted tests to relate the results of the 4 dimensions with socio-demographic data, namely gender. The hypothesis of whether or not gender has an influence on the four measured dimensions, using the Mann-Whitney test, according to the data presented in Table 3, rejects the zero hypothesis ($p < 0.05$) for all dimensions except for the dimension stress, that is, gender has a statistically significant relationship with sleep quality and the levels of depression and anxiety.

Table 3 - Mann-Whitney test results for grouping factor “gender”

	Gender	N	Mean Rank	Sum of Mean Rank
PSQI	Male	146	227.21	33173.00
	Female	364	266.85	97132.00
	Total	510		
Depression	Male	146	278.63	40680.00
	Female	364	246.22	89625.00
	Total	510		
Anxiety	Male	146	289.72	42298.50
	Female	364	241.78	88006.50
	Total	510		
Stress	Male	146	259.91	37947.00
	Female	364	253.73	92358.00
	Total	510		

Source: Authors (2017)

The quality of sleep perceived by the respondents and the quality of sleep measured through the PSQI were also compared. Table 4 shows that all the groups demonstrate a quality of sleep above 5 points, that is, a poor quality of sleep.

Table 4 - Relation between self perceived sleep quality and the PSQI and the DASS subscales

Self perception of sleep quality		PSQI	Depression	Anxiety	Stress
Very good	Mean	6.1875	3.7500	5.2031	6.6406
	N	64	64	64	64
	SD	5.02336	1.87718	3.83045	4.09555
Good	Mean	7.8918	6.3684	6.6784	9.3947
	N	342	342	342	342
	SD	4.64044	1.90044	3.72855	4.90009
Poor	Mean	10.0745	9.6383	8.2979	12.5213
	N	94	94	94	94
	SD	5.36865	2.34108	3.91257	5.32942
Very poor	Mean	15.5000	12.7000	13.0000	17.2000
	N	10	10	10	10
	SD	7.10634	3.62246	5.41603	6.17882
Total	Mean	8.2294	6.7667	6.9157	9.7784
	N	510	510	510	510
	SD	5.09674	2.74854	3.99149	5.27588

Source: Authors (2017)

It is also worth noting that there is a relationship between the measured sleep quality and the remaining 3 measured dimensions, that is confirmed by the correlation between the 4 dimensions that in all combinations is significant at the 0.01 level as presented in Table 5.

Table 5 - Spearman correlation between the measured dimensions

	PSQI	Stress	Anxiety	Depression
PSQI	1.000	.449**	.396**	.397**
Stress		1.000	.806**	.826**
Anxiety			1.000	.791**
Depression				1.000

** Correlation is significant at the 0,01 level (bilateral)

Source: Authors (2017)

We can therefore conclude that the results show poor sleep quality for the majority of students surveyed, as well as a statistically significant correlation between sleep quality and mental health in the analysed dimensions, and also the statistically significant poorer sleep quality among female students and higher levels of depression and anxiety among male students.

These results are in line with the complaints made by students who use psychology consultations in the clinical office of the Polytechnic Institute of Bragança (IPB).

4. DISCUSSION OF RESULTS

The results of the present study are in line with other studies carried out, namely with those of Caetano and Thomaz (2012), Paiva (2015) and Pinto *et al.* (2012). The poor quality of sleep among students of higher education is symptomatic and there is an urgent need to take measures to inform students about the possible consequences and the measures to be taken to reverse the situation.

In the study of Boscolo, Sacco, Antunes, Mello and Tufik (2007), it was verified that the period of study and sleep habits are associated and can influence academic performance, being that students with fewer complaints about sleep showed better performance in memorising words. When inefficient diurnal behaviours occur in which there is greater instability in the overall performance of the youth, including their academic performance, they occur simultaneously with interrupted nights of sleep or insufficient quantity (Dewald, Meijer, Oort, Kerkhof & Bögels, 2010).

Also, the relationship between sleep quality and mental health, which is confirmed in our study, is worrying and may lead to other psychic problems and risky behaviours. However, as in the present study, it has been difficult to determine cause and consequence, and there may even be a circular and alternating relationship as the parameter of anxiety as an endogenous factor affects the temporal expression of the sleep-wake cycle pattern, and the irregularity of the sleep-wake cycle derived from school schedules and academic demands (exogenous factors) cooperate to increase the state of anxiety (Almondes & Araújo, 2003).

A good night's sleep is essential for physical and mental wellbeing, but sleep is sometimes modified or even disturbed by biological and environmental factors (Kabrita, Muça, & Duffy, 2014). The preservation of its quality is fundamental, since those who sleep well have a high capacity of adaptation to adverse circumstances, such as stress, anxiety, among others.

It is also noteworthy that female students, despite having a poorer quality of sleep than male colleagues, present lower mean levels of stress, anxiety and depression, and this difference is statistically significant for anxiety and depression. This result, together with the fact that women need, on average, more sleep time than men (Horne, 2007), leads us to recommend a focus on this apparent better resistance on the part of women to stress, anxiety and depression in future studies.

Thus, the results obtained in our study lead us to conclude that the sleep quality levels of the students of the sample, as well as the levels of anxiety, depression and stress, show values that we can classify as worrying, being that the 4 dimensions are correlated and a group of these students can enter a decreasing spiral with worsening indicators.

These results are in line with previous studies on the same problem and lead us to think that the implementation of a Sleep Hygiene Consultation programmes can be an efficient help in solving this problem.

5. CONCLUSIONS

There is evidence of a relationship between sleep habits and students' mental health. It will be important, however, to continue to gauge the cause in this correlational relationship, in order to propose action measures on the origin of the problem instead of trying to correct the consequence.

Based on the National Mental Health Plan 2007-2016 (2008), the following promotion and prevention strategies were favoured:

(...) Mental health education programmes in schools, teacher awareness, youth violence prevention, counselling for children and adolescents with specific problems, drug abuse prevention, personal and social development programmes, suicide prevention and eating disorders; (...) programmes for the prevention of depression (second cause of disability in the European Union) (...)

In general, young people should have knowledge about the importance of sleep hygiene, changing harmful lifestyles through more appropriate behaviours such as physical exercise (dance, gymnastics, athletics...), playing music, do yoga, among others.

In this context, and considering the results of our study, the Sleep Hygiene Consultation inserted in the clinical office of IPB, makes perfect sense. In particular, the comparative results between the perceived quality of sleep and the measured quality of sleep lead us to understand that in most of the situations the subjects assume to have a good quality of sleep when in reality and according to the defined standards that same quality is considered to be poor, having consequences at various levels.

Improving literacy about sleep and resting habits will promote students' fitness throughout academic activities and thus contribute to a healthy development with fewer risks of anxiety, depression and stress.

ABSTRACT

“Reaching for the moon” portrays the story of Lota de Macedo Soares, who designed one of the largest architectural projects in the city of Rio de Janeiro, Flamengo Park, and her homoaffective relationship with the award-winning American poet Elizabeth Bishop. Through an observational study within a qualitative approach, based on a foucaultian framework, the paper intends to explore how the hegemony of discourses, norms and behaviors related to gender roles are also visible in the reproduction of (symbolic?) patterns of exclusionary and patriarchal urbanization. The historical invisibility of Lota’s role in the design and construction of the world’s largest urban park, a World Heritage Site, is demonstrative of how gender norms regulate the way conditions appear on how to appear in the public space; how the public and private are distinguished, and how this distinction is instrumented in the service of sexual politics. The visibility of the feminine figure in the monuments has as reverse: the invisibility in the historical construction. The contribution of this study goes beyond the fictional and cinematographic limits, it aims at thinking about the conditions under which the processes of forgetting and invisibility of women in the construction of public spaces are operated.

Keywords: Invisibility, Gender, Recognition, Power.

1. INTRODUCTION

In the discourse on gender, heterosexual identities are seen as natural, although attributes are included in the sexed body (Rich, 1999; Sunderland, 2004). Symbolic differences and anatomical differences between men and women are emphasized in the social construction of gender to justify power relations. In Western society, the relations of symbolic domination of the masculine over the feminine, considering the work of cultural valorization of biological attributes of man, are marked by ‘naturalization’.

This naturalization aims to decontextualize the social construction of gender, referring to the determinism of evolutionist theses the issues of body and corporeity. Rosaldo (1995) points out that the justification of natural origins for gender issues is an ideological construction that leads to the acceptance that “what we are today is something more (other) than the product of our history and our world, more particularly, that our gender systems are primordial, trans-historical and essentially unchanged in their roots” (p. 15).

These are ideological constructions of femininity and masculinity associated with the expectations that have been created about what is appropriate for women and men. Thus, to speak of gender is to refer to a set of beliefs, broadly shared by society, about the feminine and the masculine, which are independent of the concrete reality of each human being - his capacities and aspirations, his physical and psychological individuality -, a set of beliefs that, as prejudices, conditions the lives of one or the other, restricting their choices, their paths and projects of life.

The denunciation of images associated with the naturalization of the female and male condition was always present in the different feminist movements. It is, however, with Beauvoir’s (1967) critique of the nature of the body as the surface of a cultural invention, evident in the classic assertion, “no one is born a woman, becomes a woman” (p. 9), that opens the way to a radical interpretation of gender by the second wave of feminisms. The centrality that sexual policies assume from this point on in feminist struggles requires a more powerful conception of power, capable of giving a reason for daily practices and habits, for which the liberal and Marxist theoretical tradition seems to have no answers.

Foucault’s (1975) notion of a “micro-physics of power” allows us to analyze how power relations operate in different ways, in an intricate network of connections which include family, workplaces, or other marginal institutions. The notion of micro-power, points to micro-social conditions, questioning the sense of public / private distinction, in which it is difficult to think of the conditions in which subjectivities are shaped and worked in family, group, and school contexts. As Duncan (1006) points out, the public-private distinction is not neutral, it is gendered, it serves a context of domination, shadowing the micropower that functions in private contexts (family, interpersonal relationships, group, etc.).

This binary opposition has been used to legitimize oppression and dependence on the basis of gender. It has also been used to regulate, normalize, sexuality. The private appears as an ideal type, which has traditionally been associated and confused with the domestic, the embodied, the natural, family, property, the gloomy interior of the home, personal life,

intimacy, passion, sexuality, the good life, care, shelter, unpaid labor, reproduction and immanence. On the other hand, the public sphere appears in this binary opposition as an ideal type that traditionally is the domain of the disincarnate, abstract, cultural, rational, critical public discourse, citizenship, civil society, justice, the market, wage labor, production, polis, state, action, militarism, heroism and transcendence (Duncan, 1996). Against this dichotomy, it should be said that the private is also part of the political sphere. There is a dynamic of power that is a political even in minor everyday practices, in gestures, in the relation to space, in language, in the ways in which the world is received from the very beginning.

In this article we assume the concept of gender as an analytical category, following the theoretical proposal of Joan Scott (2008), in which “the core of the definition depends on the integral connection between two proposals: gender is a constitutive element of social relations, which Based on the perceived differences between the sexes, and gender is a primary form of the symbolic relations of power” (p. 65). This perspective of Foucauldian influence allows us to unite the gender relational category with the polymorphic dimension of power relations in terms of subjectivation, embodiment and subjection (Foucault 1975; Butler, 1997; Haraway, 1995). In addition, it helps us realize how, despite the dissemination of power, the gender device operates in different ways in the subordination of women, in interaction with other devices of power, such as sexuality, constitute a “situated experience” (Adán, 2006), according to what the current discourses in a society allows.

As Foucault argues (1969) discursive practices are inserted in historical regimes of truth, from which the subjects of knowledge are legitimized and the objects and rules of production and validation of knowledge are delimited.

The objective of this article is to explore the way in which the hegemony of discourses, norms and behaviors related to gender roles are also visible in the reproduction of (Symbolic) patterns of exclusionary and patriarchal urbanization.

2. GENDER AND IDENTITY

Walter Lippman (1922) argues in his pioneering analysis of stereotypes that they play an important role in human judgments and information processing, functioning as “pictures in our heads” (p. 4), giving explanation, justification, of certain actions and differentiations between groups and people.

Gender stereotype is directly related to the fact that conceptions of the feminine and the masculine are erected in a dichotomous way and are mutually opposite, mutually exclusive, as in the sexual differences between women and men. These beliefs include the characteristics, skills and competencies considered as “innate” to men and women, the attitudes, behaviors and (re)actions expected of each other, activities and social roles accepted as appropriate to each sex.

As in other dimensions of life, the labor markets and the division in the functional organization of labor are also marked by this stereotype. Most jobs are sexually typified as female or male and, therefore, naturally occupied by women or men, respectively.

In a deeper analysis as proposed by Billing and Alvesson (1994) we can also say that a certain work has a certain gender symbolism. “The concept of gender symbolism then goes a bit deeper than sex typing, meaning not only that a particular job is openly viewed as women’s or men’s work, but it also refers to non-explicit meanings, unconscious fantasies and associations” (Alvesson & Billing, 2009, p. 70).

Ideas about what is feminine/masculine are historically rooted in the cultural systems of meanings and ideas, and later considered appropriate as work for women or men. There are, in a vaguer or more specific way, certain ideas about the characteristics of each type of work and the more masculine or feminine qualities it is required to possess (Alvesson & Billing, 2009). This division of labor between “female” and “male” workplaces is considered a key element in the subordination of women to work and society (Acker, 2009; Alvarez & Billing, 2009; Hirata, 2007).

As Butler (2009) argues “Gender norms have everything to do with how and in what way we can appear in public space; How and in what way the public and private are distinguished, and how that distinction is instrumental in the service of sexual politics” (p. ii).

Thinking gender according to ideas about what is appropriate and natural to male and female people, giving them shared and “normal” traits of masculinity or femininity, respectively, does not allow equating adequately many of the problems associated sexual policies.

Social constructions of gender “imprison” people to the representations of sex and, therefore, can be a great obstacle to overcoming the rigid and oppressive divisions that occur in different cultures. It is this focus on the body that is implicit in the affirmations: “this is a man,” in contrast to “this is a woman.”

Bringing gender into the sex organs and other bodily signals implies taking into account a huge variety of outcomes in the “women” category, from striptease dancer, elite swimmer, grandmother and business woman. In the same way, when certain values such as individualism, aggression, competition, sport and drink are associated with men, it is necessary to take into account that any person can have these characteristics and yet continue to be seen as feminine according to other dimensions, such as appearance or maternity, for example (Alvesson & Billing, 2009).

The notion that men and women can be defined from complete and exhaustive concepts is very critical. As Butler (1990) argues, “gender norms have everything to do with how and in what way we can appear in public space; how and in what way the public and private are distinguished, and how that distinction is instrumentalized in the service of sexual politics (p. ii). There is nothing called “sex” or “gender” that precedes our own concepts.

The process by which “normality” is delimited, and from which one defines who is “inside” and who is “outside”, or rather, who is “inside” but kept “outside”, allows one to understand in what ways performativity and precariousness are close concepts, as defended by Butler (2009).

In the assertion that gender is performative underlies the idea that the appearance of gender is usually understood as a sign of its internal or inherent reality; That this reality is induced by mandatory norms that impose identification with the male gender or with the female gender, and thus its reproduction is always a negotiation with power and, finally, that there is no gender without the reproduction of norms that are at risk to undo or redo the norm in unexpected ways, thus opening up the possibility of a transformation of the reality of gender into different lines.

As for precariousness, it describes the set of different conditions to which the living beings can be subjected, of their own will or by accident. Thus, precariousness also refers to the political conditions in which some populations do not have access to social and economic support networks, being more exposed to injury, violence and death, as well as politically induced conditions that expose populations to the arbitrary violence of the State and other forms of aggression that are not registered by the State, against which the late does not offer protection. Thus, precariousness may refer to populations subjected to hunger or sex workers who have to defend themselves against street violence and police persecution (Butler, 2009, p. i-ii).

3. METHODOLOGICAL PROCEDURES

To grasp or interpret the complex phenomena derived from human and social relations, is a task that requires quite a lot of the researcher. This requirement to enter the field of meanings is a fundamental characteristic of qualitative research, since, as Goldenberg (2004) affirms, “qualitative data consists of detailed descriptions of situations with the aim of understanding individuals in their own terms” (p. 53).

The qualitative approach to research provides a contribution to a closer investigation of social phenomena and seeks to “study things in their natural settings, trying to understand, or interpret, the phenomena in terms of meanings that people impart to them” (Denzin & Lincoln, 2006, p. 17). The scenario presented here is fictitious, but based on real stories and portrays the narrative involving human relationships, enabling their analysis and understanding.

Among its various techniques of data collection, we make use of observation, as a spectator of the observed content. Patton (2002) assigns to this work the purpose of “describing the scenario that was observed, the activities that took place in this scenario, the people who participated in those activities and the meanings of what was observed in the perspectives of those observed” (p. 262).

The observational study in film language, a methodology characterized by Machado & Matos (2012), is adequate to achieve this work, because it allows “the observer to feel part of what he sees described in the film and make possible the decoding and coding of various symbols, either with texts, with the images or with the behaviors observed in the characters” (p. 12).

To perform this study, we follow the path proposed by Machado & Matos (2012), in the following steps: the construction of a research objective; selecting a movie; the general view of the film narrative; the identification of scenes and their detailed description; the construction of a theoretical framework and the production of a final report, without the pretension of exhausting the discussions about what could be observed.

This type of analysis, as we pointed in some previous works, is relevant and has consistent methodological proposals, since the film is made by elements of the real world, such as the human relations exposed there, for example, although has fictitious characters (Machado, Ipiranga & Matos, 2013), are analyzes of representations. Visual methods help sensory perception and comprehension of the situation represented, which can be systematically visualized repeatedly for attention to the proposed research problem (Matos, Lima & Giesbrecht, 2010).

Thus, during the later sections, the observational study is presented, with a brief summary of the film in narrative, and the considerations obtained from the filmic analysis, related to the previously presented approaches, in order to base what was perceived in the study.

4. THE OBSERVATIONAL STUDY

The movie “Flores Raras” (international title: Reaching for the moon) is set between the years 1950 and 1967 in two main scenarios, New York City, while portraying the work of Elizabeth Bishop as a poet and later teacher, and in Rio de Janeiro, Brazilian city where the writer gets acquainted to Lota de Macedo Soares, the companion of his old friend Mary Morse.

“How is ‘it’ here?” The question Elizabeth addresses to Mary relates to her relationship with Lota. The response reflects the need for discretion over the exposure of her homosexuality, a social camouflage that is strengthened by life in a house away from the urban center of Rio de Janeiro, as well as the family of protagonists who do not accept their sexualities. “How close were you in college?” The following dialogue between Lota and Mary about Elizabeth also reinforces the perceived difficulty of social acceptance of the lesbian being, something the two Americans tried to hide during adolescence.

Lota begins an affective relationship with Elizabeth. The film shows the conviviality of the two at home, moments of intimacy, walks and support in the parallel works that develop. However, after winning the Pulitzer Prize in 1956 for her book “North & South - A Cold Spring”, the poet is invited to a homage in the city of Rio de Janeiro and, even if accompanied by Lota, does not present her as his family or as any other proximity bond. The situation is repeated on other public occasions.

“That’s not visible! Give them a beautiful park ... And then you’ll make history as you deserve”. Lota encourages the governor, a friend she supported during the electoral process, to build a park for which she will be responsible for the work and development. At the end of the construction, Lota tries to turn a park into a foundation to separate the administration and protect it from the probable instability of government, but the military put her aside in the process. Lota is hospitalized with depression and dies after a meeting with Elizabeth in New York.

The invisibility of Lota's role in the construction of the Flamengo Park allows us to understand the importance of the "silent curriculum" in our daily life (Moi, 1990, p. 271). The reproduction of discourses based on the nature/culture dichotomy, alongside the masculine/feminine dichotomy, where the feminine appears particularly related to naturalized aspects, frame the pragmatic dimension of the discourses with the mechanisms that regulate the places of enunciation, elaboration and authority for the construction of meanings (Foucault, 1969).

It is from this performative function of the discourses and the productive operability of the concepts of sex and gender that one can understand the response of one of the interviewees to the newspaper *O Globo*¹, in a report about Lota de Macedo Soares, to Flamengo Park visitors. The journalist at one point writes: Arnaldo de Oliveira, a retired merchant. Thirty years ago he lived in Flamengo, did daily walks in the Aterro, with other retirees. He never imagined that it had been done by a woman. He always thought it was the work of Burle Marx.

It is the "proper place of woman" that is challenged here. "Where did you study architecture? I was born an architect". The justification that Lota did not have a diploma in architecture is not enough to explain the forgetting of his name in this work, since Burle Marx also did not have formal education in architecture. In the same way that his political positions on the right are also insufficient justification, since the park of Flamengo received the name of Parque Brigadeiro Eduardo Gomes, in homage to a soldier linked to the ideals of right wing that, in 1964, participated in the dismissal of João Goulart from the presidency and, in the Castelo Branco government, was minister of aeronautics.

The forgetting of Lota in history operates from two great impossibilities: being a woman and being a lesbian. The question is thus posed by Butler: "What do we call those who do not and cannot appear as" subjects "within hegemonic discourse?" (2009, p. iii). Lota's recognition is deeply marked by norms about sex and gender, which somehow condition her "eligibility."

Lota, wanting to impose herself in the public space, breaks with the normative discourse that defines women, in patriarchal societies, as the Other, as the non-essential in relation to man, as a mere object of immanence. Women are thus denied both culturally and socially, subjectivity, autonomy and creativity (Beauvoir, 2009).

The Lota can tolerate his rebellious spirit when driving a jaguar or when wearing men's outfits. It is always possible to frame these attitudes in a kind of "rich girl eccentricity" or associate them with the spirit of the era strongly marked by modernism and feminist struggles. "What? Nobody is looking?" However, her behavior is publicly measured when it comes to the affection she shows for her female partners, her sexual orientation, her position as head of household, or as an authority in the carrying out of the park's works.

The woman can inspire a monument, but no one expects her to monumentalize. The construction of a monument, "monumentalization," "elevation," is not tied to the "nature" of the woman. The visibility of the feminine in the monuments is paid with the invisibility in the historical construction. As Beauvoir (2009) explains, "condemned to play the role of the Other, the woman was also condemned to possess only a precarious force: slave or idol, it is never she who chooses her destiny" (p. 134).

The widespread tendency to identify "with one or the other pole of an inevitable binary opposition between the two sexes" (Bauer, 2001, p. 38) puts Lota at risk of not being qualified as subject of recognition. She is a woman, but she does not fit into the "feminine", she is not a man, but presents herself with competences normally recognized to the masculine gender.

Lota's forgetfulness is saturated with power, precisely at the moment when it is discarded of recognition, in a double movement that simultaneously allows to expel and to confine. That is, expulsion is not operated by forms of law or obligation, but through an exercise of power that depends on barriers and obstacles, through a certain confinement that deprives it of public recognition (Butler & Spivak, 2012). It is an expulsion that keeps "in".

The invisibility of Lota's importance in history happens through complex modes of governmentality, in ways not easily reducible to sovereign acts, and can happen through modes of instrumentality that are not necessarily initiated or supported by a sovereign subject (Ibid, p. 34-35). The process occurs in a very underground way.

Lota is not prohibited from working, conducting, or being politically active, by any legal framework, but by a set of disciplinary techniques and practices that have developed and generalized precisely, according to Foucault (1975), when establishing formal and codified form of the politically free subject in the 19th century. XIX. As explained by Oksala (2016): "There are forms of power, such as disciplinary power, that do not function according to the dichotomous distinction between legal and illegal but use much more subtle distinctions, by operating on the sliding scale of healthy/Sick and normal/abnormal, for example" (p. 474).

In modern societies, all dimensions of life are guided by a mode of governance that Foucault (1991) called governmentality (which includes the rule of others and self-government). Order is established and reproduced not only from what compels people, bodies and things, but also in a dynamic process in which they are simultaneously an active part. It is in this sense that the constitution of what is "normal" is produced by the hegemony of discourses, norms and behaviors (where the relation between knowledge and power is included). As Lorey (2006) explains:

"The normalized subject itself is, once again, a historical construct in an ensemble of knowledge forms, technologies, and institutions. This ensemble is aimed at the individual body as well as the life of the population as a whole. Normalization is lived through everyday practices that are perceived as self-evident and natural" (s/p).

Performativity is associated with those who qualify to become a recognizable subject and precariousness characterizes all unqualified lives as recognizable, readable, and between those that common sense suggests that we regret their loss.

Based on these definitions, it is possible to see how precariousness can be associated with gender norms, since those who do not live by their gender according to the established standards are more likely not to meet the profile necessary to be considered deserving recognition.

¹ Edição de 2 de Julho de 1994, caderno "Ela".

It is from this association between performativity and precariousness that one can elucidate the conditions in which Lota de Macedo Soares, despite his proven professional competence, is relegated to invisibility. The economic conditions, cultural and intellectuals of Lota are not enough to keep her from precariousness, because her life is colonized by the dominant culture, which pushes her to an unrecognized life. Some of the issues raised by Butler (2009) may here be adapted to think of Lota's right over his professional achievements and about who he loved. How could he claim a right that is not even recognized as such? It is not economically precarious, it is not culturally precarious, but how does one live in unrecognizable life? If what and how you love is already a kind of nothing or nonexistence, how can you possibly explain the loss of this non-thing, and how would it become publicly grievable? Subjugation to conformity could be an "exit", a "solution", but it would be another (tragic) dimension of precariousness.

5. FINAL CONSIDERATIONS

This article presents a study about the invisibility of female work in architecture from an analysis of the movie Flores Raras (Reaching for the moon). From the viewing of this film, it was concluded that Foucault's analyzes of power and resistance, of the production of subjectivities, of gender, in the case, in the context of micro-powers and also of disciplinary powers, appeared as the most susceptible to justify the invisibility of the work of Lota in History. This invisibility happens through complex modes of governmentality, through which subjects assume (govern) themselves and assume the roles that social contexts make available.

Like gender relations, the design of cities is far from neutral, reproducing dominant patterns and discourses. As Duncan (1996) explains, "As a normative ideal the public sphere is open to all; In practice, however, it is much more restricted" (p.130). Since what constitutes collective memory and historical accounts is organized around public events, those that escape normativity become invisible.

The discourses and roles attributed to the genre include, as Butler (2009) and Lorey (2006), in a foucaultian line emphasized, the performativity proper of acts of language. If the production of subjectivity (i.e., the configuration of a world in the process of education, socialization) is always achieved through a singular appropriation of the various modes of culture, a process in which language has a nuclear role, discourses, practices have a performative dimension in the whole of this process, making available the conditions of this production. In Lota's case this performativity also leads to a precariousness and a lack of recognition of her work.

It is not a formal, legal exclusion. Contemporary modes of governmentality go further by the ways in which subjects appropriate norms and all the normativity underlying language and practices, so that it is often the subjects themselves who monitor their behavior according to the expected standards. The subjects are urged to govern themselves, to put into practice the norms in their own interest. Even rebellion has this context (when one does the opposite of what is expected of us) of normativity, underlying performativity and precariousness.

In a review of the course of this article, with a note on the future of gender studies, we cannot address gender issues without taking into account these diffuse modes of power, which occur both at the micro level and at the macro level of social contexts and dominant discourses. Moreover, cannot address these problems without examining its own conditions of production, performativity, division, and even the definition of gender.

ABSTRACT

This report presents part of a research on public culture policies, more specifically, for libraries and movie theaters in the city of Belo Horizonte / Brazil. Following from the presupposition that, although culture is an attribute that belongs to the human being, the access to libraries and cinema, as cultural practices capable of contributing to the strengthening of citizenship, is still very restricted in Brazil. Thus, it was intended to know the access of pedagogy students to these cultural assets. It was based on an interdisciplinary theoretical reference, with a main focus on the discussion about the so-called art cinema in opposition to the commercial cinema, mainly the Hollywood ones, and a quantitative/qualitative methodology was used. It was sought to know the conceptions and cinematographic practices of Pedagogy students, whether attending movie theaters, by television, internet or other means. About a hundred public and private pedagogy students were asked, among other things, about the criteria for choosing the films they watch and about the importance of cinema in their lives and in the teacher training. It also questioned about what the objectives and criteria of selection and screening of films in college and elementary schools should be. The findings and analysis of the collected data aim to contribute to a reflection and possible expansion of the offer of this cultural practice, as a possibility of enhancing the skill and the formation of future pedagogues.

Keywords: Culture, Movie Theater, Teacher Training, Interdisciplinarity.

1. INTRODUCTION

Culture is a human being's inherent practice, and even if it is universal, produced even unconsciously, in contemporary society, it is also considered as a citizen's right. Therefore, it is necessary for the State and public policies to stimulate their production and to promote the access of the majority of the population to cultural goods and services such as libraries, museums, theater and cinema, among other services, activities, practices and cultural manifestations.

However, although the Federal Constitution contemplates this right, the public policies in this area are still very incipient. In this scenario, there are parallel initiatives of non-governmental institutions that seek to develop this cultural practice in an attempt to fill this gap of the public policies.

In the first stage of this research, among the different cultural practices, it was decided to investigate the offer of the art cinema, because it is a modality of culture capable of enabling the strengthening of citizenship, when considering quality cinema, opposing art cinema to the commercial cinema explored by the mass industry. It was assumed that access and familiarity with the language of art cinema contributed to citizenship and local development.

Continuing this investigation, this study was deepened, seeking to know the cinematographic cultural practice of students of pedagogy. Believing that access to art cinema makes it possible to improve a more critical view, it is important to know if future educators have access to the seventh art and in what way.

With an essentially sociological foundation focusing on culture, citizenship, local development and cinema as a world reading that contributes to an emancipatory practice, a quantitative-qualitative research was used. The scenario is the city of Belo Horizonte, where the access to cinema was analyzed by pedagogy students of public and private higher education institutions. Finally, the quality of this access was analyzed starting from the frequency and extending to the genre of films and their unfolding in the personal and professional formation of the researched students.

2. INTERDISCIPLINARITY IN THE TEACHING FORMATION: CULTURE AND CINEMA

Considering the importance of the educator as a mediator in the formation of children and adolescents, it becomes necessary to know their worldview and their cultural practices related to reading in the scope of the cinematographic

culture. It is considered important to explore this universe of the formation of future educators, in order to understand what possibilities they may or may not offer the students as future readers. Although the relation between an educator and an intense cultural practice and his or her work with the students, and the effect of the former on the latter, is not mechanical, the reading attitude and the posture of the educator specifically in relation to cinema should have influences on those students with whom he/she will work.

This concern with teacher formation is based on a perspective that teacher education should be interdisciplinary, as defended by Thiesen (2008: 545)

The need for interdisciplinarity in the production and socialization of knowledge in the educational field has been discussed by several authors, mainly by those who research the curricular theories and educational epistemologies. In general, the literature on this subject shows that there is at least a consensual position on the meaning and purpose of interdisciplinarity: it seeks to respond to the need to overcome the fragmented vision in the processes of production and socialization of knowledge.

It is also emphasized that interdisciplinarity should include the introduction of new areas of knowledge and also culture, as well as to make possible the dialogue and interaction between these different fields. Morin (2010:44) emphasizes the importance of culture related to the sciences in general and the humanities:

It is the novel and the film that show the relations of the human being with the other, with society, with the world. [...] And the miracle of a great novel, like a great film, is to reveal the universality of the human condition, by immersing itself in the singularity of individual destinies located in time and space.

This way, it is justified the importance of improving the teacher's perspective in reading the world from the cinematographic text because, as Lopes (2007: 37) clarifies, "To educate by the cinema or to use the cinema in the school process is to teach to see different. It is to educate the gaze, to decipher the puzzles of modernity in the frame of the imaginary space". Therefore it is necessary to know and to reflect on the quality of the cinematic readings practiced by the future educators, on this depends, to a large extent, the contribution of these to their future students.

Language and, therefore, cinematographic literacy is an additional instrument that the teacher can use for human and citizen education as far as cinema as art deals with social, cultural and political aspects. Besides this, cinema brings to reflection and discussion elements that are both universal and of diversity, which serve as criticism for an education that is intended to be integral. However, for this purpose, it is necessary, in the words of Lopes (2007), a cinematographic literacy, which enables the teacher and his students to master specific codes for reading in this sense. Hence the importance that justifies the effort to know a little more about the students' practices around this art still so little valued in the school environment and even in university.

In this context, analyzing the cultural practices of students of pedagogy related to cinema was also made pertinent by the fact of composing the reflection around the demands and interests of the population by the "seventh art" as a way to broaden their cultural repertoire and, consequently, to construct new perceptions and interpretations of reality. In addition, it is also important to investigate to what extent actions directed to the cinema have been contemplated in the curriculum and the practices of formation in pedagogy from an interdisciplinary perspective as well as if it has been the focus of the cultural policies and to what extent they can be propellers of actions that lead to local development.

3. CULTURE, CITIZENSHIP AND LOCAL DEVELOPMENT

Since the concept of culture is polysemic, the idea here is not to exhaust considerations about its meaning, but to emphasize how it is also relevant to elucidate questions regarding the actions developed by the public power or by other social actors related to the field of public policies. This is because culture, in addition to guiding and influencing the way individuals interpret the reality in which they are inserted, is also part of the field of conflicts and struggles for the conquest of social and political rights. This way, culture is defended in this study not only as something present in the daily actions of subjects delineating, in a way, their behaviors in the most diverse situations, but as an important and constitutive element of reflection in the field of public policies.

To briefly consider the concept of culture, it is worth mentioning Benedict's (1972) idea that culture can be thought of as a lens through which men see the world. The lenses are diverse and this leads to thinking about the cultural diversity that makes humanity up, that is, how different are the ways of seeing and interpreting the world, of living and experiencing daily life. Therefore, one of the ways to notice the presence of culture in the daily lives of individuals regardless of place and how they live is to dwell on the various ways of giving meanings to the events and material objects that each society processes over time.

These meanings are the result of conflicts and tensions between their various groups over what will be considered as valid and culturally constructed by them. In addition, it is important to emphasize that culture is always the result of a collective process, that is, it always refers to a collective production that expresses the world view(s) of the many groups of subjects of a society. Another important point to consider relates to the fact that culture is inserted in time, in history which has as consequence the change of aspects that compose it, changes that can be related to the forms of behavior, to the content of meanings that cover the events or objects of a given society (Laraia, 2003).

For DaMatta (1986), culture can be understood as a code through which people in a given group classify, think, and modify both the world and themselves. This way, culture is present in all social groups and allows them to express themselves

and present themselves socially in different ways because they share different codes and the changes that occur in the settings where they live are also reflections of the transformations that occur within these codes from the actions that the individuals of these groups perform.

Among the actions carried out by individuals who contribute, in a certain way, to the transformations of culture, the interest here is to highlight those that refer to the conquest of rights, corroborating the practice and political action of individuals in a society and, in turn, be related to the pressure that the citizens put in the public power for the implementation of public policies. This means that actions to exercise citizenship can also be thought of as reflections of transformations in the field of culture. In the Brazilian case, we can think how the process of re-democratization of the country, begun in the 1980s, contributed to this change in the culture and political practices of its citizens, since this process culminated not only in the change of the way of governing the country, but also in a new configuration in power relations (Jara, 1997). This new political culture, democratic and participatory, aimed at the departure of the military regime and, moreover, pointed to the institutional legitimation of the new social actors.

The change observed was the transformation from a centralized way of addressing public issues to a decentralized way of managing, making decisions that came to rely on a greater or lesser degree of social participation. The 1988 Constitution, through the federative pact, expanded municipal responsibilities as well as their collection capacity, since one of the objectives was the decentralization of the treatment of public issues. It was in this scenario that the popular participation had an institutional recognition being understood as a new form of practicing citizenship. This practice contained the idea that popular groups demanded a new way of expressing interests and demands, as well as a way of demonstrating their ability to participate in the public management. This was a demonstration that communities were aware of the need to make decisions about a way of life. According to Jara (1997: 213), decisions always reveal the values from which men organize and reorganize their social relations. Almost every social decision of collective change compromises the fate of society as a whole and therefore has a historical impact.

The new Brazilian context that now counts on decentralized actions when regarding the public management of resources also began to count on the participation of the citizens, not only in the exercise of collective actions that meant pressure to the public power for the fulfillment of the rights guaranteed to all Brazilians by the 1988 Constitution, as well as to exercise control over public expenditures. Citizens call for their role in deciding the development model to be implemented not only in the country but also in the localities where they live their daily lives. In this sense, it is clear that the perception of the citizens involved in the struggles for their rights in relation to the management of public resources does not consider that this action is exclusive to the State and the economic elites, since civil society plays an important role in this process. This way, since the enactment of the 1988 Constitution, municipalities have been enlarged with administrations that count on the effective participation of the population through committees, councils and other deliberative bodies (Martins, Caldas, 2009). In this way, when they actively participate in the administrative process, they move towards the construction of citizenship (Tenório, 2004).

In the 21st century, this scenario of citizen participation in decisions and directions to adopt in their local spaces of daily experiences has undergone changes, but the idea of collectively building development processes has not cooled down, only gained new “nuances.” In these new “nuances”, we highlight the actions related to local development that, according to Ávila (2000), make it possible for the subjects of a given territorial space to recognize their capacities, skills and competences to increase the culture of solidarity and, this way, be able to manage and use the resources of their locality with a view to finding solutions to issues of all order and nature present in their daily lives.

According to Tenório (2004), thinking about local development implies taking into account the economic, social, cultural, physical-territorial, environmental and scientific-technological dimensions, as well as analyzing the different interrelated patterns of the various social actors. According to the author, local development processes involve the efforts of both state actors, civil society and capital to construct projects from the negotiation of interests that may be divergent and conflicting. But for this to happen, it is necessary that the actors involved in the process gain visibility, be strengthened and develop socio-economic proposals that boost local potential in order to achieve the improvement of the quality of life of the population.

And an interdisciplinary education that includes and promotes actions geared to culture can contribute to local development, through teacher formation, which will then be deployed in the education of a new generation when these students of pedagogy become teachers and educators.

4. CINEMA AS CULTURAL AND CITIZEN PRACTICE

In this study, cinema is considered a practice capable of contributing to criticality through art. It is assumed that non-commercial, quality art cinema makes it possible to read the world and the criticality that builds the citizen. But for this, a literacy of the cinematographic language is necessary, which will happen from the familiarity of the subjects with this modality of the culture, as Martin (2003: 28) emphasizes: “It is necessary to learn to read a film, to decipher the sense of images as one deciphers that of words and concepts, to understand the subtleties of cinematographic language. [...] there are as many interpretations of each film as there are spectators”.

Access to cinema becomes, therefore, a condition for this reading to take place:

According to the French sociologist Pierre Bourdieu (1979), the experience of people with cinema contributes to developing what can be called “competence to see”, that is, a certain socially valued disposition to analyze, understand and appreciate any story told in cinematographic language. However, the author points out that this “competence” is not only acquired by watching films; the cultural atmosphere in which people are immersed -

which includes, in addition to school experience, the degree of affinity they hold with the arts and the media - is what allows them to develop certain ways of dealing with cultural products, including cinema (Duarte, 2002: 13).

This author warns that “going to the movies” is a “social practice” that will allow certain taste and a qualification for the choice and appreciation of the different genres of films. Also according to her:

In audiovisual societies such as ours, the mastery of this language is a fundamental requisite for transitioning well through the most different social fields.... It is undeniable that the relations between spectators, between them and the movies, between film-makers and cinema and so on are deeply educational. The world of cinema is a privileged space for the production of relations of “sociability”, in the sense that Simmel gives the term, that is, an autonomous or playful form of “socialization”, a possibility of full interaction among unequals, as a function of values, in function of common values, interests and goals. “(Duarte, 2002: 14-17)

For Lopes (2007: 37), the film brings us a new look, broadening our knowledge and bringing us questions and criticism about issues that were common to us and which we named easily with the way it was culturally passed to us. “[...] but educates in the sense that it broadens and questions our knowledge of familiar and easily-named appearance contexts”

It is also important to discuss the place occupied by cinema and to emphasize its colonizing and acculturation role, especially in the Hollywood film industry as opposed to the art cinema that allows reflection (Lopes, 2007) and focuses on alterity and cultural diversity (Bergala, 2006).

According to Lopes (2007), it is also necessary to consider that the industrialization of culture, such as the American monopoly, not only can standardize the means of expression of cinema, but also impose the consumption of this culture early on to children and young people who are not taught reflection and criticism.

Lopes and Teixeira (2003: 10) show that cinema is an artistic creation that implies a “way of looking” that presupposes an idea about the world, “a historical-social, philosophical, aesthetic, ethical, poetic, existential idea “. Hence the importance of allowing access to art cinema that in form and content can enable a more critical world view in the sense of not only showing the world how it is but how it could be and still give clues on why it is not different than what it is.

Bergala (2006: 46-47) warns of the real danger in relation to cinema that “can, however, cause deeper and more lasting damages: that of mediocrity or artistic nullity. Worse than bad movies are mediocre movies.” And, to avoid this danger, he defends the permanent contact with the art film that stimulates emotion and thought for the “formation of this taste that allows him to take some distance away from the bad films”, which he calls “popcorn film”. Hence the importance of students of Pedagogy, future educators, to have access and a greater familiarity with cinema, but cinema as art.

In opposition to cinema as art is the hegemony of commercial cinema, like the Hollywood films that occupy most cinemas. On this “Hollywood strand,” Lopes (2007: 70-84) uncovers its numerous traps that are not always perceived by the spectator. He explains that Hollywood films use sophisticated and advanced technological resources, creating an imaginary and unreal universe that subtly contributes to alienation, creating a “dream world [...] of the American dream, according to which all men would have the same assets to succeed in life”.

This author shows that it is a type of cinema that does not portray the world as it is, bringing unreal, extraordinary, almost immortal characters, or shows the world as it is, but without possibilities for change, without questioning social inequality, exploitation, encouraging acceptance and compliance.

In general, Hollywood films show the western white man as superior and “ridicules” other peoples such as Indians, blacks and Latin Americans. Reinforcing manichaeism between good and evil, all those who escape the standard of the American man are seen as subversive, perverse, “psychopathic” or “amoral”. In relation to the woman, she has a secondary role in relation to the man or it is someone who causes his “perdition”. In addition, it is a kind of film that manipulates sentimentality, stimulates individualism, consumerism, sex and violence, intensely exploiting action and catastrophes, or what the author calls “instant culture.” In short, all these are formulas that do not make possible or allow to think or to reflect (Lopes, 2007, p. 70-84).

In the face of a controversy about the exhibition of films in this hollywoodian perspective versus the art films, Lopes (2007, p. 94) states: “We defend a cinema of reflection of thought and resistance to banal forms. A cinema that has difficult access to the distributor market, restricted to the rooms of a circuit that survives only in the great capitals of the first world”. But as this author points out, the art film, the one that stimulates feeling and thinking, that is, besides the time that the spectator stays in a movie theater, that touches the feeling, that leads to the reflection, that allows intertextualities with other cinematographic or written texts or with his own life and that contributes with the criticality of the subjects, this one is of difficult access to the majority of the population.

And thinking about the role of cinema in school, it is important to think that the school needs to work so that both the student and the teacher stop being just a passive viewer and also begin to criticize, to understand the political interference, the intentions behind the scenes, that are able to critically read the images and understand the codes behind them. As put explicitly by Lopes (2007: 87): “It is important that the school subject goes from a passive agent to an active, free, responsible and critical subject of the media, through different forms of creative expression. - Through images, codes, symbols, relationships, emotions and sensations”. Lopes (2007) also highlights the interlocution between school and cinema as something that produces relationships, creates senses and meanings for school subjects and promotes learning from the everyday life.

In spite of the great inequality in the production, distribution and access to the art cinema, there are some initiatives in the sense of socializing this type of cinema. With the law of cinema in the school, these questions raised here become even more pertinent. The law that adds to articles 8 to 26 of the No. 9,394 Law of December 20, 1996, which establishes the guidelines

and bases of national education, to compel the exhibition of films of the national production in primary schools and was signed by President Dilma Rousseff in Brasília, June 26, 2014; according to the website of the Federal District, the law adds article 8, which reads: “Paragraph 8: The exhibition of films of national production shall constitute a complementary curricular component integrated with the pedagogical proposal of the school, and its exhibition shall be mandatory for at least 2 (two) hours per month”. (Brasil, 2014)

Around the enacted law, many discussions arise, as for example how these films would enter the classroom, how they would be chosen, what criteria would be used in that choice and of course one can not help but wonder if teachers are prepared to use this resource, if they have access to cinema and if there is in their formation a preparation to use cinema as a source of knowledge.

Increasingly, the responsibility of teachers is getting bigger in society, a responsibility to form a citizen capable of not only knowing how to do, but also having a critical thinking and a political and social conscience. Cinema can be an ally, when used as a didactic resource, but will the teacher be prepared to use this resource?

For Duarte (2002), when it comes to cinema, it is necessary to develop a “competence to see”, disposition to analyze and to understand any story told in cinematographic language. According to this author, this competence is not only acquired by watching films, but it is necessary to know the directors, the ideologies behind the films and to understand even the ways a light is placed, the soundtrack, the place where the plot happens, therefore the language of cinema needs to be understood so they can use a film as a didactic resource, so that it is not only there in the classroom as entertainment or as a way to cover up a hole in the absence of a teacher or an unforeseen event.

The teacher should *get all* the information about the film to make it available to the students, before showing it in the classroom. Having all this information, the teacher will help the student to watch the film with a more critical look, as Lopes (2007) says.

This research therefore is proposed to know, firstly, if the pedagogy students have had access to cinema and, if so, what is the quality of this cinema. It is interesting to know, besides their frequency, whether it is an art cinema or the so-called Hollywood popcorn cinema. It also sought to know what unfolding this cinema has in the lives of students, whether the cinema is just entertainment or if it touches the feeling and provokes reflection and the formation of citizens.

Although broad and interdisciplinary teacher formation is advocated, including aspects of knowing different disciplines and citizen and cultural formation, these latter aspects are generally relegated and left to the responsibility of each student. Especially cinema, although it is a fundamental component for the strengthening of citizenship, is a cultural asset that has not yet been explored, is not well offered, is not valued enough. In this context, cinema seems to occupy a place of non-priority cultural practice, which demands a greater knowledge and questions about its access, with the aim of enabling and stimulating a greater familiarity with this cultural expression in order to strengthen citizenship through art, creativity and criticality.

5. THE PLACE OF CINEMA IN THE STUDENTS' LIVES

It was sought to carry out an investigation in the form of an essentially quantitative research, considering that a survey was carried out to identify the cinematic practice of students, although at the same time it has been sought to apprehend their conceptions in relation to cinema and the contributions that the seventh art brings to the teacher, human and citizen formation.

The sample included a group of 105 students from two pedagogy courses and a questionnaire was applied to 52 students from a private college and 53 from a state public university. The sample consisted of 93% of female respondents distributed from the 1st to the 8th period of the pedagogy course with the highest concentration in the first 3 semesters of the course. There will be no distinction here between the respondents of the two colleges, private and public, for there were no striking differences between the responses of one group and another.

Two thirds of the students are single and very young, half of them are in the age group of up to 25 years old. Only a fifth of them is over 30 years old.

Most of them live in their own homes with not very high schooled parents. About 40% have parents with incomplete primary education. Only about 10% of the parents of these students have a college degree.

Internet access takes place at home, college and on the cell phone, by 98% of the students in this sample and this is the support used by half the respondents to access movies. Television was the next indicated and only 6% pointed at the movie theaters.

About half of these students watch movies weekly and only 11% daily. Regarding the purpose or the unfolding of this cultural practice, almost half (40%) believes that cinema serves at the same time to excite, amuse and reflect. When isolated, the fun was the most pointed purpose (25%), followed by emotion (10%) and lastly reflection (3%).

A huge number of students (70%) do not have a cinema near their homes, and 92% of them attend rooms located inside shopping malls. Only the remaining 8% attend movie club rooms and art cinemas. The attendance at movie theaters is not very intense, being monthly for practically half the students of the research, followed by 18% attending every 2 months and 9% fortnightly. The rest goes even more rarely. And when they go to the movie theaters for the most part, these students are accompanied by friends, family members. Only 6% have the habit of going alone. However, when watching movies at home, 47% have a habit of watching it without any company.

Asked about how they make their choices, initially regarding the nationality of the films they watch, most, 28% pointed to those of North American origin, while 33% prefer these alongside the French. Only 6% pointed to films of Brazilian

origin as their favorite. It is still quoted Indian and Chinese in small percentages and *yet al.* ways accompanied by the North American cinema, which was pointed, if counted with the ones of other nationalities, by 94% of the respondents.

Other aspects related to the criteria of choice concern the theme, the synopsis, the advertising and the indication of friends. A total of 66% of the respondents pointed out these 4 aspects being that the advertising surpasses the indication of friends. But it is noteworthy that only 4% cited the director of the film as a criterion and *yet al.* alongside the theme and actors.

In another block of questions, students were asked what keeps them from attending movie theaters, and free time (54%) was the most chosen factor, followed by the entrance fee (41%). The location was pointed out by only 5%.

6. THE IMPORTANCE OF CINEMA IN EDUCATION

The last block of questions was mainly about the importance of cinema in college and elementary school. The students of this sample are unanimous about the importance of cinema in the school and university space, and about 74% said that teachers exhibit films in their classes with predominance of documentaries (67%) on art films (23%). But most of them (81%) do not have any information about the law that intends to oblige the monthly exhibition of Brazilian films in elementary school.

It is interesting to note in the answers of these Pedagogy students that when asked about the importance of cinema in their formation, objectives such as “possibility of acquiring a view of a different and expanded reality, of leaving the common place of showing the culture of society and reality, of reflecting in a critical way” surpasses preferably didactic/academic objectives such as “to understand the subject, to emphasize what the teacher presents in the class, to improve the understanding of the content of the subjects, to help with learning”.

However, in pointing out the criteria that the elementary school teacher should adopt to show films for the students, these students reversed their previous opinion and emphasized aspects of schooling such as: “to help the content of the subjects, to facilitate the learning of the worked content, to help the content of the subject and the topics dealt in the classroom”. They also revealed a concern about the “adequacy to the age group of the students according to the indicative classification of the film” and, finally, with the “education in general, with the pedagogical contribution aiming to add something to the development of the student”. In a much smaller number, some respondents pointed out the importance of criteria in choosing films that would allow students access to the cultural context, reality, reflection on prejudice, diversity, art and aesthetics. Only 3 students mentioned entertainment and pleasure and 2 mentioned the students’ taste and interest.

7. FINAL CONSIDERATIONS

These findings reveal that pedagogy students do not escape the prevailing conception in school practices and apply them even in practices that are preferentially social and cultural. Just as the school institution “literacy” literary reading practices (Soares, 2007), the principles governing times and school spaces also seem to regulate the seventh art as alerts Bergala (2006) about the risk of the school making it compulsory the exhibition of movies.

The results of this brief survey, although they can not be generalized, serve to provoke a reflection on the risks of an excessive schooling of the culture in the teacher formation and of the need to rethink the possibilities of the inclusion of cinema in the practices of the pedagogy students as well as in those of fundamental education so that this art is an enrichment of the human citizen and aesthetic formation of educators, of children and the adolescents.

In order to do so, different strategies may be thought of to broaden the offer and discussion of films, mainly the art ones, in the school and university space, with a view mainly to inclusion and respect for culture, not allowing cinema to be adopted simply as another instrument of school work. One of these possibilities is indicated by Morin (2010: 84-85), proposing a reform of thought that could for example “institute, in all universities and colleges, an epistemological or transdisciplinary tithe, which would withdraw 10% of the duration of the courses for a common teaching, oriented to the presuppositions of the different knowledges [...]”. Thus, cinema could perhaps be included in teacher formation and have the space and importance that are due without being adulterated in its essence, in order to fulfill its role in education with care not to de-characterize it as art.

ABSTRACT

In the service sector mainly in the traditional retailing, customers and the employees are key actors in service interplay. The quality and performance of any service are dependent on customer expectations and the efficiency the company is able to serve its customers. The crucial point of customer satisfaction is to identify the important attributes, considered by customers as their needs and expectations. The purpose of this study is to suggest the adaptation of SERVQUAL in evaluating the perceived quality of service offered by traditional retailing, namely in traditional retail stores in the North Region of Portugal. The proposed conceptual model aims to analyse if: (1) perceived service quality (five dimensions of SERVQUAL) directly contribute to customer satisfaction, customer-perceived value and brand image; (2) brand image and customer-perceived value directly contribute to customer satisfaction; (3) brand image directly contribute to customer-perceived value; (4) customer satisfaction directly influences the intention to return and WOM recommendation (Word-of-Mouth communication intention); and (5) the intention to return has a direct impact on WOM recommendation. This research is of particular interest to the literature on the retailing and to the practitioners, since there are few studies in this field which apply to the Portuguese traditional retailing.

Keywords: Customer Satisfaction, Traditional Retailing, North of Portugal, Service Quality.

JEL Classification: M10, M31

1. INTRODUCTION

The term quality is very present in the business segment, where all organizations aim to provide quality to their customers, suppliers, partners and others. But it is not as simple as it sounds, because to benefit from quality, organizations must be ready to meet the expectations of their customers. With this, we can define that, in order to stay in the market more and more competitive, companies from all sectors have already adhered to quality, and be it consumer goods or services. Presently, providing quality of service is seen as the way to remain competitive in markets where global competition and technology have turned products and services into commodities (Nadiri and Gunay, 2013). Globalisation, strong competition, instable consumer demands and changes both in economic, technological and political systems force enterprises to learn faster and to adopt themselves to environmental changes (Ginevičius and Gudačiauskas, 2004). Some of the fastest growing sectors of the global economy are related to the focus on customer satisfaction. In a period of economic recession, remarkable performance will depend on those retailers who are able to create customer loyalty by answering to consumer demand (Ghosh, Tripathi and Kumar, 2010). Furthermore, customer needs and buying patterns have altered enormously. To meet several needs, enterprises to adopt customer-oriented marketing strategies and differentiated to rise a competitive advantage in the market, which allows them to stand out in the competition (Ko, Kim, Kim and Woo, 2007). Additionally, Ko *et al.* (2007) advocate that improved relationships with consumers can main to better customer loyalty, retention, effectiveness and profitability. Consequently, it is central to make a durable, strong and consistent relationship with customers in today's competitive society.

The replacement of small family owned, traditional stores with modern retailing is a universal phenomenon. However, traditional retail systems exist as well in less developed countries as in developed economies where traditional retail formats often operate alongside modern retailing. In recent years, the retail industry has drastically changed, with consumers increasingly informed and varying their route to purchase between in- traditional store, online and modern retailing. Therefore it is crucial for traditional retailers to offer an experience to someone going into their store that they could not receive via another

channel or in modern retailing. Some of the fastest growing sectors of global economy are related to the consumption of experiences (Pine and Gilmore, 2008). Despite the increasing variety of ways in which we can purchase merchandises, the in-store experience is still the first thing that springs to mind for the majority of people when thinking about a retailer; so whether it be through great customer service, a nice shopping atmosphere, cutting advantage in-store technology or an pleasant checkout experience, retailers are looking to create an in-store environment which will offer something different to their customers. During this evolution, quality has acquired a very important weight in all industries of the economy and has become a key factor of business survival. Undoubtedly, the term quality is very present in the retailing industry, where all organizations aim to provide quality to their customers. But it's not as simple as it sounds, because to benefit from quality, organizations must be ready to meet the expectations of their customers. With this, we can define that, in order to remain in the market increasingly competitive, companies from traditional retailing have already adhered to quality.

The traditional retail industry is not indifferent to customer loyalty and satisfaction with the service. Although most customers do not immediately associate a commercial surface with a service, the service is one of the main tools in obtaining consumer satisfaction and loyalty (Yuen and Chan, 2010). Continued aggressive promotion based in price, such as the creation of coupons, temporary discounts, and others, while widely used, often have a minimalist effect on company results, as they tend to attract the wrong customers, and this does not always mean profit (Sirohi, McLaughlin and Wittink, 1998). Somewhat, the retail store must find a way to differentiate itself so it can stand apart from other retailers and drive more consumers to its store. Service quality is one way to accomplish this. Retailers need an efficient way to assess the service quality of their store (Simmers and Keith, 2015). However, the focus on customer retention in this area of business is one of the right strategies to generate profits (Sirohi *et al.*, 1998). Loyalty is an important step in ensuring that consumers perform something that is beneficial to the firm, whether through purchase or simple word of mouth (WOM). It is believed that satisfaction is a consequence of the quality of the service, and guaranteeing it, increases the likelihood of involving the customer and loyalty. Several studies have shown that there is a positive relationship between quality of service and consumer loyalty (Yuen and Chan, 2010).

In a highly competitive industry, as is the retailing sector, it is critical that organizations have a good knowledge of the business aspects that are important to their customers (Yuen and Chan, 2010). Only with a deep understanding, is it possible to respond positively to the expectations of customers regarding the services offered. To this extent, the strategy for creating competitive advantage resides in providing a high quality of service which results in satisfied customers (Shemwell, Yavas and Bilgin, 1998) and customer retention (Callan and Kyndt, 2001), dimensions which are essential for the survival of the retail industry.

From the review of literature on quality, it has been found that research efforts are concentrated on defining and measuring quality in the manufacturing sector. Since service quality is an elusive concept, there is considerable debate in relevant literature concerning which is the best way to conceptualize this phenomenon. Although an all embracing definition of service quality is not yet possible, definitions of service quality proposed by researchers revolve around the idea that it is the result of the comparison customers make between their expectations about service and their perceptions of the way the service has been performed (Grönroos, 1984; Parasuraman, Zeithaml and Berry, 1985, 1988). If service quality is to be improved, it must be reliably assessed and measured. According to the SERVQUAL model (Parasuraman, Zeithaml and Berry, 1988), service quality can be measured by identifying the gaps between customers' expectations of the service to be rendered and their perceptions of the actual performance of the service.

Numerous authors have studied the relationship between perceived service quality and customer satisfaction in the services industry (Al Khattab and Aldehayyat, 2012; Chiou, Droge and Hanvanich, 2002; Cronin and Taylor, 1992; Ekinci, Dawes and Massey, 2006; Jamal and Naser, 2002; Mohsin & Locker, 2009; Monteiro & Veloso, 2013; Zaibaf, Taherikia and Fakharian, 2013; Zhang and Prybutok, 2005), confirming that service quality is an important antecedent of satisfaction. In this regard, Dabholkar, Thorpe and Shepherd (2000) argue that traditionally, most researchers conclude that customer satisfaction resulting from a particular experience of consumption, leads to an evaluation / attitude about the quality of service over a period of time. However, the reverse situation has stood out as the most relevant. The services sector is one of the most important sectors of the Portuguese economy. About 68.4% of the employed population work in this area of activity in 2016, with 21.2% of the Portuguese active population working in the trade, hospitality and catering sector (INE, 2017). Only in 2016 did the services sector actively contribute 76.9% to the national gross value added, with trade, accommodation and catering contributing 21.6% to the national wealth (INE, 2017).

While the quality of service in the retail industry has been extensively researched internationally (Dabholkar *et al.*, 2001; Das *et al.*, 2010; Durvasula and Lysonski, 2010; Khare *et al.*, 2010; Martinelli and Balboni, 2012; Mahfooz, 2014; Minh and Huu, 2016; Nadiri and Gunay, 2013; Simmers and Keith, 2015; Tang *et al.*, 2015; Yuen and Chan, 2010; Yu and Ramanathan, 2012), there has been little research done in Portugal to examine service quality as an antecedent of satisfaction and behavioural intention of customers in the Portuguese retail industry. The choice of this topic is due to the need for retailers to properly understand whether the service meets customer perceptions in the different dimensions of SERVQUAL, contribute to their satisfaction and behavioural intention (intention to return and recommend services), since they are determinant variables in maximizing profit, market share, and return on investment (Hackl and Westlund, 2000).

In the Portuguese retail industry, few research has been undertaken to directly evaluate the relationship between service quality, customer satisfaction and behavioural intentions. In this context, the main objective of this paper is to propose a methodology that allows for the examination of the antecedents and consequences of customer satisfaction, in traditional retailing sector in North of Portugal. We specifically intend to present a conceptual model is used as a framework to identify the dimensions of service quality and examining the interrelationships among customer satisfaction, perceived value, brand image and behavioral intentions and service quality in the traditional retail industry.

In this paper, after this present introduction, a review of the main literature on customer satisfaction, service quality, brand image, perceived value and their behavioural intention is made, then we propose the conceptual model and research hypotheses, ending with the presentation of the findings and the contribution of the research. This research is mainly important for retail managers (survival and growth of retail companies), politicians (wealth creation, economic growth, etc.) and for the development of the literature in the Portuguese traditional retail industry.

2. THEORETICAL BACKGROUND

2.1 Service Quality, Perceived Value, Brand Image, Consumer Satisfaction and Behavioural Intentions

2.2.1 Service Quality

In these last decades there has been several research in the area of service quality (e. g. Amin *et al.*, 2013; Ladhari, 2009) and it is discussed lots for the aim that no consensus has been reached thus far on its definition and measurement. Early studies on service quality defined it as a measure to which a service provides customer needs, and implicates a comparison of customer expectations with their perceptions of actual service performance (Parasuraman *et al.*, 1985; Parasuraman *et al.*, 1988). Service quality has assumed a major role both in public and private institutions, as an indispensable requirement to the costumers' satisfaction. There are two basic ways to define quality: one from the viewpoint of the service provider and the other from the costumer's perspective. Firstly, it should be noted that the measurement of service quality is an important area of academic and scientific interest, which has assumed special prominence after the contribution of various authors (Parasuraman *et al.*, 1985). These authors, who represent the American school, have designed an instrument for measuring quality of service, called SERVQUAL. Initially, the proposed model incorporated 10 dimensions of quality (tangibility, reliability, responsiveness, professionalism, courtesy, credibility, security, access, communication and customer understanding). However, these dimensions were revised and subsequently reduced to five (Parasuraman *et al.*, 1988). The dimensions of courtesy, credibility, security, competence and communication have led to a new dimension: assurance, while the dimensions of understanding/knowing customers generated the dimension of empathy. A Parasuraman *et al.* (1988) suggested the following definitions for the five dimensions:

- Tangibles: Physical facilities, equipment and appearance of personnel;
- Reliability: Ability to perform the promised service dependably and accurately;
- Responsiveness: Willingness to help customers and provide prompt service;
- Assurance: Knowledge and courtesy of employers and their ability to inspire trust and confidence;
- Empathy: Caring, individualized attention the firm provides its customers.

SERVQUAL measures service quality from the customer's perspective of customer perceptions, through the amplitude of the discrepancy that exists between the expectations and perceptions of customers. Cronin and Taylor (1992) view that the validity of the use of expectations in the SERVQUAL model was called into question when consumers had no well-formed expectations and developed the SERVPERF scale which consists of the same 22 "items" of SERVQUAL, although centered only in measuring consumer perceptions regarding the quality of service. Despite the criticisms of SERVQUAL (Buttle, 1996; Cronin and Taylor, 1992), it remains the most widely used theoretical framework for measuring the quality of services so that, in the literature there are numerous studies that apply the SERVQUAL scale to assess quality of services across physical (Donnelly, Hull and Will, 2000; Mukherjee and Nath, 2005) and in digital environments (Wang and Tang, 2003; Kuo, 2003). Despite the diversity of studies in many fields, in this study, SERVPERF will be applied to the traditional trade in the North of Portugal in a similar manner as that of other studies realized at an international level, in the area of the trade industry (Abd-El-Salam *et al.*, 2013; Durvasula and Lysonski, 2010; Khare *et al.*, 2010; Martinelli and Balboni, 2012; Tang *et al.*, 2015; Yu and Ramanathan, 2012; Yuen and Chan, 2010). According to Nadiri and Hussain (2005) service quality increases customer satisfaction, stimulates intention to return, and inspires recommendations.

2.2.2 Customer satisfaction

Customer satisfaction is the outcome of the customer's perception of the value received in a transaction or relationships, where value equals perceived service quality, compared to the value expected from transactions or relationships with competing vendors (Zeithaml, Parasuraman and Berry, 1990). Customer satisfaction is a mighty immaterial asset like to service quality and can be attained through the compliance of customer expectations (Jayasankaraprasad and Kumar, 2012; Oliver, 1980). Also, customer satisfaction is a function of the disagreement between a customer's expectations previous to buying and their perception of the same service subsequently Anderson and Sullivan (1993) and Oliver (1980) will be significant if the perception is placed at a higher level than the expectation. More value for customer incomes great satisfaction, which can benefit the retail enterprise in the long term (Cronin, Brady and Hult, 2000) and generate higher profits. Customer satisfaction is found to be dependent on the quality of service presented to the customer and is one of the instruments to enhanced value for customers. The major challenges for service industry are service quality and customer satisfaction. According to Gundersen *et al.* (1996) the central point of customer satisfaction is to identify the crucial attributes, considered by customers as their needs and expectations. As Valdani (2009) points out, enterprises exist because they have a customer to serve. The key to customer satisfaction lies in identifying and anticipating customer needs and especially in being able to satisfy them. Enterprises which are able to rapidly understand and to satisfy customers' needs, make greater profits than those which fail to understand and satisfy them (Dominici and Guzzo, 2010).

In order to be successful, especially in the service industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing (Dominici and Guzzo, 2010). On the other hand Bennett and Rundle-Thiele (2002), argued that for customers to escalate their loyalty, their perceived value of the good or service presented need be at par with reality, forming an integral part of the corporate aims of the organization.

Additionally, Sirdeshmukh *et al.* (2002), reported that customers' satisfaction has close relationship to brand loyalty as well as service quality. Analogous claim is presented by Hoq and Amin (2010), who postulated that customer satisfaction is the emotional tendency of a customer towards repurchase of products and services offered by a retail store. In order to be successful, especially in the retail industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing ones (Yuen and Chan, 2010).

2.2.3 Brand Image

The concept of brand image has been widely studied by researchers in the area of marketing (Abd-El-Salam *et al.*, 2013; Kim and Kim, 2005; Kim and Lee, 2010; Sahin and Baloglu, 2011; Yu and Ramanathan, 2012). For Kim and Kim (2005) a "brand symbolizes the essence of the customers' perceptions of the organizations". Also, Keller (1993) defined corporate image as perceptions of an organization reflected in the associations held in consumers' memory. Corporate image is defined as the "general impression" left in the customers' mind as a result of accumulative impressions or feelings, attitudes, ideas and experiences with the firm, saved in memory, transformed into a positive/negative sense, retrieved to rebuilding image and recalled when the name of the firm is heard or brought to ones' mind (Bravo, Montaner, & Pina, 2009). According to Sahin and Baloglu (2011) brand image is defined as the perception of customers about a brand or a product labelled with that brand. Different authors consider brand image as an important component of strong brands and a determinant in the obtainment of competitive advantages (Lim and O'Cass, 2001).

An overall assumption is that a promising corporate image will have a positive impact on consumers' behaviour towards the brand, such as the opportunity to command premium prices, buyers who are more loyal, and more positive word-of-mouth reputation (Martenson, 2007). Some researchers developed in last years, have tested the effect of corporate image on customer satisfaction and loyalty (Kim and Lee, 2010; Yu and Ramanathan, 2012). Their empirical findings showed that corporate image plays the important role in founding and retaining customer loyalty in the markets. Additionally, these authors found that customer satisfaction and corporate image perceptions positively influence service loyalty, with satisfaction having a greater influence on loyalty than image.

Thus, corporate image is believed to create a positive effect on customers' satisfaction. When customers are satisfied with the service provided of company, their attitude toward the company is enhanced (Srivastava & Sharma, 2013).

2.2.4 Perceived Value

Nowadays the retailers are more worried with the pricing strategy attached the effectiveness and the competitiveness of the market. A broad pricing model is largely a crucial requirement for achieving a unique corporate success, this argument has been supported by many researchers as Ailawadi and Keller (2004). These authors proved that the application of a pricing strategy improves the volume of sales and profit margin. Also, the study developed by Hinz *et al.* (2011) showed up to 20% rise in revenue due to the execution of a price setting, thus strengthening customers' satisfaction and loyalty. According to Matzler *et al.* (2006) the pricing strategy is a main determinant to strengthen and improve the customers' satisfaction and loyalty, indeed in the retail industry, the pricing strategy and the value perceived is as much or even more important than the perceived service quality in the corporate strategy. Therefore, it can be contended that a suitable pricing model and a favourable perceived value positively strengthen the business's global success in the retail industry (Nikhashemi, Paim, Sidin and Khatibi, 2014). Some research have also related that perceived value variation has beyond the close relationship with quality service adopts a significant relationship with product delivery and customers' expectations and loyalty (Hellstrand, 2010). Several authors have also found numerous perceived value influences on quality service. This does not mean that the perceived value will have be low to exist satisfaction, but that the value perceived by the customer will take into account the received and its relationship with the price paid. Previous studies on goods have showed that the perceived value relationship was considered enough important for customer satisfaction (Qin and Prybutok, 2008).

2.2.5 Behavioural intentions

The literature suggests behavioural intentions as a construct which permits the evaluation of customer loyalty (Yang and Peterson, 2004). These are behaviours related to the intention to repurchase and even to the intention of recommending the product/service (Clemes *et al.*, 2008; Lai and Chen, 2011; Sumaedi *et al.*, 2012; Yuen and Chan, 2010; Zeithaml *et al.*, 1990). Some studies developed in service industry have found the positive relationship between perceived service quality and loyalty (De Ruyter and Van Birgelen, 1998; Wong *et al.*, 1999). Customers frequently develop an attitude toward purchasing based on a prior service experience or, still, this attitude can also be influenced by previous information, based on the image of the retail in the market and even by word of mouth (WOM recommendation). With reference to the previous conception, customer loyalty has been usually defined as occurring when customers repetitively buying goods or services over time and retain positive attitudes towards the enterprise delivering the goods or services (Yuen and Chan, 2010). Service providers are increasingly developing loyalty, as they consider that it helps to rise income, and leads to largest market share, effectiveness and profitability (Al-Wugayan, Pleshko, and Baqer, 2008). In this sense, behavioural intentions can be define as the customer's judgment about the likeliness to repurchase in this firm or the willingness to recommend the firm

to others. We conceptualize behavioural intentions as a higher-order construct consisting of (1) positive word of mouth (Boulding, Kalra, Staelin and Zaithaml, 1993), (2) willingness to recommend (Parasuraman, Zeithaml and Berry, 1991), and (3) intentions to continue buying from a particular service provider (Bowen and Shoemaker, 1998). Based on previous definition, behavioural intention in this study may be described as a stated likelihood to repurchase in the hypermarkets in the North of Portugal and to recommend the hypermarkets to family, friends and others in the future. Research has established the many benefits of behavioural intention, such as making it a tendency for retailers to follow, as well as developing and maintaining a loyal customer base (Yuen and Chan, 2010). There is also ample evidence of the influence of service quality on behavioural intentions, a huge body of research has demonstrated the significant relationship between service quality and customers' behavioural intentions (Parasuraman *et al.*, 2005; Sousa and Voss, 2010). According to Chaudhuri and Holbrook (2001), behavioural intentions, and not attitudinal intentions, can be related to increased market share. Zeithaml *et al.* (1996), compiled a list of specific positive behavioural intentions, included loyalty, switching intentions, willingness to pay more, external response, and internal response. In a multi-industry study, the authors later provided evidence of the significant effect of perceived service quality on customers' favourable behavioural intentions, such as repurchase, tendency to say positive things and recommend the company (Zeithaml, Berry and Parasurama, 1996). In addition Cronin and Taylor (1992), find a favourable association between service quality and repurchase intentions. Also, Zeithaml *et al.* (1996) and Fullerton (2005), find a positive relationship between service quality and behavioural intentions. Moreover, preceding research has demonstrated associations between service quality and particular dimensions of behavioural intentions, like as Parasuraman *et al.* (1988), find a favourable relationship between service quality and willingness to recommend the firm, and Boulding *et al.* (1993), find a positive correlation between service quality and repurchase intentions, saying positive things, and willingness to recommend. Several authors point out that customers may not necessarily buy the greater quality service and that there may be other factors that define consumer choice, such as satisfaction (Ryu and Han, 2010; Wang *et al.*, 2004). Therefore, we expect customers who perceive the quality of the service as high to be more likely to demonstrate intentions, and we again believe that this relationship will hold regardless of the buyers' collectivist orientation. Loyal customers are main assets to firms, they make proportionally more purchases at their 'first choice' store than customers who shift (Knox & Denison, 2000). Usually, great service quality leads to customer loyalty, as it increases customer confidence towards and satisfaction with the company. It is supposed that positive perceptions of service quality enhances the possibility of customers being dedicated in supporting the company and developing and strengthening loyalty behaviour (Yuen and Chan, 2010).

3. CONCEPTUAL RESEARCH MODEL AND HYPOTHESES

In according this theoretical background, the aim of this study is to, as Figure 1 indicates, propose a model that consists of evaluating the impact of: (1) service quality on customer satisfaction, brand image and customer-perceived value; (2) brand image on customer-perceived value; (3) brand image, customer satisfaction and customer-perceived value on behavioural intentions (intention to return and WOM recommendation) and (4) intention to return on WOM recommendation.

Figure 1. Research model

The retail managers should focus their attention on customer service quality evaluation as they must have actual knowledge that the service quality perceived by the client meets their expectations, as contended by Parasuraman *et al.* (1985, 1988). Based on these assumptions the purpose of this study is to examine whether the perception of the services provided in the different dimensions of SERVQUAL, exceeds the customer expectations.

However, the main objective of this study is to test the conceptual model shown in Figure 1, which includes four research hypotheses, as explained below.

The relationship between service quality and satisfaction has not been consensual in the literature as several authors argue that, on the one hand, both concepts are identical, while others consider them as distinct (Dabholkar, 1995; Dabholkar *et al.*, 2000; Oliver, 1993). According to Dabholkar (1995), while evaluation of service quality is essentially cognitive, for its part, satisfaction integrates both cognitive and affective components. This author claims that these two concepts are distinct for recent consumers of a product. However, in the long run, the affective dimension tends to be blurred and to that extent, the concepts tend to overlap. Meanwhile, Ngobo (1999) also reinforces the distinction between perceived quality and satisfaction level of the three dimensions. Assuming that these two concepts are distinct, a question that immediately arises relates to the order of their occurrence in the mind of the consumer and as such, the causal relationship between them. In this regard Dabholkar *et al.* (2000) argues that, most investigators traditionally hold that consumer satisfaction results from a particular consumer's experience of a service which leads to an evaluation/attitude on the overall quality of service over a given period of time (Parasuraman *et al.*, 1988). Recently, however, the reverse situation has stood out as the most relevant. This position is particularly evidenced by Oliver (1993) who suggested that the quality of service should be an antecedent of consumer satisfaction irrespective, of the experiential or the time factor. Similarly, Cronin and Taylor (1992) analysed the effect of these concepts in both directions and concluded that the quality of service perceived exerts a greater impact on customer satisfaction than otherwise. Recently, several authors have considered service quality as an important antecedent of satisfaction (Chiou *et al.*, 2002; Ekinci *et al.*, 2008; Mahfooz, 2014; Martinelli and Balboni, 2012; Nikhashemi *et al.*, 2014; Saleh and Ryan, 1991; Yuen and Chan, 2010; Zhang and Prybutok, 2005). Most studies assessing the relationship of service quality on customer satisfaction demonstrate the existence of a statistically significant level in studies of the service industry. Moreover, the literature suggests that perceived service quality positively influences perceived brand image (Oh, 1999; Yu and Ramanathan, 2012) and the perceived value (Howat and Assaker, 2013; Nikhashemia *et al.*, 2016; Ryu *et al.*, 2008). In line with this, and based on SERVQUAL, the following hypotheses are proposed in the present study.

H1: The quality perceived by the customers has a positive influence on their satisfaction.

H₁₁ – The higher the tangibility, the greater the degree of the customers' satisfaction.

H₁₂ – The higher the reliability, the greater the degree of the customers' satisfaction.

H₁₃ – The higher the assurance, the greater the degree of the customers' satisfaction.

H₁₄ – The higher the responsiveness, the greater the degree of the customers' satisfaction.

H₁₅ – The higher the empathy, the greater the degree of the customers' satisfaction.

H2: The perceived service quality by the customers has a positive influence on perceived brand image.

H3: The perceived service quality by the customers has a positive influence on perceived value.

The study of image has received increasing attention in the literature on marketing (Chen and Tsai, 2007; Ryu *et al.*, 2008; Wu, Yeh and Hsiao, 2011), since it affects the individual's subjective perception (Chen and Tsai, 2007). In the area of service industry, Ruy *et al.* (2008) confirm that the corporate image of a restaurant positively and significantly influences the perceived value. Thus, this study proposes the following hypothesis:

H4: The brand image perceived by the customers has a positive influence on the perceived value.

The relationship between image and perceived value on customer satisfaction has gained little attention in the services industry literature (Ryu *et al.*, 2008). These authors have evaluated the impact of the image of a restaurant and perceived value on customer satisfaction and they found a positive and significant relationship between these constructs. In the area of retail industry, Yu and Ramanathan (2012) confirm that the corporate image of a retail store positively and significantly influences customer satisfaction. In this sense, we intend to propose the following hypotheses:

H5: The perceived brand image by the customers has a positive influence on their satisfaction.

H6: The perceived value by the customers has a positive influence on their satisfaction.

In reviewing the literature, we have found that marketing services have extensively researched behavioural attitudes (e.g. Andreassen and Lindestad, 1997; Bobbitt and Dabholkar, 2001; Dabholkar, 1996; Zeithaml, Parasuraman and Berry, 1996). These are behaviours related to the intention to repurchase and even to the intention of recommending the product/service (Clemes *et al.*, 2008; Lai and Chen, 2011; Sumaedi *et al.*, 2012; Yuen and Chan, 2010; Zeithaml *et al.*, 1990). Several concepts have been examined as antecedent factors of behavioural intentions, such as service quality (Brown, Churchill and Peter, 1993; Zeithaml *et al.*, 1996) and satisfaction (Andreassen and Lindestad, 1997; Oliver, 1999). According to Liang and Zhang (2011, p. 156), "*it is generally believed that satisfaction leads to repeat purchases and positive WOM recommendations*", assuming that if customers are satisfied with a product/service, they are more likely to continue to purchase it, and are more willing to spread positive WOM. Thus, we propose our seventh and octave hypotheses:

H7: Customer satisfaction positively influences intention to return.

H8: Customer satisfaction positively influences WOM recommendations

According to Nadiri and Hussain (2005, p. 471), “service quality promotes customer satisfaction, stimulates intention to return, and encourages recommendations”. Oh (1999) found a positive and significant relationship between intention to return and WOM recommendations. In this study we intend to uphold the following hypothesis:

H9: Intention to return positively influences WOM recommendations.

4. METHODOLOGY

A questionnaire was designed as the survey instrument, which were included all the constructs of the proposed model. The questions in the questionnaire were based on a review of the literature in the area of the service industry, described above in the theoretical background. This study was applied to customers from of traditional retail stores during the months of February and March 2017. It was used a non-probabilistic sampling using convenience technique. The questionnaires were distributed online and the answers came from several cities and places of the north of Portugal. In this study, respondents were required to fill out a three-page three sections. The first section consisted of a standard demographic profile of respondents. The second section contained the characterization of purchase process. The last section includes the statements of dimensions and their sub dimensions. The measurement items to measure primary and sub-dimensions of service quality were adapted from several researchers (Chen *et al.*, 2011; Cronin and Taylor, 1992; Dabholkar *et al.*, 1996; Wu *et al.*, 2011) and a series of items focusing on the behavioural intentions, customer satisfaction, perceived value and corporate image, which were adapted on the basis of several researchers’ results (Nadiri and Gunay, 2013; Nikhashemi *et al.*, 2014; Nikhashemia *et al.*, 2016; Ryu *et al.*, 2008; Wu *et al.*, 2011; Wu, 2013; Yu and Ramanathan, 2012; Yuen and Chan, 2010; Zeithaml *et al.*, 1996). Respondents were asked to use a five-point Likert-type scale (where 5–point scales anchored 1 = “strongly disagree” and 5 = “strongly agree”) to record their perceptions. Construct reliability will assessed by using the Cronbach’s alpha coefficient.

Data analysis will be conducted using the Statistical Package for Social Science (SPSS) for Windows (version 20.0). For the descriptive analysis it will used absolute and relative frequency tables. The Spearman correlation coefficient it will used to measure the intensity of the linear correlation between variables. Multiple linear regression will used in order to estimate models that could identify the determinants of the behaviour of the variables under analysis. The significance level of 5% will assumed. Additionally, to test the causal relationship between different constructs, we will use the structural equation model, given that the theoretical model includes the complex relationships between latent variables measured with different items that are presented simultaneously as independent and dependent variables.

5. FINDINGS AND CONTRIBUTION OF RESEARCH

The objective of this study was proposes a conceptual model to identify the dimensions of service quality and examining the interrelationships among customer satisfaction, corporate image, perceived value and customer loyalty and service quality in the traditional trade, in addition to investigate the impact of customer satisfaction, service quality, perceived value and corporate image on customer loyalty in the traditional commerce in the North of Portugal. This methodological approach is similar to that used by some researchers, mentioned in the theoretical background to analyse those constructs in other service industries. So, it is believed that the model proposed will permit to evaluate the hypotheses presented, as well as to contribute to the retail managers better understand the implications of the dimensions of service quality, of perceived value, of corporate image on the customer satisfaction and on behavioural intentions, and the consequently on the profitability of the retail stores.

The customer satisfaction and the customer loyalty process allows for significantly increased revenue from traditional retail store by obtaining sales growth and a better return of investments. With this in mind, the manager retail needs to know the real customer service needs and expectations, so that the service is tailored to the customer’s satisfaction, in order to retain them and attract potential new customers. Thus, this study proposes to develop and analyze a conceptual model that aims to explain the relationship between the five dimensions of SERVQUAL, brand image, perceived value, customer satisfaction and behavioural intentions (intentions to return and WOM recommendation).

Based on research conducted in bibliographic data bases, we have identified a gap in the literature about the retailing in Portugal, which relates to the knowledge of the factors affecting customer satisfaction and behavioural intention. It is hoped that this research will contribute to the development of the literature, politicians (wealth creation, economic growth, etc.) and managers of traditional retail stores (the survival and growth of traditional trade). From a practitioners’ point of view, the understanding of the factors that influence customers’ satisfaction and behavioural intentions, on the one hand, may contribute to the retail manager’s development when establishing strategies and contribute to the improvement of services provided by the traditional retail stores and consequently increase profit, market share, and improve return on investment (Hackl and Westlund, 2000).

Findings are expected to report high levels of perceived quality and a significant relationship between service quality dimensions and customer satisfaction and their behavioural intentions, and yet we expected to prove that the brand image, the perceived value and service quality dimensions are interrelated (Ryu *et al.*, 2008; Wu, 2013; Yu and Ramanathan, 2012). Furthermore we will try to show like as Ryu *et al.* (2008) also have demonstrated, that the relationships between brand

image and perceived value dimensions and the relative importance of the dimensions of service quality can provide useful insights for how firms should allocate resources in the traditional retail stores. Retail service providers need to recognize the importance of service quality dimensions in order of their significance, and implement appropriate strategy for competitive advantage over domestic and international players competing for share of an expanding consumer base (Mahfooz, 2014). Moreover, we will try in this study, show that improving customers' perceptions of service quality can effectively increase satisfaction levels through high levels of value perceived and of brand image. In this way, the findings of this study will aid retailing management to identify that both customer satisfaction and value perceived directly affect behavioural intentions. Consequently, retail management should make more effort to increase perceptions of satisfaction and value perceived in order to build the favourable customers' behavioural intentions.

The study results will help traditional trade stores owners and managers to recognize and prioritize the primary and sub-dimensions of service quality. Trade management should realize that the significance customers accentuate is based on each of the primary and sub-dimension of service quality. Moreover, traditional trade management should structure their infrastructure, processes, operations and resource allocation in terms of the relative importance of the service quality dimensions to their target at specific customers. Simultaneously, the retail managers should dedicate special attention to the perceived value and the brand image that gives to the market, whether through communication actions or interaction with society where operate.

RESUMO

A análise dos padrões de mobilidade do idoso é desenvolvida considerando o eixo urbano Faro/Montenegro-Gambelas e é suportada por inquéritos à mobilidade desenvolvidos em 2013, no âmbito do projeto de investigação INLUT - Integração dos usos do solo e transportes em cidades de média dimensão.

Considerando os dados dos 226 idosos inqueridos (com idade igual ou superior a 60 anos), foram realizadas 334 viagens num dia, onde 30,2 % foram efetuadas em automóvel (como condutores), 57,8 % a pé, 2,4 % em transporte público e 1,2 % em bicicleta.

Com a presente comunicação pretende-se analisar se os padrões de mobilidade do idoso se alteram com o envelhecimento, focalizando o estudo nas faixas etárias de 60-64 anos, 65-69 anos, 70-74 anos, 75-79 anos e idosos com idade superior ou igual a 80 anos.

Os resultados indicam uma mudança substancial do modo de deslocação, sobretudo a partir dos 75 anos, com um aumento da marcha a pé e uma redução no uso do automóvel como condutor.

Palavras-chave: Idoso, Envelhecimento, Mobilidade, Género, Marcha a Pé.

1. INTRODUÇÃO

O envelhecimento é um processo dinâmico normal que vem acompanhado de transformações biológicas, psicológicas e sociais no idoso, o que tem implicações na sua capacidade funcional e motora.

Efetivamente a capacidade funcional (ex. força muscular) a determinada altura da vida das pessoas entra em declínio, situação que está relacionada por fatores associados ao estilo de vida, mas também a fatores externos sociais, ambientais e económicos (Kalache & Kickbusch, 1997).

Em 2011, Portugal tinha cerca de 19% da população com 65 ou mais anos de idade, comparativamente com 16% em 2001 (INE, 2012).

O Gabinete de Estratégia e Planeamento procedeu à análise dos Censos de 2011 em termos de informação sobre deficiências ou incapacidades, e concluiu que as pessoas com 65 ou mais anos de idade representam 56% da população com pelo menos uma dificuldade (GEP, 2016).

Estudos internacionais evidenciam que a mobilidade diminui com o aumento da idade (Metz, 2000; Alsnih & Hensher, 2003) e que as pessoas à medida que se tornam mais velhas optam por diminuir a condução de automóveis (Rosenbloom, 2001).

Analisando inquéritos sobre a mobilidade realizados na União Europeia considerando as pessoas com idade igual ou superior a 55 anos, 44,8 % andam de automóvel (no grupo etário dos 40-54 andam 61,3 %), 20,8 % de transportes públicos (no grupo etário dos 40-54 utilizam-no 14,1 %), 19,3 % a pé (no grupo etário dos 40-54 andam a pé 13,0 %) e 0,8 % utilizam motociclo (no grupo etário dos 40-54 utilizam-no 1,7 %), entre outros modos (European Commission, 2007). Ou seja, há uma tendência para uma redução da utilização de automóvel e de motociclo, um acréscimo na marcha a pé e no uso de transportes públicos.

Com o presente estudo pretende-se analisar se os padrões de mobilidade do idoso que reside na cidade de Faro, se alteram com o envelhecimento, focalizando o estudo nas faixas etárias de 60-64 anos, 65-69 anos, 70-74 anos, 75-79 anos e idosos com idade superior ou igual a 80 anos. Analisam-se algumas perceções sobre os meios de transporte e hábitos de deslocação. Considera-se a área urbana delimitada pelo eixo Faro/Montenegro-Gambelas.

Esta análise é suportada por inquéritos à mobilidade realizados no âmbito do projeto de investigação INLUT - Integração dos usos do solo e transportes em cidades de média dimensão, que foi desenvolvido pela Universidade de Trás-os-Montes e Alto Douro, a Faculdade de Arquitetura da Universidade de Lisboa e a Universidade do Algarve. O projeto foi financiado pela Fundação para a Ciência e a Tecnologia e teve como um dos objetivos específicos analisar os padrões de deslocação dos habitantes de cidades de média dimensão.

2. O EIXO URBANO FARO/MONTENEGRO-GAMBELAS

A cidade de Faro localiza-se no litoral sul de Portugal Continental, é capital de distrito e sede do município de Faro que detém 202,57 km² de área e 64 560 habitantes. A cidade detém um grande número de serviços administrativos importantes para a região, e múltiplas atividades comerciais e económicas, devido à sua tradicional capacidade atrativa. Tem uma boa rede de equipamentos culturais e mantém bons níveis de oferta de eventos, por isso é considerada uma cidade polarizadora de atividades culturais.

A cidade, em 2011, apresentava uma população de 44119 habitantes, distribuídos por 47% homens e 53% mulheres, registando um aumento demográfico em relação a 2001, período no qual apresentava uma população residente de 41307 habitantes (INE, 2012). No município há 28572 pessoas economicamente ativas empregadas, 3% dedicam-se ao setor primário, 13% ao secundário e 84% ao terciário. As mulheres têm uma contribuição importante constituindo 50,97 % dos ativos. Há 11654 pessoas com idade superior ou igual a 65 anos, o que traduz 18 % da população municipal.

A cidade ocupa uma área de cerca de 12 km² e tem uma densidade populacional de cerca de 3646,4 hab/km², sendo considerada compacta e detentora de usos mistos urbanos, sobretudo nas zonas tradicionais. O clima é temperado, do tipo mediterrânico, com temperaturas amenas, invernos suaves e verões quentes. A orografia é suave.

A taxa de motorização do concelho de Faro é elevada, registando-se 496 veículos ligeiros/1000 hab. e 705 veículos/1000 hab. no ano de 2011 (ISP, 2012).

Considerando as deslocações pendulares ocorridas no concelho de Faro, regista-se um domínio do transporte individual motorizado (60%), seguido do modo pedonal (33%) (INE, 2012).

Nas últimas décadas a cidade expandiu-se principalmente a norte e poente do segundo anel circundante que constitui a Av. Calouste Gulbenkian, com a localização de equipamentos coletivos de educação, saúde e comércio em zonas residenciais. A expansão urbana deu-se, também na Freguesia de Montenegro, especialmente com a construção do Campus de Gambelas da Universidade do Algarve (1986) e as sucessivas ampliações do aeroporto, consolidando, em conjunto com a cidade de Faro, num eixo urbano denominado Faro/Montenegro-Gambelas (Figura 1). Esta zona de estudo tem uma área total de 10,0 km² (1007,6 ha). A altitude varia entre 1 m e 42 m.

Nos últimos anos o município tem promovido medidas integradas para uma mobilidade sustentável. Destaca-se a nova rede urbana de transportes coletivos (detentora de uma razoável cobertura espacial e temporal), a organização do estacionamento, com taxação na Baixa e no Mercado Municipal, técnicas de acalmia de tráfego, mobilidade elétrica e melhorias pontuais nas infraestruturas pedonais e cicláveis. O estacionamento na cidade de Faro é suportado por um sistema de parques de estacionamento pagos (mais centrais) e por parques de estacionamento não pagos. No centro da cidade tem vindo a ser implementada a política do utilizador pagador, com estacionamento pago quer na via pública, quer em parques subterrâneos. Este sistema é complementado por oferta de transporte público com vista a potencializar a transferência modal. Atualmente, de forma generalizada, não existe défice de lugares de estacionamento face à procura revelada.

Na freguesia de Montenegro não existe estacionamento pago nem atividade de fiscalização sistemática. Verificando-se frequentemente a existência de estacionamento ilegal (em segunda fila e em cima dos espaços pedonais).

Os transportes públicos têm uma razoável cobertura espacial e temporal (praticamente toda a população encontra-se a 400 m de uma paragem de autocarro) e tem-se vindo a assistir a um melhoramento da articulação entre os modos ferroviário e rodoviário.

No caso do modo ciclável, para além da Ecovia do Algarve, que na sua génese tem uma função eminentemente de lazer, são escassos e dispersos os percursos adaptados às bicicletas, não existindo uma rede de ciclovias. Existe uma perceção generalizada pela população do concelho de Faro que o uso da bicicleta é extremamente perigoso.

Com exceção do centro da cidade de Faro, os espaços pedonais não constituem uma rede articulada e agradável à sua usufruição. A ocupação dos passeios por automóveis, a desorganização do mobiliário urbano e a largura reduzida não contribuem para o incentivo a caminhar. No entanto, registam-se preocupações, por parte da autarquia, em proceder a melhoramentos.

3. PADRÕES DE MOBILIDADE DO IDOSO NO EIXO URBANO FARO/MONTENEGRO-GAMBELAS EM 2013

Os inquéritos foram realizados nos meses de novembro e dezembro de 2013 aos residentes na cidade de Faro e na freguesia de Montenegro e estava estruturado em três grupos de perguntas: (1) os dados do inquirido, do seu agregado familiar e da sua habitação, (2) caracterização das viagens referentes ao dia anterior ao inquérito e (3) avaliação de perfis (atitudes). Os inquiridos deveriam ter idade superior ou igual a 17 anos e as viagens a pé inferiores a 5 minutos não foram contabilizadas.

Considerando os dados gerais, os 1277 inquiridos realizaram 2363 viagens/dia, sendo 44,8 % efetuadas em automóvel (como condutor), 40,5 % a pé, 4,3 % em transporte público e 2% em bicicleta.

Dos 1277 inquiridos, 226 tinham idades superiores ou iguais a 60 anos, o que corresponde a 17,7 % da amostra. Estes idosos residem na cidade de Faro e em Montenegro, localizado a cerca de 4 km. A análise da distribuição das residências, permite verificar que os idosos vivem, sobretudo, em bairros tradicionais com exceção do centro histórico de Faro (Figura 2).

Apresenta-se a caracterização socioeconómica dos 226 idosos, nomeadamente: género, posse de habitação, situação face ao mercado de emprego, instrução, rendimento do agregado familiar, posse de carta de condução e posse de passe de transportes coletivos.

111 inquiridos são homens (49,1 %) e 115 mulheres (50,9%) (Tabela 1), 77,4 % tem habitação própria, 18,1 % aluga casa e 4,4 % vive em casa de familiar; 176 estão reformados (77,9 %) 10 são domésticas (4,4 %), 6 estão desempregados (2,7%), e 34 pertencem à população ativa (15,0 %).

68 inquiridos não tem instrução (30,1 %), 27 tem o 1º ciclo do ensino básico (11,9 %), 31 tem o 2º ciclo do ensino básico (13,7 %), 27 tem o 3º ciclo do ensino básico (11,9 %), 21 tem o ensino secundário (9,3 %), 45 tem ensino pós-secundário (19,9 %) e 7 tem ensino superior (3,1 %).

Cerca de 56,2 % dos agregados familiares dos idosos inquiridos têm rendimento mensal líquido igual ou inferior a 1000 euros.

Dos inquiridos 58,4 % possui carta de condução e 7,5 % tem passe de transportes coletivos.

Os correspondentes aglomerados familiares possuem 216 automóveis. Há 70 famílias que não têm automóvel (31,0 %).

Figura 2. Localização das residências dos idosos inqueridos com 60 ou mais anos de idade

Fonte: elaboração própria

Tabela 1. Caracterização dos grupos etários das mulheres e homens seniores inqueridos

Grupo etário	Total	N.º de mulheres seniores	N.º de homens seniores	% de mulheres reformadas	% de mulheres ativas	% de homens reformados	% de homens ativos
60 - 64 anos	49	27	22	48,1	29,6	63,6	27,3
65 - 69 anos	71	31	40	71,0	19,4	87,5	10,0
70 - 74 anos	53	23	30	82,6	13,0	96,7	3,3
75 - 79 anos	34	20	14	80,0	10,0	78,6	21,4
>= 80 anos	19	14	5	85,7	7,1	100	0,0

Fonte: elaboração própria

20 inquiridos consideraram que têm mobilidade condicionada (8,8 %), registrando-se uma maior percepção, sobretudo por parte do homem idoso no grupo etário dos 60-64 anos. Nas faixas de idade dos 70-74 anos e dos 75-79 anos registou-se uma percepção crescente, tanto por parte da mulher como do homem (Figura 3).

Figura 3. Percepção dos idosos inquiridos sobre mobilidade condicionada

Fonte: elaboração própria

Dos 226 inquiridos, 61 mulheres e 57 homens realizaram no total 334 viagens/dia (neste estudo não se consideraram as deslocações com duração inferior a 5 min). Destas viagens 30,2 % foram efetuadas em automóvel (como condutor) e 57,8 % a pé, registando-se apenas 2,4 % em transporte público e 1,2 % em bicicleta (Tabela 2). Considerando o conjunto das viagens em automóvel como condutor e em automóvel como passageiro, a percentagem afeta a este meio aumenta para 38,6 % do total das viagens. As mulheres utilizam menos o automóvel e andam mais a pé e de transportes públicos. A extensão média das viagens, num dia, foi de 597 m, as viagens das mulheres são mais extensas (872 m) e a dos homens são curtas (321 m).

Em relação à mobilidade das mulheres, foram realizadas 171 viagens por 66 % das mulheres 51 % dos homens realizaram 163 viagens. As mulheres (que se deslocaram) realizaram em média 2,80 viagens num dia e os homens 2,86 viagens, revelando-se ativos.

Tabela 2 – Viagens realizadas pelos idosos por modo de transporte e género

Modo de transporte	Nº de viagens	%	Homens		Mulheres	
			Nº de viagens	%	Nº de viagens	%
A pé	193	57,8	77	47,2	116	67,8
Bicicleta	4	1,2	4	2,5	0	0,0
Transporte público	8	2,4	0	0,0	8	4,7
Mota/Motociclo	0	0,0	0	0,0	0	0,0
Automóvel (condutor)	101	30,2	78	47,9	23	13,5
Automóvel (passageiro)	28	8,4	4	2,5	24	14,0
Total	334	100,00	163	100,00	171	100,00

Fonte: elaboração própria

Analisando a mobilidade por grupos etários e por género (Figuras 4, 5 e 6), constata-se que a faixa de idosos com 65-69 anos tem maior mobilidade em relação ao grupo dos com 60-64 anos, possivelmente por se encontrarem reformados e com mais tempo disponível.

Nos grupos etários dos 70-74 anos, 75-79 anos e ≥ 80 anos ocorre uma progressiva diminuição da mobilidade, independentemente do meio de transporte que utilizam. Essa diminuição é visível na marcha a pé e na utilização do automóvel nas suas deslocações, neste último caso, acontece, sobretudo, a partir do grupo etário dos 75-79 anos. Esta tendência de diminuição da mobilidade tanto ocorre nas mulheres como nos homens.

Fonte: elaboração própria

Figura 5. Mobilidade das mulheres idosas por grupo etário

Fonte: elaboração própria

Figura 6. Mobilidade dos homens idosos por grupo etário

Fonte: elaboração própria

A análise da distribuição espacial das residências dos idosos que marcham a pé (Figura 7) permite concluir que, tanto no caso da cidade de Faro como no Montenegro, estão localizadas nos bairros tradicionais, que são caracterizados por deterem usos mistos urbanos. A proximidade de serviços e residências é, geralmente, um fator determinante pela escolha deste modo de transporte.

Figura 7. Localização das residências dos idosos que se deslocam somente a pé

Fonte: elaboração própria

4. ATITUDES EM RELAÇÃO ÀS DESLOCAÇÕES

Os inquéritos à mobilidade realizados no âmbito do projeto de investigação INLUT, consideravam as atitudes dos inqueridos em face aos meios de transporte que utilizam.

A análise dos padrões de mobilidade dos idosos permitiu averiguar que há um grande número de viagens realizadas a pé e, em oposição, há um pequeno número de viagens realizadas em transporte público. Pretende-se averiguar se as afirmações proferidas no inquérito justificam estes padrões.

Um conjunto de afirmações é referente ao transporte público: as “A rede de transportes pública é adequada”, “É agradável andar de autocarro”, “Os transportes públicos devem de ser melhorados com financiamento de quem anda de automóvel”, “Usar transportes públicos é impraticável” e “Andar de autocarro é caro”. Os resultados destas afirmações encontram-se na Figura 8.

Na primeira análise às afirmações das atitudes relativas ao transporte público é possível constatar que as respostas às atitudes “A rede de transportes pública é adequada” 52,2 % das mulheres concordam/concordam totalmente e somente o fazem 42,3 % dos homens. 21,7 % das mulheres e 17,1 % dos homens discordam/discordam totalmente. Estes resultados são consensuais com a maior utilização de transportes públicos por parte da mulher.

Em relação à afirmação “É agradável andar de autocarro” 60,9 % das mulheres concordam/concordam totalmente e somente o fazem 42,3 % dos homens. 16,5 % das mulheres e 24,3 % dos homens nem concordam nem discordam, traduzindo, possivelmente, a não utilização deste meio de transporte.

As respostas a estas duas afirmações estão em concordância com a afirmação “Usar os transportes públicos é impraticável”, onde 47,8 % das mulheres discordam/discordam totalmente, e 49,5 % dos homens o assume, mostrando que existe uma certa concordância na praticabilidade da utilização do transporte público. Contudo, na afirmação “Os transportes públicos devem ser melhorados com financiamento de quem anda de automóvel” 53,0 % das mulheres e 59,5 % dos homens discordam/discordam totalmente, traduzindo uma certa valorização coletiva do automóvel.

Apesar das afirmações descritas anteriormente, e atendendo a que a rede de transporte pública de Faro é bastante adequada e que a viagem de autocarro é agradável, na realidade não se traduz nos padrões de mobilidade havendo uma percentagem reduzida de viagens realizadas por transporte público, possivelmente pelo facto de tanto as mulheres como os homens terem uma posição marcada em relação ao preço da viagem de autocarro. 56,5 % das mulheres consideram que as viagens de autocarro são caras, e 45,9 % dos homens também o afirmam. Esta situação pode efetivamente influenciar os padrões de mobilidade apresentados anteriormente.

Estas opiniões se atendidas pelo meio institucional e empresarial poderiam contribuir para uma efetiva transferência modal.

No que respeita às opiniões referentes aos modos suaves (Figura 9) na afirmação “Sempre que possível prefiro ir a pé” 84,3 % das mulheres e 76,6 % dos homens concordam/concordam totalmente, possivelmente trata-se de um indicador de envelhecimento saudável. Mas os valores baixam quando respondem à afirmação “É agradável andar a pé no meu bairro” com 33,9 % das mulheres e 45,9 % dos homens a concordarem/concordarem totalmente.

Figura 8. Atitudes dos idosos em relação aos transportes públicos

Fonte: elaboração própria

Figura 9. Atitudes dos idosos em relação à marcha a pé

Fonte: elaboração própria

5. CONSIDERAÇÕES FINAIS

Em termos de caracterização dos inquiridos idosos constata-se que a maioria tem posse de casa e posse de carta de condução e 15 % ainda integram a população ativa. Na faixa dos 60-64 anos, cerca de 30 % ainda trabalha. Os idosos são, geralmente, considerados pessoas com mobilidade reduzida, no entanto, somente uma pequena percentagem tem perceção dessa condição.

Comparando os resultados gerais da mobilidade intraurbana considerando o eixo urbano Faro/Montenegro-Gambelas com os da mobilidade das pessoas com idade igual ou superior a 60 anos, conclui-se que estas andam mais a pé, utilizam menos os transportes coletivos, usam menos o automóvel como condutoras. Considerando o género, constata-se que apenas uma pequena percentagem de mulheres idosas usa o automóvel como condutora, é muito ativa em termos de marcha a pé e utiliza mais os transportes públicos. Assumem ser agradável andar de autocarro.

Constata-se que a faixa de idosos com 65-69 anos tem maior mobilidade em relação ao grupo dos com 60-64 anos, possivelmente por se encontrarem reformados e com mais tempo disponível.

Nos grupos etários dos 70-74 anos, 75-79 anos e ≥ 80 anos ocorre uma progressiva diminuição da mobilidade, independentemente do meio de transporte que utilizam. Essa diminuição é visível na marcha a pé e na utilização do automóvel nas suas deslocações, neste último caso, acontece, sobretudo, a partir do grupo etário dos 75-79 anos. Esta tendência de diminuição da mobilidade tanto ocorre nas mulheres como nos homens.

Assim, os resultados indicam uma mudança substancial do modo de deslocação, sobretudo a partir dos 75 anos, com um aumento da marcha a pé e uma redução no uso do automóvel como condutor.

Tanto os homens idosos como as mulheres assumem que sempre que possível preferem andar a pé, traduzindo esta preferência um indicador de envelhecimento ativo e saudável. No entanto, a maioria não considera agradável andar a pé no seu bairro. Esta perceção deve ser considerada nas políticas de regeneração urbana, que devem integrar a opinião do idoso nos processos de participação pública.

Efetivamente, os espaços exteriores, os edifícios, os transportes constituem características fundamentais do ambiente físico de uma cidade, e exercem uma grande influência sobre a mobilidade individual, a independência e a qualidade de vida dos idosos (OMS, 2009).

Assim, na gestão urbana e da mobilidade estão a desenvolver-se abordagens que atendem às necessidades dos idosos (*Age Sensitive Design*) de forma a potenciarem a sua qualidade de vida, a sua segurança e a contribuir para um envelhecimento ativo.

AGRADECIMENTOS

Este estudo teve como suporte uma base de dados produzida no âmbito do Projeto de Investigação “Integração de Usos do Solo e Transportes em cidades de média dimensão” referência FCT PTDC/AUR-URB/111013/2009, financiado pela Fundação para a Ciência e Tecnologia, com cartografia em formato digital fornecida pela Câmara Municipal de Faro.

INCORPORAÇÃO DA EXPERIÊNCIA DE CONSUMO NO DESENHO DO SERVIÇO DE ALOJAMENTO HOTELEIRO NO ALENTEJO

Nicolau Miguel Almeida
Instituto Politécnico de Portalegre, Portugal
(nicolau@estgp.pt)

RESUMO

A maioria dos estudos sobre experiência de consumo tende a centrar-se mais na perspectiva do consumidor e não tanto na perspectiva das operações, em especial como a experiência de consumo é incorporada no desenho do serviço de alojamento hoteleiro. Para analisar a incorporação da experiência proporcionada no desenho do serviço prossegue-se os seguintes objetivos: 1) identificar e analisar os fatores e a sua importância relativa que levam um determinado estabelecimento hoteleiro no Alentejo a incorporar ou não a experiência de consumo no desenho do serviço de alojamento (ECDS); 2) evidenciar as características que diferenciam os que incorporam dos que não incorporam a ECDS; 3) propor um modelo para calcular a probabilidade de um determinado estabelecimento hoteleiro incorporar a ECDS; 4) identificar os tipos de estabelecimentos onde é maior a propensão de incorporar a ECDS. É proposto um modelo de análise que será empiricamente testado em cento e vinte e um estabelecimentos hoteleiros no Alentejo. Esta investigação permitirá compreender a perceção dos dirigentes dos estabelecimentos hoteleiros no Alentejo sobre a expectativa de experiência de consumo por parte do cliente, o que tem implicações para o marketing e para a gestão das operações.

Palavras-chave: Desenho do Serviço de Alojamento Hoteleiro, Experiência de Consumo, Marketing, Gestão de Operações, Alentejo.

JEL Classification: M11, M31

1. INTRODUÇÃO

O termo experiência tem surgido cada vez mais no vocabulário do marketing e verifica-se que a literatura sobre o conceito de experiência, sendo este um fator importante para a competitividade e o sucesso da oferta das empresas, tem crescido rapidamente, o que evidencia a existência de um debate fervente entre académicos e profissionais sobre o tema da experiência. Por isso, a compreensão da perceção dos dirigentes dos estabelecimentos hoteleiros no Alentejo sobre a expectativa de experiência de consumo por parte do cliente, através da evidência sobre a propensão para o estabelecimento hoteleiro incorporar a experiência de consumo no desenho do serviço de alojamento torna-se relevante na temática da experiência de consumo.

Verifica-se ainda que o intenso debate em torno do conceito de experiência desperta cada vez mais a atenção dos investigadores e profissionais do marketing, na passagem do serviço para a experiência, razão pela qual interessa analisar a incorporação da experiência de consumo no desenho do serviço, inicialmente a partir de uma revisão da literatura, procurando, deste modo, apresentar quais são as principais abordagens, debates e controvérsias.

Posto isto, salienta-se que se trata de uma literatura vasta e rica, pelo que as questões básicas - o que é a experiência?, quando e onde surgiu este conceito?, quem lançou este conceito?, por que razão surgiu?, qual o significado deste conceito para o marketing e para a gestão das operações? e como utilizá-lo? ou, dito de outro modo, como operacionalizá-lo? - servirão de fio condutor.

Neste sentido, Pennington (2016) defende a incorporação da experiência na estratégia de negócio de maneira que a empresa opere o conceito ao longo de todas as funções e na cadeia de valor. Assim, conhecer o que interessa na experiência do cliente é um novo território, o que apela à mudança, ou seja, à procura de métricas que permitam medir a experiência de serviço composta por fases, tal como Jüttner, Schaffner, Windler and Maklan (2013) as designam, podendo estas ser observadas em contexto de alojamento hoteleiro. Estas fases são a tomada de decisão, a reserva, a chegada ao estabelecimento hoteleiro e *check-in*, a estada, as experiências no local, o *check-out* e a partida, e o tempo após a estada.

Pode-se então considerar que a criação de uma experiência memorável (Lindgreen, Vanhamme and Beverland, 2009), como suplemento de um produto ou de um serviço, abrange o processo mental, um estado da mente (podendo ser uma sensação ou uma emoção) que é valorizado na combinação de um produto ou serviço com um momento considerado único de consumo, cuja vivência se torna memorável, por constituir uma experiência emocionalmente rica, logo única e memorável.

Daqui decorre que a experiência do cliente é originada em um conjunto de interações entre o cliente e o produto ou serviço, a empresa ou uma parte da sua organização, interações essas que provocam reações (Gentile, Spiller and Noci, 2007).

No campo da expectativa de experiência interessa, por exemplo, Lindgreen *et al.* (2009) que obtiveram resultados da sua investigação empírica que interpretam em reações geralmente positivas das pessoas, muito embora a maioria destas não tenha tido uma experiência anterior às situações hedónicas associadas aos encontros de serviço nos quais essas pessoas participam com expectativas relativamente vagas. Significa que estas expectativas formadas estarão relacionadas com as experiências

anteriormente vivenciadas e serão comparadas com as memórias que resultam de uma experiência atual emocionalmente rica. Numa avaliação holística, a experiência como um todo, na sua avaliação geral, tem mais significado do que a soma das partes.

Meyer and Schwager (2007) definem a experiência como uma resposta interna e subjetiva do cliente a qualquer contacto direto ou indireto deste com a empresa. Estes autores entendem que as empresas devem identificar as componentes das experiências que resultam em satisfação do cliente, realçando que a maioria das experiências não é consequência das ofertas das empresas, o que requer a reformulação do interesse no conhecimento das expectativas de experiência.

Torna-se, então, necessário enquadrar os encontros de serviços, entre clientes e prestadores (Voss, Roth and Chase, 2008), pois não só compreendem múltiplas interações de serviço e canais de distribuição, como também envolvem a componente temporal significativa e a estratégia de operações da empresa. Esta estratégia consiste em lidar com cada vez mais encontros de serviços e mais complexos. Neste sentido, Chauhan and Manhas (2014) verificam que a experiência do cliente é um constructo multidimensional.

O encontro de serviço é caracterizado por um processo de elevada participação do cliente (Chathoth, Altiney, Harrington, Okumus and Chan, 2013). Neste contexto de encontro de serviço, o primeiro processo produtivo a considerar consiste na análise da criação e desenho do serviço de alojamento hoteleiro com o aprofundamento de um conjunto de atividades que o estabelecimento hoteleiro realiza e que requer o conhecimento de todos os fatores que intervêm ou podem afetar o processo (Pérez, 2004).

Posto isto, nenhum modelo proposto na literatura é adequado para avaliar a formação da intenção por parte dos estabelecimentos hoteleiros de incorporar a experiência de consumo no desenho do serviço, pelo que se torna relevante encontrar resposta para as seguintes questões:

- 1) Que fatores determinam a intenção de incorporar a experiência de consumo no desenho do serviço (ECDS) do estabelecimento hoteleiro no Alentejo?
- 2) Qual a propensão do estabelecimento hoteleiro para incorporar a ECDS?
- 3) Há tipologias de estabelecimentos hoteleiros no Alentejo com maior propensão para incorporar a ECDS?

Para analisar a incorporação da experiência proporcionada no desenho do serviço e encontrar respostas para as questões de investigação explicitadas, torna-se necessário prosseguir os seguintes objetivos:

- identificar e analisar os fatores e a sua importância relativa que levam um determinado estabelecimento hoteleiro no Alentejo a incorporar ou não a experiência de consumo no desenho do serviço de alojamento;
- evidenciar as características que diferenciam os que incorporam dos que não incorporam a ECDS;
- propor um modelo para calcular a probabilidade de um determinado estabelecimento hoteleiro incorporar a ECDS;
- identificar os tipos de estabelecimentos onde é maior a propensão de incorporar a ECDS.

Para o prosseguimento destes objetivos, dada a relevância do tema aqui explanada, esta comunicação abrange o enquadramento teórico, com destaque para o debate sobre a passagem do conceito de serviço para o de experiência, o conceito de experiência de consumo vivenciada, a incorporação da experiência de consumo no desenho do serviço e as variáveis determinantes da experiência de consumo que farão parte da proposta de modelo de análise do qual derivam as hipóteses de investigação, terminando esta comunicação com as considerações finais, incluindo uma descrição do caminho a seguir para obter as respostas às questões de investigação, o teste das hipóteses e os contributos.

2. ENQUADRAMENTO TEÓRICO

2.1 Passagem do conceito de serviço para o de experiência

As economias mundiais desenvolvidas estão dominadas por empresas de serviços. Enquanto as tecnologias que suportam o serviço evoluíram rapidamente, as abordagens para projetar e gerir como o cliente vivencia a experiência de entrega do serviço permanecem praticamente primitivas (Dasu and Chase, 2013). Ainda segundo Dasu and Chase (2013), as abordagens típicas para a melhoria da experiência de serviço incluem normalmente a análise de inquéritos de satisfação e a realização de sessões de *feedback* em *focus group*. Significa que o desenho do serviço é mais suportado no conhecimento das expectativas do cliente (Zeithaml, Bitner and Gremler, 2009), por parte de uma organização, seja esta com ou sem fins lucrativos, para que a perceção de qualidade do serviço, por parte do cliente, coincida com a sua expectativa, o que, assim sendo, permite concluir que o desenho do serviço é orientado para proporcionar a experiência única e memorável.

A passagem do serviço para a experiência, quer ao nível das operações quer do marketing, deve assegurar que a satisfação do cliente com o estabelecimento hoteleiro e a consequente intenção do cliente em retornar podem ser controlados em cada momento de interação entre o prestador do serviço e o cliente, sendo este um coprodutor do serviço de alojamento.

O estabelecimento hoteleiro, enquanto unidade de análise, encontra-se situado no destino turístico Alentejo. Murphy, Pritchard and Smith (2000) focam a sua atenção no que designam por produto destino e entendem este produto como um conjunto complexo de elementos e de experiências, cuja perceção pelo turista é necessário compreender. Para estes autores, “o destino pode ser visto como uma amálgama de produtos e oportunidades de experiências individuais que combinam na forma de uma experiência total na área visitada.”

Esta noção de destino turístico, dando corpo a uma experiência, está na linha de pensamento de Smith (1994), o qual realça o papel importante dos serviços do destino na criação da experiência e descreve o modo como os vários *inputs* do destino podem produzir uma experiência (*output*) para os turistas. Posto isto, a gestão de marketing centrar-se-á mais na experiência do que no produto ou serviço.

Na abordagem da experiência de serviço, Johns (1999) evidencia que os clientes têm diferentes visões dos fornecedores de serviços consoante a natureza dos serviços. A este propósito, Chade and Mattsson (1996) referem que o cliente avalia a totalidade dos serviços encontrados e não apenas a interação com o fornecedor do serviço.

Na perspetiva do processo de produção turística, que interessa à gestão de operações, Smith (1994) separa os conceitos de serviço e experiência, considerando que o serviço prestado é um produto intermédio e que a experiência é o produto final.

O modelo de Smith (1994), reconhecendo o papel da experiência humana, tendo esta o lado positivo e negativo tal como muitas atividades humanas (Ryan, 2002) no produto de turismo, indica os elementos (recursos naturais e infraestruturas; serviços; hospitalidade; liberdade de escolha; envolvimento do turista) que podem ser aplicados a uma experiência turística, embora com um nível elevado de intangibilidade. O conceito de intangibilidade é utilizado pelo marketing de serviços desde os anos 60 (Baker, 2000). E este conceito coloca desafios à competitividade das empresas quando procuram focar-se no cliente, ou seja na experiência que este vivencia no encontro de serviço.

Para Gentile *et al.* (2007), hoje em dia competir no mercado global tornou-se crescentemente difícil, pelo que somente a criação de vantagens competitivas duradouras parece oferecer a via para a sobrevivência de empresas. Porém, persiste a questão de saber por onde deve a empresa começar a desenvolver a sua vantagem competitiva. De facto, são vários os autores, nomeadamente, Craig and Douglas (2000), Farinet and Ploncher (2002), Kotler and Keller (2009) ou Peppers and Rogers (2000) que defendem que uma das vias principais para atingir essa vantagem competitiva é por meio de um maior enfoque no cliente.

A perspetiva de um enfoque no cliente acarreta a ideia central de expandir a transação com base na noção de relação com cliente para um conceito de experiência do cliente em contínuo. A implicação que este enfoque tem é precisamente a necessidade de considerar aspetos relativos ao lado emocional e irracional do comportamento do cliente (Holbrook and Hirschman, 1982), em que se tem em conta todas as experiências resultantes do conjunto de interações entre a empresa e os seus clientes.

Eis então o ponto fundamental, isto é, tais experiências desempenham um papel fundamental ao determinar as preferências dos clientes, as quais, por sua vez, influenciam as decisões de compra dos mesmos (Gentile *et al.*, 2007). Significa então que, enquanto a teoria económica clássica vê o consumidor como um ator lógico e racional, cujas decisões de compra são baseadas em elementos racionais, os recentes desenvolvimentos nas áreas da economia e do marketing, em particular no chamado Marketing Experiencial (*Experiential Marketing*), apontam para o conceito de experiência do cliente (*customer experience*). Defendem então a exploração de elementos intangíveis relacionados com o valor emocional percebido pelos clientes. Daí ser inteligível que para Shaw and Ivens (2005) cada vez mais gestores vejam a experiência do cliente como o próximo campo de batalha pela competitividade.

No entanto, ainda segundo Gentile *et al.* (2007), apesar do entusiasmo sobre o tema, a realidade indica algo bem diferente e longe do que aquela literatura defende ou que as empresas afirmam ser a sua declaração de intenção. Ou seja, a literatura científica sobre o tópico revela limitações e insuficiências, as quais são próprias nos campos de investigação que ainda estão longe de atingir a sua maturidade, sobretudo quando existe uma falta de terminologia precisa e de um modelo conceptual que permita operacionalizar o conceito, neste caso, de experiência e assim apoiar a adoção das respetivas práticas.

No que concerne ao estado da arte sobre o Marketing Experiencial, Gentile *et al.* (2007) e Lanier (2008) fazem uma importante síntese. Lanier (2008) refere que só nos últimos vinte cinco anos os investigadores de marketing e de gestão começaram a referir-se às experiências como tendo a sua lógica e valor específicos.

Holbrook and Hirschman (1982) defendem o reconhecimento dos aspetos relacionados com a experiência de consumo, pelo que esta última está dirigida para a busca de fantasias, sensações e divertimento. A abordagem sobre o processamento de informação deve ser enriquecida com a adição de uma perspetiva experiencial e, assim, expandir a investigação sobre o comportamento do consumidor.

Deste modo, Arnould and Price (1993), partindo da descida de rios como componente em crescimento da indústria de serviços de lazer no Colorado (EUA), assinalam a importância da comercialização de experiências hedónicas para o marketing, existindo uma relação complexa entre as expectativas e satisfação dos clientes e a experiência de tipo extraordinária (*extraordinary experience*).

Estes entendimentos iniciais deram origem a um movimento na investigação que explora muitos aspetos da produção e do consumo de experiências, exemplificativos em Carù and Cova (2007), Joy and Sherry (2003), Kozinets, Sherry, Storm, Duhachek, Nuttavuthisit and Deberry-Spence (2004), LaSalle and Britton (2003) e Shaw and Ivens (2002).

Larnier (2008) refere também que embora se tenha aprendido bastante com a investigação desenvolvida, ainda existe alguma confusão com respeito à natureza das experiências, suas dimensões principais e características essenciais, sendo que para este autor é possível distinguir dois tipos de enfoques, um relativo às experiências proporcionadas pela empresa (*firm-driven experiences*), ou seja, as experiências que são desenvolvidas ou oferecidas pelas empresas e nas quais os consumidores participam, o outro com referência às experiências de consumo (*consumption-driven experiences*), isto é, as experiências que são construídas pelos consumidores e as quais podem ou não envolver ofertas das empresas.

As experiências proporcionadas pela empresa e as suas práticas denominadas de marketing experiencial (O'Sullivan and Spangler, 1998; Schmitt, 1999), têm dado origem a uma explosão de livros e artigos. No entanto, existe pouco consenso sobre o que o mesmo implica. Para Larnier (2008) existe confusão entre académicos do marketing e profissionais quanto à natureza da experiência baseada no mercado: esta experiência é uma função subjetiva do consumidor ou uma função objetiva da oferta, ou ambas? Bem, dependendo da perspetiva, encontra-se várias respostas a estas questões.

Dito isto, o ponto importante da revisão de Larnier (2008) é ter um conceito geral de experiência que anteceda a análise do marketing experiencial.

Neste sentido, Carù and Cova (2003) contribuem, no campo da gestão, com a definição de experiência, sendo esta um acontecimento de interação entre a necessidade ou desejo do consumidor e o consumo, necessariamente dependente da

compra de produtos ou serviços no mercado ou de outro tipo de aquisição, por exemplo, através da família, de amigos ou da posição pessoal e profissional; aquele acontecimento pode estar associado a uma sensação subjetiva ou emoção de uso do produto ou de consumo do serviço.

Esta definição coloca uma ênfase no processo de decisão de compra do consumidor, no qual a expectativa de experiência pode ser gerada no consumidor aquando das suas escolhas inseridas no referido processo de decisão. Não obstante, se a ênfase fosse colocada nas atividades de consumo, então é sugerido que em qualquer organização, seja ela com fins lucrativos ou não, uma cadeia de valor é identificada, cujo *output* final pode ser traduzido pelo conceito de experiência.

Nestas duas perspetivas, a do processo de decisão de compra do consumidor e a da cadeia de valor na organização da oferta de serviços, a existência de alguns desenvolvimentos na conceptualização da experiência não é suficiente, uma vez que a necessidade de construção de um caminho sólido para a estrutura do conhecimento futuro, o qual permita a compreensão do fenómeno da experiência, mais do que mudar o estilo e a forma de teorizar a experiência, é cada vez mais premente Uriely (2005).

Acrescenta-se também que no campo da Psicologia sobre experiência, a literatura apresenta os três componentes de todas as experiências: o sujeito da experiência (pessoa que vivencia a experiência e sobre quem reside os efeitos da experiência, por exemplo, o consumidor), o objeto da experiência (o que é experimentado, por exemplo, a oferta do mercado) e o processo da experiência (ato de experimentar o objeto pelo sujeito) (Russon, 2003).

Tendo em conta aqueles três componentes ou dimensões, segundo a ordenação de Larnier (2008), na literatura sobre o comportamento do consumidor a experiência é usualmente definida em termos do sujeito da experiência e mais frequentemente em termos do processo da experiência, sendo que o objeto da experiência é várias vezes desvalorizado ou considerado apenas como um *input* menor no processo de consumo (veja-se Dalli and Romani, 2007; Holt, 1995). Assim sendo, nesta literatura, a experiência é, em linhas gerais, referida como uma experiência de consumo (Carù and Cova, 2007; Holbrook and Hirschman, 1982).

Já na literatura sobre gestão e estratégia de marketing, a experiência é normalmente definida em termos do objeto da experiência, pelo que o enfoque incide fundamentalmente em como criar uma oferta de experiência que atraia os consumidores para aspetos memoráveis (Marconi, 2005; Pine II and Gilmore, 1999), o que significa que o processo da experiência é, de modo geral, tido como garantido e os sujeitos da experiência são vistos simplesmente como efeitos passivos do processo. Deste modo, nesta literatura, a experiência faz referência ao marketing experiencial (Marconi, 2005; O'Sullivan and Spangler, 1998).

Por sua vez, Larnier (2008) argumenta ideia central de que quer se fale de experiência de consumo ou de marketing experiencial, as três dimensões de uma experiência (sujeito, objeto e processo) estão todas presentes e devem ser tidas em conta e ser explicadas umas em relação às outras.

A diferença entre as duas abordagens (experiência de consumo e marketing experiencial) reside no seu enfoque, pois a experiência de consumo incide principalmente no sujeito e processo, enquanto que o marketing experiencial tem como foco fundamentalmente o objeto.

Por outro lado, o objeto da experiência pode ser basicamente tudo para a abordagem da experiência de consumo (por exemplo, pode-se ter uma experiência de consumo com a alface que cresce na própria horta ou comprada no estabelecimento comercial) e aí o consumidor é definido em termos do ato de consumo e não do seu papel no processo de troca de valor, pelo que é visto como a fonte da experiência (Belk and Costa, 1998; Kozinets, 2002).

Para a abordagem do marketing experiencial o objeto é especificamente uma oferta do mercado e que é desenvolvido por uma empresa e apresentado aos consumidores pela experiência que a oferta pode proporcionar. O grau de participação do consumidor na produção/criação da experiência é variável, mas a plataforma básica é criada ou montada pela empresa e oferecida ao consumidor normalmente por meio de um preço.

Para Gentile *et al.* (2007), o conceito de experiência do cliente (*customer experience*) foi concebido primeiramente nos meados da década de 1980 quando, junto com a corrente dominante do comportamento do consumidor, a qual considerava os clientes como decisores racionais, surge uma abordagem experiencial que proporcionou uma visão original sobre o comportamento do cliente (Holbrook and Hirschman, 1982). Foram então reconsideradas variáveis até à data afastadas, como as emoções e as sensações (Addis and Holbrook, 2001).

O conceito de experiência do cliente ganhou mais relevância na década de 1990, sobretudo com o livro sobre *Experience Economy* de Pine II and Gilmore (1999), em que as experiências são apresentadas como a nova oferta económica e como o passo seguinte depois das matérias-primas, bens e serviços, numa chamada progressão do valor económico (*progression of economic value*).

Mas, tal como Gentile *et al.* (2007) realçam, o ponto de partida é o modo renovado de considerar o próprio conceito de consumo, ou seja, como uma experiência holística que envolve uma pessoa (em oposição ao cliente) num todo em diferentes níveis e em toda a interação entre a pessoa e a empresa ou a oferta da empresa (LaSalle and Britton, 2003). Ainda nesta perspetiva, as empresas não vendem experiências mas antes fornecem os artefactos e os contextos que conduzem às experiências, os quais podem ser empregues de forma apropriada pelos consumidores para cocriar as suas próprias e únicas experiências (Carù and Cova, 2003; Carù and Cova, 2007).

De facto, Schmitt (1999) defende que um *marketer* necessita de providenciar o ambiente e cenários certos para fazer emergir as experiências desejadas pelos clientes. Mais recentemente Carù and Cova (2007) referem-se à experiência de consumo, na qual identificam um contínuo de experiências de consumo que se estende das experiências que são principalmente construídas pelos consumidores até àquelas que são em boa parte desenvolvidas pelas empresas, passando pelas experiências que são cocriadas pelos consumidores e empresas.

De acordo com esta perspetiva, o papel da empresa muda em cada fase desse contínuo: desde a empresa a perseguir uma abordagem quase tradicional de marketing de produto ou de serviço, à adoção por parte da empresa de uma abordagem

holística e de imersão do marketing experiencial (assim proporcionando experiências por meio das quais um consumidor “mergulha” numa experiência que é total e detalhadamente desenvolvida pela empresa), passando por uma fase de cocriação, na qual a empresa fornece ao consumidor uma plataforma básica que é usada por este para moldar e obter a sua própria experiência (Gentile *et al.*, 2007).

Apesar das diversas contribuições científicas, existem, segundo Gentile *et al.* (2007), diversas interpretações e conceptualizações com respeito à experiência do cliente, sendo que apenas algumas empresas têm adotado esta perspectiva, o que se pode explicar por duas razões fundamentais: pela ausência de uma terminologia comum e de um modo de pensar partilhado na literatura existente, por um lado, e pela falta de uma abordagem estruturada de gestão, a qual pode ser apenas ultrapassada por uma compreensão mais profunda do papel desempenhado pela experiência do cliente, por outro.

2.2 O conceito de experiência de consumo vivenciada

Tal como referido no ponto anterior, no campo da gestão, a definição de experiência por Carù and Cova (2003), como sendo um acontecimento de interação entre a necessidade ou desejo do consumidor e o consumo, coloca uma ênfase no processo de decisão de compra do consumidor, no qual a expectativa de experiência tanto pode ser gerada no consumidor, aquando das suas escolhas, como nas atividades de consumo, o que sugere que em qualquer organização, seja ela com fins lucrativos ou não, uma cadeia de valor é identificada, cujo *output* final pode ser traduzido pelo conceito de experiência. E esta resulta de um processo de coprodução e de cocriação de valor com elevada participação e influência do cliente (Oyner and Korelina, 2016).

Significa que tanto a perceção após a vivência da experiência de consumo como a variação da perceção devido à vivência da experiência conduz à satisfação do cliente (Sharma and Rather, 2015). Deste modo, a perceção de qualidade do serviço após a vivência da experiência de estada no hotel, com a variação de perceção de qualidade durante a vivência, quando comparado com a respetiva expectativa, conduz à satisfação do cliente com a experiência vivenciada no hotel. Significa que o cliente encontrou melhor do que esperava (Zeithaml *et al.*, 2009).

A economia da experiência bem como o sistema de produção da experiência, ou seja, a maneira de produzir e entregar a experiência, abrangem várias indústrias (Sundbo and Darmer, 2008). Segundo Sundbo and Darner (2008), o referido sistema inclui o modelo geral de negócio, a estrutura de organização e gestão da produção da experiência, a gestão estratégica dos recursos humanos e das capacidades necessárias, para criar a experiência, a maneira como a empresa inova, e a maneira como a experiência é entregue.

Não obstante, em vez de produção da experiência e sua entrega, assume-se a utilização dos termos “proporcionar” a experiência pela empresa (oferta económica) e “revelador” enquanto a experiência dura (abastecimento ou entrega pela empresa), os quais são utilizados por Pine II and Gilmore (1998) e Gilmore and Pine II (2002).

Para Schmitt (1999), uma experiência é um acontecimento individual que ocorre como resposta a um estímulo, o qual provoca diferentes sensações, emoções, comportamentos e valores relacionais que substituem os valores funcionais. E Bigné, Andreu and Gnoth (2005) referem que existe uma relação entre as emoções, a satisfação e a experiência. Na sua investigação, estes autores concluem que na experiência turística as emoções podem ser elementos explicativos da satisfação do turista.

As experiências são proporcionadas e também cocriadas através da interação entre o cliente e o prestador do serviço, numa perspectiva de cocriação de valor, tal como sugerem Prahalad and Ramaswamy (2003) e Chathoth *et al.* (2013). Para Heinonen, Strandvik, Mickelsson, Edvardsson and Sundström (2010), o cliente do serviço é mais considerado o foco da atenção no processo de interação e cocriação de valor, numa lógica dominante do cliente de serviço, do que na lógica dominante do serviço. Sabe-se que a lógica dominante do serviço tem sido usada por Vargo and Lusch (2004) e Lusch and Vargo (2011).

Também Lusch, Vargo and O'Brien (2007) referem que a lógica dominante do serviço fornece a *framework* para clarificar o conceito de serviço e o seu papel na troca de valor e na competitividade da empresa através do serviço. Neste processo de troca, a prestação do serviço e o consumo do mesmo ocorrem em simultâneo, o que traduz a natureza interativa das atividades de serviço.

Mas, para Grönroos and Ravald (2011), a lógica de serviço deve permitir a criação recíproca de valor, sendo esta a base do negócio. Significa que o fornecedor é um facilitador da criação de valor do cliente com recursos e processos interativos (bens, atividades de serviço, informação, etc.) e, durante as interações com o cliente, o fornecedor torna-se um cocriador de valor.

Por outro lado, a experiência do cliente, como um constructo, deve ser conceitualmente validado, o que é aliás proposto na investigação conceitual de Palmer (2010). De facto, Palmer (2010) aborda a experiência do cliente no âmbito da gestão da experiência do cliente, matéria que tem vindo a assumir importância na literatura, cuja evidência é corroborada pelo autor ao afirmar que muitas empresas abordam a gestão da experiência do cliente como sucessor da gestão da relação com o cliente.

Não obstante, Frow and Payne (2007) defendem que a experiência necessita de ser considerada ao longo do ciclo de vida da relação com o cliente. Ora, Palmer (2010) conclui que a experiência pode ser formada dentro de qualquer parte do processo de prestação do serviço, mesmo na que não é controlada pela empresa.

Ainda segundo Frow and Payne (2007), a relação do cliente com o fornecedor do serviço pode englobar centenas de experiências que se manifestam em diferentes pontos de contacto e momentos, envolvendo a memória do cliente. Os mesmos autores defendem que a memória na experiência de serviço é objeto de debate, pelo que se questiona o efeito da memória. Por outro lado, a memória presume “respostas aprendidas,” podendo estas serem inconsistentes com a definição de experiência do cliente, que enfatiza as respostas a estímulos da empresa, tal como Jüttner *et al.* (2013) referem, também citando os autores atrás referidos.

Para Knutson, Bleck, Kim and Cha (2009), a experiência do cliente é um constructo interno com natureza pessoal e individualizada, e que é extremamente difícil de medir. Não obstante, para medir a experiência de serviço do cliente, Jüttner

et al. (2013) propõem uma métrica que integra duas técnicas estabelecidas no comportamento do consumidor e no marketing de serviços, isto é, a *laddering technique* (Reynolds and Gutman, 1988; Reynolds and Philips, 2008) e a *sequential incident technique* (Gremler, 2004; Strauss and Weinlich, 1997). De salientar que Jüttner *et al.* (2013) consideram que tais técnicas são acessíveis às pequenas empresas.

Por outro lado, é relevante que Jüttner *et al.* (2013) assumam que a experiência do cliente é composta por quatro vias (forte influência do processamento cognitivo, processamento maioritariamente cognitivo, processamento maioritariamente emocional e forte influência do processamento das emoções) de interação em contínuo entre o processamento cognitivo e as emoções. Contudo, não é possível perceber qual das quatro vias ocorre em primeiro lugar. Tal constitui um interesse de investigação futura, exatamente por não se saber, em concreto, a que via se dirigem os estímulos da empresa e qual dos processamentos é atingido em primeiro lugar e os restantes, numa certa ordem, se tal for possível. Consequentemente, não é perceptível à empresa a direção das respostas, pela intensidade das reações dos clientes, aos estímulos.

Através de investigação anterior, verifica-se que as respostas cognitivas e emocionais predizem a satisfação do cliente (e.g. Homburg, Koschat and Hoyer, 2006; Phillips and Baumgartner, 2002). Também a definição de estímulos de natureza cognitiva e emocional, para a experiência do cliente, tem sido um tema que tem conduzido a literatura sobre o desenho da experiência de serviço (e.g. Berry, Carbone and Haeckel, 2002; Laros and Steenkamp, 2005; Mattila and Enz, 2002).

Por sua vez, Woodruff, Cadotte and Jeukens (1983) entendem a satisfação como uma resposta emocional positiva ou negativa à desconfirmação entre o que se espera e o que se encontra numa determinada zona de diferença. Já Hunt (1977) tinha entendido que o prazer retirado da experiência de consumo é a avaliação de que a experiência foi, no mínimo, tão boa como se esperava que fosse. Isto implica avaliação cognitiva.

Giese and Cote (2000) encontraram na literatura uma definição unânime que considera a satisfação como um tipo de resposta, é emocional, baseada numa avaliação cognitiva de expectativas, produtos, experiências de consumo, entre outros, que ocorre num período específico, tal como antes da compra, depois do consumo ou depois da experiência alargada.

Por outro lado, a Organização Mundial de Turismo (OMT, 1985) define satisfação do cliente de turismo como um conceito psicológico que envolve o sentimento de bem-estar que resulta da obtenção do que alguém deseja e espera de um produto ou serviço. Sendo a satisfação um estado emocional do turista, o levantamento da questão das emoções e da sua importância no processo de decisão de compra, tal como abordado por Holbrook and Hirschman (1982), tem perfeito enquadramento. Estes autores introduziram o conceito de consumo hedónico, no qual o comportamento do consumidor é influenciado por estímulos sensoriais (visão, audição, olfato, tato e paladar) e por emoções positivas ou negativas, tal como o prazer ou mau humor, e ainda por fantasias do consumidor sobre aspetos que nunca experienciou. Também Parasuraman, Zeithaml and Berry (1988) entendem a satisfação como o conjunto das emoções que resultam da confirmação ou não das expectativas e sentimentos formulados previamente em relação à experiência de consumo. Por isso, as emoções positivas têm efeito na satisfação.

2.3 Incorporação da experiência de consumo no desenho do serviço

Para gerir o desenho da qualidade do serviço é necessário arte na reunião das expectativas do cliente com a experiência que se quer consistente ao longo dos pontos de contacto que integram a prestação do serviço (Lovlie, Downs and Reason, 2008). Por sua vez, o desenho do serviço consiste em gerar ideias e na sua implementação, conduzindo ao crescimento dinâmico da empresa e do lucro (Nixon, 2010). Contudo, segundo Voss *et al.* (2008), o modelo de desenho do serviço experiencial resulta de um complexo agrupamento de ofertas tangíveis e intangíveis desenhadas com a intenção de evocar a resposta “Wow!”

Deste modo, a experiência do cliente tornou-se bastante importante, por permitir diferenciar o serviço e agregar-lhe valor (Sarmiento and Patrício, 2014). As experiências são vivenciadas em cada um dos aspetos da oferta do serviço, abrangendo a qualidade do atendimento ao cliente, o ambiente circundante e a confiança, bem como a interação do cliente com o prestador do serviço e com outros clientes. Portanto, o valor é cocriado pelo cliente em cada momento e ponto de encontro, através das suas interações com o prestador do serviço (Vargo and Lusch, 2004).

Por sua vez, Sarmiento and Patrício (2014), no estudo da experiência de serviço com utilização de tecnologia, referem a necessidade de aprofundar a compreensão da interação do cliente com o prestador do serviço nas diferentes tarefas envolvidas nas operações de serviço, identificando os detalhes em diferentes pontos de contacto do serviço, os momentos e o que estava envolvido para melhorar a experiência de interação. Neste sentido, Patrício, Fisk and Cunha (2008) sugerem a utilização do *Service Experience Blueprint* (SEB), o qual, segundo os mesmos autores, permite a compreensão dos detalhes da experiência de interação do cliente em cada ponto de contato, a conexão entre pontos de contato e o mapeamento de resultados.

Por exemplo, no serviço com dispositivos móveis, outros métodos, tal como observações, entrevistas, mapeamento de contexto e mapeamento de viagem permitem compreender a experiência do cliente e integrar as diferentes dimensões da experiência de acordo com a sua importância em relação aos diferentes estágios de desenvolvimento e prestação do serviço, o que facilita a incorporação da experiência no desenho do serviço (Sarmiento and Patrício, 2014).

Para Khan, Garg and Rahman (2015), a experiência do cliente incorpora a interação entre o prestador do serviço e o cliente, incluindo os aspetos funcionais e emocionais desenvolvidos através de diferentes pontos de contacto com preocupação pela qualidade da experiência nas operações do hotel. Esta evidência resulta do estudo empírico que estes autores realizaram com os hóspedes de hotéis na Índia, a fim de capturar a verdadeira essência do constructo experiência do cliente.

Ainda assim, continua-se a não encontrar na literatura uma abordagem ou um trabalho empírico que permita compreender a incorporação da experiência de consumo do serviço de alojamento nas operações do hotel, com base no conhecimento das expectativas do cliente.

2.4 Variáveis determinantes da experiência de consumo

No estudo com estabelecimentos de bebidas, Bujisic (2014) utiliza as variáveis qualidade do produto, qualidade do serviço, meio ambiente físico, meio ambiente social, informação conveniente e percepção da equidade de preços como antecedentes da experiência do cliente, sendo esta tratada com as dimensões estado experiencial cognitivo e estado experiencial afetivo, e ainda a variável moderadora tipo de estabelecimento. O resultado da experiência de consumo é analisado ao nível do comportamento de fidelização do cliente. Ora, para além deste estudo, outros não são encontrados que permitam, com base no conhecimento das expectativas do cliente, compreender a incorporação da experiência de consumo do serviço de alojamento nas operações do hotel.

3. PROPOSTA DE MODELO DE ANÁLISE

Os estudos prévios não propõem um modelo que seja adequado para avaliar a formação da intenção por parte dos estabelecimentos hoteleiros de incorporar a experiência de consumo no desenho do serviço ou que expliquem a incorporação ou não da experiência no desenho. Por isso, desenvolve-se um modelo explicativo da incorporação ou não da ECDS, do qual derivam as hipóteses de investigação (Figura 1). Neste sentido postula-se que a intenção de incorporação da ECDS, por parte dos responsáveis dos estabelecimentos hoteleiros no Alentejo, está associada, pelo menos, aos seguintes fatores relacionados com as expectativas dos clientes, enquanto coprodutores do serviço:

- Tipologia de estabelecimento hoteleiro;
- Qualidade do produto;
- Qualidade do serviço;
- Meio ambiente físico;
- Meio ambiente social;
- Serviço conveniente;
- Percepção da equidade do preço;
- Incorporação da ECDS dos concorrentes.

Assim, a definição de um modelo explicativo da formação da intenção de incorporar a ECDS, integrando um conjunto de fatores que facilitam a incorporação, é desenvolvido para ser testado empiricamente nos estabelecimentos hoteleiros no Alentejo.

Com este modelo de análise procura-se encontrar resposta para as questões de investigação levantadas.

3.1 Qualidade do produto

Para Peri (2006), os clientes têm geralmente elevadas expectativas em relação à qualidade do produto, o que muitas vezes é mais importante que outros atributos de qualidade, e reconhece que a qualidade dos produtos nas indústrias de restauração e bebidas é o principal atributo a ser considerado como condição necessária para satisfazer as expectativas do cliente, o que, segundo Namkung and Jang (2007) está relacionado com a natureza do constructo qualidade, por exemplo, dos alimentos em ambiente de restaurante, tal como seja o sabor, a apresentação, a variedade, a frescura, a temperatura e a opção pelo saudável, os quais podem ser considerados como fatores de qualidade.

3.2 Qualidade do serviço

Segundo Zeithaml *et al.* (2009), a qualidade do serviço é um atributo importante que afeta a escolha e o comportamento de compra do consumidor, para além de ser um antecedente da satisfação do cliente (Qin and Prybutok, 2008), sendo esta um antecedente da sua fidelização (Polyorat and Sophonsiri, 2010). Zeithaml *et al.* (2009) definem a qualidade do serviço como a percepção do cliente em relação a cada interação que supera a expectativa gerada, sendo essa qualidade vista como um benefício intangível proporcionado pelos colaboradores da empresa no seu desempenho em cada ponto e momento de contacto da prestação do serviço.

A qualidade é percebida durante o consumo que ocorre em simultâneo com a produção do serviço, em cada momento de interação no ponto de contacto, sendo o cliente um coprodutor. Significa que as expectativas do cliente são pontos de referência para a percepção da qualidade do serviço prestado.

Pode incluir os fatores: pontualidade, responsividade, segurança, atenção pessoal, simpatia e empatia (Bujisic, 2014; Kim, Ng and Kim, 2009; Rust and Oliver, 1994; Stevens, Knutson and Patton, 1995).

3.3 Meio ambiente físico

Encontra-se evidência de que a qualidade do meio ambiente físico tem uma importância significativa na indústria de serviços (Bitner, 1990; Wall and Berry, 2007). Bitner (1990) utiliza o conceito de *servicescape* para se referir ao ambiente físico construído ou artificial no qual o encontro de serviço ocorre e que tem efeito, quer no prestador do serviço quer no cliente, o qual faz o seu julgamento de acordo com o que encontra e observa ao nível das dimensões: condições do ambiente, *layout* do espaço e funcionalidade, sinais, símbolos e objetos. Trata-se de elementos tangíveis com impacto na percepção de qualidade por parte do cliente ao efetuar a comparação com as expectativas geradas.

O ambiente, ou seja, o conjunto das evidências físicas e de outros elementos tangíveis, contribui para a qualidade da experiência do cliente. Deste modo, Katsigris and Thomas (2008) referem que um bom ambiente físico inclui o que designam

por fatores “soft”, abrangendo a imagem, estilo, conforto, marketing e ambiente, e “hard”, incluindo a eficiência operacional, custo, segurança, limpeza e manutenção, ergonomia, ruído e alocação de espaço, o que, segundo Bujisic (2014), na hotelaria, em termos de desenho das instalações, tem contribuído para o aumento das taxas de ocupação.

Pode incluir os fatores: qualidade do espaço físico, qualidade dos acessos, iluminação, design, decoração, mobiliário, instalações físicas, *layout*, conforto, limpeza e aparência do pessoal de contacto (Ryu and Jang, 2008).

3.4 Meio ambiente social

Segundo Heide and Gronhaug (2006), o conceito de ambiente social é geralmente conhecido como “atmosfera” e pode influenciar a percepção de qualidade do cliente quanto ao ambiente em que ocorre o encontro de serviço, o que traduz a sinergia de clientes e do prestador com o ambiente da prestação do serviço. Por sua vez, Bitner (1992) refere que o *servicescape* e a atmosfera representam dois conceitos de uma configuração de serviço.

Para Heide and Gronhaug (2006), a atmosfera é criada por indivíduos no ambiente da prestação do serviço e consiste em características que podem representar alguns atributos físicos que não se limitam ao ambiente, sendo, de acordo com estudos, essencial para suscitar sentimentos agradáveis e gerar satisfação no cliente.

Pode incluir os fatores: programa de eventos, música ambiente, número de clientes em interação uns com os outros e com o prestador do serviço, a aparência do cliente, o humor do cliente, a apreciação do cliente (Bujisic, 2014).

3.5 Serviço conveniente

A conveniência do serviço constitui um tópico que tem merecido atenção na investigação de marketing (Colwell, Aung, Kanetkar and Holden, 2008) e está relacionado com o tempo e o esforço dos consumidores na aquisição de produtos ou serviços no processo de consumo (Brown, 1990), muitas vezes inseparável do contexto de serviço e do processo de consumo do cliente (Berry, Seiders and Grewall, 2002). Berry *et al.* (2002) desenvolveram cinco dimensões de conveniência de serviço: percepção de tempo e despesa na tomada de decisão de compra (decisão conveniente), percepção do tempo e esforço para o início da prestação do serviço (acesso conveniente), percepção de tempo e esforço imputados a uma transação (transação conveniente), percepção do tempo e esforço para o consumidor experienciar os principais benefícios do serviço (benefícios convenientes), percepção do tempo e esforço para o cliente reiniciar o contacto com a empresa, após a experiência dos benefícios do serviço (pós-benefício conveniente). Para além destes, segundo Bitner (1992), junta-se a percepção da informação prestada sobre produtos e serviços comunicada ao cliente, podendo usar sinais ou símbolos apropriados (informação conveniente).

Assim, pode incluir-se os fatores: localização, estacionamento, mapa de viagem e acesso, informação de preços e serviços, informação de atrações e de eventos, características do pessoal de contacto, forma de atendimento, falhas e segurança.

3.6 Percepção da equidade de preços

Na avaliação de um serviço, a equidade de preço torna-se um dos fatores mais importante a considerar pelo cliente. De acordo com Chung and Petrick (2013), alguns clientes são influenciados nas suas decisões por preços baixos e outros estão dispostos a pagar mais por um produto de melhor qualidade. O julgamento do preço justo é explicado como uma impressão do cliente sobre o processo de transação que sugere tratar-se de preço razoável e aceitável (Chung, Kyle, Petrick and Absher, 2011). Pode incluir os fatores: estratégia de comunicação de preços e expectativa do cliente, comunicação e explicação da variabilidade de preços ao cliente (Choi and Mattila, 2005).

3.7 Incorporação da ECDS dos concorrentes

Segundo Krassa (1988), as decisões tomadas diariamente dependem geralmente das percepções dos decisores das empresas sobre os seus parceiros que trabalham em ambientes similares e que já tomaram decisões semelhantes. Por sua vez, Carr and Harris (2004) defendem que existe uma tendência para a imitação. Ora, se o contexto ambiental envolve fatores relacionados com a envolvente externa onde o estabelecimento hoteleiro se insere, e se este entende que uma parte dos concorrentes já incorpora a ECDS ou tem a intenção de incorporar, então tal pode influenciar positivamente a decisão de incorporação da ECDS.

3.8 Tipologia de estabelecimento hoteleiro

Vários estudos utilizam fatores que moderam ou controlam o efeito de variáveis na experiência de consumo (por exemplo, Verhoel, Lemon, Parasuraman, Roggeveen, Tsiros and Schlesinger, 2009; White and Dahl, 2006). No estudo de Verhoel *et al.* (2009), o tipo de estabelecimento atua como um moderador entre vários antecedentes da experiência do cliente. Também Walls, Okunus, Wang and Kwun (2011) evidenciam que o efeito do ambiente físico e da qualidade do serviço na experiência do cliente é diferente conforme a tipologia de estabelecimento hoteleiro.

Figura 1 – Proposta de modelo de análise

3.9 Hipóteses propostas para teste

- H1: Os estabelecimentos com maior nível de concordância com a qualidade do produto nas expetativas do cliente identificadas têm maior propensão para incorporar a ECDS;
- H2: Os estabelecimentos com maior nível de concordância com a qualidade do serviço nas expetativas do cliente identificadas têm maior propensão para incorporar a ECDS;
- H3: Os estabelecimentos com maior nível de concordância com o meio ambiente físico nas expetativas do cliente identificadas têm maior propensão para incorporar da ECDS;
- H4: Os estabelecimentos com maior nível de concordância com o meio ambiente social nas expetativas do cliente identificadas têm maior propensão para incorporar a ECDS;
- H5: Os estabelecimentos com maior nível de concordância com o serviço conveniente nas expetativas do cliente identificadas têm maior propensão para incorporar a ECDS;
- H6: Os estabelecimentos com maior nível de concordância com a percepção da equidade de preços nas expetativas do cliente identificadas têm maior propensão para incorporar a ECDS;
- H7: Os estabelecimentos que percebem uma maior incorporação da ECDS dos concorrentes têm maior propensão para incorporar a ECDS.

4. CONSIDERAÇÕES FINAIS

No seguimento do enquadramento teórico, verifica-se que a respostas às questões de investigação apenas podem ser analisadas ao nível da proposta de modelo de análise antes desenvolvido, não significando que este traduza as respostas, como se fosse a resolução de um problema de investigação formulado. Mas, pode constituir a explicação de um caminho a seguir.

Na hotelaria e em outras indústrias a qualidade do serviço e a satisfação do cliente com a experiência de consumo vivenciada são determinados pelo desenho do serviço que resulta, em parte, do conhecimento e interpretação das expetativas do cliente em cada momento e ponto de contacto no encontro de serviço e do processo de interação com o cliente. Assim, segundo Zeithaml *et al.* (2009), o foco no cliente implica que o estabelecimento hoteleiro reconheça que os clientes possuem diferentes tipos de expetativas quanto ao desempenho do serviço. As expetativas são crenças sobre a prestação do serviço,

constituindo motivos de escolha da experiência, e que servem como padrões ou pontos de referência em relação aos quais o desempenho é julgado. Uma vez que os clientes comparam as suas percepções de desempenho do serviço com esses pontos de referência, quando avalia a qualidade do serviço, o conhecimento profundo sobre as expectativas de experiência do cliente (motivos de escolha) é fundamental para os profissionais de marketing e para a gestão das operações associadas à prestação do serviço de alojamento.

O modelo de análise proposto será empiricamente testado nos estabelecimentos hoteleiros no Alentejo. Tratar-se-á de um estudo correlacional que testa o conjunto das sete hipóteses, sendo a unidade de análise o estabelecimento hoteleiro de uma população de cerca de 121 estabelecimentos registados no Turismo de Portugal. Para testar as hipóteses realizar-se-á um conjunto de testes estatísticos, nomeadamente, a análise fatorial confirmatória (AFC) e a regressão logística, a qual permite a evidência no sentido de se considerar os fatores que serão determinantes e significativos no cálculo da probabilidade de um dado estabelecimento hoteleiro poder incorporar a ECDS. Também é possível obter a evidência da tipologia de estabelecimento que terá maior propensão para incorporar a ECDS.

Assim, o desenho da investigação caracteriza-se por: propósito de teste de hipóteses; tipo correlacional; seccional no horizonte temporal; a unidade de análise é o estabelecimento hoteleiro; o tipo de estudo é de campo, através de inquérito aos dirigentes dos estabelecimentos hoteleiros.

O modelo será testado com dados obtidos através de questionário construído com base no modelo explicativo desenvolvido. O questionário será disponibilizado via Google Forms, o qual será previamente testado junto de 30 estabelecimentos hoteleiros escolhidos aleatoriamente na base de dados de 121 estabelecimentos, antes da aplicação definitiva. Este processo de recolha de resposta será operacionalizado em junho e julho de 2017.

Procurar-se-á, então, estimar a probabilidade de um determinado estabelecimento hoteleiro incorporar a ECDS, utilizando o modelo de regressão logística (Almeida, 2008) que permitirá evidenciar uma relação não linear entre a variável dependente binária e o conjunto de variáveis explicativas. Esta abordagem de regressão logística, utilizando um modelo não linear (Long, 1997), envolve o conceito fundamental de *odds ratio* (Menard, 2001), para além dos conceitos de probabilidade e de transformação *logit*.

Segundo Almeida (2008), o interesse na utilização de um modelo *logit* assenta basicamente nos seguintes motivos (Hair, Andersosn, Tatham and Black., 2001):

- 1) permite modelar fenómenos em que a variável dependente é binária;
- 2) é uma técnica genérica e robusta, pois a sua aplicação é apropriada a várias situações de investigação, permitindo operar quer com regressores quantitativos quer com regressores *dummy*;
- 3) não pressupõe a normalidade multivariada do conjunto dos regressores, sendo este um pressuposto, por exemplo, da análise discriminante que também permite modelar variáveis dependentes binárias;
- 4) é uma técnica com bastantes semelhanças relativamente à regressão linear múltipla.

O modelo de regressão logística é consistente com o modelo representado na Figura 1 do qual derivam as sete hipóteses de investigação. A confirmação destas hipóteses permitirá responder às questões de investigação números um e dois. A resposta à questão número três será possibilitada pela divisão das observações em grupos por tipologias de estabelecimentos hoteleiros. Com a aplicação do referido modelo de regressão logística na análise dos dados encontrar-se-á algum fator ou fatores que discriminem entre os tipos de estabelecimentos com maior ou menor propensão para a incorporação da ECDS.

Esta investigação permitirá compreender a percepção dos dirigentes dos estabelecimentos hoteleiros no Alentejo sobre a expectativa de experiência de consumo por parte do cliente, através da evidência sobre a propensão para o estabelecimento hoteleiro incorporar a experiência de consumo no desenho do serviço de alojamento, bem como verificar esta propensão por tipologia de estabelecimento, e sobre a importância dos fatores que determinam a intenção de incorporar a referida experiência no desenho do serviço, o que assegura que o problema em estudo é relevante para a comunidade científica, por permitir ainda fornecer alguns contributos essenciais: formulação de estratégias e definição de práticas de gestão de operações conducentes ao melhor nível de qualidade em cada momento e ponto de contacto entre pessoal de contacto e cliente, tornando a experiência de consumo única e memorável, o que tem implicações para o marketing e para a gestão das operações.

MACHO ONDE ?! MAL ONDE ?! CORPO, IDENTIDADE E SAÚDE EM CLÍNICAS DE FISIOTERAPIA

Diogo Nogueira Protásio Lopes de Oliveira
Universidade de Évora
(dnprotas@gmail.com)

RESUMO

As questões de gênero ligadas às diversas masculinidades expressas no atual contexto político, social e econômico brasileiro exige um repensar tanto sobre o acolhimento destes homens e suas queixas nos serviços de saúde, quanto sobre a eficácia das intervenções no acompanhamento da sua carreira como homem doente e na afirmação de sua identidade. Observamos pacientes que se questionavam sobre sua masculinidade ao se confrontar com o próprio corpo, com suas limitações e facilidades, no decorrer do tratamento fisioterapêutico. O resultado da observação participante em clínicas de Fisioterapia na cidade de Belém sugere que há um repensar sobre as atitudes viris por parte deles, ao se depararem com suas incapacidades. «Os homens mudam» foi o título dado ao encontro dirigido por Welzer-Lang (2014) sobre a resistência do masculino a aceitar as mudanças sobre si trazidas por um novo contexto social. É no panorama embebido do pensamento de influência feminista que os homens ensaiam um repensar o masculino, as expressões de masculinidade. As questões ligadas à identidade de gênero, à orientação sexual e a representação do masculino chegam às clínicas de Fisioterapia como lugar privilegiado para uma intervenção no aspecto social.

Palavras-chave: Corpo, Masculinidade, Identidade, Saúde.

JEL Classification: I12

1. INTRODUÇÃO: MASCULINO TAMBÉM É GÊNERO?

O masculino e as formas de abordá-lo em ciências humanas ainda são temas de discussão. Contudo, é Welzer-Lang (2002) que nos chama a atenção para o fato de Nicole-Claude Mathieu em 1971 alertar sobre a necessidade de estudar o homem e o masculino como uma categoria de mesmo patamar que a das mulheres e do feminino. Inseparáveis, feminino e masculino são as categorias de sexo, componentes do sistema estrutural que cobre a totalidade do campo social. Fala-se em sistema social de sexo para se referir ao funcionamento dialético das relações sociais entre os sexos.

O masculino é gênero a partir da relação com o feminino, e portanto não é pressuposto a partir do sexo. O homem se constrói como tal ao incorporar práticas que são reconhecidas como masculinas dentro do grupo social no qual se insere. Contudo, no que se refere ao indivíduo, há um história e uma permanente afirmação da identidade masculina. O corpo, a corporeidade dos homens e a saúde são alguns dos vários aspectos que compõem a identidade masculina.

Corpo, identidade e saúde do homem são os três eixos que gostaríamos de tratar nesse artigo. A motivação surge da demanda indireta dos próprios homens, usuários do serviço fisioterapêutico. Por questões diversas, em geral ligadas a uma momento de bifurcação biográfica, muitos trouxeram as sessões de tratamento físico queixas ligadas a sua identidade como homem. Aparentemente, o ambiente terapêutico criado em um ginásio de reabilitação física contribui para que homens se sintam à vontade de trazer questões paralelas ao tratamento, mas que contribuem para a sua saúde.

Concomitante às reflexões individuais, é criado no Sistema Único de Saúde – SUS (programa brasileiro de saúde pública) o projeto voltado para atenção integral a saúde do homem, indistintamente do gênero declarado. Uma resposta do governo à uma necessidade social face aos altos índices estatísticos de morbidade e mortalidade ligado aos homens supostamente produtiva. É da crítica feminista em sua leitura do social que denuncia tais agravos resultantes da construção de uma identidade de gênero no qual se tem por modelo o masculino viril e a prática heterossexual como norma. O mal está no androcentrismo¹ (Welzer-Lang, 2010).

Percebemos que a Fisioterapia contemporânea contribuído com abordagens onde se busca compreender os homens em sua totalidade, tendo em conta os fatores biológicos, psíquicos e sociais que o integram. A nós interessa ao modo como os homens sustentam aquele modelo ao reagir a uma doença física, especificamente a um trauma de natureza ortopédica. Em outras palavras, nos questionamos sobre os possíveis impactos, se há algum, do tratamento fisioterapêutico na construção de uma identidade masculina. Buscamos com isso perceber se os recursos usados na Fisioterapia podem contribuir para o desenvolvimento de um masculino baseado na não violência.

Interessa-nos compreender se os homens se apropriam das técnicas corporais praticadas nos ginásios terapêuticos, e como eles o fazem. Partimos da hipótese que se a consciência corporal sexuada oriunda do processo de socialização é reforçada ao longo da vida, uma mudança nas práticas corporais imposta por um transtorno no sistema musculoesquelético,

¹ O androcentrismo é uma mistificação coletiva visada pelos homens em esconder a forma de interação (real, virtual ou imaginária) entre eles e os modos de construção do masculino centrado sobre as atividades de luta, concorrência e poder, tendo as mulheres sempre em minoria.

por exemplo, poderia ser percebida como um momento de bifurcação biográfica² (Bidart, 2006). Haveria portanto uma adaptação ou o desenvolvimento de uma nova imagem de si próprio?

Foi no exercício profissional como fisioterapeuta que nos deparamos com as queixas de clientes em relação a sua autoimagem, sobretudo no que tange a representação do corpo. A carreira (Dramon, 2008) de doente por vezes os fazia notar diferenças de como se percebiam antes e após o trauma. Acontecia dos clientes tomarem consciência da necessidade de uma nova condição pessoal a partir do percurso trilhado durante o tratamento. Os antigos referenciais de identidade já não eram mais coerentes com a percepção de si no presente, depois de submetidos ao tratamento fisioterapêutico.

Assim, em um primeiro momento apresentamos como se construiu a identidade do homem belenense. Tomamos por base estudos históricos e antropológicos em torno de temas ligados ao mito, a religião e política local.

Em seguida, daremos maior atenção para as reflexões sobre masculinidade e saúde no contexto atual. A esse propósito pensamos ser importante alargar a discussão sobre as questões da masculinidade, cuidado e saúde no o contexto amazônico, de modo que, apesar de esse estudo ser realizado em um cenário micro-social como clínicas de fisioterapia, os resultados obtidos possam convergir com as reflexões atuais inerente ao processo de mudança vivido por homens quanto ao pensar e expressar a sua masculinidade em esfera mais ampla, macrossocial.

Em um terceiro tópico, abordaremos as questões de escolha metodológica, as dificuldades e potencialidades vividos na pesquisa de campo, antes de se entrar na discussão dos resultados propriamente dito.

Gostaríamos com isso ressaltar o panorama de fundo das práticas corporais associadas ao masculino e as questões de gênero no âmbito dos profissionais da saúde. O benefício desta pesquisa é ressaltar a necessidade de se repensar a abordagem terapêutica e as práticas corporais no cuidado de homens em situação de vulnerabilidade ou sofrimento, assim como incluir o tratamento fisioterapêutico no rol de estratégias para repensar a saúde do homem e as expressões de masculinidade.

2. BELENENSE³ DE RAIZ⁴: HISTÓRIA, MITO, IDENTIDADE

A cidade de Belém, capital do estado do Pará, foi fundada há 400 anos, no início do período colonial de Portugal sobre o Brasil. Viveu a chamada *Belle Époque*, período de maior desenvolvimento econômico e social, entre os anos de 1850 e 1920 com a exploração da floresta de seringueiras, extração de látex e exportação da borracha (Duarte, 2007). A partir destas datas, se pode dividir a história da cidade em três etapas: do descobrimento à *Belle Époque*, momento marcada pela presença religiosa e termina com a revolta dos Cabanos; a *Belle Époque* em si com a formação de uma elite burguesa; e o período contemporâneo, já após a queda da monarquia no país e a consolidação da República Federativa do Brasil.

O marco temporal coincide aproximadamente com os elementos que se agregam na construção da identidade. Maués (2005) resalta que a identidade do povo na Amazônia ocidental está apoiada em três pilares: a memória da «Cabanagem» - revolta popular ocorrida na primeira metade do século XIX – ainda presente no sentimento de pessoas nascidas nas cidades mais marcadas pelo movimento de libertação; a religiosidade, notoriamente a fé católica nos santos populares – em especial a «festa do Círio» dedicada a Nossa Senhora de Nazaré; e as personagens lendárias, geralmente ligados à natureza e presentes nos rituais de cura praticados pelo caboclos⁵ da região. Ribeiro (2015) destaca que esta identidade regional, rica em historicidade e simbolismos, traz em si a mistura complexa de característica próprias de ribeirinhos, de caboclos e de cidadãos na composição do que é ser paraense⁶.

Ricci (2006) esclarece que esta mistura se dá justamente porque no movimento da «Cabanagem» havia um interesse comum de liberdade partilhado por indígenas, negros e mestiços. Era o esboço de um sentimento patriota, algo novo para a época já que não havia ainda a noção de nação brasileira ou de pátria (no sentido de terra mãe ou local de origem). Foi justamente em torno da revolta contra o poder autoritário exercido pela capital do império e pelos portugueses que se criou um romance nacional com seu heróis e símbolos. O sentimento de se apropriar de um território e defender a cultura local cresceu justamente com a revolta da «Cabanagem».

Neste sentido, a «Cabanagem» está mais próxima do pensamento independentista concebido na América espanhola e no Caribe do que dos movimentos similares desencadeados nas demais regiões do Brasil, nos quais era forte a atitude política de base republicana e contra o escravagismo. Ricci (2012) defende a teoria de que a Amazônia ocidental foi profícua em técnicas de luta armada voltada à resistência contra qualquer tipo de poder autoritário, para além do sistema colonial. De fato, a «Cabanagem» teve grande influência anarquista, o que gerou momentos de grande incerteza nas principais cidade do estado por falta de um governo efetivo.

A «Cabanagem» é mencionada como marco ideológico na luta contra uma dominação institucionalizada. O movimento foi dissipado por divergências internas, por opressão do governo e intervenção da Igreja (Ricci, 2012). A referência à esta memória revolucionária pode ser ainda vista no imaginário do belenense como componente de sua identidade masculina na medida em que o homem cabano é qualquer um dos que luta pela cultura local, seja ele mestiço, negro, branco ou indígena.

Outro fator é a presença Católica na região. É importante dizer que foram os religiosos da Companhia de Jesus os primeiros a chegar na Amazônia, portanto os verdadeiros colonizadores da região. Tal marca é notada tanto no nome da cidade hoje Belém – mas Santa Maria de Belém do Grão-Pará quando da sua fundação – e no calendário civil ainda repleto de festividades religiosas ao longo de todo o ano. Talvez o «Círio de Nossa Senhora de Nazaré» seja a mais importante delas.

² Entendemos por bifurcação como um momento de crise a partir da qual se abre uma encruzilhada imprevisível ao início de na trajetória biográfica de uma pessoa, mas que implica uma tomada de decisão a partir da qual há uma mudança importante na orientação pessoal.

³ Belenense ou belemense diz-se de quem nasce na cidade de Belém, capital do Estado do Pará.

⁴ A expressão « de raiz » é usada entre brasileiros para indicar algo que está na estrutura de sua formação e, portanto, inseparável de sua identidade. Há no francês o equivalente « de souche » que designa geralmente uma linhagem de família, origem, estirpe.

⁵ Caboclo é um termo específico para designar a mestiçagem entre índios e brancos. Atualmente se refere genericamente aos nativos da região que ainda vivem longe dos centros urbanos.

⁶ Paraense é a pessoa nascida no território do Estado do Pará.

O mito originário da festa fala de um caboclo que encontra uma estatueta de Nossa Senhora às margens do rio e a leva para casa. Misteriosamente, a estatueta some e é reencontrada novamente no mesmo local na beira do rio. Fato que se repete noites seguidas até que o caboclo decide por construir um altar dedicado a Santa no lugar onde sempre aparecia a imagem (IPHAN⁷, 2006). Em poucas palavras, o chamado «Círio de Nazaré» consiste em uma série de procissões que encenam o ato de ir buscar a estatueta no que era o limite da cidade antigamente, trazê-la ao centro e reencontrá-la no seu ponto de origem. A primeira procissão oficial data de 1793 (Almeida, 2013), época em que a Igreja exercia grande poder local. Ainda hoje esta é uma celebração tão importante quanto as do Natal e Páscoa para a comunidade católica da cidade de Belém (Maués, 2008).

Almeida (2013) acrescenta que o culto a Nossa Senhora foi desde o início uma manifestação popular. Apesar de ter sido institucionalizado pela Igreja, há divergências entre as expressões segundo os preceitos Católicos e outras formas de expressão de fé ou respeito pelo tradicional culto à Virgem de Nazaré. Pode-se citar a «corda do Círio» e a «festa das Chiquitas» como exemplos de afirmação da identidade do povo.

A «corda do Círio» é um elemento incorporado à procissão já no século XIX, fase posterior a *Belle Époque* com decadência dos valores burgueses e perda de prestígio no panorama nacional. A berlinda na qual estava sendo conduzida a estatueta da Virgem de Nazaré ficou de rodas atoladas em um lamaçal, ao que os devotos atrelaram uma corda e conduziram-na até a Basílica, ponto final da procissão. O gesto se tornou símbolo da devoção e superação do povo, representado por uma demonstração de força e fé que se perpetua até nossos dias (IPHAN, 2006).

Ribeiro (2015) refere que ainda mais recente é a «Festa das Chiquitas» (ou Filhas da Chiquita, ou ainda das Maria Chiquitas). Criada já em meados da década de '70 por um grupo de artistas e intelectuais – no qual a presença de gays, lésbicas e travestis não eram exceção – em uma atitude quase carnavalesca, mas sobretudo irreverente e contestatória, de demonstrar a sua fé em Nossa Senhora de Nazaré. A festa inicia logo após o fim da procissão noturna e vai até o raiar do dia seguinte quando inicia a procissão principal. O nome «Maria Chiquita» faz alusão tanto a Virgem Maria, Mãe de Jesus, quanto a folclórica personagem da mulher negra presente nas antigas músicas de carnaval.

Estes dois exemplos nos mostra o quanto a construção da identidade masculina local é atravessada tanto por estereótipos de força e superação quanto por questões de gênero e reivindicações sociais. Pode-se falar em dualidade, um conceito explorado por Maués (2006) a partir da análise que faz dos mitos presentes na região. Segundo aquele autor, a cultura e a natureza amazônica são indissociáveis do humano quando se trata do caboclo, pois ele como pessoa está intimamente ligado ao rio, à floresta que o circunda e nutre. É desta simbiose que nasce personagens como a do «boto» (uma espécie de golfinho de água doce), ao mesmo tempo peixe e mamífero, aspecto esse que confere a ele uma certa humanidade.

Diz a lenda que o boto assume a forma de um homem quando sai das águas do rio para seduzir as moças jovens durante a noite; ou ainda em uma mulher que seduz os pescadores, deixando-os loucos. A urbanização e instrução vinda com a modernidade fez dessas histórias um tentativa de explicar o que era visto como desvio de conduta (homossexualidade, por exemplo), doenças graves, ou ainda a gravidez indesejada de uma menina solteira – sem que o verdadeiro autor fosse revelado, até para proteger a honra da moça (Maués, 2008).

A partir dos estudos citados podemos perceber que o homem belenense pode ser um misto de valoroso, robusto e visionário com algo de contestador, transviado e sedutor. Adjetivos que, para além do caráter de cada indivíduo, estão inscritos no corpo daqueles que se identificam com a região e se reconhecem nela. São fruto da miscigenação de traços e culturas europeias, africanas e ameríndias. O homem belenense é um tipo único ainda ligado com a natureza que o cerca e lhe confere sentido.

3. MASCULINIDADES EM BELÉM: CORPO, VIRILIDADE, SAÚDE

Pimentel (2011) é quem traz a lume a discussão sobre masculinidade em Belém. Afirma que o padrão de masculinidade atravessa um momento de ruptura. As imagens fantasmáticas do pênis ereto e da penetração sexual perde pouco a pouco o sentido de virilidade e potência. Passa-se a valorizar características como os laços afetivos de amizade, a capacidade de escuta e abertura para o diálogo, o desenvolvimento pessoal e a elaboração de um senso crítico através da literatura, arte e esporte. Neste momento reconhecido como de transição entre modelos do masculino, reconhece, contudo, que há ainda uma pluralidade de expressões de masculinidade coexistentes. No mais, a autora insiste sobre a necessidade de maior trabalho das instituições públicas e da família para a formação de homens com masculinidades mais sensíveis ao outro, no sentido de ser viril sem ser necessariamente violento.

O Ministério da Saúde do Brasil, se mostrando sensível às questões sociais ligadas ao masculino, institucionalizou a Política Nacional de Atenção Integral à Saúde do Homem – PNAISH na no ano de 2009 através da Portaria 1.944. O objetivo do programa é diminuir as taxas de morbidade e mortalidade dos homens, considerada como elevada em comparação aquelas das mulheres no país. Além disso, tais medidas visam a criação de espaços no serviço de saúde (hospitais, clínicas especializadas, postos de saúde e serviços em geral) nos quais os usuários possam ser melhor acolhidos em suas necessidades enquanto homens. Na sequência desta lei, um setor estratégico foi criado em cada estado da federação para se dedicar especificamente à temas relativos à saúde do homem.

Em Belém, as ações em saúde com homens se limitam ao nível primário de intervenção. São organizadas campanhas de despistagem do diabetes, hepatites, hipertensão arterial e câncer de próstata (por exemplo, com a adesão a campanha internacional «Novembro Azul»). A secretaria de estado investe em encontros e palestras informativas destinados aos usuários e profissionais como forma de conscientização da população em geral e capacitação das equipes de agentes de saúde. No pano de fundo destas medidas, há o combate ao preconceito de que saúde do homem se restringe às doenças sexuais e genitais; bem como, contra o descaso dos homens com sua saúde e sua agressividade para consigo e com os outros.

⁷ Instituto do Patrimônio Histórico e Artístico Nacional – IPHAN.

No entanto, Separavich & Canesqui (2013) chamam a atenção para o risco de se colocar os homens em uma atitude de vitimização, ao não se levar em conta a relação de dominação e poder do masculino para com o sexo feminino, existente desde o início do processo de socialização. Mencionam ainda que as questões de gênero tornam-se ainda mais evidentes quando os dados estatísticos mostram que os fatores externos (exposição a uma situação risco, acidentes de automóvel, violência) são as principais causas de morte de homens entre 20 e 59 anos. É de extrema importância ter sempre uma abordagem relacional de modo a pensar o gênero na construção da identidade dos homens e do corpo masculino. Postura essa que é facilmente esquecida quando se fala de políticas públicas no campo da saúde.

A tendência é frequentemente de fazer do corpo uma propriedade da medicina, reduzindo-o ao aspecto biológico. Um exemplo claro é de pensar a impotência sexual masculina como uma dificuldade de ereção por fatores hormonais, sem se preocupar com as questões emocionais e afetivas, com os laços sociais também como causadores de disfunção. Esse tipo de abordagem reforça a ideia de pênis como um símbolo do macho viril, do sexo forte, eleva a função reprodutiva ao patamar mais importante, pondo em detrimento a percepção de si na relação com o corpo na construção da identidade masculina. Por vezes, o corpo masculino não é nem mesmo considerado nas intervenções de saúde pois aparece como secundário a outros aspectos como o papel de pai, de provedor, de marido, o que reforça ainda mais um padrão de masculinidade hegemônica (Gomes, 2014).

Percebemos que a falta de um olhar sobre o gênero no âmbito do sistema de saúde brasileiro faz com que os homens tenham ainda mais dificuldade de ter acesso ao serviço de saúde, a adotar medidas preventivas e a aprender a cuidar por si de sua saúde. A caricatura é do homem viril incompatível com a fragilidade associada ao necessitar de cuidados ainda vigora no país. Em resumo, o imaginário androcêntrico é nocivo aos próprios homens. Como resultado, eles não se sentem acolhidos nos serviços de públicos de saúde, por acreditar que ali não é espaço para eles.

Logo, as medidas de saúde pública não deveriam ser dissociadas do contexto onde serão aplicadas. No caso dos belenenses, sabemos que a construção da identidade local tem suas raízes na historicidade da região, na religião e seus símbolos, e nos mitos que afirmam o sentimento de pertencer a um território em particular. De que modo tais características podem ser associadas às ações de intervenção em saúde para melhor atender as necessidades da população alvo? Eis um dos desafios que o sistema de saúde local deve enfrentar no que se refere à saúde dos homens na região amazônica.

Percebe-se que o modo com que o sistema de saúde aborda as questões sobre o masculino determinam a relação do próprio homem com o seu corpo e sua saúde, na construção da masculinidade como forma de expressão, e na interação social. Corpo, saúde e identidade (no caso deste estudo, a identidade masculina, mas não só) são facetas da estrutura social atravessada por questões de gênero. O estudo do corpo na interface entre os aspectos biomédicos e psicossociais dá outro sentido às práticas corporais praticadas por homens que se vem em busca de uma afirmação de sua masculinidade.

4. QUE CORPO É ESSE? O MASCULINO NOS GINÁSIOS FISIOTERAPÊUTICOS

Le Breton (2010) anuncia que a existência é corpórea, portanto é através da formação dada ao corpo que cada sociedade se estrutura. Por essa razão, os estudos sociais sobre o corpo e as práticas corporais são também legítimos. Heritié (2003) menciona a natureza sensível do corpo é o que concede uma dimensão afetiva à vida em sociedade.

No mesmo sentido, Meidani (2007) explica que não é o indivíduo que se inscreve em um grupo social, mas as normas sociais e seus valores que são inscritas no corpo. As marcas do social próprias ao indivíduo são incorporadas de maneira a permitir que ele possa fazer uso de suas práticas corporais.

O masculino se constrói na relação com o outro, notadamente no conflito entre os gêneros. Para os homens, o processo de reconhecimento de si passa pela negação do feminino e de tudo que o assemelha como baliza para descrever tudo que é viril. Welzer-Lang (1994) afirma que negar a presença do outro em si gera sofrimento e desencadeia a atitude violenta percebida e registrada no corpo.

Connell (1992) é quem primeiro desenvolve a ideia de que há um modelo universal de masculino tendo por base parâmetros históricos, linguísticos e sociais. Apresenta o conceito de uma masculinidade hegemônica comum a todas as culturas estruturadas sobre as diferenças sociais intrínsecas às questões de gênero.

Acrescenta ainda que as definições de virilidade e de masculinidade não são de todo evidentes, nem tão pouco a relação direta entre os dois termos. Estes conceitos são uma construção social, portanto mudam de acordo com o contexto histórico e social. É conveniente falar de masculinidades (no plural) para incluir atores com identidade e orientação divergente ao da norma, por serem esses a muitas vezes denunciar problemáticas quotidianas nas relações entre os sexos (Connell, 2013).

Acreditamos que o aspecto político na construção do sujeito sexuado é apenas um dos fatores se articula com a percepção próprio corpo e a consolidação de uma identidade de gênero. Logo, o conceito de masculinidade hegemônica poderá ser utilizado como ótica de leitura em alguns casos, mas que não pode ser usada neste estudo por preferirmos o método compreensivo sobre o sujeito, tendo por baseados seus relatos.

5. COMO ABORDAR O TEMA SOBRE CORPO E MASCULINIDADE?

Com frequência durante os tratamentos de fisioterapia surge a reflexão sobre o falar do corpo e o gesto como expressão: «Quando se fala do corpo, não é o próprio corpo que fala? Ou ainda, o que se diz deste corpo que fala?». Há o cuidado em fisioterapia de se perceber o corpo inscrito no mundo social que o organiza e dá sentido, antes mesmo de se tentar percebê-lo a partir de suas estruturas anatômicas e fisiológicas. Afinal, a Fisioterapia em sua origem tinha por objetivo primeiro reabilitar pessoas com dificuldades motoras ao convívio social.

O tratamento fisioterapêutico intervém justamente no registro corporal, nas feridas, na dor. Em Fisioterapia, o corpo é ao mesmo tempo instrumento de trabalho e objeto de estudo. Mais comumente visto através do prisma da biomecânica, o corpo traz em si a expressão do indivíduo e as suas representações sociais. A experiência profissional nos mostra que o gesto, também chamado de prática corporal, é o limite do tratamento terapêutico.

Foi a necessidade de acolher, acompanhar e cuidar de jovens adultos no percurso de construção da sua identidade enquanto homens que nos instigou a ponderar sobre as consequências das certas práticas corporais na afirmação social de uma imagem viril. Este estudo centra-se sobre a pessoa, particularmente sobre os homens que se declaram masculinos, heterossexuais e viris. Tem-se por base, contudo, que o masculino possui diversas formas de expressão podendo inclusive ser plural, de características passíveis de mudança. Para nós, a identidade deve ser afirmada continuamente, portanto deve ser sempre compreendida no contexto específico de tempo e espaço social. É necessário um recorte na biografia do indivíduo para se abordar as questões de identidade, no caso usamos o tempo no qual se submeteram ao tratamento fisioterapêutico.

Como a construção da identidade é atravessada pelas questões de gênero, trataremos as práticas corporais como meio pelo qual cada pessoa toma consciência de seu corpo como sexuado, sendo essa apenas uma etapa na construção da identidade individual. Logo, um trabalho de análise sobre o masculino deve sempre considerar que esse está inserido em um sistema social de sexo situado em um espaço e tempo determinado. É tendencioso pensar o masculino separado do feminino ou, ainda mais grave, fora da análise sob a ótica de uma teoria feminista. Optamos por uma leitura preferencialmente diferencialista, contudo sem perder de vista que os homens passaram por uma construção social para o viril – entenda-se, através da violência. Sendo esse com frequência um fator que os leva à práticas de risco e ao adoecimento.

Utilizamos como método etnográfico de observação participativa para uma análise compreensiva sobre como as práticas corporais usadas em Fisioterapia. O papel de observador foi facilitado pelo fato de o pesquisador ter a formação profissional em Fisioterapeuta, o que justificava a sua presença no ginásio terapêutico. Além disso facilitava obter informações quanto a história do paciente e de que modo os recursos fisioterapêuticos contribuíram para a construção de uma identidade masculina dos homens ali envolvidos.

Os maiores desafios foram: estar atento a vários atendimentos que aconteciam ao mesmo tempo no ambiente e não intervir diretamente no tratamento. Foram escolhidas duas clínicas, uma de natureza pública, outra privada, para assim se ter um apanhado mais amplo quanto a expressões de vários tipos de masculinidades.

A escolha do terreno foi baseada em quatro aspectos: 1. Estudos recentes sobre masculinidade e identidade desenvolvidos na cidade; 2. Abertura recente na Secretaria Estadual de Saúde do setor de saúde do homem voltado a implementação de projetos de prevenção primária e conscientização dos profissionais da saúde a respeito do tema; 3. Local de nosso exercício profissional, portanto, onde primeiro se teve contato com a demanda de clientes; 4. Facilidade de acesso a clínicas no setor público e privado, por intermédio de nossa rede de relacionamentos profissional.

Acompanhamos os profissionais durante dois meses consecutivos. As anotações eram feitas ao final de cada hora de atendimento ou registradas em áudio e imediatamente transcritas durante os períodos de intervalo. Ao término do período de observação, oferecemos uma devolutiva aos diretores das instituições onde foram realizadas a parte de campo, de modo a contribuir com a melhoria dos serviços prestados.

Foram considerados como informantes, homens de idade entre 20 e 60 anos que se declaravam ativos profissionalmente, de orientação heterossexual e oriundos da região. Dez deles foram tidos como informantes privilegiados por terem aderido verdadeiramente ao tratamento e se mostrarem mais dispostos a participar das entrevistas. Frequentavam o ginásio terapêutico de duas a três vezes semanais de acordo com o programa estabelecido pelo/a fisioterapeuta responsável. Os atendimentos duravam entre três quartos a uma hora.

Vale ressaltar que ambos os ginásios terapêuticos eram frequentados tanto por homens quanto por mulheres, indistintamente. Comumente, havia sempre um/a acompanhante que também interagira ou mediava a relação entre profissional e o usuário.

Não raro, era a partir da interação entre usuários que surgia a pergunta sobre o que quer dizer verdadeiramente ser um homem; ou ainda de que maneira se poderia continuar a expressar uma masculinidade após ter vivido ou ser portador de um problema de saúde. Havia sempre emoção envolvida na fala e no gesto ao falar do assunto.

Por outro lado, surgia em nós perguntas como: A sessão fisioterapêutica seria o momento favorável para se por em questão as práticas corporais viris? Como eles se apercebem de seu corpo e sua saúde? O trauma os faz ter mais atenção com o seu corpo? Quais práticas corporais da fisioterapia que eles se apropriam? Os que passaram pela batalha contra o seu corpo é um 'homem de verdade'? Se há mudanças na autoconsciência quais seriam essas? O objetivo era observar se através do uso de técnicas corporais seria possível chama-los a atenção para um modelo de masculino mais complacente.

6. RESULTADO E DISCUSSÃO

Em nossas observações iniciais, nos surpreendeu o fato de fisioterapeutas não praticarem em si mesmos as técnicas que recomendavam às outras pessoas. No caso de fisioterapeutas homens, era ainda mais difícil que eles reconhecessem a necessidade de se cuidar. Todos tinham dificuldades em aceitar ajuda de um colega, a não ser a dor os impedia de trabalhar ou praticar esporte. Notamos que muitos homens fisioterapeutas acumulavam cirurgias ou disfunções de ordem ortopédica. A narrativa sobre o fato dava um sentido viril à lesão. Em um dado momento, nos sentimos forçados a sugerir que, dentro de uma mesma equipe, eles ao menos se tratassem uns aos outros.

O mesmo não acontecia com as mulheres fisioterapeutas. Elas aproveitavam os momentos de pausa para serem atendidas por outras colegas. Faziam isso como rotina dentro da sua semana de trabalho. Welzer-Lang (1993) explica que no que se

⁸ Sobre a expressão 'homem de verdade' é usada em um jargão popular para fazer distinção entre o homem e os outros (crianças, mulheres, idosos, homossexuais), geralmente associado a capacidade de penetração com do pênis ereto (Welzer-Lang, 1994).

refere às tarefas domésticas, as mulheres assumem uma atitude preventiva enquanto os homens seguem em geral um padrão remediador. Por analogia, ousamos dizer que em relação ao corpo e a saúde, os homens conservam uma postura idêntica, como se houvesse uma regra geral de como o masculino gerencia o que é do âmbito da sua intimidade. Eles se apropriam de um discurso médico para justificar suas práticas e perpetrar assim a violência contra si e contra os outros.

Boltanski (1971) fala do distanciamento entre classes sociais na relação entre terapeuta e paciente. Em nossa observação, notamos o uso de palavras distintas como «cliente» e «paciente» de acordo com o capital do usuário. Segundo a classe social do usuário, ele poderia descrever o fisioterapeuta como aquele que detém um conhecimento específico para melhorar a saúde (o doutor); ou como um colega em quem confio e a quem recorro para discutir um problema ligado a sua formação profissional. Vale ressaltar que a formação profissional em fisioterapia deu acesso a uma classe social mais elevada, em alguns casos.

Ressaltamos esse aspecto pois, aparentemente, o modo de lidar com o corpo é distinto em cada classe social. Via de regra, pudemos observar que quanto mais baixa a classe, ainda menos atenção se faz ao corpo. Soma-se o fato de falta de infraestrutura básica e exposição a violência em meios sociais menos favorecidos no Brasil.

Percebemos também que os homens não se sentem deslocados quando se trata de estar atento aos cuidados corporais. Eles apenas buscam mais facilmente o esporte como meio de autoafirmação. Tem dificuldade de falar do sofrimento, mesmo de encontrar palavras que descrevam a dor que sentem. No mais, não reconhecem que têm a necessidade de ajuda para encontrar um modo de se cuidar sem que os faça sentir ferido quanto a sua masculinidade.

A construção da identidade masculina se dá comumente através de uma prática de risco (Meidani, 2005). Por consequência destes atos é que muitos homens são encaminhado ao tratamento em clínicas de fisioterapia. As causas mais comuns são o excesso de consumo de álcool, acidentes no trânsito e a prática de esporte. O corpo do homem é vítima da afirmação do viril.

Vale ressaltar a invisibilidade de homossexuais, travestis e intersex ao sistema de saúde, notadamente às clínicas de fisioterapia. Talvez por falta de acesso ou ausência de políticas públicas para estes grupos específicos, apesar de constar na portaria sobre saúde do homem a necessidade de atender aos diversos grupos.

Rupturas no percurso de vida como a morte (do pai ou avô), o divórcio, o nascimento de um filho, são também momentos em que os homens são encaminhados ao tratamento fisioterapêutico. A lesão ortopédica é facilmente associada ao panorama de vida pelo qual atravessa, como se o corpo expressa a dor que vem de um outro lugar. A maturidade enquanto homem surge a partir da travessia de uma fase de sofrimento. Pimentel (2011) cita, por exemplo, o pai e o avô como os modelos de masculinidade mais mencionados pelos homens entrevistados em Belém.

Ao se submeter a um tratamento fisioterapêutico, os usuários entram em contato direto com as suas fraquezas. Consequentemente, podem surgir questões mais profundas ligadas a estrutura mais essencial da pessoa como as que constituem a sua identidade. Muitas vezes, o usuário vai buscar sustento em suas raízes, o que no caso dos homens tange a sua afirmação de gênero e virilidade. É neste sentido que percebíamos as constantes referências a uma identidade local, a uma história pessoal, a um passado muitas vezes ainda presente e, paralelamente, uma elaboração sobre o que é ser homem, masculino e viril naquele contexto.

Uma preocupação era de não fazer da Fisioterapia uma prática corporal de afirmação do viril, mas para a construção de uma identidade masculina saudável. Dizemos em especial nos casos onde a intervenção cirúrgica é incontornável. Observamos que usuário tende a afirmá-la como um troféu, símbolo de uma masculinidade viril pronta para superar qualquer obstáculo. Ao dar um tal significado à intervenção, o tratamento equipara-se a um campeonato ou ainda o corpo do macho viril é reconhecido como um campo de batalha. Aspectos inerentes ao mundo social como o preço pago, o local onde foi realizada e com qual médico responsável agregam valor. O homem apresenta a doença aos seus parceiros como um capital social, para ser reconhecido como modelo a ser seguido. Do mesmo modo as cicatrizes tornam-se marcas de virilidade.

O corpo exposto pelo homem não é o mesmo daquele que ele se apropria. Aparentemente, mesmo num momento de debilidade ou no processo de reabilitação, o demonstra o seu aspecto viril. No plano de fundo, há sempre o sofrimento seja de qual ordem for mas com predominância de um dos aspectos: físico, emocional, social. Para encobrir sua debilidade, o homem supervaloriza o corpo para se consagrar como macho.

Em nossa passagem pela observação de campo, pudemos constatar que as técnicas corporais usadas no tratamento fisioterapêutico mostram-se favoráveis para ajudar os homens que se encontram no processo descoberta e construção de sua masculinidade, não obstante o contexto social no qual se inserem e a estrutura do sistema de saúde brasileiro muitas das vezes não lhes sejam acolhedores em suas necessidades.

7. CONSIDERAÇÕES FINAIS

«Os homens mudam» foi o título dado ao encontro dirigido por Welzer-Lang (2014) sobre a resistência do masculino a aceitar as mudanças sobre si trazidas por um novo contexto social. É no panorama embebido do pensamento de influência feminista que os homens ensaiam um repensar o masculino, as expressões de masculinidade. As questões ligadas à identidade de gênero, à orientação sexual e a representação do masculino chegam às clínicas de fisioterapia como lugar privilegiado para uma intervenção no aspecto social.

A Fisioterapia em sua origem estava restrita aos hospitais de reabilitação ortopédica. Atualmente, questões de ligadas ao corpo e identidade são temas corriqueiros em sessões de tratamento fisioterapêutico, já com profissionais visto como agentes de saúde em um espectro de atuação mais alargado. Por exemplo, relatamos neste artigo constatações resultantes da observação participante em clínicas fisioterapia no que se refere às questões em torno do masculino.

Geralmente os homens fazem uso de práticas corporais de cunho esportivo, o que fez das salas de fisioterapêuticos verdadeiros ginásios de esporte. Um risco que se corre em tornas as práticas de saúde um ambiente viril. Nota-se que o

sistema de saúde no brasileiro não está ainda de todo preparado para acolher os homens em suas necessidades. A tendência é sempre a de reforçar a ideia de que homens masculinos nunca adoecem. A solução seria abordar as questões do masculino sempre dentro de uma perspectiva de gênero, tendo em mente que a construção da identidade é sempre atravessada pelas questões ligadas ao sexo.

Ainda assim, mesmo que haja uma tentativa de capitalizar a doença ao se valorizar as cicatrizes marcas de superação, permitir que os homens construam uma carreira de doente através do processo fisioterapêutico os ajuda a reestruturar uma identidade masculina saudável. Há inclusive aqueles que aderem plenamente a uma expressão diversa de masculinidade ao se apropriar de novas práticas corporais, sobretudo de cuidado com o corpo, às quais não se atribuem valor viril.

Discutir sobre quais novos modelos ou expressões do masculino coexiste atualmente vai para além do que nos propomos neste artigo. No entanto, observamos que o homem belenense tende a reafirmar suas raízes históricas, religiosas e míticas na busca de sentido ao que entende por masculino.

As sessões fisioterapêuticas se mostram um local favorável para se abordar as questões ligadas a masculinidade e a virilidade a partir do momento em que com suas técnicas apresenta práticas corporais menos agressivas. Através dessas é que os homens em tratamento fisioterapêutico puderam perceber melhor o seu corpo, repensar seus gestos e lidar de modo saudável com seus próprios limites. Isso diminui a violência contra si e contra o outro, notadamente a mulher no contexto social. A mentalidade do « sem dor não há ganho » sede espaço para pequenos ganhos distribuídos ao longo do tratamento de reabilitação.

O corpo responde ao tratamento e se recupera no ritmo particular a cada um a partir do momento em que os homens são acolhidos em suas necessidades. O medo, a dor, o sofrimento são compreendidos como parte do processo de reparação, não mais como fatores contrários ao ser homem ou como obstáculos a serem vencidos para se afirmar viril. A partir desse momento é que os homens puderam se apropriar verdadeiramente do seu corpo e expressar-se masculinos sem necessidade de aprovação.

Foi no momento do tratamento fisioterapêutico no qual surgia a questão do que é ser homem, afinal. Aqui o masculino foi percebido também como uma construção social a partir de uma orientação pessoal na formação da identidade, semelhante a como se passa com as mulheres e os outros gêneros. O ser homem e masculino depende da maneira como o indivíduo percebe, se apropria do seu corpo, e se integra na cultura e sociedade na qual se reconhece. Assim, ao longo do artigo usamos como exemplo os elementos componentes da masculinidade do homem belenense.

Esperamos com este artigo estimular a intervenção social no âmbito da corporeidade e saúde dos homens a partir de práticas corporais usadas em Fisioterapia. Pretendemos chamar atenção também para a necessidade de repensar o sistema de saúde brasileiro sob a perspectiva do gênero no que se refere ao programa de saúde do homem. Por fim, há ainda a necessidade de maior estudo na região sobre a relação entre identidade e o processo de saúde e doença para a expressão do masculino em sua diversidade em uma atitude de não-violência.

ABSTRACT

This study aimed to evaluate the influence relationship between structural empowerment, global empowerment and job satisfaction perceived in 151 nurses working in Primary Health Care, Personalized Health Care Units and Family Health Units in the Algarve region. As these nurses, despite performing similar functions, have different incentives, it was also sought to verify if there are significant differences in the perception of structural empowerment, global empowerment and perceived satisfaction in work, in both groups of nurses, with and without incentives. Data were analyzed using SPSS software, version 21. The results obtained show a statistically significant relationship between structural empowerment, global empowerment and job satisfaction, and statistically significant differences between the two groups of nurses, with and without incentives, and nurses receiving incentives have significantly higher levels of structural empowerment, global empowerment, and perceived job satisfaction than nurses who do not receive such incentives. One of the limitations of this study was the fact that the results obtained cannot be extrapolated to all Portuguese nurses. Future research may extend this study to other health units.

Keywords: Nurses, Primary Health Care, Structural Empowerment, Job Satisfaction.

1. THEORETICAL FRAMEWORK

Health care institutions exist for citizens and health professionals exist to serve these citizens. However, this premise is valid only if these professionals see their needs fulfilled, so as to favor their commitment to the quality of care provided (Conselho dos Enfermeiros, 2001). Moreover, within the organizations, the workers have needs for realization, which go through the acquisition of greater autonomy, independence and freedom of action. At this level, empowerment is considered a very powerful tool, since it is a mechanism capable of triggering a greater involvement of nurses in the execution of the activities developed by them within the organization, by gaining greater autonomy, freedom and Independence of action. To that end, we refer the improvement of the environment in which care is provided, according to Kennedy, Hardiker and Staniland (2015), the creation of labor structures that facilitate access to information, support, resources and opportunities that empower and potentiate employees to enable them to carry out their work in a more effective way. All of these assumptions confirm Kanter's (1993) theory, that access to information enables employees to make faster decisions as well as make significant gains in transmitting information to others in order to achieve better results (Gilbert, Laschinger and Leiter, 2010); Access to support allows employees to receive greater feedback and guidance from their peers, subordinates and superiors, allowing them to make extraordinary, innovative and risky decisions without having to go through the riddles of organizational bureaucracy; The access to resources, expresses a greater ability of the worker to obtain economic and material means, and time to do the work effectively (Kanter, 1993), that is, more efficiently and effectively; And, finally, access to opportunities fosters the growth and professional development of workers (Kanter, 1993).

Transposing these premises and the theory of Kanter that underlies to the nursing context, we can say that the empowerment of nurses comes from the following three components: of structures in the workplace necessary and essential to the promotion of empowerment; of the nurses' psychological belief in their own ability to have power; And recognition by the nurse that it is possible to have power in the relationships and health care provided (Manojlovich, 2007). A deeper understanding of these three components could, according to this author, help and strengthen nurses in how to make use of power in their professional practice in order to better care for the patient. In addition to these factors, there are others that also contribute to the empowerment of nurses, such as leadership style, culture, organizational structure, characteristics, knowledge and skills of nurses, social support and effective guidance (Al-Dweik, Al Daken, Abu Snienh and Ahmad, 2015), among others. For example, nurses who maintain a quality relationship with their superior tend to perceive greater structural and psychological empowerment and, consequently, feel greater job satisfaction (Laschinger, Purdy and Almost, 2007).

Satisfaction is therefore a relevant factor in the context of health care, which is critical to success in individual performance, since knowledge of its level or degree can identify the reasons behind possible maladjustments that may have harmful consequences in order to implement measures that can achieve the desired transformations (Batista, Santos, Santos and Duarte, 2010).

Nurses' job satisfaction is therefore described as a positive attitude toward work as a general factor and to the various facets of work that correspond to the needs desired by nurses as a result of the evaluation of their value or equity in their work experience (Liu, Aunguroch and Yunibhand, 2016). According to Chen, Yang, Gao, Liu and Gieter (2015), if nurses feel satisfied with the salary satisfaction dimension and if they receive psychological rewards from the head nurse, they exhibit positive work attitudes.

In the literature several have been the authors that have related the empowerment and the satisfaction in the work of the nurses. Li, Kuo, Huang, Lo and Wang (2013), for example, have shown the relationship between structural empowerment, psychological empowerment and job satisfaction in service nurses of Long-term Care Units, stressing that a satisfactory structural environment can result in high psychological empowerment in the workplace. In addition, this study concluded that structural empowerment is a precedent of psychological empowerment and that this relationship culminates in positive employee retention outcomes, such as job satisfaction (Cicolini, Comparcini and Simonetti, 2014). In another study by Cai and Zhou (2009), which evaluated the relationship between structural empowerment, job satisfaction and nurses' turnover intentions, as well as perceived levels of structural empowerment among Chinese nurses, the results showed that nurses perceive levels of structural empowerment in the workplace, when they perceive greater access to resources, followed by opportunities, support and information. In another study by Avram and Priescu (2012) the impact of the dimensions of structural empowerment (access to Information, resources, workplace support, and development opportunities) on job satisfaction, commitment, fairness and emotional exhaustion in a health facility. These results showed that health professionals, when they access information and receive support in the workplace, associated with opportunities and resources granted by the organization, perceive greater satisfaction and tend to experience less emotional exhaustion when confronted with work. Other studies have confirmed this significant relationship between job satisfaction and structural empowerment (eg Cai, Zhou, Yeh and Hu, 2011; Kanter, 1993; Laschinger and Havens, 1996, among others). For its part, Lautizi, Laschinger and Ravazzolo (2009) aiming to analyze the relationship between structural empowerment, job satisfaction and work stress in nurses in two health care settings in Italy, observed a significant relationship between structural empowerment, global empowerment and job satisfaction, corroborating this close relationship between satisfaction perceived by nurses and the delegation of power by health care institutions.

In a somewhat different context, Ferreira (2011) in a study that aimed to compare the professional satisfaction of nurses who perform their functions in two units offering different incentives, Family Health Units and Health Centers, concluded that satisfaction depends on the type of unit where the professionals work. The results showed that the nurses who work in the Family Health Units who received incentives, had higher levels of satisfaction than those who worked at the Health Center, who did not receive any kind of incentive.

2. PROBLEM, OBJECTIVES AND RESEARCH HYPOTHESES

In 2005, the reform of Primary Health Care was created with the objective of obtaining more and better health care for the citizens, with increased accessibility, proximity in quality and consequent increase in the satisfaction of users of services (Pisco, 2007, 2011). Thus, the reconfiguration of health centers and the implementation of Family Health Units, respectively (Biscaia, Martins, Carreira, Gonçalves, Antunes and Ferrinho, 2008). This new management model and health governance structure aimed to strengthen Primary Health Care to reduce inappropriate use of Differentiated and Emergency Health Care, achieve efficiency gains and better control costs (Lapão and Dussault, 2012). It was also intended to increase the satisfaction of professionals, so as to create good working conditions, improve organization and reward good practices (Pisco, 2007, 2011), raising the interest of wondering if there is a relationship between perceived empowerment and job satisfaction.

What happens, in fact, is that nurses perform similar functions, both in the Family Health Units and in the Personalized Healthcare Units, however, professionals working in the Family Health Units, regardless of the model they are in (model A or Model B), have access to a variable remuneration component, known as incentives, which is included in the commitments letter, contracted annually and which is measured by the performance shown in four areas: access, care performance, efficiency and satisfaction of users (Portaria nº 377-A/2013 de 30 de Dezembro). Incentives may be of an institutional or financial nature. In turn, the nurses working in the Personalized Healthcare Units do not receive any type of incentive regardless of the results obtained. These different rewards that characterize these two groups of health professionals (group with incentives and group without incentives) raise a question that is to ask if there are significant differences in the level of empowerment and job satisfaction in the two groups studied.

The objective of the present investigation was to evaluate the influence relation of structural empowerment, global empowerment and satisfaction perception in the work, and also to verify if there are significant differences in the two groups of nurses that perform functions in units, with and without incentives.

Next, we present the research objectives and hypotheses:

Objective 1 (O1): Describe the levels of structural empowerment, global empowerment and job satisfaction in the study participants.

Objective 2 (O2): To evaluate the relationship between job satisfaction, structural empowerment and global empowerment.

Hypothesis 1 (H1): Work satisfaction relates positively and significantly to structural empowerment and global empowerment.

Objective 3 (O3): To verify if there are significant differences in the level of structural empowerment, global empowerment and job satisfaction in the two groups of nurses, with and without incentives.

Hypothesis 2 (H2): There are statistically significant differences at the level of structural empowerment, global empowerment and job satisfaction in the two groups of nurses, with and without incentives.

3. SAMPLE

The sample consisted of 151 nurses, corresponding to 58.75% of the evaluated population described above. The ages of the nurses are between 28 and 64 years old ($M = 44.04$, $SD = 8.133$), of which 132 are female (87.4%) and 19 are male (12.6%). Regarding their academic degree, 13.2% of nurses have a bachelor's degree, 81.5% have a graduation and 5.3% have a master's degree. 17.2% of the nurses are specialists, in which 12.6% are specialists in community nursing, 0.7% specialists in medical-surgical nursing, 0.7% specialists in rehabilitation nursing, 1.3% specialists in child health and pediatrics nursing and 2% specialists in maternal and midwifery health nursing, and 82.8% of the respondents do not have any specialty. As far as the service provision regime is concerned, all nurses are full time (100%). As to their age in the profession, 99.3% of the respondents were nurses for 1 year or more, and only 0.7% of the respondents were nurses for less than 1 year. In relation to their seniority in the institution 4% have been under 1 year and 96% have been for 1 year or more. Of the nursing professionals who participated in the survey, 23.2% work in another organization than the one where they work and 76.8% work exclusively in the organization.

Of the 151 nurses who participated in the study, 95 (62.9%) performed functions at Personalized Healthcare Unit, did not receive any type of incentives and 56 (37.1%) at Family Health Unit, received incentives.

4. ASSESSMENT INSTRUMENTS AND METHODOLOGY ADOPTED

The scale used in this study to evaluate Structural Empowerment was the Conditions of Work Effectiveness Questionnaire II - CWEQII2, developed by Laschinger, Finegan, and Shamian (2001), and validated for the Portuguese nurses' population by Teixeira, Nogueira and Alves (2016). This scale consists of 4 subscales (12 items), which refer to the 4 empowerment structures defined by Kanter (1993), access to opportunities, information, support and resources, and a measure also developed by Laschinger *et al.* which evaluates Global Empowerment, consisting of 2 items, both measures use a five-point Likert scale (1 - strongly disagree and 5 - strongly agree).

The structural empowerment scale used in this study has a Cronbach Alpha value of 0.77 (sub-scale opportunity), 0.93 (subscale information), 0.92 (sub-scale support) and 0.72 (subscale resources), having a total value of 0.89 (global scale). Regarding the overall measure of Empowerment the value we found from Cronbach's Alpha is 0.86. The scale used to evaluate nurses' perception with work satisfaction was the Lima, Vala and Monteiro (1994) Work Satisfaction Scale, composed of 8 items, using a likert scale of seven points (1-extremely unsatisfied and 7-extremely satisfied). The Cronbach's Alpha for this scale in this study was 0.81.

Based on the objectives of this research, namely to find relationships between the different variables and test the hypotheses, it was decided to collect the information through a questionnaire survey. 205 questionnaires were delivered and 151 questionnaires were received. This is made up of sociodemographic variables, already mentioned previously, and already existing scales in the literature, validated and with psychometric qualities to measure the variables of this study.

The collected data were submitted to different statistical analysis, namely bivariate correlation analysis, parametric tests: T test and ANOVA, were also computerized and treated through SPSS software, version 21. Bivariate correlation analyzes were performed, parametric tests: T-test and ANOVA to analyze the presence of relationships between sociodemographic variables, structural empowerment, global empowerment and job satisfaction. However, no statistically significant differences were found between sociodemographic variables, structural empowerment, global empowerment and job satisfaction.

5. RESULTS PRESENTATION

In order to achieve objective 1 (O1): describe the levels of structural empowerment, global empowerment and job satisfaction in the study participants, and objective 2 (O2): to evaluate the relationships between job satisfaction, structural empowerment and global empowerment, and test hypothesis 1 (H1): job satisfaction relates positively and significantly to structural empowerment and global empowerment, it were calculated averages, standard deviations, asymmetry, kurtosis coefficient, and Pearson's correlation coefficient of the study variables (see table 1).

Table 1 Descriptions and correlations of variables

	<i>Empowerment opportunity</i>	<i>Empowerment support</i>	<i>Empowerment resources</i>	<i>Empowerment information</i>	<i>Empowerment structural</i>	<i>Empowerment global</i>	Job satisfaction
<i>Empowerment opportunity</i>	1	-	-	-	-	-	-
<i>Empowerment support</i>	0,451	1	-	-	-	-	-
<i>Empowerment resources</i>	0,259**	0,441**	1	-	-	-	-
<i>Empowerment information</i>	0,515**	0,662**	0,456**	1	-	-	-
<i>Empowerment structural</i>	0,682**	0,842**	0,697**	0,868**	1	-	-
<i>Empowerment global</i>	0,561**	0,527**	0,572**	0,501**	0,687**	1	-
Job satisfaction	0,524**	0,426**	0,370**	0,410**	0,547**	0,517**	1
Mean	3,6711	3,1479	2,9161	3,1347	3,22	3,43	4,31
SD	0,70025	0,94409	0,84259	0,98295	0,678	0,904	0,858
Asymmetry	-0,800	-0,594	0,052	-0,375	-0,556	-0,593	-0,433
<i>Cronbach Alpha</i>	0,772	0,921	0,728	0,931	0,89	0,86	0,81

The results obtained in Table 1 show that average values of the studied variables of structural empowerment, global empowerment and job satisfaction show a tendency very close to the central point, and professional satisfaction obtained the highest mean score ($M = 4.31$, $SD = 0.858$), while the resource dimension of empowerment showed the lowest average ($M = 2.92$, $SD = 0.84259$). The values of asymmetry and kurtosis respect the parameters that characterize normality in the data distribution ($|SK| < 3$ and $|Ku| < 10$) (Marôco, 2010), thus confirming the hypothesis outlined. Although these results do not allow us to guarantee the normality of the distribution of the responses to the items, the sample size and the magnitude of the coefficients lead us to admit that deviations from normality will not have great expression in the analysis that we will perform.

The results obtained also show the positive and statistically significant correlation of global empowerment in relation to the different dimensions of structural empowerment, such as the opportunity dimension ($r = 0.561$, $p = 0.01$), support ($r = 0.527$, $p = 0.01$), resources ($r = 0.572$, $p = 0.01$) and information ($r = 0.501$, $p = 0.01$). On the other hand, the statistically significant relationship between job satisfaction and all dimensions of structural empowerment (opportunity, support, resources, information) and structural empowerment ($r = 0.547$, $p = 0.01$) and global empowerment ($R = 0.517$, $p = 0.01$), confirming Hypothesis 1 (H1).

To achieve objective 3 (O3): To verify if there are significant differences in the level of structural empowerment, global empowerment and job satisfaction in both groups of nurses, with and without incentives and to test Hypothesis 2 (H2): There are statistically significant differences at the level of structural empowerment, global empowerment and job satisfaction in both groups of nurses, with and without incentives, the t-test was performed.

The results obtained show statistically significant differences in the scores of the structural empowerment ($t(146,069) = -5.308$, $p = 0.00$) regarding the two groups of nurses, namely those who receive and do not receive incentives; Nurses receiving incentives have higher levels of structural empowerment ($M = 3.57$, $SD = 0.472$) than those who do not receive incentives ($M = 3.01$, $SD = 0.697$).

The results also show statistically significant differences in the overall empowerment scores ($t(147,624) = -3.878$, $p = 0.000$) for the two groups of nurses, those who receive incentives and those who do not receive incentives, although professionals receiving incentives also have higher levels of global empowerment ($M = 3.79$, $SD = 0.631$) in relation to those who do not receive ($M = 3.22$, $SD = 0.975$);

Finally, statistically significant differences were also found in job satisfaction scores ($t(149) = -3.220$, $p = 0.002$) for the two groups of nurses, those who receive incentives and those who do not receive incentives, and professionals who do receive incentives are more satisfied ($M = 4.59$, $SD = 0.752$), in relation to those who do not receive ($M = 4.14$, $SD = 0.876$), confirming Hypothesis 2 (H2).

6. DISCUSSION AND CONCLUSIONS

Not intending to close the complex reality of this theme, it was intended to study the relationship between structural empowerment, global empowerment and job satisfaction perceived in nurses who provide health care in Personalized Healthcare Unit and Family Health Unit. Based on empirical models, conceptualizations and evidences, the purpose of

this study was also to understand if there were significant differences in these two health units. This concern arose from the current context in which we live in increasingly competitive societies, in which the degree of demand in relation to the results to be obtained is increasing, leading the nursing professionals of both units to compare, once currently are receiving different incentives for their work.

The obtained results allowed us to conclude that job satisfaction is positively and significantly related to structural empowerment and global empowerment. These very significant association relationships are corroborated by the study by Lautizi and collaborators (2009), which showed that job satisfaction is related in a significant and positive way with structural empowerment and global empowerment. This positive and significant correlation between structural empowerment and job satisfaction has also been evidenced by other studies (eg, Laschinger and Havens, 1996; Laschinger *et al.*, 2001; Cai and Zhou, 2009; Li *et al.*, others). These results show that the managers of the health units should devote particular interest to the empowerment of nurses through the implementation of effective work environments that promote the empowerment of nurses in order to trigger positive attitudes of satisfaction in the nurses' work and also in their individual performance and, consequently, in obtaining greater gains in health care. The managers of these health care providers should also adopt Kanter's model of structural empowerment (1993) as a management tool, since it is a useful model for analyzing and evaluating nursing work environments in order to provide workers Working conditions that aim at achieving goals in a meaningful way.

The results also showed that there are statistically significant differences in structural empowerment, global empowerment and job satisfaction in the two groups of nurses with and without incentives. Incentive workers have higher levels of structural empowerment, global empowerment, and job satisfaction than those who do not receive incentives. Although in the literature it was possible to access, no study on empowerment was found comparing two groups of professionals with and without incentives, a study carried out by Lautizi and collaborators (2009), which aimed to compare two health units in Italy, corroborates the results obtained in the present study, since the authors observed a significant relationship between structural empowerment, global empowerment and job satisfaction. Also, the studies by Cai and collaborators (2011) and Kanter (1993), observed the significant relationship between job satisfaction and structural empowerment, among other observations. Our results are further corroborated by Ferreira (2011), which show that nurses' satisfaction varies according to the type of unit where the professionals work, with professionals working in Family Health Units (with incentives) showing a greater satisfaction regarding those who work in health centers (without incentives). The results obtained in the present study have important practical implications for the Portuguese government in the implementation of equitable measures that benefit the nursing professionals of both units, so that they do not feel inequalities. One possible strategy would be for both nurses, working in Personalized Healthcare Unit and working in to Family Health Unit receive similar institutional and financial incentives since they perform the same functions.

We cannot finish without presenting some theoretical, methodological and practical limitations of the present study. The fact that this study was limited to the nurses of the Health Centers Groupings of the Algarve region does not allow to extrapolate and generalize the results obtained to all Portuguese nurses. The followed quantitative nature methodology could have been complemented by a more qualitative one based on semi-structured interviews where it was possible to raise motives and reasons underlying the identified levels of empowerment and job satisfaction.

We could not end without leaving some clues for future research, namely the idea of extending the study to other regions of Portugal. And, the possibility of also applying the study in other health units and in other organizational contexts, as well as carrying out the same study comparing Family Health Units model A and Family Health Units model B, since they benefit from different incentives.

ESCOLA: CENÁRIO DE VIOLÊNCIA SIMBÓLICA

Thania Mara Teixeira Asinelli
Letra Produtos Educacionais Ltda. Curitiba/Brasil
(thaniata@yahoo.com.br)

ABSTRACT

The considerations presented here are based on the experience, on the study and on the researches directed to the Brazilian school context. As a few social instances, formal educational institutions in Brazil exert symbolic violence in an unparalleled way, imposing on their attendees - particularly those who are less favored in the social and economic spheres - a considerable range of useless and inapplicable “knowledge”. School and teachers, arbitrarily, deny students stimulating experiences that do not raise the challenges and dispense reflection. Bourdieu’s assertion undoubtedly illustrates this fact: “[...] the more or less important violence which has been continually aimed at the most deprived schools, is nothing more than the visible manifestation of the permanent effects of the contradictions of the school institution and the violence of an absolutely new kind that the school practices over those who are not meant for it “ (Bourdieu, 1998, p. 264). Ivan Illich (1971) and Daniel Pennac (2007) report similarly to the school as a space for access to literate culture, in which knowledge has meaning and promotes insertion and participation of learners in social practices. In this sense, Literacy is taken as a process that transcends simple decoding. It implies the understanding that methodological referrals must prioritize what is produced and transformed by humanity and taken as an object of reflection in the classroom, taking into account what the student hears and observes in his everyday life, in his games, in the relationship with adults or in spoken and written media.

Discorrer sobre o isolamento de parte expressiva das instituições escolares brasileiras e da distância que mantêm, face à realidade, já se tornou “clichê” e tal repetição, por si só, não tem sido profícua e tampouco opera as mudanças necessárias.

Às agruras físicas e emocionais, à negligência do Estado e das famílias impetradas às crianças brasileiras - especialmente, àquelas menos favorecidas nos âmbitos social e econômico - somam-se à agressão simbólica como força coercitiva e objeto de dominação à qual frequentadores dos bancos escolares encontram-se, amiúde, expostos. A escola, como poucas instâncias sociais, consegue exercer tal violência de forma incomparável, em um “acordo” tácito com seus “subjulgados”.

Paralelamente, aos números importantes de crianças que ingressam no universo escolar, nos deparamos com um enorme contingente, em fase inicial de escolaridade (e mesmo, muito além desta), longe de adquirir, sequer, os instrumentos básicos para uma relativa autonomia na utilização da leitura e da escrita, imprescindíveis ao exercício da cidadania. Convenhamos, que tal constatação não traz novidade alguma, porém, o tema segue merecendo pesquisas, estudos e debates em todas as esferas da sociedade. Entretanto, é imperativo que se vá além da retórica.

Reconhecemos que, a partir dessas considerações, um questionamento se impõe: o que esperar de alunos, frequentadores de uma escola que não lhes assegura um mínimo de conhecimentos úteis e aplicáveis à sua vida? Nesta direção, Bourdieu (1999, pp. 7-8) sinaliza: “[...] violência suave, insensível, invisível a suas próprias vítimas, que se exerce essencialmente pelas vias puramente simbólicas da comunicação e do conhecimento, ou, mais precisamente, do desconhecimento, do reconhecimento ou, em última instância, do sentimento”. Embora, tratando-se da obra “A dominação masculina”, a assertiva supracitada aplica-se ao universo escolar, no sentido do consentimento daqueles que se sujeitam, ordinariamente, a tais forças, atribuindo-lhes legitimidade.

Entre as muitas questões que pairam sobre a insustentabilidade da escola, nos perguntamos por que ela insiste em se manter inapetente para tantas crianças, cujo comportamento (fora dela) é ativo, dinâmico, próprio de quem busca com avidez as respostas e as soluções para suas curiosidades? O que confere a nós (professores e escola) o direito a certas arbitrariedades que negam aos alunos uma experiência estimuladora, em um ambiente destinado a eles e não aos docentes?

Caminharemos rumo à profecia de ILLICH, na obra “Uma sociedade sem escola” (1971)? No espaço de um pequeno-grande livro escrito há tantas décadas, o autor postula a liberdade, o lazer, a independência e a autonomia de crianças e jovens, cuja necessidade de aprender é violentada pela amarga experiência escolar.

Inclinamo-nos, novamente, sobre as palavras de Bourdieu:

“[...] as violências mais ou menos importantes que, continuamente, têm tido como objetivo os estabelecimentos escolares mais deserdados, nada mais são que a manifestação visível dos efeitos permanentes das contradições da instituição escolar e da violência de uma espécie absolutamente nova que a escola pratica sobre aqueles que não são feitos para ela. Como sempre, a Escola exclui: mas a partir de agora, exclui de maneira contínua (...) e mantém em seu seio aqueles que exclui, contentando-se em relegá-los para os ramos mais ou menos desvalorizados. (Bourdieu, 1998, p. 224).

Quais caminhos devemos seguir, para que os frequentadores dos bancos escolares adquiram um mínimo de saberes significativos, úteis e, por que não, atrativos?

São de Pennac (2007) as palavras: “Criança alegre, porém, triste aluno”¹. Gerada pela absoluta falta de interesse no que se refere aos conteúdos, tal constatação pode ser de cada um de nós, professores. O que falta nas aulas e nas escolas para que se tenha a dualidade: “criança alegre, aluno contente”? A resposta, apenas e tão somente, o sistema de ensino e o educador podem dar. Refletir sobre a inutilidade de um sem número de “ensinamentos”, além das estratégias inférteis, é de uma urgência sem precedentes. Pior do que admitir um triste aluno é assumir como concludente tal constatação, depois de tantos anos consagrados à crença de que a escola deveria ser um espaço de reflexão, de produção, não apenas de conhecimento, mas de ruptura com o conformismo, parafraseando Illich.

No entanto, não podemos (e não queremos) “dispensar” a instituição escolar. É absolutamente fundamental a defesa desse espaço-tempo, sobretudo, porque para muitos é a única possibilidade de estabelecer o contato sistemático com o conhecimento produzido historicamente. E, mais do que isso, ser partícipe e construtor dos fatos que constituem a história das sociedades é um direito absoluto, que vai além das legislações e das normas, essas facilmente burláveis.

Retomemos Illich (1971, p. 213):

“Para que um homem possa ‘crescer’, ele precisa do livre acesso aos fatos, aos lugares, aos métodos, aos acontecimentos, aos documentos. Ele precisa ver, tocar, manipular tudo que está ao seu redor, em um meio/ambiente que não seja desprovido de sentido. Esse acesso, hoje, lhe é negado. Desde que o saber se tornou um produto assumiu as características de uma propriedade privada”².

Muito se tem debatido, porém, muito pouco se faz, efetivamente, no sentido de reverter o quadro de fracassos do processo de literacia; *letramento*, no contexto brasileiro (considerado, aqui, no seu sentido mais amplo, ou seja, em todas as disciplinas das áreas de ensino).

Transformar o cenário desalentador de desempenho escolar dos alunos do ensino fundamental brasileiro, em particular, dos que frequentam as escolas públicas implica, por exemplo, proporcionar o acesso à leitura e à linguagem oral e escrita como um processo de pertencimento, revelando a importância que tal processo representa para a vida, nas sociedades letradas. Ou, ainda, permitir que o aluno leve para a sala de aula suas experiências correlatas à leitura e à escrita e as socialize de modo a se fazer entender e sensibilizar os colegas que, por certo, têm outras relações com essa produção humana, quer na dimensão oral, quer na escrita.

Salientemos que o termo Alfabetização adotado, no Brasil, refere-se à etapa inicial do processo de aquisição da leitura e da escrita e, embora, preferencialmente, apontado para as crianças inseridas na escolaridade formal é também dirigido aos Jovens e Adultos, na modalidade do ensino fundamental e médio, que não tiveram acesso à alfabetização ou não a completaram em idade apropriada.

O conceito de alfabetização amplia-se, progressivamente, de acordo com as necessidades sociais e já não basta, apenas, codificar ou decodificar sinais gráficos. Surge daí, o conceito de *letramento*, que Val (2006) define, de forma pertinente, como:

“[...] o processo de inserção e participação na cultura escrita. Trata-se de um processo que tem início quando a criança começa a conviver com as diferentes manifestações da escrita na sociedade (placas, rótulos, embalagens comerciais, revistas, etc.) e se prolonga por toda a vida, com a crescente possibilidade de participação nas práticas sociais que envolvem a língua escrita, como a leitura e redação de contratos, de livros científicos, de obras literárias, por exemplo. (Val, 2006, p. 19)”

A abrangência do supramencionado pressupõe um professor que tenha adquirido e que siga exercendo o seu próprio processo de literacia/ *letramento*. Do contrário, teremos uma séria contradição: esperar do docente um trabalho com o aluno que ele mesmo não interiorizou e não aplica, em seu próprio benefício.

Independente da nomenclatura, relativamente recente para nós brasileiros – *letramento* é uma forma de definir a alfabetização no seu caráter amplo, inserida no contexto social e, como uma “via de mão dupla”, conferindo ao aluno acesso e participação efetiva na produção dos saberes. Assim, alfabetização e *letramento* não caminham separadamente; complementam-se. Mesmo que o termo emprestado de outras realidades - particularmente, das línguas inglesa e francesa - não tivesse sido por nós adotado, ainda assim, seríamos capazes de compreender e de exercer a alfabetização como um processo, portanto, ela é contínua.

Reiteramos, então, o caráter indissociável de *letramento* e alfabetização, pois, necessário se faz vincular código e significado.

Tal preâmbulo tem a finalidade de postular, o que tem sido recorrente: ensinar de forma significativa. Chegaremos um dia, na plenitude do ensino preconizado no discurso acadêmico atual? Muito provavelmente, a dificuldade esteja justamente aí: na impossibilidade de adequar/aplicar o discurso dos programas de formação das Universidades ao “chão” da escola. Formar professores para atuar nos diferentes níveis de ensino, implica em dotá-los de conhecimentos, não apenas didáticos e pedagógicos, mas culturais. Sabe-se, que um repertório desejável constrói-se ao longo da vida; não se adquire um capital cultural, necessário a um educador, apenas durante um curso de formação, mas pode-se, ao menos, minimizar os prejuízos que vêm se acumulando e recaindo sobre os alunos. Esse é o papel fundamental das Universidades e dos programas de formação continuada.

Em contrapartida, há experiências valiosas, embora pontuais, de ações pedagógicas que tratam o aluno não como “culpado” pelas dificuldades de aprendizagem, mas como seres que apreendem no seu tempo e ritmo. Tais experiências, certamente, são fruto do discernimento, da reflexão, do estudo e de uma dose considerável de bom senso do professor.

É o caso da adoção de encaminhamentos metodológicos que priorizam o que é produzido e transformado pela

¹ Pennac, Daniel. “Chagrin d’école”. Paris: Éditions Gallimard, 2007. Tradução da autora.

² Illich, Ivan. *Une société sans école*. Paris: Éditions du Seuil, 1971, p. 213. Tradução da autora.

humanidade, tomado como objeto de reflexão dentro da sala de aula e que o aluno ouve e constata em seu dia a dia, em suas brincadeiras, no convívio com adultos ou na mídia falada e escrita.

A fragilidade da compreensão dos aspectos cognitivos dos alunos, das suas diferentes trajetórias, do tempo de cada um e, sobretudo, a falta de sistematização e organização dos conteúdos da leitura e da escrita, fazem com que os aprendizes transponham etapas e anos escolares sem um mínimo necessário de aquisições de conteúdos, porque o sistema, representado pela escola e professores, não tem a devida clareza do compromisso e da intencionalidade que tais instâncias têm, obrigatoriamente, que exercer.

Para finalizar, retomamos as palavras de Pennac:

“(...) um ensinamento claro, confiante e preciso, acompanhado de uma palavra amigável e de um olhar compreensivo, pode dissipar o sentimento de nulidade (o “chagrin d’école”) instalado nos jovens aprendizes, bem como, trazer leveza aos seus espíritos. (...) Certamente, nós professores não somos os únicos responsáveis pelas transposições de barreiras, mas, essas mulheres e esses homens passam muitos anos de sua juventude, lá, diante de nós. E, um ano de fracasso escolar pode representar uma enorme ameaça; uma perda irreparável”. (Pennac, 2007, pp. 68-69).³

Longe de identificar culpados e inocentes, o que gostaríamos, na essência, seria fazer possível - uma vez identificadas as razões para o atual quadro desanimador do nosso sistema de ensino - o sucesso da busca por uma escola em que nossos alunos e nossos professores sejam parceiros e que os “especialistas” desçam de seus pedestais, tornando acessíveis e aplicáveis o que parece tão coerente nos seus discursos.

Muito além da transposição das fronteiras estabelecidas entre os anos letivos, é direito do aluno que os desafios, as experiências positivas e o sucesso escolares tenham um peso infinitamente maior em sua vidas, do que os momentos de frustrações.

ABSTRACT

Joining in Higher Education brings with it a range of new life learnings of the young academic, in any university course. Often the students are surprised positively when faced with different realities than they had previously lived, due to lack of experience. The research aimed to accompany the training process of Physical Education academics, and is characterized as a quantitative, of a cross-sectional survey, in which 100 academics of the Federal University of Pampa- UNIPAMPA, in Uruguai- Rio Grande do Sul- Brazil, answered the Assessment of Initial Motivation and Pedagogical Support Questionnaire (which examines factors of admission in the higher course frequented and factors of choice of the teaching profession), attending different semesters of their course. The most relevant results were: high Initial Motivation Assessment and Pedagogical Support with a mean of 26.16 points (SD = 5.36); Educational Training Model evidencing valorization of this process, average 58.85 points (SD = 7.73); Professional Results pointing to a positive perspective regarding the professional future, average 29.28 points (SD = 3.65); good Support in the Internship with an average of 49.69 points (SD = 8.75). We could contrast the results with other previous studies, this being considered smaller. It is necessary construct experiences in more realistic university spaces, provoke learning at higher and positive levels of well-being, through support for constructive practical and theoretical experiences, insertion in richer experiences in inner and outside school environments, participation in study groups and, mainly, by a better continuous professional appreciation of the Physical Education.

Keywords: Education, Physical Education, Motivation, Pedagogical Support, Well-being.

JEL Classification: I20, I23, I29, I31

1. INTRODUCTION

Taking as a starting point the (trans)formation of the student in the teacher, we can observe that the general formation is devalued, considering that the important thing is, on the one hand, the specific formation in terms of the learning of the contents that the teacher must teach to its Students and, on the other hand, the professional experience to learn strategies that allow the teacher to conduct more effectively the process of teaching content.

Throughout the course, students are required to have greater autonomy to participate in curricular and extracurricular activities, such as lectures, courses, congresses and others.

As people perceive themselves with satisfactory resources to deal with stressful factors, coupled with feelings of pleasure and joy, there are so-called “protective factors,” which are basically personal health skills and abilities. Among the components of well-being are satisfaction with life and the balance of positive and negative affects, including the notion of cognitive evolution, quality of life, and affective relationships.

It is known that college students are vulnerable to a wide range of threats to their well-being. We believe that in the initial formation of the Physical Education teacher, it is important to allow cognitive conflicts so that the academic is led to reflect on the reality in which he will be inserted and, from it, to enable him to solve the problems that he will face since his formation To their practice in the labor market.

These theoretical approaches confirm our intention to investigate the context in which the teacher is inserted in pedagogical training in undergraduate courses in Physical Education, reflecting on his personal and professional side aiming to constitute references that enable new actions that promote well-being in teaching.

The debate about malaise and well-being has been passing through the time and the educational models instituted in our training schools. From this point of view, we can say that several studies on this theme, which are under development, emphasize the search for structures that contribute to the improvement in the quality of life of educational professionals.

This shows the need for studies that reveal the process faced by teachers, academics, from their formation to their actual performance in educational environments, traditional or not.

In short, as previously explained, the study seeks to deepen knowledge of the personal and professional trajectory of the student who becomes a teacher and their relationship with aspects of teacher well-being. Thus, I initially delimit the research problem for this study:

How does the process of training of Physical Education students Initial Motivation and Pedagogical Support in the construction of the good and malaise student?

2. CHARACTERIZATION OF THE STUDY

The research process should be guided by the methodology that best evidences the object under study, clarifying the central issue ventilated and allowing a precise analysis of the information collected (Minayo, 2001), in order to create a gear that guarantees a good scientific identity (Santos, 2000).

This part of the research was developed is characterized as a quantitative, cross-sectional exploratory-descriptive research, offering support for research during the undergraduate course in Physical Education plus one semester of the beginning of the professional career of those involved, raising quantitative data through information sheets and standardized questionnaires. Data analysis was performed using the statistical software SPSS, version 17.0. There is also a complementary qualitative part.

This study was successfully submitted to the Scientific Committee of PUCRS (protocol no. 192/2014), which it considered necessary to send to the Ethics Committee. Upon approval, the project is also registered in the Brazilian Platform, according to resolution 466/12, which received approval, opinion no. 808.522.

3. FIELD OF STUDY

For the research, the Federal University of Pampa, in the city of Uruguai-RS, was chosen for its ease of access and greater availability in scheduling with academics and being in the researcher's residence city.

4. POPULATION AND SAMPLE

All the academics enrolled in the undergraduate degree in Physical Education of the Federal University of Pampa, Uruguai-RS campus, were invited, which totaled 147 students to participate in the study.

The initial sample was delimited in 100 academics from different semesters who accepted to participate in the study.

5. DISCUSSION AND RESULTS

In order to evaluate this variable, we used the Initial Motivation and Pedagogical Support Questionnaire, by Jesus (1996), which is characterized by evaluating the initial motivation for the profession teacher. In terms of the motivational orientation for this profession, the author posed two questions: the first concerning the factors of entrance in the attended upper course and the second to the factors of choice of the teaching profession.

For the first question are presented six alternatives, two that show a greater initial motivation for this profession and four that express a lower initial motivation. For the author, the initial motivation for the teaching profession is all the greater since the attended upper course was, from the outset, seen as a means to concretize the project of joining this profession.

For the second question, seven alternatives are presented, four that show a greater initial motivation for the teaching profession and three that show less motivation. According to the author, the initial motivation is all the greater as intrinsic factors are the basis of the choice of this professional activity.

The items are presented in a 5-point Likert format (from 1 = none to 5 = many) and added in the sense of the highest initial motivation for the teaching profession.

When dealing with subjects such as the motivation of the Physical Education professional and its academic update are not so simple, because it is a very complex and difficult subject to study, due to its different approaches and theories that deal with the subject.

The motivation for an activity depends on the meaning each person attributes to it. It is important to take into account the existence of individual and cultural differences between people when talking about the subject (Vernon, 1973; Murray 1978; Davidoff, 1983).

In this way, we will treat it in a more comprehensive way, not only looking at an aspect but seeking the perspective of a being with a potential for realization. Thus, motivating people to develop activities is one of the basic problems in any process of teaching and learning motor, in the contexts of Physical Education (Weinberg and Gould, 2001).

In our study with Physical Education students, we obtained an overall mean of 26.16 points with a standard deviation of 5.36 points. This result falls short compared to the studies of Jesus (1996) and Sampaio (2014).

Averages followed by the same letter do not differ statistically from each other, at the significance level of 5%, according to the LSD (Adjustment for multiple comparisons: Least Significant Difference equivalent to no adjustments) test.

In relation to the initial motivation for teaching practice, Jesus (1996) reports a study by Huberman (1989) with 160 Swiss teachers, in which 9% of the answers translated passive motivations (lack of better professional alternatives), 28% translated motivations Materials (going to the profession as a means of subsistence) and 63% translated active motivations (joining the teaching profession as the desired choice, being the contact with young people the main factor).

The motivation for the teaching profession is, therefore, one of the main factors of orientation of the professional project of the teacher, constituting the process of initial formation, one of the fundamental stages for the development of this project.

The study developed by Jesus (1996) revealed that the initial motivation has a direct and significant influence on the professional project. What can be observed with these results is that the initial motivation of the Physical Education academics of Unipampa, falls short of the studies developed here with this particular population, situated in a phase of constant doubts and diverse professional options.

The issues of regulation of Physical Education as a profession and areas, rather than health or education, have been generating some discussions. Nowadays, physical activity is gradually being valued with society as a factor of health and well-being, through sports, dance, gymnastics, recreation and also activities with a softer focus such as alternative body practices. This fact expands the range of professional activity, not restricted only to elementary and middle schools, creating, thus, a new dynamics in the labor market.

Therefore, we can affirm that in Unipampa's Physical Education academics, the initial motivation for the teaching profession suffers a decrease in the comparison between the initial semesters of the course. This may be due to experiences and experiences on the part of the academic during the course, because the more advanced the semester in which these academics meet, the greater their prospects of insertion in the labor market.

Silva and Carneiro (2006) suggest the need for a greater number of initiatives that orient students in high school to a more informed choice of career in higher education.

Analysis of the results of the instrument that evaluates the Educational Formation Model, for the evaluation of the model of educational formation, as it was perceived by the trainees, Jesus (1996) formulated a measure, consisting of eleven items that intend to translate a relational model of formation, Taking into account the assumptions that several authors have presented to characterize this model, differentiating it from the normative model of formation.

The items are preceded by the phrase "teachers in educational subjects, considered as a whole [...]" and evaluated in a 7-point format (from 1 = totally disagree to 7 = strongly agree).

At this point we consider the training actions to be relevant, especially during the course, according to the perception of the learners, indicating the valorization of pedagogical strategies that the teacher can use. According to Moraes (1996), to innovate, to act pedagogically on new bases involves a profound change of mentality, which is difficult, especially for those who work in the educational field. Therefore, it is important to emphasize that the educational models available are of fundamental importance for academic development in a gradual and complete way.

In our study it was evidenced a valorization of this process, since it obtained an average of 58.85 points (SD = 7.73), being well superior to the study of Jesus (1996), although it is smaller than the average observed in the study of Sampaio (2014) it is important to highlight the licensee to assimilate the new knowledge, it requires time to be able to compare, to establish the connections, to understand the differences and to integrate the knowledge.

Thus, we can affirm that, as in the study of Sampaio (2014: 90):

There was success in the actions that allowed the trainees to reflect on the possible attitudes to adopt in situations of disinterest, indiscipline and school failure as students; On the presumption that the teacher has his personal style; In describing potentially effective alternatives to dealing with problematic situations in the classroom that the teacher can use.

Considering that one learns throughout life, learning becomes one's own life. And personal decisions influence not only the individual but also the life of all mankind. That is why education is strategic. The question was: what is the purpose of education?

The objective, according to Lück (2000), is to contribute to the full realization of the human being, in which he is able to

integrate the dimensions of the “T” and the “world”, seeing in his daily problems, in a complexity of global problems solve, results for them solving them locally. It also aims to help in the renewal of society by producing new knowledge, seeking answers to solve the problems faced by various human groups.

According to data on the vocational training model, we again observed that the best means are found in the initial semesters, but it is worth noting that the general results of this variable are above the average of other studies already mentioned. What is worth mentioning is the importance of teacher trainers in this phase of academic life, because through the actions implemented by these professionals will facilitate (or not) how academics will face the obstacles of the teaching profession.

Analyzes of the results of the instrument that evaluates the Professional Results, for the evaluation of the previous professional results, in situations experienced in their early stage of the career, according to the author's questionnaire we made an adaptation, replacing the terms beginning of the career by academic stage, without The need to adapt to other issues.

It was formulated by Jesus (1996) a scale consisting of eight professional goals located within the scope of the relationship with students in the teaching-learning process, and the learner indicate the degree of success perceived in each of them, through a balance of professional experiences In their academic stage, on a 5-point scale (from 1 = unsuccessful to 5 = successful).

The training of the graduate in Physical Education, according to the National Curricular Guidelines, must be conceived, planned, operationalized and evaluated aiming at the acquisition and the development of specific skills and abilities that contemplate the perspective of health promotion in the different spheres of action of these professionals.

According to the National Council of Education (2004), the Physical Education guidelines propose the formation of a professional profile aimed at understanding the social context of individuals and communities in order to intervene professionally with their academic specialty and with the expansion of knowledge, adopt healthy habits.

Every curricular proposal aims at providing a complete and adequate training to the demands placed on the profession. However, due to the dedication and commitment of those who assign themselves the task of constructing higher education curricula, there are always elements that escape perception.

Based on these statements it is desired that the professional in Physical Education has a huge range of skills and abilities to develop their activities.

The overall results of UNIPAMPA'S Physical Education academics point to a positive perspective regarding the professional future, since despite the overall results 29.28 points (SD = 3.65), still below the 32,03 average of the Sampaio study (2014), is a little more than that of Jesus' (1996) studies, 26.93, which points to a formation that allows us to envisage a promising professional future for future professionals.

Source: Baez (2016)

Averages followed by the same letter do not differ statistically from each other, at the significance level of 5%, according to the LSD (Adjustment for multiple comparisons: Least Significant Difference equivalent to no adjustments) test. Here we show a concern with the future professional and the ability to reflect on one's own career because this reflection can facilitate the entry and / or permanence of the professional in the labor market. These results are showing trainers that only groundbreaking information and knowledge about the area and its target audience are no longer seen as the fundamental factors of professional development. Therefore, a permanent discussion with the reality is necessary in search of new alternatives for overcoming the teaching practice.

In order to evaluate the support provided by the traineeship supervisor (s), according to the trainee's perception, Jesus (1996) elaborated a scale consisting of twelve items, Of them a pedagogical implication deriving from the cognitivist theories of motivation that can be fulfilled by the instructor of the pedagogical stage in the cognitive-motivational support that it provides to the trainee.

The items are preceded by the sentence - The orientation that was given to me during my pedagogical stage led me to ... And evaluated according to a Likert scale of 7 points (from 1 = totally disagree to 7 = totally agree).

In the global division by semester the results presented better values in the second and fourth semesters with 52 points (DP = 8.20) and 50.32 points (DP = 7.28) respectively, but in more advanced semesters such as the sixth and eighth semesters The scores were even lower with 45.72 points (SD = 9.56) in the sixth semester and 48.55 (SD = 9.67) in the eighth semester. Semesters that already count on the supervised internship discipline.

	eighth	48,359A	1,865	

Source: Baez (2016)

Averages followed by the same letter do not differ statistically from each other, at the significance level of 5%, according to the LSD (Adjustment for multiple comparisons: Least Significant Difference equivalent to no adjustments) test.

According to Tardif (2002), supervised internship is one of the most important stages in the academic life of undergraduate students and, following the requirements of the National Education Guidelines and Bases Law, from 2006 onwards it constitutes a proposal for Supervised internship with the objective of providing the student with the observation, research, planning, execution and evaluation of different pedagogical activities; An approximation of academic theory with classroom practice.

Thus, when analyzing the results of Physical Education students, the general results are 49.69 points (SD = 8.75), which represents a score well below the studies of Jesus (1996) and Sampaio (2014).

For Pimenta (2002), the internship is the central axis in teacher training, because it is through this that the professional knows the aspects indispensable for the formation of the construction of the identity and the day-to-day knowledge.

According to Pimenta (2002), the supervised internship becomes essential in the teacher training process, since it provides conditions for future educators, specifically for undergraduate students, a close relationship with the environment that involves the daily life of a teacher and, from this experience, academics will begin to understand themselves as future teachers, for the first time facing the challenge of living, speaking and listening, with languages and knowledge that are different from their environment, more accessible to the child.

At this point it becomes necessary to explain why, since UNIPAMPA'S Education course is characterized as a new course, it has a curriculum that, in front of many undergraduate courses in Physical Education, can be considered innovative because it allows the insertion of the academic In the school since the first semester through the Curricular Pedagogical Practices that seeks through the various disciplines developed in the academic semester to provide the real practice, ie, the accomplishment of the activities developed in the academic environment in the school environment where effectively the future professional will perform their teaching practice .

Thus, the supervised stage gives the licensee the mastery of theoretical and practical instruments essential to the performance of his duties. The purpose of this exercise is to benefit from the experience and promote the development, in the professional field, of the theoretical and practical knowledge acquired during the course in the higher education institutions, as well as, to promote, through various educational spaces, the expansion of the universe Cultural background of academics, future teachers.

6. CONCLUSIONS

Using as basis the question of research in which we seek to identify the graduates in Physical Education in the process of formation, with regard to indicators of well-being, we identified that in physical education academics the structuring of well-

being seems to constitute At the beginning of its formation process in which this academic, is structuring ways to overcome the challenges imposed by the initial training period.

We emphasize that for the construction of well-being it is necessary to construct positive university experiences and for academics in the process of formation this can be done through the valuation of practical and theoretical experiences, being they, through the insertion in the school environment, Participation in study groups and mainly for the professional appreciation of the chosen area of work.

ABSTRACT

The influence of the consumption of products for babies in the psychic and physical distancing between the mother and the baby is obvious after the analysis of this research. We study the relationship between the consumption of baby products (0-3 years) and the physical and psychological separation between both. It seems to be that there is a contradiction between the products offered and scientific knowledge of the matter brings over of the physical and psychological benefits for babies.

The research started from numerous interviews with people associated with motherhood. After these interviews, a survey was developing in 1115 mothers of babies 0-3 years.

Regarding the results, it notes that, as regards products for the sleep as well as with regard to breastfeeding, ride, travel, security, toys, furniture and accessories; they are the most used those dissociate the mother of the baby, encouraging the child to sleep without physical contact, don't take the chest, stroll separated from the mother, etc.

The conclusions, while not "politically correct" for marketing environment are a revealing importance to begin to consider new products that promote other types of mental and physical relationship between mother and baby, products that promote world more intelligent, friendly and close.

Keywords: Consumerism, Consumer Behaviour, Ethics of Marketing, Consumer Psychology.

JEL Classification: I12, I20, M31

1. BACKGROUND

The baby products industry has undergone a boom in recent years, although still difficult rating figures, secreted by groups, is billing the sector. Even being products with quotas of sale rather than representative, their promotional strategies for the buyer-based merchandising, promotional marketing in health centres and hospitals, journals and few insertions in television advertising; increasing the presence in electronic journals. This "commercial effort" causes that, together with the dynamic Western manners, an expectant mother, without having been almost exposed to advertising impacts, until the baby is born because there will be bought very likely: the basket (pacifier, bottle, nasal aspirator, wipes, diapers, dishes, bibs, rattles, creams, shampoo, gel, etc), plus multiple products such as: furniture room, cart, Moses, bath toys seat car, clothes, crib, blankets, sheets, park or garden, magazines and videos and so on depending on the volume of relations of the mother. These acquisitions are made regardless of the analysis by the mother of the need for the purchase of products; i.e. in this case, is in breach of the purchase decision process since there is a need for actual purchase, and may that it did not exist depending on the method you decide to raise your baby. But this is often not an approach that European or American mothers are made globally.

Analyzing the segment of products aimed at infants 0 to 3 years are not investigations of this industry that would address it in a comprehensive way, and even, it is difficult to access data, since many of these products are within the Group of "products" that encompasses a segment more large. It can find figures of specific elements, such as the one done by the consulting firm TNS Wordpanel (Consumer, 2007), which concludes that increased spending on infants of 0 to 3 years, focuses on clothes (48%), diapers (19%) and power (20%). According to the study, the lower is the older child is made disbursement. Spanish families invested in 2002 about 511 euros per year in children aged zero to three months; 467 euros, in 3 to 6 months; 411 euros, from 6 to 12 months, 390 euros, in 12 to 18 months; 305 euros, at from 18 to 24, and 222 euros, in the 24 to 36 months, says the report, although the figures seem to us with an important focus down. By items, up to three months increased spending occurs in the textile sector (55.6%), diapers (19.2%) and food (13%), figures which stood at 44.6%, 19.2% and 25.2% from three months to six. In the case of 6-12 months, 39% of the disbursement is for clothes, 30% for food and 21% for diapers.

On the other hand, children 12 to 18 months consumed mostly clothes (44.3%), but also food (23.6%) and diapers (23.5%). These figures become 46.7%, 17.2% and 27.1% for 18-24 months; and 61.1%, 12.5% and 18.3%, in the case of 24-36 months. Bearing in mind that this study considers that the expenditure is lower in other products of the sector, and taking into account a product possessing a significant number of parents (55' 7% it is used fairly or very often), the intercom sound, has a price average of 114 euros, seems to be that spending that is carried out in the maintenance of the

babies is considerable. With respect to other sectors not many data, we find is interesting to study in United States (Hirsh-Pasek and Michnick, 2005) on the category of educational toy for babies, which constituted a business of billion of dollars of benefits. This study is relevant because this sector (chips and pedagogical books for babies) are currently in expansion promoted by Governments and curricula, and what started in United States expands to Europe (although these methods undermine the creativity of children). This type of product, type Baby Einstein (Lodish, 2007), is expanding its market share in Spain developing new lines of videos and toys educational and at the same time contribute to creating a new generation of parents focused on children who think that so-called enrichment activities can push their young directly into the path of the fast learning explicitly and implicitly success.

There are different companies in the sector that promote educational products and entertainment services for babies and sets for babies of-less-in-three-years, such as The Baby Prodigy ("dedicated to contribute to the growth of smart and happy children) and Brainy Baby ("learning for life"). Various television as the Teletubbies or Little Einsteins products also work in this line. However, as this educational business of babies became a lucrative sector of 20,000 million dollars annually, some groups defending the rights of the child warned parents that they seriously thought about the products and the hidden message behind the campaigns aimed at infants and children. In 2006, *Campaign for a Commercial-Free Childhood* interposed a complaint to the *Federal Trade Commission* against Baby Einstein Company by false and misleading marketing. The American Academy of Pediatrics (American Academy of Pediatrics), joins the demand by pointing out that evidence showing that these videos will help to physical or intellectual development of infants and children (but opposite) as shown by several studies there is no. In addition, (MEAD, 2007), a report by *Education Sector*, argues that the majority of so-called educational toys for infants and children in fact are not. This report demonstrates why adults can't get that newborn babies are smarter or have more success by simply putting them to music of Beethoven or playing with blocks inspired by Einstein.

There is plenty of literature that collapse theories pro consumption based on early learning (Hirsh-Pasek and Michnick, 2005) or Thomas (2007). Also arises if products and marketing campaigns aimed at the purchase of products for babies under three years of age could indeed end up doing damage to infants and children, which younger history have become consumers.

As a group, parents are definitely vulnerable to strategies of marketing (Lodish and Small, 2007). Parents are vulnerable because they have always wanted the best for their children, according to Small (o. c.) exists a great temporal distance between the use of the products "for development" and the feedback obtained from them. Products for infants and young children allegedly get results in the future, such as a higher intelligence, better socialization, which some consider that it helps when it comes to enter the best universities or jobs of greater prestige. In any case, most of the people buying these products because they are the ones on the market. Never has been evidence showing that these toys, programs and educational products provide some educational benefit for young children, rather on the contrary (Zimmerman, Christakis and Meltzoff, 2007). The truth is that, today, to be competitive in the business of toys for babies, manufactured products must promote learning or at least hold that they encourage it. This new market of babies between 0 and 3 years old has become the first segment of the entire life cycle marketing.

Thus, while in this multi-billion dollar sector of products in development "intellectual", below may result in various misfortunes in their training and neuro linguistic skills, in others all damages in the physical and mental babies health is not less serious by providing them substitutes chemicals in breast milk (Aguayo, 2004; American Academy of Pediatric, 2005; UNICEF, 2007; Koletzko *et al.*, 2000; UNICEF-IRC, 2006; UNICEF, 2007; VV. AA, 2004), since breastfeeding promotes a balanced weight of the future child and adult (Hediger *et al.*, 2001; Dietz, 2001); breastfeeding is important in preventing postnatal transmission of HIV, since is associated with a lower rate of mortality at seven months, these results demonstrate the risk of providing artificial feeding formula to infants in sub-Saharan Africa, and the need for studies of alternative strategies: (Coutsoudis *et al.*, 2001; UNICEF program Directive CF/PD/PRO/2002-003, 2004; De Wagt and Clask, 2004; Liff *et al.*, 2005; Doherty *et al.*, 2006; Thior, 2006). There is a significant positive association between duration of breastfeeding and intelligence in the adult (Mortensen *et al.*, 2002; Kramer *et al.*, 2008). Breastfeeding does not cause deaths by poisoning in drinking water (required for milk dispensing of formula) which kills two million children every year (UNICEF, 2007), also has problems of massive intoxication such as those that occurred in China (Jano, 2008a), who have achieved figures close to 100,000 (taking into account the "freezing" of data by the Chinese authorities in these matters). In addition, according to Hernandez and Aguayo (2005): feeding with substitutes increases the risk of sudden infant death (Alm *et al.*, 2002), post-neonatal during the first year of life (in developed countries) (Chen and Rogan, 2004) and infant mortality in children under 3 years (Alm, 2002).

Infants fed with artificial formulas have more infectious diseases (primarily gastroenteritis, respiratory infections, and infections of urine (Temboury *et al.*, 1991; Lopez-Alarcon, 1997; Cushing *et al.*, 1998; Kramer *et al.*, 2001), these are more severe (Dewey *et al.*, 1995; Wang and Wu, 1996; Scariati, 1997; Baker and Henderson, 1988; Wilson *et al.*, 1998; Wright *et al.*, 1998; Raisler, Alexander and O'campo, 1999), and generate more hospitalizations (Heinig, 2002; Cesar *et al.*, 1999; Oddy *et al.*, 2003; Bachrach, Schwarz and Bachrach, 2003; Albernaz *et al.*, 2003; Olivares and Buñuel, 2007), etc.

Another sector that has a significant amount of sales is the associated with the products associated with sleep: cribs, intercoms, rags and dolls of attachment, furniture of rooms, textile ad hoc, pacifier cords, etc. Behavioral problems that can cause baby night insulation and others that basically affect physical health are referred to in the scientific literature (Byard and Cohle, 2004; Jackson and Newton, 1989; Jove, 2006; McKenna *et al.*, 1990; Pantley, 2002; Parmeggiani and Velluti, 2005; Sears, 1985; Stores, 2001).

Associated with these sectors, develop other not less important as strollers, chairs, baskets or masicosis that cause an at least physical estrangement between mother and son, with the implications that this entails (Montagu, 2004).

As said Bolton and Alba (2006) it is not reasonable to expect that consumers take into account all the evidence in regard

to products and educational demands. Are left with the idea that something must of true, and... who doesn't want the best for your baby? It's media intuitions.

It is relevant to apparently, this trade sector, in general, it seems that it is more conducive to their business success, that the target population (mothers or carers of infants 0 to 3 years) behave in certain form in the relationship with babies. This type of relationship would not encourage a climate of love and harmony with that baby. Certainly we are concerned that you may be favoring, directly or indirectly, a type of communication or relationship by this sector, forms of *push* or shaped *pull*. All these ideas were the germ of our research, and we believe that its conclusions may be a priority value already not only for the marketing environment, but for the whole society.

2. OBJECTIVES

Our research seeks to understand in a broad sense the consumption of products for babies zero to three years. It seems that there is a contradiction between the products that are offered on the market and the scientific knowledge of the matter about the physical and psychological benefits, that is, human, for babies. We have a complex investigation, relevant, that may collide with strongly preconceived ideas and that, in short, means a confrontation with the *establishment* with portfolio of sector guidelines and, above all, with our own consciousness not only as mothers and fathers, who want a better world to their children, taking into account that this world will be the children that will give them the world. In addition, as people with a conscious responsibility to humanity. The basic objective of the first phase of our research, which is that raised in this paper, is the analysis of consumption of products for babies zero to three years by their mothers, while occasionally products may act as separators physically mother or, if, on the contrary, they foster the human union with the creature that we understand psychic and biologically mother due to their immaturity is dependent that seems obvious and evident by the scientific literature, for the effective and efficient development in terms of overall health of the baby.

3. STUDY DESIGN

Research departed from numerous interviews with people associated with motherhood and, subsequently, it was a pretest for mothers and fathers was also evaluated by specialists in the subject. In the pretest were obtained data that advised to take as it shows only to women, since 98% of the time were mothers who made purchases and, in addition, with regard to the time spent with the babies, mothers working outside the home or not, spent far more time with the baby, as well investigations of the INE (2009) had ratified it that obtained the following dedication of the time in minutes:

Table 1. Relationship of time share of fathers and mothers with their babies

	PADRES		MADRES	
	Ocupados	No ocupados	Ocupadas	No ocupadas

Therefore, develops the next sheet in table 2.

Table 2. Field work sheet

Universe:	Mothers of infants aged 0-3 years
Geographical scope:	Malaga
Design of the questionnaire:	Own research
Sample size:	1115 mothers of infants 0 to 3 years
Sampling error:	±3%
Trust level:	95' 5% ($\sigma = 2$ sigma)
Sample design:	Simple random sampling with a proportional affixation in the 10 districts of Malaga.
Date of fieldwork:	15 to 30 May 2016

Source: Own elaboration

The design of the field work was carried out in two lines:

Pollsters 120 surveys conducted in each of the following districts: No. 1 district: Málaga - Centro. District No. 2: Málaga - East. District No. 3: Garden City. District No. 4: Bailén - Miraflores. District No. 5: Palm - Palmilla. District No. 6: Cruz de Humilladero. District No. 7: Carretera de Cádiz. District No. 8: Churriana. District No. 9: bells. District No. 10: port of la Torre.

Medical centres in which there was a section of Pediatrics, children's parks, walks, etc., where also *on-site* to the questionnaire answered were made in the street, with approaches to children's centres, nurseries.

1200 questionnaires were distributed, the valid were taken randomly 1115 to adjust to the classical sample sizes. There was only problem in conducting the surveys by reluctance of mothers. The questionnaire, that Yes, having 195 items it was fairly tired of filling up, so the motivation is working for mother and who understand the importance that would do a thorough completion. Finally, we highlight that they work with groups of products for two reasons:

- a) with a view to a possible future segmentation with interest for marketers.
- b) to group them with respect to our demand of information.

4. RESULTS

The questionnaire is valued the level of use of products grouped by sectors. Asked to bring if you did not know him, or if he had not used it ever; After establishing a scale from 1, that the product has been used up to four times, up to the last position, 5, indicating a continued use of at least three months. The percentage results to our questionnaire are as follows:

- In regards to products for the “dream” which split the mother of the baby are those who favor the child to sleep without physical contact. BabySleep system so that it is a product with sound sleep facilitators is practically unknown by mothers (65%) Although a 11.7% has used it to level 5. The sleeping bags, are surprisingly almost unknown (72.3%), useful so that the child can sleep in mother bed. Rag or the attachment doll are used instead of the physical contact of the mother, are fairly or very used, 49 and 25% respectively. Medication or plants that induce sleep, used much or rather by 9.3%, it is a very separator element.
- Regarding the “hygiene”, cloth diapers, therefore detergent for diapers, eco disposable nappies, reusable swim diapers and learning just used, and it can be said that they are not known: 95’ 8%, 93’ 7%, 67%, 71’ 4% and 79% ‘ 5 respectively. We should appreciate that, currently, a mother who uses cloth diapers hard will give it to care for someone else, since it would be quite “cumbersome” for that person. The used are those of cellulose, especially Dodots (73’ 3%), Huggies (28.3%) and other brand (48’ 3%), that we understand that they are with dealers brand diapers. Cellulose of swim diapers are almost unknown (59’ 7%) and very used a 15’ 7%, which by common sense would be the percentage of children under 3 years old who come regularly to the pool.
- In “suction, breastfeeding and feeding”, firstly to analyse the data on breastfeeding clips (68’ 4%) which is more or less equivalent to the percentage of women who have chest six months (69’ 6%). Breastfeeding clothes (shirt, jersey...) is perhaps a term that we should specify more, because passes from 46% who acknowledges not knowing what it is to a 31’ 9 which says have used very frequently (may be that the consumer cover appropriate though non-specific clothing). Breast pump a 28 it ‘ 6% used, what looks like a high rate (exhaust, in some ways is more unifying than separator, because that is often used when the mother is not or the baby is premature, but with the intention of maintaining lactation). Nursing pad, unknown by a 76.2% and very used by 11.6%, this product interferes with physical contact, since the mother wearing it, to have the free arms, lee or does something else, “takes time”, “isolating” baby. Discs of lactation, but in very common use in three to six months that gradually becomes unnecessary, so it should be about the relationship of data with the first lactation, and responded effectively, 5 a 60’ 4% and four 6’ 7%, bone, 67.1 versus 69’ 6. Liners, a separator used to level 5 and 4 by 22.5%. Isn’t an equally optimistic of the pacifier, used much by a 75’ 2%, which would be the data of children who use pacifiers, while a 10’ 1 never use it; knowing that the pacifier (such as teats) are drawbacks for breastfeeding (Righard and Alade, 1977); (Who-UNICEF, 1989) among other important problems. Dummy baby packs, should be a fact associated with the pacifier and is certainly used by 63.6% and pretty much; coinciding with the previous data. Infusions digestive, used by a 48’ 3% of mothers. Relaxing infusions, is administered to a 24’ 1% of children in the qualitative interviews mothers claimed that frequently administered at dinner, instead of water; Obviously it is an absolutely separator product. Water glucosidic, this fact must be considered that it is not a product administered in the long run, find here people who have answered with a 5 (15%) is amazing for us, the sum of the rest is 49%, that is, almost a half of the babies are given this product. Bottle (for milk) is used much or rather by a prominent 87’ 4%, seems a little daunting, although we think that although a more than six-month-old baby can drink from a Cup is given milk in bottle for comfort reasons. Bottle (for cereals), used with a 71’ 7%. Bottle anti colic, widely used in a 38’ 3% of the population, that don’t know is if it is as a preventive or restorative; crossing it with the data of digestive infusions (48’ 3%) seems consistent. Baby bottle sterilizer, widely used by a 67’ 4%; a fact that does not block much if means that the bottle is sterilized when the baby is very small, unless it is being administered to your baby breastfeeding and “formula” of cow at the same time. Isothermal bag for bottles, with a 35’ 4%; Another fact complex if there is a mixed breastfeeding. Heat baby bottles, with a 38% ‘ 1. Drinker, frequently used by 45%. Milk adapted (1), here is where we appreciate the relevant data that, although you breast-feed, or state that breastfeeding up to six months, they have used much or rather on a daily basis by a 72’ 1%, a milk taken from birth until the third or fourth month and some sixth month, that is, have given “little help” that according to experts (C.L.M.A.E.P., 2004) does not promote breastfeeding. Follow-on milk

(2) (to use from the sixth month until approximately) used by a 81' 2% of the population, it seems that complement is used to mix with cereals, are evidence of new mothers still breastfeeding offered substitute formula to complete the daily intake of milk. Although this is in accordance with the advice of spaces for women (www.enfemenino.com, 2008) supported by prestigious companies such as "El Corte Inglés, Ikea, Chevrolet, Central Lechera Asturiana and other" claiming before the issue of the incorporation of women to work when the baby is 4 months: "If you really want to get back to work, not you can continue giving you breastfeed your child It is clear that you can't be in two places at the same time. Therefore, while you are at work they will have to give a bottle to the child. Anyway do not worry because your son with 4 months of breastfeeding is sufficiently immunized", uncertain data from the scientific perspective (Aguayo, 2001, and others). Continued milk (3) (from the year up to three years approximately), used by a 56' 9%. Milk of growth (from 1 to 3 years), is different from the previous one because it is already prepared liquid as if it were a milk for adults, used it a 64' 6%. Entering in the cereals sector first of all tackle the gluten-free cereal Babyfood, employed starting from the 4th month, is widely used by the 82' 1% of mothers. Porridge of grains, from the 6th month, is fairly or very used by 81%, according to the previous data. Organic cereals babyfood, unknown by 81%, does not seem to be a product of success only used by 9% of the population. Cereals babyfood (Tetrabrik) prepared, used by 21%. Yogurts for babies, some specialists say that they are "ideal" to replace the maternal intake, it is very or fairly used by 69.3%. Baby food salty not ecological, say use the 30' 8% and not know them the 44' 7%, a slightly strange. Baby food sweet not ecological, us strange also that it claims to not know it the 40' 5%, there may have been a problem in the understanding of the question, and use it often on 32' 5%. Salted baby eco, unknown by 68' 6%, data, this Yes, that find us it credible, they claim to use it 15' 9% of mothers. Finally, sweet baby organic, also unknown to the 67' 1% of mothers, are used by the 17' 2%.

- In the segment of "ride, journey", products that make this physically together baby to adult, such as Backpack Sling, although unknown by 38.4% of the population claim to use it the 32' 6% of the population, a fact that find us something for observation data. Such products contribute to the link (Bowlby, 1995). Baby Sling, indeed, is unknown or never used by the 85' 8% of the population, maternal, and used by a 7' 6% of mothers. The shoulder sling is unknown by a 84' 2% and says have used quite 7%; We consider that the purchase of cloth and shoulder strap, not being exactly the same products (the cloth is for longer and more comfortable rides to hold the baby in the back) but with the same philosophy, can be bought by the same population. Car seat, is an element that we consider basic and priority in any type of relationship, widely used or enough for a 97' 0% of the population, we estimate that the rest has no car; Although the observation shows sometimes mothers with baby in arms. Stroller, is fairly or very worn by 96% of the population, if we return to the cloth and carrier data (7% approx.) make us see that the cart is used while having this other transportation system. Street/stroller carrycot, this element is used up to four to six months at most, and the use is a 88 ' 2%.
- In the products that we have encompassed within 'security', highlight first intercom sound - interphone, which claims to be quite or very used to the 55' 7% of the population. Sound intercom e image , low to 15% ' 1. Intercom monitoring respiratory movements, a 6' 7%. All these products are, physical separators of the baby. Crying Analyzer is a product which, although often it works as a gift, only used by the 2' 6% of the population, although the 94'3 don't know it. This product seems to reveal a fairly serious lack of understanding between the mother and the son, and the need for a machine interpreter.
- In the Group of products related to "health", the data obtained are the following (quite or very used): digital pacifier thermometer, 9' 3%. Drops clean ears, 14' 2%. Humidifier, 26' 9%. Cream for buttocks, 89%. Shampoo specific for baby, 94' 8%. Specific gel for baby, 96' 5%. Lotion or body oil for baby, 93' 1%. Nasal aspirator, 68' 2%. Cleaning wipes, 97' 3%. Milton solution or similar (disinfectant objects), 43' 9%. Amukina or similar (disinfecting fruit and vegetables), 11' 1%. Thermometer ear or forehead, 41' 6%. Thermometer of mercury or digital, 72% ' 7.
- In "toys" have highlighted the following products: wooden toys, 47' 8%. Soft toy that emits the sound of the heart of the mother, a 9' 4%. Toy to set pieces (circle, square...), 72' 5%. Toys lego type, 61' 1%. Toys that emit music or sounds when pressing buttons, 88' 7%. Piano, 59%. Electric swing, 16' 9%. Ball, 85' 5%. Doll, 61.3%. Sheets reading, 54' 1%. Rattles, 73' 3%. Tricycle, 69' 6%. Wit toys, 60' 4%. Mobile for the cradle, 53' 8%. Blanket gym, 66.1%. Adapted books of learning, a 75' 6%. Tales, a 81' 8%.
- In 'furniture and accessories' highlight: vertical bath, 39' 8%. Traditional bath, 83%. Thermometer for the bathroom, 54' 1%. Mat for the bath, 53' 4%. Garden - playground, 55' 5%. Cot, 93' 5%. Travel cot, 62' 4%. Guardrail for bed, 69' 5%. Hammock, 61' 1%. Chair for the bath, 33' 9%. Table changer, 70'8%. Night lamp, 42%. Learning urinal, 51'8%. Diaper container, 20%. Trona, 74.3%. High Chair table, 29' 8%. Baby cutlery, 75'3%. Babypappa (for purées kitchen robot), 10'9%. Steam cooking for babies 9' 7%.
- In the segment "others" have included diverse products, obtained the following data regarding the population that had used much or rather the following products: organic clothing, 3' 9%. Music of prenatal stimulation, 23'1%. Instructional videos (baby Einstein, baby Shakespeare...), 31'4%. Videos of mental stimulation (brainy baby...), 12'6%. Films for babies or only children's channels, 66'5%. Journals of babies 61'6%. Parenting books, 43' 2%, find us an optimistic answer also by mothers who seems to read one or two books having read many books; in interviews of approximation drew us attention that some mothers who already had a previous child did not need any book that addresses ageing.
- Regarding the formation by reading selected a group of books that had been mentioned more in the pretests: "Sleep children" by *Estivill and Béjar*, 43'6%, this free is totally separator, and shocking is the fact that half of the population

is subject to its influence. “Sleeping without tears” by Rosa Jove, 2’9%, unifier (from 2006). “Kiss me a lot” by Carlos González, 5’7%, unifying. “Kids come without instructions” by Montserrat Jimenez, 9%, this book is separating tendency and it can influence only point it 9% the fact that the first edition was in 2006. My child do not eat me by Carlos González, 4’8%, unifier and the Continuum concept by Jean Liedloff, 0’8%, unifier.

- The last part of the questionnaire was directed to take the socio-demographic data, to know if being the only child could affect buying patterns (46’8 girls and 50’4 children, 2’ 5% as twins or twins/as and 0’ 2% triplets as.) Being the 44’1% only sons, the 41’ 4% had 1 brother, 11’4 two, the 2’ 2% three and 1% more than three). The average age of the baby is 24.1 months. The age of the mother ranges between 18 and 50 years, being the most common group of 30 to 35 years, comprising 49% of the sample. Works out a 71’6% and an average 6.63 hours. The type of work performed is: entrepreneur (10’3%), Directive (6%), liberal professional (10’ 8%), officer (or contracted with the Administration) (13’ 6%), middle management (14’ 3%), workers or qualified employee (24’ 9%), working or employed without qualifying (20’ 2%). The level of studies of the population sampled is divided into the following strata: primary (17’7%), media (38’5%), University of 3 years (22’ 3%), University of 5 years (19’ 3%) and Dr. (1’ 8%). With regard to the demand for information of how long mother devotes a day exclusively to his son (not doing something else while the child is present) results have come out, we understand optimistic by the mother, since thorough investigations only this particular give very different data. The sample gives an average of 7.96 hours a day. Our population was breast-feeding her baby 10’ 9%, a 83 had breastfed him ‘ 7%, of which 31% had not moved from the third month, and the 69’ 6% moved from the sixth, being already 95% in twelve months. Given that 70% of the surveys come from mothers of children who were in day care, get us that the 30’ 9% is cared for child care and a family member, the 50’ 3% only nursery, 6’ 9% a family member and a 11’ 7% only the mother or her partner; It must be taken into account in the results that interviewing all kinds of baby ages, some have no age to be admitted in any nursery and others are still small and grandmothers are caring for them or similar. The average hours that babies spend in the nursery is 6.10 hours. Finally, stating that the 97’2% of the sample lived with his partner and a 2’ 8% were single-parent units.

With respect to our demands for information, we analyze the means of consumption products separators and unifiers, obtaining the results shown in table 3 and 4.

You can be seen in the results that mothers who read "FALL ASLEEP CHILD" used in larger share separators products.

5. CONCLUSIONS

The products most consumed by babies from zero to three years are those who distance them physically from their mothers, with physical and mental implications that this entails (works cited in theoretical framework).

This fact can become mother desire for more independence, comfort, etc., or Western fashions of the importance that the baby is independent, self-sufficient and autonomous, to be possible since it was born, with the generation of violence it entails (Miller, 2001; Barudy and Dantagnan, 2005; Andreoli, 2006).

Mothers who read “sleep children” buy more separator products to those who have not read it.

It should be in a qualitative way to investigate the causes that provoke the mother wants to distance himself from the baby and the degree of awareness that this has its behaviour, so whether it is or not free of it.

Products “to develop the mind of the baby” follows in Spain the Anglo-Saxon current foster the growth of this sector.

ABSTRACT

Since the adoption of the '*Lei de Bases...*' of 1984, the quality of education in Portugal is declining, undermined by 'critical, creative and independent thinking', implemented by neglecting memorization as a learning tool, as supposedly students should understand things without knowing them. As a consequence, vast majority of students can't retain any abstract knowledge. They prepare from scratch for their tests and forget everything afterwards. The students never acquire essential primary-school skills such as capacity to do mental calculations, hence the title of this report, comparing contemporary school + university education to pre-1984 primary school of 4 years.

The quality of education is further degraded by 'evaluation' of teachers at school and university, judged by academic success and degree of satisfaction of their students. With the students objectively incapable to learn, understand or remember, the teachers have a dilemma of either letting such students pass without retained knowledge, skills and competences, or else have their own 'evaluation' suffer. As the generations change, students who were 'passed' become teachers themselves, still with no retained knowledge and thus no moral authority to fail their own students. Thus, the level of requirements monotonously degrades, with the educational fraud perpetuated in the new generations.

Keywords: Higher Education, Primary Education, Memory Development, Creative Thinking.

JEL Classification: I21, I23

1. INTRODUCTION: PORTUGUESE SCHOOL REFORMED

The concept of learning-by-doing schools was introduced in Portugal in the mid '80s, following the US lead along with other European countries¹. In Portugal it was introduced following the adoption of the *Lei de Bases* in 1984, with the objective of introducing universal secondary education and expanding higher education (*Lei de Bases*, 1984; Fig. 1 shows the rapid expansion of the higher education over the last 25 years). This concept emphasises the development of critical, creative and independent thinking of the students, starting already in the first year of primary school, in stark contrast with the previously used model of formal school, which gave a lot of attention to memory and memorization. I. K. studied in the Soviet school system from 1964 till 1974, where his education was also largely based on memorization. Coming to Portugal in 1993, he still found students who were preparing to retake their final exams in Mathematics according to the pre-reform curriculum, and needed to know the formulas of trigonometry, logarithms etc., same as the students in the Soviet school.

Officially, the learning-by-doing school does not require knowing anything by heart. Instead, the student should understand how the respective formulas and results may be obtained, and what their consequences are². This approach is strictly followed from the first year of the primary school; for example, it is unnecessary to know the multiplication table by heart, as a result, only very few students do. Similarly, no poems are learned by heart, while they do study the poetry of Camões in the secondary school. Some time ago a TV program interviewed students at the entrance of the Instituto Superior Técnico (IST) in Lisbon, one of the pre-eminent schools of engineering in the country. One student, when asked the result of multiplication of six by seven, replied: "I'm not a mathematician". Note that this competence had been routinely acquired in the primary school, whereas now it is not required even at a university.

¹ The primary source of information for this paper was educational observation by I. K. while teaching General and Physical Chemistry at the University of the Algarve for more than 20 years, and of his four children going through this same system, from the primary school through the higher education and to defending PhD theses (two at the time of writing).

² The reality is very different from the theory: the method of work used by many students includes learning by heart the entire book chapters without understanding a single thing, replying to the questions by locating, in the paragraphs of what they memorized, the words that appear in the test paper, and forgetting everything after walking out of the exam room: "I already studied this, and don't need to know it any more!" One of the private students of I. K. used these techniques to routinely obtain grades of around 13 (satisfactory, on the scale of 0 to 20) in Chemistry and Physics (9th year of school), which shows that the school tests do not validate the achievement of the study objectives, because passing such tests does not require any retained knowledge.

Figure 1. Expansion of higher education in Portugal over the last quarter century; left panel: annual number of graduates of all degrees and both sexes, right panel: annual number of graduates in science and technology courses

Source: Instituto Nacional de Estatística, 2017, <https://www.ine.pt/>

Naturally, with an access to a calculator, the students will be able to do the calculations even without knowing the multiplication table. However, being unable to make approximate mental calculations, they can't evaluate the validity of the results obtained and detect errors that would be clearly evident otherwise. Another group of difficulties comes from not knowing the basic rules of mathematics, such as priority of multiplication and division with respect to addition and subtraction – which were not learned by heart – therefore, calculating an expression on the calculator, they are unable to correctly introduce the implicit parentheses. For example, in an expression like this:

$$\frac{85.34 - 32.67}{44.15 + 321}$$

in order to avoid errors in the calculator usage, the students copy the intermediate results to their notes, and then key them in again, before doing another operation. The re-entering of numbers increases the (already large) probability of error and makes it difficult to check the results. Rounding off is apparently also very difficult, as the students don't recall the rules of significant digits and decimal places, using doubtful recipes instead, like always rounding off to the hundredths. Frequently no rounding whatsoever is done and the result of the calculation is just copied entirely. Rounding-off to the hundredths used by higher-education graduates working at the National Institute of Statistics sometimes produces largely meaningless results by discarding the information contained in the digits that were rounded off (Instituto Nacional de Estatística, 2017; look for data represented by decimal fractions).

Identical phenomena are observed in the majority of other EU countries, followed by Russia and other FSU countries that also adopted the concept of the learning-by-doing school, with emphasis on the development of critical thinking³. The first and very obvious symptom is the students being unable to recall any formulas, and unable to choose between one of possible expressions in the rare cases they are able to recall something, for not remembering the measurement units of the quantities involved.

2. THE SYMPTOMS OF DECAY: NO RETAINED KNOWLEDGE

Here we describe the most the most serious problems generated by the learning-by-doing school that is depriving students of any retained abstract knowledge.

2.1 Memorizing by heart and permanent memory

The failure to know the multiplication table by heart, apart from disabling approximate mental calculations, has even more serious consequences. This is because our long-term memory works as an associative database, that is, elements of information, when memorized, get associated to others, according to the relations apparent at the moment when we get to know them⁴. Therefore, in order to form the knowledge base in a specific subject area like mathematics, first of all we need to learn by heart some information related to mathematics. A piece of information that we have just been in contact with will be transferred from our short-term memory to our long-term memory, *provided* that within a short time span (a few days) we shall encounter it repeatedly, and preferentially in varied circumstances, multiplying the number of useful associations. However, if we have no knowledge of mathematics in our permanent memory, the new elements we are memorizing will

³The experience of I. K. in the international educational projects indicates that not requiring the multiplication table to be known by heart is an excellent indicator of a learning-by-doing (degraded) system of education. The majority of European countries fall into this category, in addition to all of the FSU countries. Russia in particular entered this category around the year 2000.

⁴Those who have ever learned a poem or a song by heart know that after reciting the first line, the second one immediately comes up, etc. This is an example of associative memorization. All of the long-term memorization is associative.

get associated to something irrelevant for mathematics – such as the personality of the teacher, the latest football game, etc. Obviously the memorization without any references to other knowledge in mathematics will not advance the student in any useful way – given that the associations do not belong to this study area, the students will not be able to recall much knowledge of mathematics when need arises, apart from a vague notion that they should have heard something about the subject. The missing associations are provided to such students by different hints – those embedded into the test, formulas from the list of formulas, results of calculations, cheat sheets, copying from a colleague, etc. However, none of these hints exist out of the classroom, leaving the graduates helpless in real-life situations, without any retained knowledge that might be applicable to their current situation or problems either directly or as a starting point for reasoning⁵.

2.2 Diagnosis of the Portuguese educational system: the empty-head syndrome

Recently the PMAT project, organised by the Portuguese Society of Mathematics (SPM), has evaluated whether the preparation acquired by students at the secondary school is sufficient to study mathematics at the university (Pires, 2012). Thus, a diagnostic test was given to 1398 first-year students of two leading national technical universities, who passed the Mathematics A (the most advanced curriculum in Mathematics) exam at school and were to study 2 disciplines in Mathematics during the first semester of their studies, Analysis I and Linear algebra. The average higher-education entrance grade of these students was 15.7 on the scale of 0 a 20, which is a very good (although not an excellent) grade. They had to answer 30 multiple-choice questions on the scholar curriculum in Mathematics, choosing one unique correct answer from three suggested possibilities. The students were not allowed to use calculators or any other auxiliary material. The exact same test was administered two times, before the start and after the end of the first semester. The researchers found a strong correlation between the academic achievement at the secondary school and at the university: those students who had their entrance average over 15, passed both disciplines in Mathematics in their first semester, while those with the average below 13 failed one or both. However, the average grade for the first diagnostic test was 0 on the scale of 0 a 20 – on average the students gave 10 correct answers out of 30. Choosing from three possible answers, 10 hits out of 30 are scored by random choice, requiring no knowledge whatsoever. The best student in this group of 1398 got the grade of 12 on the scale of 0 to 20 (22 correct answers). The zero average of the group is explained by the (positive) knowledge of the best students being compensated by the negative knowledge of the remainder, who chose wrong answers more frequently than a completely random choice would imply. The average grade for the second test was 2 points on the 0 to 20 scale (12 correct answers), while the best student got 16 points this time (26 correct answers). The students improved their results only as regards functions and derivatives, studied during the first semester in Analysis I. Some of the students were also interviewed (the best 20% and the worst 20%), and asked to compare the two tests – quite surprisingly, none of them perceived that they were asked to do the same test twice, having completely forgotten everything about it in 5 months. Repeating the same test in a couple more months, we would surely discover that the short-term memory of the students has completely purged itself, with the results returning to the starting point of zero average knowledge. In fact, we should expect very similar results in all disciplines of the scholar curriculum, as the teaching methods are uniformly based on the identical refusal to develop and use memorization in the educational process.

The absence of specific knowledge memorized by heart, in either mathematics or any other study area, results in the vast majority of students being unable to form knowledge bases in their respective memories in any single discipline of the scholar curriculum, which manifests itself as the empty-head syndrome. Having some hints, these students frequently manage to recall the information they need – the hints providing the associations that the student missed. Naturally their teachers try to build sufficient hints into the tests and exams, so that they can give good grades and approve a significant proportion of students, independently of their real level of knowledge, because the teachers' performance is evaluated based on the academic success of their students (see below).

Figure 2. Year transition rates in the Portuguese secondary school; note the marked growth starting from the academic year 2005/2006, since the new curricula were introduced

Source: Instituto Nacional de Estatística, 2017, <https://www.inec.pt/>

⁵ The usual counter-argument is that though people may not know something, they are still able to find it in the information networks. This argument works in the context of scholar group assignments and essays, when the students know the topic and can find other similar essays on the internet and adapt those to their necessities. Here knowing the topic equals knowing all the answers – but the answers are known only to the most frequent questions. The real-life problems confronting a person may not have pre-packed answers, while the right questions would have to be formulated first anyway; thus, our graduates will be unable to find answers, lacking the retained information that could help in their reasoning. Therefore, the learning-by-doing school is bound to fail its main objective of independent thinking: apart from being totally dependent when possible, thinking of students/graduates is completely impossible in the most important non-standard cases. Such persons will have to turn to the irrationality of religion as their last resource – no thinking required and all answers available, even to questions yet unknown.

We should recall that during almost a decade the average grades for the national exams in Mathematics and Sciences were around 7-8 points (Júri Nacional, 2005⁶), while the average grades as evaluated by current control in these disciplines were around 12 points⁷.

The difference may be explained by the students predominantly using their short-term memory, being unable as they are to use their long-term (permanent) memory. This short-term memory can accommodate a limited amount of information and for a short time only, hardly exceeding several days. Thus, the short-term memory is more efficiently used in the current control, usually done by tests – a reduced amount of information can be memorized in 2 or 3 days that students typically use to get ready for a test. On the other hand, the amount of information is much larger when students prepare for a final exam, whereas short intervals between exams do not allow a proportionally larger period of time for preparation, resulting in a lower preparation quality. Also, by the end of a prolonged study period, the temporary memory starts losing the information acquired in the beginning. Therefore, necessarily and inevitably, the exam grades must be lower.

In practice, the ministry of education, under cross-fire by all of the stake-holders, adjusted the difficulty and grading criteria of the exams by introducing new school curricula starting from the academic year 2005/2006 (FENPROF, 2006). This had a short-term effect of increasing the approval rates, as the students prepared under the previous (more stringent) criteria were evaluated by the new, more lax criteria, so that the average exam grades increased by 5 points, coinciding for some years with the average of the current control grades and increasing the number of students that passed to next year of studies or graduated (see Fig. 2). Thus, the universities were opening their doors to the students whose level of competences and knowledge is so low that previously they were squarely rejected as inapt⁸. Several years later, the student preparation levels have relaxed back towards the new lower requirements, with the difference going back to about 3 points in Mathematics and Portuguese and up to 5 points in Sciences, though with higher averages (Juri Nacional, 2009⁶).

2.3 Memorization and abstract thinking

An international independent commission that recently evaluated the Portuguese system of higher education noted a general and recurrent complaint of the university professors: the students are unable to think creatively and logically (Blättler *et al.*, 2013). Thus, the learning-by-doing school paradigm has failed its principal declared objective and its reason for existence, used as the pretext for the destruction of the formal school – the independent, creative and critical thinking is not being cultivated in students. This directly results from the absence of knowledge specific to the respective disciplines of the scholar curriculum, retained by students permanently and in a form allowing its recovery and usage. Namely, abstract thinking requires memorized definitions, theories, formulas, dates and other elements that form the foundations of the knowledge base in any specific study area. Missing these elements in their permanent memory, the students are incapable of abstract thinking in the respective area – as each of these has its own set of notions and ideas, its specific language, which we must learn by heart before we can even dream of abstract thinking. The same effect is notable in language studies of either the mother tongue or a foreign language: enlarging their active vocabulary, the students gradually obtain the capacity to discuss problems of ever growing depth and complexity. However, apart from the vocabulary, we also need the capacity of abstract thinking and the knowledge of logics⁹. In the existing school system, the vast majority of students is deprived of these capacities, and has neither conditions nor motivation for their development. The latter is the consequence of the faulty study habits and evaluation methods that do not require or test the retained knowledge, with the students needing the short-term memory only. This is the least-resistance approach, taking only 2 or 3 days to prepare for a test or an exam – while precluding acquisition of permanent knowledge – something that students never needed to pass a discipline in the first place. Thus, the students prepare for the exams using their short-term memory, then pass – using every available hint, starting from those deliberately introduced by their teachers into the test papers, to copying and cheating in every possible way and without the least of scruples¹⁰, and next forget everything they just learned as fast as they can.

2.4 Critical thinking in primary school

All attempts of the learning-by-doing school to develop and use critical, creative and independent thinking in primary schools will necessarily fail, because such capacities do not exist in children of that age, at the neuropsychological level¹¹. They arise from biologic necessity at puberty, when suddenly adolescents start having their very own ideas about everything, irritating both their parents and teachers. Still the primary school children are very well able to imitate the critical thinking capacity, using their inherent ability to perceive and interpret any and all clues, transmitted unconsciously or otherwise in many different forms by their teachers, who are also interested in obtaining good results of student evaluation. Thus, any evidence of critical thinking by primary-school students is generated, on one hand, by students cheating (even unconsciously), and on the other hand – by the self-hypnosis of their teachers, whereas the time used in tasks for its development – is time uselessly wasted, harming other components of the study curriculum. Indeed, instead of critical thinking we are promoting

⁶ The exams are graded using the more detailed 0 to 200 point scale, while the 0 to 20 scale is normally used in secondary school and university education in Portugal.

⁷ Regarding the national exams in Portuguese Language and Mathematics A (the highest-difficulty version), the approval rates are now usually around 50%, which seems to be socially acceptable. Before 2005 the exams required more retained knowledge, with only 10% approval rates, which generated social protest and stimulated the Ministry of Education to revise the standards down.

⁸ Being sufficiently insistent, such weak students eventually graduate, still with no retained knowledge, as they can't be failed indefinitely for reasons already mentioned, although never acquiring any knowledge.

⁹ Contrary to the ancient Rome, today the knowledge of logics is not considered a necessary competence of an educated person – the only place logics is ever mentioned is the discipline of Mathematics A, with some calculations in formal logics, completely disconnected from reasoning. Is this the progress of humanity?

¹⁰ The students have learned to leave their morality outside the classroom in the exercises of critical thinking in the primary school – v. infra. The teachers have to be immoral as well, approving students who know nothing for keeping their own job. Apparently the theory of religious morals taught to everyone does not stand up to the realities of the education system.

¹¹ Sufficient proof is given by the ease of religious indoctrination of children, as compared to adults, and the consequent desire of all churches to work with children starting from the youngest age possible.

exactly the opposite, rewarding servility and desire to please the superiors, and subverting student morality on the way without noticing¹⁰.

2.5 Memorisation as survival necessity

During millennia, and in the absence of writing, the most important knowledge had been transmitted from generation to generation by oral tradition, which naturally requires long-term memorization. However, the presence of memorized knowledge may still be the decisive factor between life and death, even in the modern civilized world with all the current development of informatics and telecommunications. Just recall the experiences of the British schoolgirl Tilly Smith and of the indigenous tribes of the Andaman and Nikobar islands, persons whose knowledge had saved their lives during the Indonesian tsunami of 2004¹² (Wikipedia, 2004). At the same time, entire crowds of the learning-by-doing school graduates armed with ‘critical thinking’ and internet-capable smartphones were unable to perceive that there are no second chances in the real life, and had been washed away into the open sea ... Obviously one can’t learn to survive tsunamis by doing.

2.6 Global or visual method of teaching to read

The capacity to study is inevitably determined by the capacities to read and complement one’s active vocabulary. These get blocked when the primary-school teachers focus on the global method of teaching to read. This method requires the students recognizing entire words by their graphics, without identifying letters or syllables. This method may be successfully used to memorize the alphabet, associating pictures to the first letters of the words that identify the depicted objects. However, if the teacher tries to use this method beyond the alphabet, the students are left with a very limited vocabulary, never exceeding several hundreds of words, and unable to enlarge it, as they can’t read any unknown words or look them up in a dictionary. Such students, reading an unknown text, are only reading the known words, trying to extract some meaning out of them. Frequently, the very existence of a problem with reading is discovered by the end of the primary school, implying a complete waste of four years of schooling (and of the life of the student), accompanied by a complete loss of motivation for academic success and of interest in studies¹³.

2.7 What may be done to develop permanent memorization?

We should stimulate the students to learn by heart the multiplication table, the definitions, the formulas, the poems, the geographic names and the historic dates, and all of the other elements that were traditionally learned by heart at school. We should not simplify the tests and exams to the point when the student who learned by heart an entire chapter, without understanding a thing, can get a passing grade by using the hints contained in the test and the auxiliary material. We should stimulate the students to write lecture notes by hand in the classroom, and additionally work with these notes and the textbooks, both before and after the new material is presented in the class, etc. The objective of all this work is to create the foundations of the knowledge bases, which will allow to create associations between new knowledge and the respective specific area of knowledge (and/or its adjacent areas), and as a consequence – develop the students’ abstract thinking abilities. An added value of hand-written lecture notes is that by ordering the information on paper we also organize it in our head, helping in its assimilation, retention, perception and usage.

3. SECONDARY FACTORS CONDITIONING THE HIGHER EDUCATION QUALITY

Here we describe the mechanisms whereby the educational fraud of learning-by-doing is sustained at school and in higher education, compelling academics to approve students with no retained knowledge.

3.1 Teacher perception and performance assessment

Contemporary education is perceived as part of the economy, and therefore has to produce profits and be economically efficient (Stallinga *et al.*, 2017). Keeping students at school (or university) to repeat the study years is economically wasteful, producing losses. Thus, the contemporary European knowledge-based economy, under the pretext of ensuring high quality of education and apparently oblivious of the fact that good grades are being obtained with zero retained knowledge, has created a Quality Assessment mechanism in higher education, and teacher performance evaluation at school, such as those existing in Portugal (Netprof, 2009; Pinto *et al.*, 2005). The assessment requirements may sometimes take grotesque forms, for instance in one of Russian universities professors are effectively required to produce between 12 and 20 publications each year, in pursuit of better university ranking (Criteria, 2016; Informer, 2017). The assessment criteria at the University of the Algarve (UALg) require publication of at least 5 to 8 papers in 3 years for an excellent grade in research, dependent on the position. The assessment of educational activities includes the Teacher Perception reports provided by the students each semester as part of the Quality Assessment (QA) process. Similarly, British higher education uses the National Student Survey (NSS) as a tool to rank the national universities, with one of the objectives to provide additional public financing to the better-ranked universities. This has produced well-justified apprehension of administrative usage of the survey results

¹² In effect, Tilly Smith saved the lives of over 100 people living in the same hotel as her family.

¹³ One of the I. K.’s sons started his experience in the Portuguese system of education at the 4th year of primary school. As it happened, this son – who already knew Latin alphabet, as he started learning English in Russia in the previous year, and was reading fluently in Russian – turned out to be the only student able to read, although naturally without understanding a word of it. Meanwhile, the rest of the students understood everything but could not read anything at all after the 3 years they have spent at the primary school. And the teacher was still unhappy with him, saying that he “did not want...” to answer the questions she asked about what he read, “...just for being stubborn”.

against teachers, and of the weak universities becoming still weaker, while the strong universities becoming stronger. In a few years, the universities have learned to play the game of the NSS, by making the students understand that good evaluation they give to the university may improve their own professional prospects, and employing other psychological tricks like pre-surveys used as a means to divert the eventual negative opinions away from the “real” questionnaire (Agrawal *et al.*, 2014). As a result, all of the British universities appear very similar to each other in the student appreciation as evaluated by NSS. All of these factors recently led both students and teachers to call for a boycott of the NSS (NUS, 2017; UCU, 2017).

Both the QA procedures and the teacher performance assessment create pressure to increase student grades. “A focus on (student) satisfaction can lead to an intellectual race to the bottom as lecturers are put under pressure to cut reading lists and shorten assessments. If students do not like reading whole books, then perhaps extracts will do. If they find essay-writing difficult, then lecturers should guide them step-by-step through what to write and how, rather than leaving them to work it out for themselves. If students do not like exams, then maybe a poster would suffice.” (Williams, 2015). We do observe these same tendencies in our own work place. Indeed, those of our colleagues who choose the easy way of letting pass at least half of their students (while admitting that these students are completely unprepared, have incorrect learning habits and are unable to learn), are evaluated as excellent teachers, while those who try to make the students demonstrate some retained knowledge are urged to improve their approval rates by lowering the learning targets and making it easier to the student. The same tendencies were confirmed in a recent survey in UK, where half of the academics reported they were under pressure to give more generous grades to their students (Ratcliffe and Shaw, 2015).

3.2 Learning outcomes and student evaluation

According to the Bologna ideas, we should define the learning outcomes, including knowledge, skills and competences for each course and discipline, and ensure that these are in fact acquired by the students. As we already found here, average students are unable to acquire any retained knowledge, therefore we may only evaluate their skills and competences. Some of the skills are specific to the disciplines studied and the course attended, whereas the competences are by definition transversal, most of them common for any course. Thus, student evaluation done by poster/presentation evaluates only the competences, having nothing to do with the specific discipline that is being graded. Even the evaluation by exam includes a large proportion of competences, including those of meaninglessly memorising huge amounts of material (as explained, unable to use their long-term memory, students have to rely on their short-term memory), of picking up the leads and hints provided by the professor in the test, and of course copying and cheating to the largest extent possible. Thus the system of education rewards reprehensible behaviour, instead of cultivating high moral standards¹⁰. As we already noted, lip service to the religious morality is unable to stop the moral auto-corruption dictated by the imperative to get a passing grade.

3.3 Conceptual complexity and prestige of disciplines

Traditionally, the higher-ranked academics prefer to teach the more specialized disciplines of the advanced years of the course, as these typically have lower student numbers, with the student profile also shifted towards stronger students as some of the weaker ones already quit their studies by then. Frequently, there are no existing textbooks or training exercises for such advanced disciplines, therefore the tests are built by compiling questions from a previously known list, or else such disciplines are evaluated by presentations or essays, none of which can test the retained knowledge. The students are perfectly capable to fill their short-term memory with answers to a couple of hundred questions, and reproduce the answers in the classroom. This does not require any retained knowledge or understanding or being capable to relate the knowledge to the specific issue.

However, the largest facilitator of the advanced disciplines is the lower conceptual complexity accompanied by the same number of ECTS credits and amount of student work. To compare the conceptual complexity of an advanced discipline with that of a first-year introductory discipline, let's look at the discipline of Photochemistry and compare it to General Chemistry. Photochemistry is concerned with the behaviour of the excited states, and imports the concepts of general chemistry and quantum chemistry, then expanding on organic and inorganic reactions taking place in the excited states caused by absorption of photons, with not many concepts of its own not appearing elsewhere.¹⁴ On the other hand, lectures on General Chemistry (Atkins *et al.*, 2017) apart from being twice as large, contain the fundamental concepts of at least half a dozen more specialized disciplines, such as thermodynamics, chemical kinetics and organic chemistry, all requiring retained knowledge for understanding and application. It is easy to see that a discipline of general chemistry, due to its conceptual complexity, requires considerably more student work than a discipline of photochemistry, although they may have the same number of ECTS credits in the course curriculum.

However – the day only has 24 hours – the students are physically unable to achieve the learning outcomes in the fundamental disciplines of the first year to the same extent as they can for the more advanced disciplines of the following years. Naturally they express their lack of satisfaction in their teacher perception, blaming their professor for the lack of academic success generated by the ambitions of his superiors. Meanwhile the higher-ranked academics enjoy high student satisfaction rates, thereby confirming their intellectual supremacy and high teaching skills, while generating direct incentive for extensive facilitation in the fundamental disciplines, leaving students without the essential retained knowledge. Meanwhile, any specialized knowledge contained in the advanced disciplines is more prone to change, due to continuing development, and has lower probability of practical application, as the graduate may get to work in an adjacent area that does not require this specialized knowledge. Thus it is a lose-lose situation for the students – they can learn comparatively well what is irrelevant for them, and learn only very superficially what is relevant for their professional activity and life-long learning.

¹⁴ This does not mean we can't produce a large textbook on Photochemistry (Balzani *et al.*, 2014), as the number of pages may be increased by repeating the material of other areas of physics and chemistry, and introducing a lot of specific photochemical properties of different classes of compounds, which brings in a lot of specific facts, accompanied by very few generalizing theories and concepts that require retained knowledge for understanding and application.

4. CONCLUSIONS: WHAT CAN WE DO TO IMPROVE?

We need to restore the exercises for memory development and memorization, as the obligatory component of the curricula of every discipline at every level of studies, starting at the primary school and ending with universities, enabling formation of the knowledge bases of the respective study areas in the students' memory. We should exclude the exercises for the development of critical independent thinking from the primary school curricula, introducing them gradually and much later, when the respective capacities become enabled by the development of the central nervous system that accompanies growth and development of children and adolescents. The systems of education of the EU and FSU countries, in their presently existing form, produce entire generations of illiterate, innumerate and ignorant young people, incapable of abstract thinking and intellectual self-advancement. The only exception is the extremely small number of students¹⁵ who either have better memorization capacities, or are being adequately motivated and stimulated by their parents or teachers – these students are always able to achieve excellent academic results, independently of any vicissitudes of the educational reforms. Changes will also be welcome by the academics, who in the current educational environment are subject to bullying by their superiors and colleagues (Shaw and Ratcliffe, 2014), with ensuing problems in mental health due to excess workload and stress at the workplace (Shaw, 2014).

¹⁵ In 2013 only 5.3% of all students who took the Portuguese national exam in Mathematics A got "excellent" grades (over 17 points on the 0 to 20 scale). Accounting for the school abandonment rates, which previously reached 45% (going down, primarily due to downgrading of the evaluation criteria), we conclude that only 2.9% of the youngsters obtain some retained knowledge in mathematics during their studies at school (Juri Nacional, 2013). Note we are only counting the excellent students as we already know that good students have no retained knowledge in mathematics (Pires, 2012).

ABSTRACT

The European Union is resorting to long-term multi-annual political and economical plans. The current set of plans, “Horizons 2020”, also involves restructuring the educational system, as in the Bologna system. The idea behind it is that education should help industry to win the competitive battle with other major economical blocks. The idea is best described by the adage of the European Union of developing a so-called “knowledge-based economy”.

It implies that education is a form of investment. We should educate people – the society should spend effort on educating people – in order for society to make profit on it. Contrasting this is the idea of education as a consumption good. In the latter, people study to become knowledgeable, since knowledge makes a person happy.

We discuss here the dissident view why an educational system that is for investment-only will at the end not bear fruit and will destroy science, creativity and eventually any form of competitiveness in the economy. It will lead to moral as well as financial bankruptcy.

Keywords: Education, Science, Politics, Economy.

JEL Classification: O38

1. INTRODUCTION

The European Union, in resemblance to the former Soviet Union, is trying an experiment. Just like the Soviet Experiment, it is trying to centralize all power and decision making in a select group of people. To avoid populism, this body of lawmakers and managers is kept out of sight and reach of the population. Quietly improving society at a distance. The idea, by big names such as initiators Churchill, is sold as a perfect way to avoid wars; the First and Second World Wars blamed on nationalism, the way to avoid them is shun any form of national sovereignty. As an example, to remove national identity, mixing of European (and non-European people) is stimulated through visiting programs (Erasmus visits in the academic world). Borders for people are removed. We are supposed to think as ‘Europeans’ and not ‘Portuguese’, or ‘Dutch’, etc. Once again, the similarity with the former Soviet Union is striking.

Yet, not many people are misled by this officially promoted ‘open’ agenda. Many by now understand the hidden corporate agenda. Especially the ones that studied the history of the European Union a little: The European Union is an evolution of the European Economical Community which, in turn, was an evolution of the European Coal and Steel Community (formed just after the Second World War) with the underlying goal to facilitate the corporate activity, based on the idea “what is good for industry is good for the people”. Thus spoke the industry. The avoidance of war was only a subterfuge for increased corporate power, basically to put the corporations in control of Europe. Interestingly, it was the exact same structure of the Germans that was defeated moments before. It took the joined effort of the rest of the world to defeat it. Apparently, if such a tiny country can nearly outdo the rest of the world, it was a way of organizing society that makes it winning. They must have thought, let’s make it our pan-European structure. (Even today we praise German industry). Note that the biggest world power at the time, the United States, entered the European war theater only when German fascism was losing (after the lost Battle of Britain and, especially, the lost battles of Stalingrad and Kursk), not when it was winning (up to, say, 1942). In hindsight, it must have been the threat of the alternative to fascism (communism) that made them decide to enter the war theater and make of Europe a US-fascist protectorate. Some curious facts then start making sense, such as the fact that the Nazi army and regime were helped by American capital. The ties between the two countries was much larger than history books are telling us.

With the ties between the victors and the defeated strong, the differences in power structure between modern-day Europe and war-time Nazi-Germany have not become very big indeed. Throw in the soviet-style centralized political structure and a new star is born. Immediately at a standoff with the real enemy of fascism, (soviet) communism.

We can see this from their very same open-agenda European mission statement. The absurd mission statement that must

be distracting us from the hidden agenda. To start with, if it is all about avoiding war, why is the European Union ever more on the lookout for war with its neighbors, especially (and ultimately) with Russia? Ukraine, Yugoslavia, Libya, Iraq, Syria. Etc. What is more, the main idea is supposed to be to avoid war; apparently, if we take this statement as literal, it does not matter what exact form of government we'd have, which is apparently of secondary importance. We can then even have German Nazi-style fascism, or any other form of government, as long as we do not have war.

Well, fascism we got. (The hidden agenda). We can call it corporate fascism, a form of government in which industry and politics bundle their forces – the Italian word for bundle is ‘fascio’ – with in corporate fascism the corporations (industry) leading. US-style fascism that beat German-style (national-pride-based) fascism. If we won the war, then why do we still have the same political structure, moreover, centralized around the exact same country that was vanquished? Nobody will deny the central role of Germany in European politics. At best Germany is the entry-point puppet-state of Washington.

“Hold your horses”, we hear you say. “This goes too far!”. Well, maybe it is strong name-calling, but – what’s in a name? – the truth had better be said if we are going to analyze our society correctly. Whatever you may call it, and whether you like it or not, it is a fact that industry is in control of law-making in Europe (Balanyá *et al.*, 1999). It has been estimated that the European Round Table of Industrialists (ERT; 50 large companies of Europe (ERTa, 2017)) and lobbyist in general write a whopping 75% of all European laws, up to and including the treaties of Maastricht and Lisbon, which were only rubber stamped by politicians without them ever having actually read them, *let alone* having written parts (Moser and Lietaert, 2012). Most members of the European Parliament (MEPs) are, in fact, working simultaneously for large companies. When you have only corporation representatives in government, it is not strange that government, as a whole, thinks like the corporations and does things in their interest. The European Commission itself does not see this blending, nor the severe lobbying, as a problem, but is only concerned about the public image. As the European Union itself writes, “... most political scientist and policy-makers recognise that public and private interests have a legitimate and important role to play in the policy process. Nowhere is this truer than in the European public policy process where some 15,000 Commission and European Parliamentary officials face some 20,000 lobbyists on a daily basis. It is therefore not surprising that a significant resource dependency between officials and lobbyists based on regulatory needs, expertises, information and reputation has emerged. For this reason it is important that as we formalised and improved the EU lobbying codes of conduct we do not damage the information exchanges and credibility of the policy process.” (Directorate General Internal Policies of the Union, 2007).

There, the word is out. The European government is a machine that represents the industry; the system resembles (corporate) fascism. Industry, in turn, is an abstract entity that has no morality in itself, but has as only objective profit. Even if you may think that companies can also have morality – some companies even allude to this, see for example the stance of the ERT on Global Warming (ERTb 2017)(of which more later) – companies with morality are rapidly weeded out in an economy that is fiercely competitive, a ferocity we would like to see and encourage. Moral companies undeniably make less profit than immoral ones and survivability in economy boils down to profitability; at best the companies want to seem moral. In view of this Darwinistic observation, we can readily comprehend that in our current economical environment all companies have a lack of morality. The lobbying and law-making in Brussels is yet another form of profit optimization; where laws are made to keep industry in check and put morality back into business by making immorality unprofitable, business tries to remove these morality-inspired profit-limiting bounds, just so to increase profit. Whatever you may think – whatever the propaganda they pour out over us – industry is not there to make Europe a better place. A substantial part of the owners of industry, if not most of it, actually resides outside Europe and couldn’t care less about the state of Europe or its citizens, the same you do not care much about the welfare of Sri Lanka, to name but an example, where your pension fund is heavily investing to guarantee your good life after retiring. You sure hope that is what your pension fund is doing, defending your interests and not those of the Sri Lankians. The same with the owners of European business; they defend the interests of their owners and not your interests, also in Brussels. Don’t be naïve.

We can thus summarize the economy and our entire post-war Americo-European society as “based on the sole paradigm of profitability”. The entities that work on this paradigm, corporations or industry in a free-market economy, in order to increase their profit have bought governments (with a centralized form of government the most efficient way of doing it, because it avoids having to have lobbyists in each and every nucleus of local or regional government). On the one hand, it was done to remove any profit barriers, a simple economical optimization. On the other hand, it imposed onto government, and society in general through the bought governments, the moral philosophy – ethics – of profitability. The two results going hand in hand. (Profitable) free-market activity seen as the Utopian goal for each and every element in society. We will analyze the second point (of the ethics) in a moment. But a small digression has to be made about the economical aspects of profit. This digression is actually worked out in detail in the book *Money: In gold we trust by one of us* (PS).

Profit we define as financial gain in an economical activity. Money is invested and at the end of a cycle money is received. By definition, profit means that more money came out than was put in. A positive return-on-investment (ROI). All very well. It is now thought that the task of government (that is, the joined corporations) is to organize the society/economy in such a way that the total profit is optimized. Even better, it should be organized in such a way that risk of loss is minimized – all having profit – in order to have unbridled investment and a production maximization, something that is the underlying open agenda; if companies invest a lot, more is produced and we will have more welfare.

The problem with this is that it is not possible that all make profit. If money is limited, the economy is a so-called zero-sum game; the profit of one is the loss of another. If some economical agents in the economy – those corporations that are mostly represented in Brussels, as in the ERT, etc. – make guaranteed profit, all the others combined make guaranteed loss! Thus, all the others will go bankrupt as long as the corporations do not relinquish power in Brussels, something that is not likely to happen. Once all others are bankrupt and have stopped their economical activity, who will take up the role of the losers in the zero-sum game in order for the corporations to continue having guaranteed profit?! Even tax exemptions for the big corporations, such as the one of Apple in Ireland, will not save the system, it will actually aggravate it. We could let the

state run into debt to save the corporations and economy. However, this just delays the inevitable, since the maximum debt is limited (90% of gross domestic product, as argued by Reinhart and Rogoff (2010)); if money does not increase its speed of circulation, GDP is limited and state debt is limited. The economy is thus doomed from the start.

The only way out of it is constantly printing fresh money, something that was made possible by abandoning the gold standard, the convertibility of money into the limited-resource gold, in the monetary system of Bretton Woods. It made money effectively infinite and the economy could be turned into a positive-sum game. Well, a silly question immediately arises: why would I do my best to work for a living, to earn money, something that is virtually infinite?

Moreover, we still remain with a system where laws are written to guarantee profit to the Brussels-represented corporations. They basically do not have to do any competitive activity – profit is guaranteed after all – other than lobbying. Lobbying itself has become the economical activity. The lobbying must moreover grow forever because the money borrowed has (theoretically) to be paid back and this can only be done if the economy is growing; Money will only be lent if tomorrow there is more of it than today since interest has to be paid as well. This means that the rest of the economical agents (like the small bakers on the corner of the street. Those lobbyistless entities that actually produce something else than lobbying) will not make profit anyway, or at least their activity will be stopped by lack of financing. Since it is not a level-playing-field, with corporations always pulling the longest straw, the entities that actually produce will stop activity and the economy will turn itself 100% virtual. Made possible by virtual money. We reach a mathematical singularity, with the average cost of real physically-tangible products being zero divided by zero. It is basically a system in which the Central Bank is printing money, the corporations getting hold of it and through dividends placing it on accounts of their owners in Panama and on the Cayman Islands. If ever any 1% of the wealthy 1% of society should decide to actually spend the ‘earned’ money that they have stored in fiscal paradises, inflation would be infinite since too little is physically produced to pin the money to something. The ‘rich’ can never enjoy their wealth. Everything is virtual. Yet, since real economy is kilowatts, and real property is kilojoules, the scheme of printing money is a mere tool of transferring real property (infrastructures) to an ever-smaller number of people.

2. KNOWLEDGE-BASED ECONOMY OR ECONOMY-BASED KNOWLEDGE?

In a society where financial profit is the sole philosophical morality – the ‘ethics’ – we can also expect that these same ethics will be applied to knowledge (science and education). Indeed, the corporations dash government have designed a soviet-style long-term plan for the economy in which knowledge plays a pivotal role. They call it a ‘knowledge-based society’. If we have an intellectual advantage over our competitors, we can sell them products (with profit) and thus sustain our economy. We said in the introduction that the profit-driven economy is itself unsustainable. But what about the idea to incentivate knowledge through the paradigm of profitability? Does that work? Will we get more knowledge through this paradigm? And will we get better education through it? Let’s analyze it in more detail.

We can distinguish between the knowledge itself and the transference of knowledge, the latter normally called ‘education’. Where schools are solely busy with education, and research centers solely busy with acquiring knowledge, universities have a special role in that they are both centers of acquisition of knowledge and dissemination of knowledge. Universities are both research centers and schools. We can call them simply ‘knowledge centers’. This contrasts them with technical high-schools, which are only institutes of knowledge dissemination, albeit on a high level. Well, these concepts have faded over the years, mostly because of the idea of profitability. Universities and technical high-schools eating into each other’s markets once financing of these institutions came ever less from primary sources, i.e. government, and ever more from secondary and ternary sources (tuition fees, project grants and donations). Institutions were basically demanded to be profitable. Universities became more like technical high-schools, educating people for industry, and technical high-schools became more like universities, doing more research. Probably because ‘university’ sounds sexier, all institutions are now called like that; technical high-schools have disappeared.

The concept of profitability has led to extreme excesses in which, for example, the University of Harvard has its major source of income in market investment (Piketty, 2014). Donations are put in lucrative investment schemes instead of teaching or research.

A university educating people for working in industry is fully a university taking over the role of a technical high-school. Instead, a university should educate people because people are happier when they are wise. And happiness be the goal, not profitability. Compare this to the function of a hospital. A hospital does not (only) cure people of malfunctioning so that they can go back to work and be more productive, i.e. the profit reason (curing people being profitable), but instead to cure people because being healthy makes people happy and happiness is the primary goal in society, or should be. Whatever we may think, profitability at the end is only a means to the real goal, happiness.

Related to the difference in function between a university and a technical high-school is the distinction between science on the one hand, and technology or engineering on the other hand. Science is the acquisition of knowledge per se, without any intended benefit for society, financially-profitable or other. That while the task of technology is to take any knowledge and to design useful products and the task of engineering is to actually make them somehow. Science is per definition not profitable. Or, as the icon of science, Albert Einstein, once said “Those that think that science is to make society a better place are utterly wrong”. In recent times, Nobel Prizes are given, not for scientific innovation, but to people addressing problems with socio-economic impact. (Compare the Nobel Prize of Crutzen for addressing the hole in the ozone layer to the one given nearly a century earlier to his compatriot Kamerlingh Onnes for discovering superconductivity; things have changed indeed. Politics has entered science). The European Union through its granting system, implementing the plan that everything should be profitable, wants to bet on science as being profitable as well. That means turning science into

technology just like universities were turned into technical high-schools.

One way to do this is through patents and copyrights. A knowledge-based economy is a patent-based economy as the European Union writes itself: “Europe requires strong industrial property rights to protect its innovations and remain competitive in the global knowledge-based economy” (Commission of the European Communities, 2008). So, now universities are required to produce copyrights and patents. It is no longer about the (beauty of) knowledge. It is about money, a positive ROI of society. Well, this is strange. The people that actually paid for the research leading up to the knowledge and patents through their taxation and funding of universities are not the ones that actually benefit from the patents. Their return-on-investment is zero. All benefit goes to the companies. If, on the other hand, the research is paid for by companies, why does the research have to be executed in universities and not in their own laboratories? This does not make sense. It is just a scheme for companies to be freeloaders – getting things for free – a scheme approved by the governments that were giving lip service to the companies, as we had already established above. A scheme that will moreover go wrong because an unlimited, infinite profit-scheme is not possible in a physically limited planet, as shown above and in the book *Money: In gold we trust*.

Science and knowledge have thus become an investment scheme. Science an industry (of which more later on). The same reasoning applies when seen from the point of view of the students. Students attending a university do this to acquire knowledge. Knowledge makes wise and wisdom equals happiness. It thus therefore does not matter if the acquired knowledge has some use or not, just as art is not meaningful other than being beautiful. As the ancient Greeks said, eternal bliss befalls those who can do philosophy. It is the ultimate state of happiness. Yet, students in the 21st century cannot hope to reach this lofty state; their goals must be more down-to-earth and work for the idea of profit.

It is understandable that, from the point of view of a profit-oriented society, citizens are investment objects, or at least vehicles of financial speculation, and it is to be expected that in such a society the projected productivity of citizens is converted into financial derivative products, thus making society speculate on its own citizens. For example, a state can more-easily get its government budget (deficit) financed if there is an outlook on an increased productivity of its workers. Education has thus become a financial vehicle for market speculation on the state as a whole. Prone to all its problems of margin calls, short selling, and whatnot.

Note that speculation, by definition, means that the value of a product is expressed in terms of the time-derivative of the value of that product. In a simplified equation,

$$p = \alpha \frac{dp}{dt} ,$$

with p the value, t time and α a proportionality factor. The solution to this differential equation is exponential growth,

$$p(t) = e^{t/\alpha} ,$$

a growth that was indeed needed, as argued above. Speculation is the (only) way to go in a profit-driven society. Yet, the moment the system saturates for some reason – and saturate it will in a non-infinite physical world – the exact same equation shows that it plummets instantaneously. Growth is exponential but slow, collapse is immediate. Speculative systems are doomed to fail. There is no such thing as a ‘sustainable economy’ when the economy is based on speculation and growth.

From the point of view of the student it is even stranger. Attending a course at the university is to be considered a (personal) investment as well, and has to have a positive return-on-investment along life. As if life itself is an investment project, and one’s goal can only be to make profit. We see here the difference between a course at the university as a consumption product vs. a course as an investment product. While argued above, an investment can only be a means to a goal of happiness, the means has now become the goal with the original goal – happiness – completely removed from sight. Everything in life, including life itself, has become an investment project. Moreover, speculation is also here important. A person’s self worth is expressed in terms of tomorrow’s worth. You are only worth anything if you are making yourself more valuable all the time. Never can there be any sort of saturation, since saturation brings collapse, as shown above. Lifelong learning is now the way to go. Always investing and never reaping. Every activity from cradle to grave an investment, even if we can see that, without any shred of doubt, this infinite investment scheme is doomed to fail for sheer limitations of a person’s life span.

This brings us to the point that the system in fact is indeed collapsing. A general positive ROI on all investments is not possible in a zero-sum game; the average ROI must be zero. The corporations are designing the rules of the game and make sure they are not the ones drawing the shortest straw; their ROI is guaranteed. Students, by not being organized and not represented in any government, draw the shortest straw and have thus a nearly guaranteed negative ROI. On average, a course costs more than it will return in a lifetime when the economy is saturating, as it is doing now. After the dot-com bubble that collapsed (ca. 2000) and the subsequent housing bubble that collapsed (ca. 2008), a threat hung in the air that it would take the entire financial sector down (ca. 2010). This was avoided by those financial corporations ordering the states to bail them out, which caused the state financing to collapse. Now is the turn for the citizens to collapse. Corporations (including corporate-styled universities) and financial institutions have guaranteed positive ROI. The state is not allowed to have a large negative ROI (hence also the need for the universities to have positive ROI and be corporate-styled). That

puts the entire burden of maintaining the system alive on the citizens, for example the academic students. They must have a guaranteed negative return on investment. That while the entire paradigm of society, up to and including that one for individuals, was to invest, to even make profit on knowledge. To see knowledge as a commodity that can be used in a profit-based society. Actually, the acquisition of knowledge is what makes the biggest loss in this society. We reach the following dialectical conclusion:

Knowledge in a knowledge-based economy is what makes loss in a society based on the paradigm of profit.

3. SCIENCE AS A COMMODITY

Science and knowledge have thus become an industry. The European Union seeing scientific research as something that can be ‘managed’ somehow. If you have a hammer as a tool, you see all problems as nails, so the EU now manages science in its typical top-down technocratic way. Scientists have to hand in project proposals – the same way proposals for building bridges and other infrastructures are resolved – in which they have to specify what will be the outcome of their research; ‘milestones’ and ‘deliverables’ (as if acquisition of knowledge can be predicted; why would you do research if you already know the answer?!). Everything seen as manageable production of a commodity. And this commodity has to make profit. This is what you get if you have a single (corporate) viewpoint in government.

Let’s take a step back and look at the difference between science and technology. Science starts from the premise that we do not know things – it starts with the assumption of our ignorance – while technology starts from the premise that we are wise. Cashing in on science is thus rather awkward. It is not possible, or at least unpredictable, since we do not know what to cash in on. We do know the knowns, but we do not know the unknowns; we do not even know what unknowns we do not know. It is stabbing in the dark and hoping we’ll find a glorkl, whatever that may be. That is science compared to technology. If things are unpredictable, they are highly shunned as investment objects.

Let’s state this more clearly. In a bottom-up organization of the world, science is discovering truths for the beauty of it, without financial objectives or other benefits for society. Technology is then looking at this acquired knowledge and see how they can be made useful to mankind. Engineering is making products and profit. That last one is highly predictable and production and profit can be managed. A profitable society thus wants as much engineering and as little science as possible. That is, unless science can be engineered as well. That means, basically, turning science into a predictable commodity. Truths should be engineered. That way science can be turned into an industry, something that is highly desirable in a profit-driven society. The only science that can survive in a highly-competitive profit-driven knowledge-based economy is all knowledge that can be engineered, doctored and constructed. Welcome to the 21st century! We use a top-down approach to our society. We start with an outcome and work our way down to the desired ‘truth’.

Let’s give some examples. First the case of cholesterol. Astra Zeneca discovered a chemical, ‘statins’ that had an effect on people, namely lowering the cholesterol in the blood. This is the potentially profitable sellable end product, and Astra Zeneca had the patent to it. Their marketing department was set to work to find an ‘illness’, which was soon found. High cholesterol could be statistically linked to cardiovascular diseases. A scientific myth was born. Cholesterol was labeled a problem, even though cholesterol is nearly as ubiquitous as water in our body, since it is needed for the double-layered lipid cell walls.

The entire research structure violates all scientific rules. The most essential is that it went out of its way trying to prove a specific model (namely “cholesterol causes illnesses”), instead of disproving it as the scientific method warrants. Moreover, research should exclude all other hypotheses before it can assume one model as being correct (for the moment). As the prime rule of statistics tells us, “Correlation is not causation!”. The fact that cholesterol is correlated to cardiovascular diseases does not mean that cholesterol is responsible for these diseases. It might be quite to the contrary, the only weapon our body has in fighting cardiovascular diseases being upping cholesterol levels. By giving statins we deprive the body of these weapons. Something similar happened to iron in the body and infections: Low iron levels in the blood correlated very well to infections. Doctors, in an attempt to help the body to fight infections, prescribed dietary iron supplements. Yet, an infected body is eliminating iron exactly for the reason of killing bacteria in a battle of survival, because these bacteria need iron even more than we do. Supplying iron tips the balance of the battle in favor of the bacteria.

Likewise, high cholesterol might not be the cause, but the result of illness. Statins that lower cholesterol might actually aggravate the problem. Fortunately, statins have no effect on cardiovascular diseases. In 2010 Scientific America wrote that there existed no reliable research whatsoever about the benefit of statins. The only research that existed was from Astra Zeneca itself:

“Direct evidence for the benefit of statins as primary prevention – that is, for preventing heart attacks in people who do not yet have heart disease – comes largely from one clinical trial published in 2008 in the New England Journal of Medicine. The trial called JUPITER and funded by AstraZeneca, ... found that rosuvastatin reduced the risk of cardiovascular events by 44 percent” (Wenner Moyer, 2010).

More recent studies found that statins have proven no effect on women and no effect can be proven on men (Brogan, 2014).

It seems that something is going wrong, but it isn’t. It is all because of a top-down structure that starts with the paradigm of profit. In such an environment everything is running smoothly. Profit is made indeed. A lot. The global market for statins is estimated to be \$29 billion (Mercola, 2012).

What we think is going wrong here is that we find it immoral that profit is made on our health, or lack of it. That we are forced to buy products that are not beneficial to our health. Such a moral – ethic – analysis, however, has no place in a society that is organized around the sole paradigm of profitability. If a product can be sold on basis of sloppy science, then this sloppy science is, in fact, a pearl of engineering in a knowledge-based economy. The (scientific) truth, in this case, was doctored. (No pun intended).

It started all with the wrong assumption that science should be useful, and, moreover, since ‘usefulness’ in a money-oriented society is expressed in financial terms, that it should be profitable. It easily boils down to this: “The truth is the one that makes most money”. The idea that cholesterol is bad for your health can propagate in society because profit can be made on the idea, and it substitutes ideas that do not result in profit. It can easily survive in society. Richard Dawkins calls such idea-genes ‘memes’ and describes how memes survive in a social environment (in analogy to genes in a biological environment) through survival-of-the-fittest selection rules (Dawkins, 1976). The cholesterol-problem is a winning meme because it is a profitable meme in a profit-driven society.

Now, as a small side note, some of the problems in modern society can be ascribed to a change of vector of the propagation of the memes. Where main stream media (MSM) are a good vector for the propagation of profitable memes, since main-stream media work on a for-profit basis as well, and the entire system is geared towards profitability with the MSM actually being owned by for-profit entities that thus have a stake in the propagation of memes, social media (SM) follow different rules; profitability is not an issue there. This change of vector of propagation of memes causes changes of the memes propagating. MSM now accusing SM of spreading ‘fake news’, and vice versa. There seems to be a revolution going on, especially caused by the change in the area of information circulation. Some, if not all, of the things being said here might all be canceled, if the change in vector causes a change in paradigm of society. For the moment we have a top-down (fascistic) structure of profitable science and education.

Before we continue, so what is the alternative then? How does it work in bottom-up? How does pure science work? Alan Chalmers asked this question in his book *What is this thing called science?* (Chalmers, 1976). He summarizes the basic principles of the famous Scientific Method of philosopher Karl Popper. Apart from the observation by Einstein that science is not intended to be useful, this method has these basic ingredients:

- 1) **Subject:** Study the natural, real world. For instance, mathematics is not science because it studies a virtual, imaginary world.
- 2) **Data collection:** Acquisition, reduction, induction: Gather data, organize data, reduce data, look for correlations and patterns. A classical example is Linnaeus who spent his entire life gathering information about species in flora and fauna, labeling and indexing them.
- 3) **Hypothesis:** On basis of all data form a hypothesis that can explain the data. Darwin that formed a model based on the data of Linnaeus.
- 4) **Isolation:** All alternative explanations for the data have to have been rejected. In case more than one model exist for the data, the simplest one is the correct one, according to Ockham’s Razor.
- 5) **Falsification:** Try to find reasons why the model is wrong. Do not try to find proof for the model, because that is what is called ‘affirming the consequent’. Bad: If P then Q, so look for Q. Good: If P then not R, and look for R. “In other words, we are trying to do our best to show we are wrong” (Feynman). A hypothesis that cannot ever be rejected is not science! Next time you see somebody entering a (pseudo)scientific discussion, ask this person, “What would it take – what piece of new data could I bring – for you to admit you are wrong?”. If no such data may exist, the entire hypothesis is silly and the science is a hoax. That is why some call the greatest scientific discovery of the 21st century the Hoax Boson. Science it isn’t. Billions spent on trying to prove a theory correct. At this very moment the same scheme is used for gravitational waves.
- 6) **Experiment:** The model should come with a prediction. Data that do not exist yet but that can be obtained through a new experiment. Einstein showed that Newtonian mechanics failed by predicting that the rays of light are bending around the Sun, later observed at a solar eclipse. On the other hand, a model that can only explain the past and has no possible way to refute it, for instance by a new experiment, is not scientific. It is mere retrodiction, or is plane silly (As Murphy’s Law, “Everything that can go wrong will go wrong”. It is silly because it cannot be tested; The test will fail, as it is governed by Murphy’s Law itself). Moreover, a rejected model cannot retroactively be modified to include the new data. Such a Bayesian, ever-adjusting, method leads nowhere. We can also immediately see that because there’d exist two models that explain the data until the last data point. And that is violating rule #4 above.
- 7) **Replication:** If the scientist has done all (s)he could do to tear down the hypothesis but failed, other scientists have to be informed. This is done by supplying all information needed to reproduce the thought train of the scientist. All data, all analysis methods, and all reasoning that led up to the conclusion by the scientist. Also, the scientist should inform the colleagues about everything that is still not well understood, where the model is on weak ground. When this is not fully followed, the scientist is a fraud and can be put in court, as was for instance done to Thomas Mann by Steve McIntyre when the former’s Hockey Stick climate data proved to be fake and Mann refused to give the data and the method leading up to the Hockey Stick.

Note that nowhere in this method does it say that science should be useful or profitable. A truth is a truth, if it is useful or not. Science in 2017 is dead! Instead, in 2017, we start with a desirable outcome of research – let’s no longer call it science. It starts with a meme can can be made into profit when it is backed up with research. Yet, anybody that does not follow the above scientific method is not a scientist. And anybody that claims to be a scientist and does not follow the scientific method is a fraud. Since money is made with this fraud, it can even be called a swindle. Many modern-day scientists are swindlers selling snake oil. Unfortunately, the designation ‘scientist’ is not protected and anybody can call him- or herself a scientist

without any legal repercussions. Educational industry actually gives a PhD (philosophical degree) to each and any person that finishes one of its lucrative courses, without these people ever having been lectured the concept of ‘science’, or philosophy in general. As far as we know, no European post-Bologna PhD program contains any ECTSs (European credit transfer system) in philosophy, let all one science.

4. THE GLOBAL WARMING MYTH: THE ULTIMATE SCIENTIFIC FRAUD

In 2017, a meme survives if profit can be made on it, otherwise it will slowly disappear from the thought-gene pool. Memes are nearly randomly created constantly, like random mutations of genes; the strongest survive. Yet, some get support from the beginning. This brings us to the mother-of-all-scientific-frauds, the Anthropogenic Global Warming. It brings us back to the political point we introduced at the introduction. A centralized government also wants to define the correct way of looking at things. In fact, the idea of ‘political correctness’ was part of Stalin’s doctrine in the Soviet Union. If people are forced to agree on things, conflict would be avoided, so they must have thought.

In the West, through the League of Nations and later United Nations, the idea of a pan-global government took shape. The so-called new world order (NWO), a designation often used by conspiracy thinkers, but no conspiracy exists, just as much as ‘capitalism’ or ‘socialism’ is a conspiracy; it is just an ideology, a new way of organizing the world, without there being specific people behind it or benefiting from it. This NWO government uses similar techniques of political correctness to join people. The idea took shape that, in the absence of an external enemy in the coming pan-globally governed society, an internal enemy was needed. It was deemed a good idea, a political correct idea, to take mankind itself as the enemy of mankind. The biggest think-tank of that era, the Club of Rome, actually wrote that (later) in their work *The first global revolution*:

“In searching for a new enemy to unite us, we came up with the idea that pollution, the threat of global warming, water shortages, famine and the like, would fit the bill. In their totality and their interactions these phenomena do constitute a common threat which must be confronted by everyone together. ... All these dangers are caused by human intervention in natural processes, and it is only through changed attitudes and behaviour that they can be overcome. The real enemy then is humanity itself.” (King and Schneider, 1991).

Or

“We’ve got to ride this global warming issue. Even if the theory of global warming is wrong, we will be doing the right thing in terms of economic and environmental policy”. (Timothy Wirth, President of the UN Foundation).

The meme of Anthropogenic Global Warming had a benefit, a political profit. It also has economical profit, but of that later. The need for top-down truth-engineering existed. Politics started meddling in science.

A United Nations think tank was created together with – for some strange reason; after all, climate is not weather – the World Meteorological Organization, and baptized the Intergovernmental Panel on Climate Change (IPCC). This is a political body, as the name implies, and has no scientific aspirations, other than engineering the proof for man-made climate change. They set out with the idea of carbon dioxide as a greenhouse effect that was presented by Roger Revelle in his groundbreaking article in Scientific American (Revelle, 1982). Later it was also propagated by his acolyte Albert Arnold Gore Jr., who even got a Nobel Prize of Peace helping to execute the NWO government program.

The IPCC set to work and doctored the proof of man-made climate change on a regular basis, with a rate of about one report every five to ten years. The doctoring they do not even hide in their reports, as the IPCC work-flow in the table below testifies. The endeavor starts with the outline of the conclusions. Experts are then contracted to substantiate these conclusions and writers hired to put it in beautiful phrases:

Table 1: IPCC work flow diagram identifying various tasks (source: climate.uu-uno.org)

Step	Task
1	IPCC approves outline
2	Governments, organisations nominate experts
3	Bureaux select Authors

6	Authors prepare 2nd-order DRAFT(*)
7	Expert and Government Review(*)
8	Authors prepare FINAL DRAFT(*)
9	Final distribution and Government Review of SPM
10	WG/IPCC accepts/approves Report and SPM

(*) Peer reviewed and internationally available scientific technical and socio-economic literature, manuscripts made available for IPCC review and selected non-peer reviewed literature produced by other relevant institutions including industry

This structure is nearly an exact replica of the one used in the former Soviet Union for denying the theories of Darwin, a failed scientific structure we now call Lysenkoism.

“Lysenkoism was a political campaign against genetics and science-based agriculture conducted by Trofim Lysenko, his followers and Soviet authorities. Lysenko served as the director of the Soviet Union's Lenin All-Union Academy of Agricultural Sciences. Lysenkoism began in the late 1920s and formally ended in 1964. The term Lysenkoism can also be used metaphorically to describe the manipulation or distortion of the scientific process as a way to reach a predetermined conclusion as dictated by an ideological bias, often related to social or political objectives.” (Lysenkoism, 2017).

In Lysenkoism, opposing scientists were silenced by blocking their career, eliminating these voices from the (politically correct) debate, just as the European Union is doing currently with climate-skeptic scientists in Europe by just removing any funding to them. It is as good as impossible to have a project approved that is critical towards the idea of AGW, whereas pro-AGW projects get bucket loads of funding. A person's stance on the Global Warming issue is a career maker/breaker. One of us, PS, is a example for that. Projects about organic electronics (efficient light sources) and solar panels, photovoltaics in general, are easily granted, the project about the analysis of Global Warming models (MoCCA) never gets any funding.

The governments thus have a clear program to propagate the AGW meme. Most of them are fully aware of the lie of the ideas, but for a politician something (the ‘open agenda’) being true or not is not so important as much as the final goal (the ‘hidden agenda’) is. If a lie is needed to improve society, then that's what has to be used. A so-called ‘convenient lie’. They therefore hired propaganda agencies to see how the lie could best be sold. An example is the Institute for Public Policy Research (IPPR). In their report, Warm Words. How are we telling the climate story and can we tell it better? they write,

“Ultimately, positive climate behaviours need to be approached in the same way as marketers approach acts of buying and consuming. This is the relevant context for climate change communications in the UK today – not the increasingly residual models of public service or campaigning communications. It amounts to treating climate-friendly activity as a brand that can be sold. This is, we believe, the route to mass behaviour change.” (Ereaut and Segnit, 2007).

The idea of programming in masses people's behavior through selective information feeding is also called ‘propaganda’. ‘Behavior change’ is equal to ‘brainwashing’ with the choice of wording depending on the point of view (government vs. citizen). To see to what a dangerous point the propaganda/lie has become, take this phrase from the same work:

“To help address the chaotic nature of the climate change discourse in the UK today, interested agencies now need to treat the argument as having been won, at least for popular communications. This means simply behaving as if climate change exists and is real, and that individual actions are effective. The ‘facts’ need to be treated as being so taken-for-granted that they need not be spoken.” (Ereaut and Segnit, 2007).

Indeed, the ‘truth’ should never be used as an argument. Lest people find out it is a lie.

Then, having shown that it is in the interest of governments to propagate the meme of AGW, and having shown that in a fascist society industry has linked up – ‘bundled’ – with government and is actually in control, we have to show that the meme of AGW is favorable for industry, that it gives them profit. There are many conspiracy theories going about (social media and main stream media alike) that, especially, oil-industry is paying scientists to deny the AGW ideas. This is easily shown to be incorrect. What is more, industry is in fact a large supporter of the AGW ideas. Including oil industry. As shown above, the European Round Table of Industrialists (ERT) are the ones that are in control in the European Union and are writing its laws. This ERT includes several oil companies:

Royal Dutch Shell (The Netherlands)

Eni (Italy)

TOTAL (France)

BP (United Kingdom)

This ERT comes with strong support of the Global Warming ideas, as can easily be seen on their internet page (ERTb, 2017). Worth noting is also the documentary movie Climate of Concern by Royal Dutch Shell (1991) where they raise serious concerns about the impact of burning fossil fuels on the climate. Shell now heavily invests in ‘green’ energies. (Take for instance their construction of a windmill park in front of the coast of Zeeland, enough to supply energy to one million households). So much for a conspiracy! It can easily be understood. An oil company does not have the paradigm of selling petrol; it merely has, like any other company, the paradigm of making profit, and up to now it was best done with selling refined petroleum products, but they are readily convinced to switch their business if opportunity knocks. As a comparison, on the same member list of the ERT is also Philips. It started as a light-bulb factory in Eindhoven, but rapidly evolved over the years into a multinational corporation making televisions, micro-electronica, consumer electronics, and recently they moved their core business to medical equipment. The capital is flexible and applies its resources to where profit can be made,

it does not have to be making the same product all the time. The ERT indeed sees the Global Warming threat as a business opportunity. Nothing less than “Growth, competitiveness and climate policy can be mutually reinforcing”.

If you have a hammer as a tool you see all problems as nails, so the problem of Global Warming is solved with ... you guessed it ... more industry (sic). Bankers, financial institutions in general, joined in to get part of the spoils, and designed and applied their financial expertise to attack the ‘problem’. Cap-‘n-trade of CO2 emission certificates are an example of such financial structures, standing at several hundred billion dollars. As New York Times wrote:

“Carbon will be the world’s biggest commodity market, and it could become the world’s biggest market over all,” said Mr. Redshaw, the head of environmental markets at Barclays Capital.” (Kanter, 2007).

If you are interested in making a buck on the gullibility of people, take a look at the Green Chip Stocks pages (Green Chip Stocks, 2017). The same pyramid scheme of speculation invented by them and that nearly took down the entire financial structure in 2008 – and the global economy with it – is now used to suck every last penny out of the gullible sheople.

In a situation where everybody benefits from false knowledge, it is not surprising that this false knowledge propagates in society. Politicians benefit. Industry benefits. Media benefit. ‘Scientists’ benefit. There is nobody that makes a loss in this profit-driven society. (We have been racking our brains and cannot come up with any way to make money with the opposite of the AGW meme, making money on the knowledge we have that AGW is false in this knowledge-based economy. If any of our readers know a way how to take money from the gullible, please contact one of us. For sure it is not “investing in oil [companies]”). Profit for everybody. Well, that is, except for the citizens. They see their spendable income come down through tax and forced consumption. They see their nature around them being destroyed by photo-voltaic and eolic parks. They generally suffer from the greatest insult that one can be submitted to: to be lied to and the liars getting away with it.

“A racket is a service that is fraudulently offered to solve a problem, such as for a problem that does not exist, that will not be put into effect, or that would not otherwise exist if the racket did not exist. Conducting a racket is racketeering. Particularly, the potential problem may be caused by the same party that offers to solve it, although that fact may be concealed, with the specific intent to engender continual patronage for this party. The most common example of a racket is the “protection racket.” The racket itself promises to protect the target business or person from dangerous individuals in the neighborhood; then either collects their money or causes the damages to the business until the owner pays. The racket exists as both the problem and its solution and is used as a method of extortion.” (Wikipedia: racket)

One may sure hope that the change of information propagation structure, from profit-driven main-stream media to free social media, will result in a change of paradigm in society, where truth (science) is again surviving somehow, other than the naive hope that truth-finding research is commensurate with trying to achieve financial goals only.

The funny thing is that most citizens actually like to be lied to; it makes them feel good. In what is called Pascal’s Wager, even if they are agnostic, they feel that they have nothing to lose by believing in the AGW meme, and everything to lose if they do not believe in it (Stallinga and Khmelinskii, 2016). In fact, they can win more if they become fervent advocates. They, in fact, demand from politicians to be lied to even more. Most people demand the dismantling of science, as it is slowing down progress in finding a solution to the problem. It is then logical that less-informed people are more fanatic about the subject. That makes the meme virtually immortal. To say it once again in a biological analogy: There are no antibodies to this viral meme. And not even facts (reality) will make people change their minds, facts will just be ignored through cognitive dissonance.

5. CONCLUSIONS

We have shown here how knowledge in a knowledge-based economy leads to financial loss in a profit-driven society. Both for the individual who invests in knowledge acquisition (a.k.a. ‘learning’) as well as society as a whole. If knowledge is sought on basis of trying to make a profit, instead any meme will be propagating, not only truths, but also falsehoods, as we have seen in the case of the AGW meme. This dialectical inversion, where profit-optimization leads to financial loss might have come unexpected for some, but should rather have been expected. A knowledge-based economy will go bankrupt, and all knowledge acquired in this economical system will be rather pointless, for being incorrect. The Brussels-centralized control of science, where politics dictates the outcome of research, has created a neo-Lysenkoism that is all but scientific.

ACKNOWLEDGMENTS

The authors declare not to have any conflicts of interests. This research was paid by no grant. It received no funding whatsoever, apart from our salaries at the university where we work. Nor are we members of any climate committees (political or other) or are we linked to companies or NGOs, financially or otherwise. We are not members of any political party or movement. This is an independent work that does not necessarily represent the opinion of our university or of our government.

RESUMO

As unidades hoteleiras, independentemente da sua classificação e tipologia, são importantes equipamentos para providenciar a acomodação dos seus hóspedes, para além de constituírem veículos de divulgação cultural (dos países onde se encontram) e de promoverem estados de bem-estar e de conforto. Em países nos quais a indústria do turismo tem um peso muito elevado no PIB, como é o caso de Portugal, esses objetivos de valorização cultural e de promoção de bem-estar e conforto são determinantes para o próprio desempenho da economia como um todo, e a uma escala regional e local podem mesmo ser decisivos para as respetivas comunidades.

Nas fases de planeamento e *design* de construção, reabilitação ou adaptação de um edifício de hotelaria, existem requisitos funcionais, arquitetónicos, técnicos e decisões gestionárias que irão comprometer o ciclo de vida de custos do edifício e da sua prestação enquanto unidade hoteleira, se essas decisões não forem as mais adequadas.

O Sector da Hotelaria tem vindo a utilizar um sistema de classificação por estrelas para diferenciar a qualidade providenciada pelas diferentes unidades hoteleiras, o qual envolve parâmetros tais como: Características das instalações e serviços; Serviço de Receção; Serviço de limpeza e lavandaria; Serviço de F&B; Outros serviços.

Os autores apresentam um exercício de análise comparativa entre os parâmetros formais (regulamentares) de classificação e os fatores que os hóspedes valorizam (valorização auto-revelada através do Booking.com®) durante a sua estadia. Esta análise também pretende relacionar as soluções de eficiência energética adotadas com os níveis de conforto experimentados.

Considerando o peso da fatia energética nos custos de exploração (a 2ª maior) de um hotel, e tendo presente a orientação política para uma melhoria de 69% na eficiência energética, é exigível a necessidade de uma transformação paradigmática dos objetivos, sem prejudicar a qualidade do serviço, a par de uma avaliação feita pelos hóspedes.

1. INTRODUÇÃO

Os empreendimentos turísticos são infraestruturas com múltiplos propósitos, que se destinam a prestar serviços de alojamento, mediante remuneração, mas também disponibilizam um conjunto de estruturas, equipamentos e serviços complementares destinados a proporcionar bem-estar aos seus utilizadores (clientes).

Enquanto equipamentos privados de utilização pública, estes empreendimentos assumem um valor acrescido em termos urbanísticos e podem, salvaguardados requisitos importantes no que respeita ao seu *design*, valorizar o ambiente construído em que se integram, constituindo referências imagéticas significativas em muitos contextos paisagísticos (não exclusivamente urbanos).

Culturalmente, o turismo é um veículo de promoção da identidade dos povos e pode dar relevante contributo para a paz e para o intercâmbio entre povos que, sem o pretexto da viagem, jamais se conheceriam. Mesmo considerando que uma quota-parte das deslocações e estadias, quer dos residentes, quer mesmo dos estrangeiros, não são justificadas pelo 'lazer, recreio ou férias' mas por outros motivos¹, o facto é que numa deslocação para fora do nosso *habitat*, a condição de experiência interculturalista não deixa de estar presente, pese embora com intensidades e alcances possivelmente distintos.

Economicamente, e em qualquer das escalas consideradas (local, regional ou nacional), a existência de empreendimentos turísticos promove o desempenho da atividade económica, quer pela criação de emprego, algum do qual bastante qualificado, gerando proveitos para as empresas, estimulando, direta ou indiretamente, outros sectores da economia (restauração, transportes, agricultura, recreação, lazer e cultura, entre muitos).

A riqueza gerada pelo sector do turismo destaca-se progressivamente no contexto do PIB (Figura 1) e reflete-se crescentemente no próprio Sector (cfr. Figuras 2 e 3). As exportações² do Sector (bens e serviços turísticos) representavam em 2006 aproximadamente 4% do PIB (em valores correntes aproximadamente 6,7 mil milhões €) e em 2016 estima-se que tenham ficado próximo dos 7% (em valores correntes cerca de 12 mil milhões €), correspondendo a uma variação de 73% em apenas 10 anos. Este crescimento é por de mais contrastante com a evolução do PIB nacional, cuja evolução tem

¹ A estatística do turismo tipifica outras situações, a saber: 'Visita a familiares ou amigos'; 'Profissionais ou negócios'; 'Saúde'; 'Religião'; 'Outros motivos'.

² A exportação de bens e serviços consiste nas transações de bens e serviços (vendas, trocas diretas e ofertas) de residentes para não residentes. A exportação de bens verifica-se quando há transferências de propriedade económica de bens entre residentes e não residentes (quer se verifiquem ou não os correspondentes movimentos físicos de bens através das fronteiras). A exportação de serviços abrange todos os serviços prestados por residentes a não residentes. (metainformação – Sistema Europeu de Contas).

sido quase anémica, quando não recessiva, e de entre os Sectores da economia portuguesa com vocação exportadora não se encontram outros com tão sólida progressão (exceto em segmentos de serviços emergentes).

Figura 1 - Turismo em % do PIB

Fonte: INE (vários anos). Estatísticas do Turismo. Gráfico dos autores

Observando pela ótica dos proveitos totais dos estabelecimentos hoteleiros (preços correntes)³, que em termos anuais ascenderam a 2,62 mil milhões € em 2015, e esmiuçando por Época (alta | baixa) e por Região do país (Figuras 2 e 3), verifica-se que na Época Alta os valores médios mensais (nacionais) cresceram 85% entre 2006 e 2016 (ou seja, ainda acima da variação observada no contributo para o PIB), destacando-se o desempenho das Regiões Norte e do Alentejo, ambas com registos de variação relativa acima da duplicação de proveitos (118%). Todavia, em termos nominais, o Algarve foi a Região com um volume de proveitos mais significativos (média mensal acima dos 147 milhões € em 2016, contra 79 milhões € em 2006), logo seguida da Área Metropolitana de Lisboa (92 milhões de € e 46 milhões €, respetivamente em 2016 e 2006).

Já em relação à Época Baixa, os valores médios mensais (nacionais) cresceram 55% em igual período (2006 e 2016), destacando-se as Regiões do Norte e da Área Metropolitana de Lisboa com variações muito elevadas (87% e 69%), evidenciando um desagravamento do índice de sazonalidade que muito vinha penalizando o sector do Turismo em Portugal. Em termos nominais, e comparativamente com a Época Alta, na Época Baixa é a Região de Lisboa a gerar maior volume de proveitos (64 milhões € em 2016 contra 38 milhões € em 2006), seguida da Região do Algarve, mas a considerável distância de Lisboa.

Figura 2 - Proveitos totais (€) dos estabelecimentos hoteleiros por Região (NUT II) e variação observada (%) entre 2006 e 2016 – ÉPOCA ALTA

Fonte: INE (vários anos). Estatísticas do Turismo. Gráfico dos autores

Estes dados de exploração revelam para o último decénio um forte crescimento do Sector, diversificação de receitas numa ótica regional e sazonal, por certo resultante do aumento da oferta e da procura, mesmo tendo ocorrido uma gravíssima crise económica mundial, cujas consequências ainda não terminaram, e tendo aparecido ou perpetuado fatores adversos (aumento da insegurança internacional, aumento do preço da energia, congestionamento progressivo das vias de transporte de passageiros, sobretudo aéreo, sinais preocupantes em termos ambientais) que têm impacto no Sector.

³ Compreende todos os proveitos resultantes da atividade do estabelecimento hoteleiro. Inclui os proveitos de aposento, os proveitos de restauração e outros proveitos decorrentes da própria atividade (ex.: aluguer de salas, lavandaria, tabacaria, telefone, etc.) (cfr. metainformação – INE, Estatísticas do Turismo).

Figura 3 - Proveitos totais (€) dos estabelecimentos hoteleiros por Região (NUT II) e variação observada (%) entre 2006 e 2016 – ÉPOCA BAIXA

Fonte: INE (vários anos). Estatísticas do Turismo. Gráfico dos autores

Normativamente, o Sector tem beneficiado de um conjunto de atualizações de natureza exigencial (muito ligadas às componentes ambiental, energética e urbanística), nomeadamente através da publicação do regime jurídico da instalação, exploração e funcionamento dos empreendimentos turísticos em 2008, alterado em 2009 e já mais recentemente, em 2014. Este regime – como qualquer outro sistema de regras formais – tem intuitos disciplinadores (regulamentares) que procuram, no essencial, salvaguardar o nível de qualidade da oferta nacional. O sistema de classificação dos empreendimentos turísticos, cerne da presente discussão, pretende ser a materialização desse intuito disciplinador em busca de uma **qualidade** que é entendida, nos termos do Plano Estratégico Nacional do Turismo (2017-2027), simplificada, como Estratégia Turismo 2027 (Turismo de Portugal I.P., 2017), como um valor axial de toda a atividade turística, e particularmente como uma orientação estratégica para cada um dos vetores da sustentabilidade (económica, social e ambiental) dessa mesma atividade (Ministério da Economia, 2017). Este é, agora, o domínio da política pública. Exemplificando, nas metas de **sustentabilidade ambiental** pode ler-se que se pretende “assegurar que mais de 90% das empresas do turismo adotam medidas de utilização eficiente de energia e da água e desenvolvem ações de gestão ambiental dos resíduos” (p. 7), numa clara alusão à melhoria do desempenho ambiental, qualificando a pegada ecológica do Sector. De igual modo, nas Linhas de Atuação é claramente definido como objetivo o desenvolvimento de “sistemas de incentivos e linhas de financiamento para reforçar a competitividade e a internacionalização das empresas do turismo, nomeadamente no que respeita à regualificação e inovação da oferta turística – alojamento, restauração, animação e serviços turísticos – privilegiando-se, entre outros elementos, a diferenciação, a orientação para a procura, o turismo acessível, a eficiência energética, a certificação ambiental, a adoção de normas de qualidade internacionais e resposta a novas dinâmicas de oferta e procura” (p. 56).

Em que medida o incremento da qualidade pode ser uma matéria num fórum sobre interdisciplinaridade? Reforçando o nosso argumento em texto anterior (Machado *et al.*, 2016), e tendo sempre presente o conceito de *sistema sociotécnico* – pelo qual se entende a inter-relação recíproca entre a ação humana e a tecnologia – a qualidade vem a ser função de uma efetividade prática (interdisciplinar convergente) com alcance ético-político e valor estratégico para a sociedade. Como refere (Pombo, 2004), “é urgente compreender também que as novas análises produzidas por essa investigação interdisciplinar têm de ser postas ao serviço da transformação da vida colectiva, social e individual” (p. 65).

Figura 4 - Esquematização da prática interdisciplinar convergente centrada na produção da qualidade

A qualidade, neste entendimento, não é mais um argumento em favor do Sector da atividade turística, da sua diferenciação perante outros sectores da economia, ou da sua promoção distintiva (estatuto social e reconhecimento público); passa a desígnio no quadro de mudanças societárias (proporcionadas por transformações científicas e tecnológicas) e ganha valor instrumental. Todavia, ele não é unidimensional, i.e. redutível a uma só visão disciplinar.

De entre essas mudanças societárias podemos sinalizar a centralidade do que pensamos ser o bem-estar na nossa sociedade, e o modo como o medimos⁴. O bem-estar (psicológico ou subjetivo) proporcionado pela atividade turística é inequivocamente relevante e quase se confunde o turismo com a produção e satisfação das necessidades de bem-estar dos turistas. Outra equivalência semântica imprecisa, mas ainda assim frequente, é a de bem-estar e conforto. Ora, o conforto é uma componente integrante do bem-estar. A definição técnica de conforto térmico - “o estado de espírito que expressa satisfação relativamente ao ambiente térmico” (ISO 7730, 2005) é, em si mesma, elucidativa desse emaranhado de influências e processos com os quais se pretende gerar conforto. Parâmetros psicossociológicos como a expectativa relativamente a um dado ambiente térmico, o tempo de exposição, a perceção de controlo (sobre as condições de temperatura e humidade do alojamento onde se encontra), são variáveis que ajudam a elucidar a variabilidade que a sensação de conforto pode assumir entre um conjunto de pessoas, mesmo que estas estejam sujeitas às mesmas condições físicas (temperatura, humidade, velocidade do ar) (Matias, 2010). Idêntica problematização poderia ser avançada para o conforto acústico, conforto visual e qualidade do ar. Para entender o significado de conforto, o capital social e cultural de um sujeito pode ser decisivo para incrementar a sua capacidade discriminativa e assim fazer julgamentos diferenciados, acionando informação que possui por via desses mesmos capitais.

Qualidade, bem-estar, conforto, são constructos (construções mentais) que proporcionam um trabalho interdisciplinar muito intensivo, diversificado, envolvendo as ciências da construção, as ciências sociais e humanas, e cujos resultados podem ser da maior relevância para a indústria do turismo. É tão dogmático e irrealista – numa sociedade que tem puxado ao limite os desafios dos sistemas sociotécnicos – pensar-se que um empreendimento turístico pode cumprir a sua missão com os recursos limitados ao perímetro das ciências da construção; como é irrealista pensar-se que pode funcionar apenas com uma gestão profissionalizada e uma liderança forte, descurando a tecnologia ou as ciências da construção; ou, em ambos os casos, descurando a avaliação subjetiva dos hóspedes, que exige conhecimentos específicos de inquirição sociológica e de estatística aplicada.

Ao bem-estar e aos serviços proporcionados pelos hotéis estão normalmente associados consumos de energia e de água, o que aumenta os custos de exploração dos mesmos, bem como os pode tornar mais vulneráveis face às alterações climáticas. Efetivamente, a vulnerabilidade às alterações climáticas é afetada por parâmetros físicos e por condições operacionais. Entre os parâmetros físicos identificam-se: dimensão do edifício, arquitetura, qualidade térmica da envolvente, clima, idade, características dos sistemas e instalações, condições de manutenção, condições de operação, vetores energéticos e respetivos custos. Na operação, destacam-se: o tipo de serviços proporcionados (cozinha, lavandaria, piscina, salas de conferência, lojas), de utilização do hotel (flutuação da taxa de ocupação, preferências dos clientes, perfis de utilização e set-points), práticas de limpeza e de gestão de energia.

Nos hotéis existem requisitos operacionais para a zona de clientes (quartos, circulações públicas, lobby, restaurante, piscina, SPA, etc) e para as zonas de serviços (lavandaria, cozinha, vestiários, etc). Os principais consumos de energia devem-se a (HES, 2011):

- Aquecimento e arrefecimento de quartos,
- Iluminação,
- Água quente sanitária,
- Preparação de refeições,
- Aquecimento de piscinas,
- Lavandaria.

Quando se procuram estabelecer indicadores de desempenho energético dos hotéis, tem-se tipicamente em conta os seguintes fatores (W. Chan, 2012; HES, 2011):

- Classificação do hotel,
- Nível de conforto proporcionado (condições ambientais interiores),
- Área útil de pavimento ou número de quartos, ou camas,
- Número de graus dias de aquecimento e de arrefecimento,
- PAX, número de dormidas (ocupação),
- Presença de cozinha e cover (refeições quentes) fornecidas,
- Presença de lavandaria e produção (kg),
- Piscinas aquecidas,
- Existência de regras da marca,
- Consciência ambiental da empresa (direção e staff) e dos clientes.

Face aos estudos anteriores infere-se a existência de uma relação entre a qualidade do hotel avaliada pela sua classificação, o bem-estar dos turistas e os consumos energéticos dos hotéis, efetuando-se neste artigo uma reflexão interdisciplinar desses três aspetos, com base nos nove casos de estudo de hotéis de 4 e 5 estrelas do projeto AdaPT AC:T (AdaPT AC:T, 2016). Para esse efeito foi seguida a seguinte metodologia:

- Identificação dos requisitos aplicáveis à classificação de hotéis de 4 e 5 estrelas;
- Identificação da perceção de bem-estar da estadia manifestada pelos hóspedes;

⁴ Sobre esta mesma discussão, cfr. Machado *et al.* 2016.

- Reflexão sobre metodologia para articular bem-estar percebido, classificação do hotel e medidas de eficiência energética.

Para realizar essa reflexão foram utilizados os nove hotéis caso de estudo do projeto AdaPT AC:T (AdaPT AC:T, 2016). Como resultado desta reflexão pretende-se contribuir para uma discussão da valorização de alguns aspetos da classificação de hotéis de 4 e 5 estrelas, que são edifícios com elevados consumos específicos de energia e de água (A. Pinto, Bernardino, Santos, Santo, 2016). São nossos objetivos neste exercício:

- Criar uma matriz que articule bem-estar e uso eficiente de recursos, garantindo ao sector uma maior sustentabilidade e prevenindo situações de indisponibilidade de serviços devido ao uso excessivo de energia;
- Promover uma melhor articulação entre a metodologia de classificação e o bem-estar percebido durante a estadia.

2. REQUISITOS APLICÁVEIS À CLASSIFICAÇÃO DE HOTÉIS DE 4 E 5 ESTRELAS

O regime jurídico da instalação, exploração e funcionamento dos empreendimentos turísticos (Decreto-Lei n.º 39/2008, n.d.) e posteriores alterações estabelece as regras para os seguintes tipos de empreendimentos turísticos:

- a) Estabelecimentos hoteleiros (hotéis, hotéis-apartamentos (aparthotéis), pousadas);
- b) Aldeamentos turísticos;
- c) Apartamentos turísticos;
- d) Conjuntos turísticos (resorts);
- e) Empreendimentos de turismo de habitação;
- f) Empreendimentos de turismo no espaço rural;
- g) Parques de campismo e de caravanismo;
- h) Empreendimentos de turismo da natureza.

O regime jurídico estabelece um sistema de classificação obrigatório, que atende aos requisitos físicos das instalações, mas também à qualidade dos serviços prestados. A classificação dos estabelecimentos hoteleiros, aldeamentos e apartamentos turísticos encontra-se regulada pela (Portaria n.º 327/2008, n.d.) e posteriores alterações, e depende da qualidade do serviço e das instalações de acordo com requisitos específicos que incluem:

1. Instalações
 - 1.1 Acessos
 - 1.2 Zonas comuns
 - 1.3 Zonas de serviço
 - 1.4 Unidades de alojamento
 - 1.5 Áreas das unidades de alojamento
 - 1.6 Estacionamento
2. Equipamento/Mobiliário
 - 2.1 Equipamento do quarto
 - 2.2 Equipamento e acessórios sanitários
 - 2.3 Sistemas de vídeo e áudio
 - 2.4 Comunicações eletrónicas
 - 2.5 Equipamento suplementar
3. Serviço
 - 3.1 Serviço de limpeza e arrumação das UA
 - 3.2 Serviço de alimentação e bebidas
 - 3.3 Serviço de pequeno-almoço
 - 3.4 Serviço de receção e acolhimento
 - 3.5 Serviço de lavandaria e engomadoria
 - 3.6 Outros serviços
4. Lazer e negócios (equipamentos e instalações)
5. Qualidade e sustentabilidade

Compete ao Turismo de Portugal I.P. classificar os seguintes empreendimentos turísticos:

- Estabelecimentos Hoteleiros
- Aldeamentos Turísticos
- Apartamentos Turísticos
- Conjuntos Turísticos
- Hotéis rurais

No caso dos parques de campismo e de caravanismo, dos empreendimentos de turismo de habitação, dos empreendimentos de turismo no espaço rural, com exceção dos hotéis rurais, a classificação é fixada pela câmara municipal, juntamente com a autorização de utilização para fins turísticos quando tenha sido realizada a vistoria nos termos do Regime Jurídico da Urbanização e Edificação, caso em que não há lugar a vistoria de classificação. Está prevista também a isenção de classificação.

A classificação dos empreendimentos turísticos é efetuada com base na satisfação de requisitos obrigatórios e na pontuação obtida em requisitos opcionais de acordo com o definido na (Portaria n.º 327/2008, n.d.), salvaguardando-se que todos os empreendimentos devem apresentar adequadas condições de higiene e limpeza, conservação e funcionamento das instalações e equipamentos, água corrente quente e fria. Para os hotéis de 4 estrelas é requerido um mínimo de 210 pontos e de 218 pontos para hotéis de 5 estrelas, devendo 20% desses pontos ser obtidos na categoria de qualidade e sustentabilidade. No sistema de classificação encontram-se disponíveis cerca de 1090 pontos, que se distribuem da forma indicada na Figura 5; ou seja, cerca de 20% dos pontos encontram-se distribuídos por cada uma das principais categorias, sendo que o alojamento e seus equipamentos é particularmente valorizado (21%). Na Europa existem vários países que seguem a estrutura de classificação HotelStars (HOTREC, 2015), que difere do sistema Português, desde logo, por não ser lei e pelos requisitos.

Na Figura 6 encontra-se representada a distribuição de empreendimentos hoteleiros em Portugal, com as classes 4 estrelas, 5 estrelas e de 3 ou menos estrelas, constatando-se uma maior concentração de hotéis de 4 e 5 estrelas nas zonas de Lisboa, Algarve, Porto, Madeira e litoral norte. O parque de empreendimentos hoteleiros tem um crescimento recente muito acentuado (Figura 7), cerca de metade é posterior a 2002, contudo poucos dispõem de certificação energética ou ambiental de carácter voluntário (Figura 8), configurando um desafio para alcançar as metas das estratégias nacionais de eficiência energética e energias renováveis (PNAEE e PNAER - (Resolução do Conselho de Ministros n.º 20/2013, n.d.)), de adaptação às alterações climáticas (ENAC - (Resolução do Conselho de Ministros n.º 24/2010, n.d.)) e da Estratégia Turismo 2027 (Turismo de Portugal I.P., 2017). Em relação às amenidades, é de salientar a grande proporção de hotéis com piscina exterior e interior e só com piscina exterior (Figura 9). Pela importância do clima nas necessidades energéticas dos hotéis, na Figura 10 representa-se a distribuição dos hotéis pelas zonas climáticas do País.

Figura 5 – Estrutura dos requisitos para a classificação de hotéis

Figura 7 – Evolução do número de empreendimentos hoteleiros e de dormidas

Figura 8 – Hotéis de 4 e 5 estrelas com certificação energética ou ambiental voluntária (dados obtidos com base em informação do Turismo de Portugal, não publicada, 2015)

Figura 9 – Hotéis de 4 e 5 estrelas com piscina (dados obtidos com base em informação do Turismo de Portugal, não publicada, 2015)

Figura 10 – Distribuição dos hotéis pelas diferentes zonas climáticas de Portugal continental (dados obtidos com base em informação do Turismo de Portugal, não publicada, 2015)

3. RELAÇÃO ENTRE BEM-ESTAR PERCECIONADO E REQUISITOS DA CLASSIFICAÇÃO DE HOTEIS DE 4 E 5 ESTRELAS

A avaliação do bem-estar e a experiência da estadia é algo subjetivo e pessoal, que envolve múltiplas dimensões desde o conforto térmico proporcionado, as amenidades e equipamentos disponíveis, a qualidade do serviço, o *staff* e as expectativas. Para controlo de qualidade do serviço das unidades hoteleiras usualmente é solicitado aos hóspedes o preenchimento de um questionário no momento do *checkout*. Contudo os resultados desse questionário é informação que não é do domínio público, e tão-pouco se conhece a metodologia de suporte (que poderá variar imenso de hotel para hotel). Neste estudo, como *proxy* para avaliação do bem-estar percecionado, a informação tratada foi recolhida na plataforma Booking.com, na qual os hóspedes são convidados a deixar comentários positivos e negativos após a sua experiência de alojamento. A plataforma utiliza uma escala de satisfação, de tipo Likert. Considera-se que estes comentários, acabam por incorporar uma apreciação mais distanciada da experiência de alojamento, do que aquela decorrente das respostas efetuadas no momento do *checkout*.

Para esse efeito foram utilizados os nove hotéis caso de estudo do projeto AdaPT AC:T (AdaPT AC:T, 2016), que são hotéis de 4 e 5 estrelas, quatro unidades situadas em Lisboa e cinco unidades situadas no Algarve. Foram recolhidos os comentários registados entre 2013 e 2015. Na análise das opiniões dos hóspedes registadas na plataforma Booking.com®, sobre a sua estadia no hotel (Machado, Rebelo, Saraiva, Pinto, 2016) as opiniões positivas ou negativas foram agrupadas nas seguintes categorias:

- Alojamento
- Equipamentos e serviços orientados para S&BE
- Alimentação
- *Wifi*
- Outros
- Manutenção (portas, torneiras, canalizações,...)
- Localização
- *Staff*
- *Housekeeping*
- Preços dos quartos, refeições e outros serviços
- Energia (AC)
- Espaços exteriores
- Entretenimento e equipamentos de recreação
- Água
- Lavandaria
- Serviços de transporte
- Estacionamento
- Segurança

A apreciação geral da experiência e classificação Booking.com é bastante elevada nas nove unidades, tendo um valor médio de 8.30 (Machado *et al.*, 2016), bem como os resultados da avaliação de conforto (Armando Pinto, Machado, Matias, Saraiva, Silva Santos, 2016). Na Figura 11 representa-se a importância relativa de cada uma dessas 18 categorias nos comentários positivos e nos comentários negativos expressos pelos hóspedes das nove unidades hoteleiras e que resultaram em mais de 5000 referências (3244 positivas e 1830 negativas). Desses dados regista-se o impacto positivo dos aspetos relacionados com o alojamento (18%), alimentação (14%), localização (15%), *staff* (17%) e espaços exteriores (9%). Pelo lado negativo, existe uma distribuição maior pelas 18 categorias, sendo de realçar a componente alojamento (22%), equipamentos e serviços S&BE (11%) e alimentação (9%). Nos aspetos relacionados com a energia e o ar condicionado não existe uma grande prevalência de opiniões (2% positivas / 4% negativas). Contudo, efetuando uma análise detalhada do aspeto conforto e energia (Pinto, Machado *et al.*, 2016) é possível evidenciar que alguns desses problemas estão relacionados com insuficiente iluminação nos quartos (12%) e cerca de 4% com problemas de quarto quente/frio (Figura 12).

Para avaliar a relação entre o bem-estar percecionado pelos hóspedes e a metodologia de classificação dos hotéis (Portaria n.º 327/2008, n.d.) os 197 requisitos da classificação da categoria dos hotéis foram alocados a cada uma das 18 categorias adotadas para analisar os comentários positivos e negativos dos hóspedes registados na plataforma Booking.com. Os resultados da importância relativa do método de classificação dos hotéis, vertida nessas 18 categorias, encontra-se representada na Figura 11 com um quadrado verde. Dessa figura é de salientar:

- A concordância entre a ponderação da classificação dos hotéis para a categoria alojamento face às opiniões positivas e negativas manifestadas.
- As componentes *staff* e localização, apresentam um impacto na classificação dos hotéis de 6%, que fica aquém dos aspetos positivos manifestados pelos hóspedes, suscitando o juízo de que deveriam ter maior ponderação na classificação dos hotéis para valorizar e incentivar a criar condições de satisfação dos hóspedes.
- Os espaços exteriores, a alimentação são outros aspetos valorizados positivamente pelos hóspedes (9% | 14%), que não tem correspondência direta com a importância atribuída na classificação (3% | 8%).
- A categoria *housekeeping* apresenta uma ponderação de 2% na classificação dos hotéis, apresentando uma prevalência superior nas referências positivas e negativas expressas pelos hóspedes (4% | 6%), dado o impacto diário na comodidade e limpeza das unidades de alojamento.
- A categoria entretenimento apresenta uma ponderação elevada na classificação dos hotéis (15%); contudo, não tem um impacto tão relevante na apreciação positiva ou negativa efetuada pelos hóspedes (4%).

- A categoria energia revelou-se menos relevante nas opiniões expressas pelos hóspedes (1% positivos, 4% negativos) face aos 10% previstos na classificação dos hotéis, o que se considera estar relacionado com o facto de nos nove hotéis estudados se registarem condições interiores de conforto satisfatórias e os problemas no ar condicionado serem diminutos, não existindo referências dos hóspedes quanto à incorporação de energias renováveis em alguns deles ou de outras medidas de eficiência energética que os hotéis analisados dispõem.

Em síntese, apesar da independência metodológica da avaliação do bem-estar na estadia no hotel utilizada neste estudo, com base nas opiniões positivas e negativas expressas por ## hóspedes na plataforma Booking.com e a metodologia de classificação dos hotéis, considera-se existir potencial de alinhamento entre as ponderações das 18 categorias de bem-estar e as ponderações da classificação dos hotéis, nomeadamente alterando:

- Localização, de 6% para 10%;
- *Staff*, de 6% para 10%;
- *Housekeeping*, de 1% para 5%;
- Espaços exteriores, de 2% para 6%;
- Entretenimento e equipamentos de recreação, de 15% para 5%.

Com estes ajustamentos nas ponderações, melhora-se a relação entre a classificação dos empreendimentos e a percepção de bem-estar manifestada (R^2 passa de 0.18 para 0.91, Figura 13).

No que ao uso eficiente de recursos diz respeito, nota-se que os hóspedes são pouco explícitos na identificação e manifestação de uma opinião positiva ou negativa quanto ao uso eficiente de energia, energia renováveis ou uso eficiente de água, apesar desta amostra de nove hotéis ter sistemas desse tipo (Armando Pinto, Silva Santos, Machado, Espírito Santo, 2016). Nesse sentido, na seção seguinte efetua-se uma análise dos aspetos de classificação dos hotéis que poderiam incorporar a valorização da utilização de sistemas de maior eficiência energética e de energia renováveis, dado existirem nos hotéis diversos equipamentos (por exemplo TV, Hi-fi, minibar) que não são diretamente abrangidos pela regulamentação de eficiência energética de edifícios (Decreto-Lei n.º 118/2013, n.d.).

Figura 11 – Comentários positivos e negativos booking.com de nove hotéis e ponderação das categorias da classificação dos hotéis

Figura 12 – Detalhe da análise relacionada com os aspetos de conforto

Figura 13 – Relação entre as ponderações das 18 categorias de avaliação de bem-estar e a classificação dos hotéis de 4 e 5 estrelas

4. CLASSIFICAÇÃO DE HOTEIS DE 4 E 5 ESTRELAS E OS ASPETOS DE EFICIÊNCIA ENERGÉTICA

Na classificação da categoria dos hotéis, os aspetos de uso da energia estão indicados em 9 requisitos (Quadro 1), tendo uma valorização de cerca de 10% nos pontos disponíveis para a classificação dos hotéis. Os primeiros cinco requisitos estão relacionados com a climatização das zonas comuns e de alojamento, enquanto os restantes 4 requisitos valorizam a certificação energética voluntária e a eficiência energética é valorizada no requisito n.º 189, até 15 pontos. Na classificação dos hotéis existe a intenção de valorizar apenas as medidas implementadas para além das exigências regulamentares (por exemplo, do sistema de certificação energética dos edifícios (Decreto-Lei n.º 118/2013, n.d.)).

No âmbito dos sistemas voluntários de certificação energética e ambiental, há que referir o sistema europeu (EMAS, 2016) e o rótulo ecológico europeu para o alojamento (Ecolabel Alojamento, 2009).

No sistema EMAS, para reduzir ao mínimo o consumo de energia nas estruturas de alojamento são valorizados:

- Sistemas de controlo e de gestão da energia;
- Melhoria da envolvente do edifício;
- Otimização dos sistemas de aquecimento, ventilação e climatização (AVAC);
- Aplicações eficientes de bombas de calor e de aquecimento/arrefecimento geotérmico;
- Iluminação e equipamento elétrico eficientes;
- Fontes de energia renováveis.

No rótulo ecológico europeu as preocupações são semelhantes às do sistema EMAS, que em Portugal na sua maioria se encontram vertidas na avaliação da eficiência energética de edifícios (Decreto-Lei n.º 118/2013, n.d.). Na certificação energética de edifícios de comércio e serviços, na qual se incluem os hotéis, existem limites para a componente regulada do índice de eficiência energética (IEE), que avalia a eficiência em relação a: aquecimento, arrefecimento, ventilação, bombagem, água quente sanitária, iluminação e elevadores. Além da avaliação da eficiência do edifício, para as novas instalações existem também requisitos mínimos de eficiência ou conceção para:

- Sistemas de monitorização, controlo e gestão de energia;
- Qualidade térmica da envolvente opaca e envidraçada;
- Rendimentos dos sistemas produtores de calor e de frio e unidades de ventilação;
- Rendimento e controlo dos sistemas de iluminação artificial;
- Incorporação de energia renováveis;
- Eficiência de elevadores e escadas.

Quanto aos restantes equipamentos, cujos desempenhos e consumos se integram na componente não regulada (IEE) do sistema de certificação energética de edifício, não se aplicam requisitos no âmbito do SCE. A esses equipamentos, que podem ter um contributo importante no consumo de energia do hotel (Armando Pinto, Silva Santos *et al.*, 2016), aplicam-se os requisitos de eficiência decorrentes da Diretiva de Conceção Ecológica 2009/25/CE (Eco Design) e da Diretiva de Etiquetagem Energética 2010/30/UE, por exemplo: eletrodomésticos, TV, frio, informática, etc. Nesse sentido, de forma a incorporar a dimensão na regulada da eficiência energética dos edifícios na classificação dos hotéis e na melhoria da qualidade dos serviços, como estratégia de mitigação e de adaptação às alterações climáticas, é importante discutir a evolução do sistema de classificação dos hotéis nos aspetos, não só funcionais, mas também de eficiência energética, por exemplo:

- Requisitos sobre elevadores (requisitos n.º 3, 4 e 12): requerer elevadores e que esses sejam da classe B de acordo com a norma VDI 4707 (RECS-E, 2013);
- Requisito de fechaduras eletrónicas (requisito n.º 21): requerer fechaduras eletrónicas e também que estas promovam o corte de energia elétrica ao quarto, com exceção do minibar;
- Requisito minibar, TV, Hi-fi, consolas, café, chá, PC (requisitos n.º 39, 71, 72, 76, 77, 102 e 152): requer esses equipamentos e que estes sejam de elevada eficiência energética, nomeadamente da classe A de eficiência de acordo com a Diretiva de Etiquetagem Energética 2010/30/EU;
- Requisito de uso de água quente (requisitos n.º 19 e 61): não valorizar a existência de banheira, pois pode proporcionar um desperdício de água quente, devendo ser privilegiada a solução do tipo duche; bem como valorizar a utilização de dispositivos eficientes para as torneiras, autoclismo e chuveiros (EMAS, 2016; Armando Pinto, Espírito Santo, Rogeiro, Martins, 2016).

Quadro 1 – Requisitos de eficiência energética na classificação de hotéis

n.º Requisito	Requisito	Pontos
10	Climatização das áreas comuns com sistemas de climatização ativos ou passivos que garantam o conforto térmico	10
11	Climatização dos corredores de utentes com sistemas de climatização ativos ou passivos que garantam o conforto térmico	10
16	Climatização das UA com sistemas de climatização ativos ou passivos que garantam o conforto térmico	---
17	50% das UA com sistemas de climatização que garantam o conforto térmico de intensidade regulável pelo cliente em cada ciclo	10
18	100% das UA com sistemas de climatização que garantam o conforto térmico de intensidade regulável pelo cliente em cada ciclo	13
189	Sistemas que promovam o consumo eficiente de energia, incluindo a utilização de energias renováveis ou equivalente, quando não obrigatórios por lei	3 pts por cada sistema - máx. 15 pts
190	Sistemas que promovam a qualidade do ar interior e o conforto térmico e acústico, quando não obrigatórios por lei	3 pts por cada sistema - máx. 15 pts
196	Certificação energética ou ambiental por norma nacional ou europeia, quando não obrigatória por lei	30
197	Certificação, prémio ou selo de qualidade atribuído por uma entidade reconhecida nacional, estrangeira ou internacional	3 pts por cada - máx. de 6 pts

Com as propostas deste estudo, considera-se que o método de avaliação da categoria dos hotéis complementa as exigências regulamentares e conduz a hotéis mais adaptados e preparados para os desafios da sustentabilidade, sem um acréscimo de complexidade no seu processo de classificação ou de custos. Por outro lado, os outros aspetos mais específicos de eficiência de equipamentos e a incorporação de energias renováveis são avaliados em contexto da certificação energética de edifícios, ou no âmbito de sistemas voluntários de certificação ambiental.

5. CONCLUSÕES

O bem-estar dos hóspedes nos hotéis de 4 e 5 estrelas foi estudado com base nas opiniões recolhidas na plataforma Booking.com, sendo possível avaliar opiniões positivas e negativas sobre a estadia em 18 categorias e estabelecer a prevalência de aspetos positivos ou negativos em cada uma dessas categorias.

Foi efetuada uma análise do método de classificação dos hotéis de 4 e 5 estrelas e foi estabelecida uma relação entre cada um dos 197 requisitos dessa classificação e as categorias de avaliação de bem-estar da estadia, bem como foi avaliada a ponderação de cada uma dessas 18 categorias no número de pontos de classificação dos hotéis. Foi possível constatar que existem cerca de seis categorias onde se regista uma diferença relevante entre a categoria de perceção de bem-estar e a classificação de hotéis, não existindo uma relação estatisticamente forte entre o método de classificação dos hotéis e a sensação de bem-estar ($R^2=0.28$). Por outro lado, efetuando ajustamento à ponderação do sistema de classificação dos hotéis nessas seis categorias é possível ter uma relação estatisticamente robusta ($R^2=0.89$) entre a perceção de bem-estar e a classificação dos hotéis. Considera-se que este ajustamento no sistema de classificação pode contribuir para criar uma classificação mais relacionada com o bem-estar e com a procura turística, criando uma métrica que permita potenciar ainda mais os aspetos positivos e minimizar os aspetos reportados como negativos, contribuindo para um turismo de maior qualidade e satisfação dos clientes.

Deste estudo, infere-se que os aspetos de energia não são percecionados pelos clientes, nem são adequadamente valorizados e identificados na sua opinião sobre a estadia. Contudo, o facto dos custos energéticos serem o 2º custo de exploração dos hotéis, associado às obrigações nacionais em relação à redução das emissões de CO₂, de incorporação de energias renováveis e de eficiência energética, conduzem a que esta seja uma categoria que deve ser valorizada na classificação dos hotéis, pois hotéis de elevada eficiência energética são o garante de um serviço de qualidade com baixos custos de exploração e não existirá a tentação para desligar equipamentos.

Em Portugal, o sistema de certificação energética de edifícios (que se aplica ao projeto de edifícios novos, bem como a edifícios existentes), abrange a generalidade dos aspetos referidos nos guias de excelência ambiental do Sector, pelo que a nossa proposta sugere uma avaliação da categoria dos hotéis que estenda a exigência da existência de alguns equipamentos à verificação da existência desses equipamentos com elevada eficiência energética. Outros aspetos específicos do conforto e da eficiência energética, que requerem uma análise mais detalhada, foram considerados no método AdaPT AC:T (Armando Pinto, Espírito Santo *et al.*, 2016) e são avaliados na aplicação *Hotel Adaptation Tracker*. Contudo, a sua inclusão na matriz de classificação dos hotéis pode ser complexa, podendo esse ou outros métodos ser incorporados na categoria do requisito n.º 196.

THE OLYMPIC GAZE

Maria Alice de Faria Nogueira
Universidade Estácio de Sá (UNESA), Brasil
(prof.maria.alice@gmail.com)

ABSTRACT

This paper introduces a research project named *The Olympic Gaze*, which focuses on how cities are globally presented as “brands” through hosting the Olympic Games. The research was inspired by the opening ceremony of the Rio 2016 Olympic Games, that, according the O Globo report, have quite surprisingly countered the negative expectations of the media by “showcasing a great image of the host country and the host city”. Acknowledged as the least expensive ceremony in the history of the games, Rio 2016’s opening spectacle has shown the world a “touristic gaze” (Urry, 2001) that differs from the one tourism industry and global media actors were used to (Nogueira; Di Cola, 2016). In a time when the so-called Olympic legacy is being questioned as the financial and social costs of the bid have increased substantially, thus becoming a “hard *political act* to manage” (Goldblatt, 2016), this investigation draws on an interdisciplinary perspective to analyze and discuss to what extent the legacy of the Games, besides infrastructure works, does also concern the creation, development, and display of a new local image through which the sociopolitical and economical transformation of the host city is globally accomplished.

Keywords: Rio 2016, Jogos Olímpicos, Olhar do Turista, The Olympic Gaze.

JEL Classification: M30, Z32

1. INTRODUCTION

“It’s hard to believe that Rio de Janeiro hosted the Summer Olympics just six months ago. Today, the Olympic Village has turned into a ghost town, and many of the venues have fallen into disrepair”¹.

The above quote begins the *Business Insider* online article published in February, 13th, 2017, about the venues of the Olympic Games held in August, 2016, in Rio de Janeiro, Brazil. It shows images of the Maracanã stadium, recently renovated for the 2014 FIFA World Cup, where the opening and closing ceremonies of the Olympic Games took place. However, due to unpaid electricity bills owed by the state government, the stadium lawn has dried out, alongside removed or destroyed seats in the bleachers, among other problems such as dirt and neglect. The online text concludes by claiming that the sports complexes which host the Games, and are considered as social and sport legacies for the host cities by the International Olympic Committee (IOC), eventually end up in ruins. For *Business Insider*, these are the conditions left behind locally, despite the promise of the organizers that “the billions of dollars spent on the two-week spectacle” will benefit the host city and generate positive effects in the long-run.

However, in February, 26th, 2017, two weeks after the photos of the Olympic facilities came out, the O Globo newspaper has published an article entitled “Carnival taps into the groove of many accents” (“Um carnaval com a ginga de muitos sotaques”²), in which it was argued that the 2017 carnival in Rio de Janeiro has attracted 1.1 million tourists, the largest number since 2009. Also according to the newspaper, the data from Empresa de Turismo da Cidade do Rio de Janeiro S.A (Riotur), the city tourism office, show an estimate of R\$ 3 billion spent by tourists – R\$ 500 million more than in 2016. In tune with the data provided by Riotur, the Brazilian Hotel Industry Association (Associação Brasileira da Indústria Hoteleira – ABIH) registered an occupancy rate of 90%, despite offering 18,000 more beds than in 2016, due to the Olympic Games. For Alfredo Lopes, president of the association, the Games have influenced the rise, especially concerning national tourists, arguing that “the crisis has helped us because people did not travel abroad. And the national market was impacted by the information on the Olympic Games”.

In this sense, despite all the disputes between the government and the local population over the advantages and/or disadvantages of hosting the Games, the image of Rio de Janeiro as the “Olympic City” seems to have been commercially successful if we consider the city as touristic destination, regardless of the fact that, six months later, the million of dollars invested in the sports legacy are falling apart before one’s eyes.

Drawing on the Rio 2016 case, this research project aims at analyzing the Olympic Games legacy not only in terms of the social and economical dimensions, but also of marketing and communication by discussing the whole commercial effort taken by the government toward the creation, development, and implementation of a local touristic image here named as “The Olympic Gaze”, through which the host city is improved in sociopolitical and economical terms in global scale. To

accomplish this objective, the research adopts an interdisciplinary perspective combining authors from the Social Sciences and Humanities, hence emphasizing History, Sociology, Tourism, Mobilities, Advertisement, and Marketing studies to verify the hypothesis that, in principle, the image of the city as a “brand” transforms the host of the Games in an “Olympic City”, with all the attributes that, according to the IOC, only the Olympic Games can offer: social development through sports, improvements in urban infrastructure and mobility, economic investments, sustainability, and expansion of the tourism industry. In this sense, this research seeks to understand at what extent do the legacy of Games – besides infrastructure works – is also concerned with the image of the city and, consequently, with increasing its participation in the global tourism and investments circuit.

But how is this image created historically? Under which political conditions, that is, of power and resistance, between governments, the IOC, the private initiative, and the local population? Based on what social and economic gains or losses for the city and its inhabitants? And, particularly, as we are interested in a new “touristic gaze” (Urry, 2001) created from hosting the Olympic Games, based in what communication and marketing strategies is this “touristic gaze” developed? At what extent does it sustain itself commercially? In a time when the so-called Olympic legacy is being questioned as the financial and social costs of the bid have increased substantially, thus becoming a “hard *political act* to manage” (Goldblatt, 2016), the questions above guide this research project which, in a first moment, uses the 2008 Beijing Olympics and Rio 2016 as objects of analysis.

The selection of Beijing and Rio de Janeiro was based on the fact that, with the exception of London 2012, all the Summer Olympics of the 21st century were hosted by cities of the “Global South”³, that, as described by Goldblatt (2016, p. 391), can be understood not only as localities beneath the equator, but also as cities situated in emerging or developing countries, as in the cases of Brazil and China, both members of *BRICS*, an acronym for Brazil, Russia, India, China, and South Africa.

The methodological approach applied here draws on the “hermeneutics of depth” (Thompson, 2000), which emphasizes that, in order to be analyzed, symbolic forms must be interpreted in articulation with the socio-historical contexts in which they are produced, transmitted, and received. Therefore, drawing on this methodological framework, the analysis focuses on three stages: before, during, and after the Games, in which communication and marketing actions with global reach take place in order to create, develop, and implement an Olympic gaze towards the city.

It is important to note that, at the time this paper was written, the ongoing research was developing the first stage of the hermeneutic methodology, that is, the socio-historical analysis. As it will be further explained later, this first stage comprises the review of conventional secondary sources, such as textbooks, newspaper articles (in print, electronic or digital form), and national and/or international theses and dissertations on the history of the Olympic Games and its impact (social, economical, political, touristic, and commercial) over the host cities. This literature review will provide the theoretical framework for the historic mapping of the scenery, as well as the ground for the further analysis of the communication actions of the Games, that is the object of the research.

In the following pages, this paper presents the structure of the project, which was divided into three sections featuring the theoretical framework and the preliminary literature review; the hermeneutic methodology, the sources and research objects; and, lastly, the final considerations, which are not intended as a comprehensive approach to the issue, but rather as the starting point of a project designed for a post-doctoral research.

2. THEORETICAL FRAMEWORK AND LITERATURE REVIEW

In 2015, before the upcoming mega-event, several cultural activities were organized in anticipation for the Olympic Games and also to celebrate *Rio de Janeiro's 450th* birthday. Between November, 2015 and March, 2016, the cariocas – the residents of Rio de Janeiro – could visit the exhibition “Rio de Janeiro as destination: travel posters from 1910-1970”⁴ (Rio de Janeiro como destino: cartazes de viagens, 1910-1970), organized by the National Historical Museum (Museu Histórico Nacional – MHN). It comprised a set of 40 posters from maritime and aerial transportation companies that are part of the collection of the Berardo Museum, Lisbon, Portugal⁵. According to the exhibition guide, the posters “make it possible to cover sixty years in the history of transatlantic traveling, through qualified publications which reflect an age of progress and modernism” (2015, p. 4).

A large number of posters show illustrations of the development of Rio de Janeiro as touristic destination, a “symbol of exoticism and curiosity for the new world”, as described in the guide, thus, a Marvelous City that, through the passage of time as illustrated in the posters, metamorphs into a “modern city with tropical tastes”, the ultimate icon of Brazil and Latin America. According to the exhibition curators, Márcio Roiter and Paulo Kauss, being the latter also the museum director, the posters display “breathtaking” natural landscapes in dialogue with avant-garde architecture and the carioca’s spontaneous hospitality, local characteristics that originated the “Marvelous City” ideal that still prevails in the global touristic imaginary. In this sense, it is possible to argue that advertising and the media were significant communicational supports through which the image of the city was created and developed globally as the place it was (and still is) perceived by tourists. Hence, according to the curators, the advertising posters from the advertising posters from maritime and aerial transportation companies “prove that the product of advertising is able to outlive its original use, transforming itself into historic document. Witnesses of history, these documents transform from fleeting artifacts of consumption to artistically and commercially valuable prints” (2015, p. 5) which have disseminated representations of the “marvelous” Rio de Janeiro in international scale.

³ Besides Beijing (China), in 2008, and Rio de Janeiro (Brazil), in 2016, The Summer Olympics also were held in Sidney (Australia), in 2000, and Athens (Greece), in 2004.

⁴ Available: <http://www.museuhistoriconacional.com.br/mh-2015-009.htm>. Accessed in 4/5/2017.

⁵ Available: <http://en.museuberardo.pt/>. Accessed in 4/5/2017.

The visit to the exhibition has elicited the basic question of the research: after ten years of major infrastructure works to host mega-events such as the Pan-American Games (2007), the World Military Games (2011), the FIFA Confederations Cup (2013), the FIFA World Cup (2014), and the Olympic Games (2016), to name only the sports events, where had been that Marvelous City, “blessed by God and naturally beautiful”, shown in the Berardo Collection’s posters?

Since 2009, when Rio de Janeiro’s bid to host the 2016 Games was approved by the IOC members, the city worldwide known as the “marvelous” one gradually became an “Olympic City”. As it happened with Rio, all the cities selected to host the Games undergo this mandatory period of intensive transformation in both its infrastructure and image in order to become, however temporarily, the mythical *Olympia* (Rubio, 2008b). The example of Rio de Janeiro is closer to the author due to her local origin. Nevertheless, it is important to stress that Beijing, the other analyzed city for this study, also experienced severe structural transformations, but not without heavy political, social, and economic costs for the population and the local government (Goldblatt, 2016; Boykoff, 2016; DaCosta, 2008; Preuss, 2004, 2007, 2008, 2013, among others).

Here, the question implies that a transformation of such magnitude – considering all the IOC’s requirements regarding infrastructure works, especially for urban mobility; the improvement of the hotel chain, ports and airports; construction of new sports facilities; removal of communities to build the Olympic Village; and the implementation of improvements in local security, telecommunication, basic sanitation, and electricity supply services (Bessa; Alvarez, 2014, p. 55) - does not occur without tension between poles of power and resistance, involving all the actors of the process, namely governments, the IOC, civil society, the media, sponsors, and real estate companies, as noted by Preuss (2008, p. 35), which support the implementation of the Olympic Games in any locality.

The following section on the methodological framework of the research addresses the network formed around the implementation of the Olympics and its actors. For now, it is important to emphasize the fact that the creation of an “Olympic City” also involves a marketing and communication plan that elevates a given locality to a distinguished status in detriment of other touristic destinations, as the imaginary of the “Marvelous City”, in the case of Rio de Janeiro, was partially constructed by the media and advertising, that is, by communication actions both in local and global scales. On this aspect, according to Bessa and Alvarez (2014, p. 60), the image of the cities, promoted by touristic marketing, is the dynamic result involving “the assimilation of information, which can be either true or not and is produced by different sources, made of the combination between historical facts and news, myths, beliefs, national characters, stereotypes, local cultural production, and touristic promotion”. As marketing, this work considers the application of the classic concept of marketing variables, or the 4Ps – Product, Price, Place, and Promotion⁶ – in the dimension of the cities, through a practice denominated by Kotler, Gertne, Haider, Rein (2005) as Marketing Places or City Marketing, in Bessa and Alvarez terms (2014).

Here the research applies the concept of Olympic Gaze to reflect on the *modus operandi* of this transformation and to what extent does this repositioning of the locality as a touristic destination is fundamentally interwoven with communication actions, without which the marketing actions would be non-effective toward the global tourism market. “The improvement of the image of a given locality is not enough to ensure its attractiveness. It takes a solid investment in infrastructure”, observe Bessa and Alvarez (2014, p. 55). The marketing variables do not work in isolation and any product only becomes known in the market – especially globally, as in this case – upon intensive communication efforts. Here, I return to the idea of image formation of the place to be perceived by tourists through advertising and the media as one of the strongest characteristics of what the sociologist John Urry calls the tourist gaze (2001), a central concept in the tourism studies literature within which this research is grounded.

According to Urry and Larsen (2011, p. 14), historically, the tourist gaze was developed around 1840 through the unique and peculiar combination between the increase in public transportation and the will to travel, and, mainly, the technical development of photography and the conditions of its mass reproduction. In this sense, the touristic gaze has already emerged in relation with new technologies and the media, particularly photography, through which images are mediatized – or “kodakized”, in Urry’s terms (2001) – hence granting visibility to the places upon their circulation. Illustrations, photos, postal cards, travel leaflets, advertisement pieces, and posters, as the ones from the Berardo Collection, all became means to disseminate and circulate the images of the places and construct, directly or not, the contemplative touristic gaze. All this advertising made places attractive enough to be visited. In this sense, the media performed a didactic role in the construction of the image of each place as tourist and travel destination. Yet, as the authors argue, “the *pure* and innocent eye is a myth” (2011, p. 2). Thus, this gaze is not only developed technically, but as something related to the then existing culture and social practices within a historical context – and by different groups with their own social characteristics, such as gender, class, race, and age – which, alongside the development of media and transportation, has become determinant in its constitution as (a form of) gaze.

Since the tourist gaze is socially systematized by the media within a historical and cultural background context, it is necessary to adopt the historical perspective, both towards the city and the Games. To understand the construction of a place as a touristic destination, authors from the field of Tourism and Mobility Studies, like the above mentioned Urry (1995, 2001) and Urry and Larsen (2011), such as MacCannell (1976), Feiffer (1985), and Knupp (2015), among others. This notion of touristic destination will be considered in relation to the transfiguration of the locality into Olympic City, drawing on the works of Jules Boykoff (2016) and David Goldblatt (2016) on the economic and political history of the Games. From a critical perspective toward the IOC position on host cities and its relationship with local governments, organizing committees, sponsors, communities, and civil society at large, both authors contextualize the way the Games changed from a “grandiose and salutary task: the reinvention of the Olympic games”, as notes Goldblatt (*idem*, p. 4) to the “quintessential example of celebration capitalism”, as described by Boykoff (*idem*, p. 156), from the first Olympics of the Modern Age to Rio 2016.

⁶ C.f.: Kotler; Armstrong (2015); Kotler; Keller (2013); Kartajaya; Setiawan; Kotler (2010); Levitt (1981); Zeithaml; Bitner; Gremler (2011); Lovelock; Wright (2003); Dias; Cassar (2005), among others.

Regarding the construction of an Olympic Gaze rooted in the lure of tourism, marketing, and mega-events, this paper resorts to Helger Preuss (1998, 2004, 2007a, 2007b, 2008), Katia Rubio (2008, 2009), and Katia Rubio and Roberto M. Mesquita (2011), who consider the use of mega-events under a more favorable light, if it is possible to say so, to change or minimally the position of a given city as touristic destination in global scale.

For the purpose of this work, mega-events are understood here as emblematic events that, once successfully funded and accomplished, “are one way that cities can *create an image* internationally and attract internal investment with the aim of promoting long-term growth”, argue Robertson and Guerrier (2003). In contrast, Bessa and Alvarez (2014, p. 19) consider the relevance of mega-events in the process of global acknowledgment of a city, but they view the situation from a critical standpoint, arguing that mega-events are the “ultimate symbol of the expansion of digital capitalism and the most celebrated strategy for transforming touristic landscapes”, whose purpose is the material transformation of a given place. For the authors, the idea is to “(re)(con)figure” the landscapes, hence ascribing a new character to the city, what is enabled through the “adoption of measures of exception and marketing strategies” (idem, p. 47). Consequently, the Olympics, the World Cup, and international exhibitions, among other major events, have been disputed as strategic opportunities to promote cities and attract both tourists and businesses, since, in general, mega-events demand the re-urbanization of the locality, as well as previous investments that, in Robertson and Guerrier terms, lead to the improvement in the local quality of life, that is, they leave legacies that are appropriated by the population. The concept of the Games’ “legacy” is crucial for this research, and alongside the notion of tourist gaze, it structures the issue of the construction of the city image through marketing actions, as in the case of the Olympic Gaze, which, in terms of local tourism, also becomes part of the legacy left by the Games, indisputably one of the most important ones, as in the example mentioned earlier.

Robert K. Barney (*apud* DaCosta, 2008, p. 125) defines “legacy” as “something received from the past that has present value and, definitely, future value”. In agreement with this notion, in its annual report of 2003, the IOC states that the sports, social, cultural, and economical legacy of the Games is the priority criterion for the selection of the Olympic host cities. “Olympic legacy is understood as the direct or indirect heritage in the form of facilities, culture, information, education, or resources generated through the Olympic Games”, as observed by Rubio and Mesquita (2011, p. 60), and: “in the IOC view, the legacy plan became the crown jewel for any bidding city because it understands that the high costs of preparation must produce social returns”.

As one of IOC major requirements for bidding cities, the question of the infrastructural legacy is a central point of the discussion proposed by this research because, during the pre-event period, it becomes a strong pole of tension between the cooperation network actors who support the implementation of the Games in any given city. The origin of this question precedes the successful bidding campaign, going back as early as the application stage. One of the materials submitted to the IOC, and used as a piece of advertising, is a video that associates the city’s existing features with the changes and the planned urbanistic, landscaping, and architectural interventions to transform the place into the next Olympia. The plans presented in the video are designed and “pitched” to the committee without the effective participation of the civil society that is directly involved in all the urban renovation works.

Due to its significance in the candidature process and as an essential marketing and communication piece that strongly contributes to the construction of what is denominated here as the Olympic gaze, the candidate’s video is the first piece to be analyzed – as it will be further described in the methodology section. For now, it is important to explain that who produces the video, and, thus, selects what will be shown and sets the agenda of the discourse, are the spheres of power involved in the process. In this sense, upon the IOC requirements, the narrative of the video is conceived according to a tourism marketing plan designed by the government, whose basic premise is the strategic cooperation of public-private partnerships, as mentioned by Bessa and Alvarez (2014).

Public-private partnerships are an attempt at fundraising to support the necessary urban renovation works to create an Olympic city. According to Bessa and Alvarez, the lack of local perspective during the negotiations between government and private initiative is one of the causes of tension among the actors – in this case, more directly, the IOC, the government, private initiative, the media, and the civil society, for “in many situations, the city eventually assumes a business character, an economic agent that follows rules dictated by the market, losing its territorial dimension of local democratic exercise” (2014, p. 63).

In fact, the history of the Olympic Games is rich in examples of how the influence of the IOC’s presence and requirements over decisions on the infrastructure of the Games and the question of the legacy eventually render the local economy and the government finances unfeasible in the decades following the Games. For instance, in 1976, Montreal hosted the most expensive Olympics so far and it took three decades to account for debts around US\$ 1.5 billion (Boykoff, 2016, p. 124). On the other hand, Montreal’s story led the next host cities, such as Los Angeles, in 1984, and especially Barcelona, in 1992, to adopt planning models that put marketing activities ahead of strategic decisions in respect to fundraising and hosting mega-events aimed at boosting the city’s prestige as a touristic destination. According to Boykoff (2016, p. 136), what is currently known as the “Barcelona Model” was the turning point in terms of the reflection on the Olympic Games as articulated with the remodeling of cities, urban planning, tourism marketing actions, and public-private partnerships that account for the economic feasibility of the mega-event without emptying the public coffers and, indirectly, the citizen’s pockets.

The Barcelona Model was used in Beijing (2008) and in Rio de Janeiro (2016), however not successfully as in Barcelona in both cases due to the social, political, and economic context each candidacy was submitted to and selected by the IOC. This context is the base of the whole investigation and it will be analyzed drawing on the *Depth Hermeneutics* (Thompson, 2000), a methodological approach that will be detailed in the third section of this paper. In order to outline a time-line, Barcelona 1992 will be the starting point of the current reflection on the legacy of the locality image as an Olympic City. In historical perspective, this research addresses the creation, development, implementation, and reception of the Olympic Gaze from the Barcelona Olympics on, specifically when the city decides to bid for the Games.

However, concerning the city and its residents, it is important to note that, from 1992 to the present date, the commercialization of the Games has reached such a high-cost level, which is not merely financial or economic, but also political and social, that a certain reluctance from big cities to bid for the Olympics hangs in the horizon. On this aspect, Christopher Gaffney (2015, 2016) forcefully questions the idea that mega-events legacies are positive ones, once they are conceived and planned in detriment of the population's expectations and what the city actually demands in terms of infrastructure, urban mobility, and housing works. As argued in the introduction of this paper, in the case of Rio de Janeiro, the facilities built or renovated to host the Games were falling apart six months after the mega-event. And it was also the case in Beijing, where, "1.5 million people were displaced from their homes to make way for the Olympics", as notes Boykoff (2016, p. 171), not to mention that the facilities built are underused and often empty, such as the Bird's Nest stadium, built in a country where there are no relevant soccer teams nor championships⁷. In line with Boykoff and Gaffney, Goldblatt (2016, p. 438) argues that "the citizens of potential host cities in North America and Europe were less sanguine about escalating costs and dubious benefits of hosting the games, and their skepticism has made an Olympic bid an increasingly hard political act to manage".

In this sense, according to the author, "it has been a decisive shift in geography of not just the Olympics, but all global mega-events and world sporting championships, towards the rising powers of the global south" (2016, p. 391). For Goldblatt, this shift towards the south, not only meaning countries below the equator, but mainly the ones identified as economically distant from the global north, was caused by four reasons: 1) after two decades of economic growth – "breakneck industrialization and booming commodities prices" – countries from the global south are able to afford mega-events; 2) the lure of new and opening sport-markets has made sponsors and governing bodies keen to send their brands and events there; 3) the idea that the games could serve as a marker of national economic development and global connectedness gained considerable ground in global south countries; and last but not least, 4) the fact that global south countries "found it much easier to work the established networks of corruption in the allocation of hosting rights by many sporting federations, while facing little or no criticism at home".

This shift towards the south is the reason why Beijing 2008 and Rio 2016 were selected as the objects of the current research. Drawing from Goldblatt, the social-historic, economic, and political sceneries – including corruption contexts – are a fundamental part of this study and will guide the analysis of the imagetic and touristic construction of the Olympic cities, as proposed by the concept of the Olympic Gaze.

3. METHODOLOGICAL FRAMEWORK

As mentioned in the introduction of this paper, the methodological reference used in the research project is the *Depth Hermeneutics* (DH) as developed by J.B. Thompson in his book "*Ideology and Modern Culture: Critical Social Theory in the Era of Mass Communication*" (2000). According to the author, "This framework highlights the fact that the object of analysis is a *meaningful symbolic construction* which calls for interpretation. Hence we must give a central role to the process of interpretation, for only in this way can we *do justice to the distinctive character* of the object domain".

I have already applied depth hermeneutics in previous studies during the doctoral research process and it proved to be especially interesting when the object of analysis are symbolic forms such as advertising, public relations, and journalistic pieces, which are the objects of the current investigation. As described by Thompson (2000), symbolic forms should be understood as "meaningful *actions, objects* and expressions of various kinds - in relation to the historically specific and socially structured contexts and processes within which, and by means of which, they are produced, transmitted and received". Consequently, in order to be interpreted, they must be analyzed under the light of their social-historical contexts since they relate, in their discourse, to the culture and the society of their time.

In this sense, Depth Hermeneutics presupposes that the interpretation of a symbolic form requires a "dive" into the historical context so the researcher, in the words of the author, can search more accurately for the meaning of cultural products within the "logic" of their own time. On this aspect, Thompson notes that it was Gadamer (2006) who has drawn attention to the fact that the idea of understanding is based in a "fusion of historical horizons" that helps the researcher to reflect on the ways the social-historical world is created by individuals who speak and act, and whose discourses and actions can be understood and interpreted by others.

It is important to explain that Thompson considers DH as an especially important method for the development of a critical theory of modern societies. To accomplish this task, the author integrates the concept of ideology with a theoretical framework focused not only in the nature of symbolic forms, but also in the characteristics of the social contexts where these forms circulate and are received. In this sense, Thompson considers that the organization and reproduction of power and domination are amplified by the "mediation" of modern culture, and, so, for this reason, symbolic forms should be studied within a specific social-historical context. Therefore, DH is "the *critical analysis of ideology [that]* can be pursued concretely, as part of an interpretative approach to the study of contextualized symbolic forms" (Thompson, 2000, p. 426).

The question of ideology is very important for several reasons, but in the case of the study on the hosting of the Games, it proves to be even more present because the bidding, the selection, and the implementation processes of the Games as experienced by a given city are thoroughly pervaded by acts of power and resistance which either places all the actors involved side by side or against each other. "To say the Olympics transcend politics is to *conjure fantasy*", states Boykoff (2016, p. 2).

This research will consider the following actors as participants in the network of cooperation, but also power and resistance:

⁷ Available: <https://www.theguardian.com/sport/blog/2015/aug/22/birds-nest-empty-monument-china-magnificence>. Accessed in: 4/15/2017.

- Federal and municipal governments in particular, with their ministries and offices responsible for the bidding and the accomplishment of the Games with all the infrastructure works and the remodeling of the city. Such works constitute the urban-marketing planning for the Games and are the base for what I call the local Olympic Gaze. Such planning is tailored to meet the IOC requirements in respect to Olympic facilities and equipments, as well as urban infrastructures for mobility and hotels accommodation.
- The International Olympic Committee (IOC) itself is the most important actor involved in the network. Since its foundation in 1894, under the coordination of Pierre de Coubertin, the IOC's principle is to view the host city of the Games as the mythical *Olympia* which, even temporarily, "will be ruled under the aegis of Olympism" (Rubio, 2008, p. 152). This apolitical positioning, in the narrow perspective of the committee, actually presents itself as a powerful tool of intervention in the organic life of the host city and, according to Bessa and Alvarez (2014), only tends to increase the existing inequalities and exclusion.
- In this case, civil society plays an important part during the process. Represented by several non-governmental organizations and associations, civil society defends the population's right to the city transformed into an "Olympic" one. Preuss (2008) argues that the local population is one of the "winning" groups of interest due to the fact that it dwells in the city selected to host the Games, considering the investments in its transformation due to the Olympics. In contrast, Gaffney (2016, p. 35) asks who is actually benefited by this transformation, hence paving the way for further discussion on the rights to the city and the legacy of the Games.
- On this matter, having closely covered the whole process, the print, electronic, and digital media, both nationally and internationally, also became an important actor, due to its role as public opinion maker. In this way, depending on the press coverage, whose discourse can assume tones of compliance or denunciation in relation to governmental and/or IOC practices, the local population obtains information, however mediated, on the bidding process. In this sense, the press plays a fundamental role in the construction of the Olympic Gaze and, for this reason, during the years between the bidding process and the Olympics itself, it is the constant target of the government and the IOC Public Relations and publicity activities. Still, according to Preuss (2008, p. 19), the media – especially television – is also part of the group of interest considered by the author as the "winner". Preuss includes television networks as winners in reference to the advertising revenue from broadcasting the Games, a profitable enterprise not only for the IOC at first, but also for the local TV networks.
- On this aspect, the next actors involved in the process are the Olympic Games local sponsors⁸ and suppliers. Generally, the IOC relies on global sponsors, such as *Coca-Cola*, *Visa*, *McDonald's*, and *Samsung*, among others, but the local organizing committee seeks potential commercial partners among local brands in order to accomplish specific communication and marketing actions in the city. This is a relevant part of the construction of the Olympic Gaze, one that directly impacts the local population, as well as introduces the image of the city for a global audience.

Besides the actors above mentioned, there is yet another member of the cooperation network comprising the institutions involved in the organization of the Games:

- Real Estate agencies and contractors. Historically, at least since the Los Angeles Olympics of 1932, which, according to Goldblatt (2016, p. 157), has innovated by creating the first Olympic Village, and, more recently, the Barcelona Olympics of 1992, in a more organized and market oriented fashion, real state agencies and contractors have introduced themselves as an active segment and a strong "business partner" of municipalities over the entire process of transformation of cities into Olympic cities. As observed by Bessa and Alvarez (2014, p. 63), behind the removal of dwellers from certain neighborhoods and communities in order to build infrastructure for the Games, what the authors call "social cleansing" or "social sanitation", lies the strong presence of the public-private partnership between the municipal government and the real estate market, that, in principle, eventually benefits from the valorization of the evicted area.

Considering the six main actors of this network, I return to the question of Depth Hermeneutics as methodology. According to Thompson, DH is divided into three different stages, which can be developed simultaneously, without hindering the analysis of the results, but as "thematically distinct dimensions of a *complex interpretative process*" (Thompson, 2000, p. 365).

Firstly, there is the social-historical analysis stage, in which the spatial-temporal conditions, the social structure, and the technical means through which the relationship between the actors participating in the network is constructed. The context studied in this stage grounds the outline of a historical perspective that will support the formal analysis of the advertising, public relations, and journalism pieces which are the object of the current investigation. The authors and concepts discussed at this stage have been mentioned earlier in the literature review section, but it is interesting to note that the whole theoretical repertoire reviewed during this first stage of research aimed at deepening the understanding of the historical circumstances within which the symbolic forms were created, disseminated, and receipted.

Following the study of the social-historical circumstances, the *formal analysis* of the symbolical forms is performed. Aiming at understanding and explaining the mechanisms of the construction of meaning both *within* and *of* the text, the research focuses on the "reading" of the selected pieces as objects of study upon which the analysis of discourse will be conducted from the viewpoint of discursive semiotics.

Stemming from the French semiotics of A. J. Greimas, according to Gomes and Mancini (n.d.), discursive semiotics "can improve an in-depth reflection on media texts, notably journalistic and advertising texts", due to its comprehensive

⁸ The sponsors of The Olympics are Coca-Cola, Visa, McDonald's, Samsung, Omega, Dow, P&G, GE, Panasonic, Athos e Bridgestone. Available: <http://exame.abril.com.br/marketing/rio-2016-nao-patrocinadores-proibidos-de-usar-17-palavras/>. Accessed in: 3/27/2017.

notion of “text” itself, including not only verbal texts (literature, newspaper and magazine articles), but also visual (paintings, sculptures, photos) and musical ones (songs and advertising jingles). “There are also those which are constructed through a mix of these different textual types, as in the case of cinema, music clips, and advertising texts, for instance [...] and this enables us to propose an analysis of advertising and media texts in their totality”, argue the authors (n.d., p. 1).

Such a definition of text is in line with Fontanille, for whom discourse analysis is an instance in which “production, that is, enunciation, cannot be dissociated from its product, the enunciate” (2008, p. 86). For this reason, according to the author, it is interesting to focus on the moment of production of symbolic or meaningful forms, since this could be the only manner through which discourse organizes the experiences and their representations to become more easily understood and shared by the public. However, for Fontanille, “this perspective has its implications, for discourse inscribes itself both in its natural unfolding in time and the time of the productions of which it is a provisional sample” (2008, p. 86 *apud* Nogueira, 2015).

And it is exactly in the combination between the time of production, the time of reception, and the time of the analysis, in this fusion of historical horizons, in Gadamer’s terms (1999), between the researcher’s moment and the time when the communication piece was created and receipted that the interpretation and understanding of the discourse takes place, hence referring to the third stage of Depth Hermeneutics: *interpretation* and *reinterpretation*. At this stage, the objective is to answer the questions guiding this investigation: how the Olympic Gaze is created? Under which social, political, and economic conditions? What are the gains and losses for the city and the local population? What dynamics of power, tension, and resistance between the actors of the cooperation network that supports the hosting of the Olympics are marked by advertising and media discourses? The communication pieces selected as the object of research are representative of the three stages of any event – before, during, and after – as in the case of the Olympic Games, namely as follows:

1º.) the pre-Games period of the bidding, when the local government provides the IOC with audiovisual material⁹ on the place and its potential as host city. As mentioned earlier, this promotional video about the city is the first advertising piece in the construction of the Olympic Gaze. The piece is part of a governmental strategy of “entrepreneurial” city management, as noted by Harvey (1996, *apud* Bessa, Alvarez, 2014, p. 20), whose narrative stands between what the city is – iconic architecture, nature, spaces for the construction and growth of the locality, and the people’s hospitality, among other aspects more related to the culture of the country – and the potential of the city to become an Olympic City: clean, sustainable, safe, mobile, technological, fun, happy and ready to welcome the IOC, the Olympic family and tourists from the whole world.

2º.) the opening of the Games, whose communication and marketing piece to be considered is the Opening Ceremony itself. According to Goldblatt (2016, p. 337), in Barcelona the opening ceremony turned from “something close to a school sports day” into “an avant-garde dance, post-modern circus, visual arts and experimental show”. Held at night for the first time, the spectacle was intended for broadcasting purposes and told the histories of Barcelona, Catalonia, and Spain for the entire world, thus inaugurating the idea of using this moment as a fundamental part of the Olympic Gaze, globally disseminating the image of the city through the Olympic Games. The same happened in Beijing 2008¹¹ and Rio 2016¹², where the opening ceremonies showed, within the social-historical, economical, and political context of that time, the new market and touristic positioning of each country and each city in global scale.

3º.) the post-Games period, during which an evaluation of the media coverage is performed and whose limit is the next event of great tourism appeal to attract visitors to the city and/or country. In the case of Beijing, the Chinese New Year, that, in 2009, was celebrated on January, 26th, five months after the Games, will be used as the touristic post-Games mark; and, in the case of Rio de Janeiro, Carnival, that in 2017 was celebrated on February 25th-28th, six months after the Games, always considering the social-historical moment within which the three communication pieces and their formats (video, event, and media) were circulated and/or published.

By considering these three pieces and the moment when they were created, distributed, and receipted, it will be possible to understand the construction of the Olympic Gaze and its implications for the host city in touristic terms.

4. FINAL CONSIDERATIONS

Based on the analyzed material so far, the question of the Olympic legacy is of ultimate relevance to all the spheres (governmental, private initiative, and civil society) and actors involved in the cooperation network – local government, IOC, civil society, the media, sponsors, and real estate market partners, among others – that supports the organization of the Olympic Games in a given locality.

The way the city is planned to become an Olympic city, the *modus operandi* of this architectural, financial, and entrepreneurial transformation, as well as the one commanding these actions, are the aspects shown to be fundamental in power and resistance relations which characterize the object itself. Therefore, these are crucial points concerning the question the research intends to answer: under the perspective of the host city, to what extent is the image legacy, the earlier mentioned Olympic Gaze, determinant toward the social-political and economic improvement of the host city in global scale?

The economic objective of converting the locality into Olympic City, that is partly “concealed” in the discursive narrative of both the government and the IOC, who emit a large part of the communication actions of the process, eventually

becomes the most important one and its purpose is to legitimize and reinforce the image of the city as touristic destination and marketplace, despite activism and resistance against the Olympic Games.

In this sense, one among other likely hypothesis is to estimate to what extent does the Olympic Gaze becomes the protagonist of the actions proposed by the cooperation network, instead of the infrastructural legacy, for instance. As mentioned, historically, the mobility, sustainability, safety, sanitation, urban planning, and other legacies are not usually enjoyed by the local population after the Games because, according to the authors, they were not planned for this purpose. Rather, planning does not take the pressing needs of the population into account, but the conditions required by the IOC for the Olympics. Consequently, the Olympic image takes the lead in decision making processes which relegate the most pressing needs of the city not only as an expression of a place to live, but of a territory of sociability, to the background.

However, as notes Preuss (2008), each individual case is distinct, since their social-historical contexts are different, and so deserve to be studied within their own political, economic, and cultural conditions. The creation and circulation of an Olympic Gaze do not occur without questionings and resistance that, by themselves, also end up as part of this imagetic whole of the place. By analyzing the implementation process of the image legacy through the three actions, formats, and suggested media, the objective of the research is to understand, in historical perspective, the construction of the Olympic Gaze in the cities of Beijing and Rio de Janeiro, in order to deepen the understanding on the conception of future *Olympias*.

SERVICE CULTURE AS A KEY DETERMINANT IN SERVICES MARKETING

João Freixo Pereira

CIEO - Research Centre for Spatial and Organizational Dynamics, University of Algarve;

Universidade Aberta

(pereirajp.consulting@gmail.com)

ABSTRACT

As both a single and augmented product offering, services have become, in recent times, a predominant activity in today's modern economies. Due to the intangible nature found in most services, the physical features upon which differentiation can be perceived, and customer behaviour influenced, tend to be rare or non-existent. Service differentiation is in its essence very attitudinal and "people" related. It relies to a great extent on the type of relationship that is established, and the way the provider interacts with the customer during the service-delivery process.

Culture is often found to be responsible for shaping people's attitudes and beliefs. It is integrative in nature, in the sense of bringing people together towards a common purpose. Based on exploratory research involving a literature search, the aim of this work was twofold: (a) to put into perspective the importance and determining role of culture in a service marketing context; (b) to encourage the acceptance and development of a service culture among service organizations.

Of particular relevance drawn from the findings of the research, is the idea that the development of a strong service culture is critical to the marketing of services and the success of organizations operating in this sector.

Keywords: Service Culture, Services, Services Marketing.

JEL Classification: M31

1. INTRODUCTION

Services are at the root of the tertiarization of the economy and are becoming increasingly less peripheral in relation to goods (Gummeson, 1994). As both single and augmented product offering, they are at the core of a growing industry in which the paradigm of market supply has shifted from goods to intangible products.

In spite of the continuous technology infusion in the service development and delivery process, services are still a "people-intensive" industry, which is both attitudinal and relational. Since most services depend on personal contact and interaction, it is the nature of these interactions that strongly influence the customer's perception of service quality (Hartline and Ferrel, 1996).

Our assertion of culture based on a systematic review of the literature is that it reflects the development of jointly constructed understanding of experienced communal adversities or problems, together with values, principles and behavior that lead to adaptive response and group integration. This adaptive and integrative nature of culture seems to be present in all its various forms, and is of vital importance for building social construction and collective identity. In this sense, culture is a means by which an individual is accepted as a natural member, or part of, a specific group, and a common way of perceiving and tackling a communally experienced problem or adversity.

Organisational culture is one of the many forms of cultural manifestation, expressed in the thoughts, intentions, actions and interpretations of the members of an organisation (Hallet, 2003). Surfacing from the need to commit the members of an organization, culture should be developed within this context to support continuous improvement and the way employees perform their tasks, allowing them in return to become more conscious of the importance of issues such as quality (Ojo, 2009). An issue that is clearly of high relevance in the service industry.

The relation between culture and organisational performance is evidenced in the literature. Peters and Waterman (1987) argue that companies that reach a level of excellence tend to present strong cultures. In fact, several studies have corroborated the influence of culture on behaviors and attitudes of individuals within the organisation (Hofstede, 1980; Ralston *et al.*, 2008). Therefore, it is imperative for management to acknowledge the importance of culture within an organisational context, and to communicate it across the organisation so that its members may assimilate it and, consequently, identify themselves with the concomitant underlying values, norms and artefacts.

Far from being merely the product of joint learning and group experience, organisational culture is equally understood by some theorists as what the organisation is (Smircich, 1983). This comprehension of culture within an organisational context, implies, simultaneously, that an organisation, besides having a specific culture, is itself one.

Culture is known to be of fundamental importance in service marketing, and is often found to be responsible for shaping people's attitudes and beliefs towards a common purpose. Service marketing is customer and service oriented, relying on an attitude and behaviour based on a specific culture that places the client in the centre of the organization.

Drawing on the main findings in the literature, this paper seeks to showcase the importance and determining role of culture in a service marketing context. It puts into perspective how culture can shape and direct behaviour, and serve as

a guide for meeting customer expectation during service delivery. While highlighting the determining role of culture, the paper also intends to encourage the acceptance and development of a true service culture among service organizations.

2. DEFINITIONS

2.1 Service

Services are not physical objects, yet in many circumstances they depend on these objects for their performance. The physical infrastructure and technical equipment that an Internet provider places at our disposal is not a service, but the right to use this infrastructure and equipment to access the Internet to our benefit in exchange for a certain fee is a service. Described as a complex phenomenon (Grönroos, 2007), the term service has been subject to much debate in the literature in search of a common definition and understanding. Judd (1964) is said to have paved the road for the contemporary approach to the definition and delineation of services. He introduced into the debate of service definition “illustrative definitions”, “definitions by listing” and himself recommended the return to definition “by exclusion (from products).

Services have been defined differently according to different authors. Most definitions have conceptually gravitated around two ideas that have been central to the definition of services. One of these ideas is that services have no physical form, and as such tend to be perceived as acts, deeds, performance or processes. The other is that services are subject to a type of market transaction in which the main objective is other than the transfer of ownership of a physical good.

Rathmell refers to services as a “deed, a performance, an effort” (1966: 88). According to Blois (1974) a service is an activity offered for sale that yields benefit and satisfaction without leading to physical exchange in the form of goods. Claude and Horne (1992) consider services to be intangible and abstract, unlike goods that are by nature tangible and concrete. Zeithaml *et al.* (1985) claim that intangibility is the fundamental difference attributed to services that is universally cited by scholars. These authors have identified four distinct characteristics in a service: intangibility, heterogeneity, inseparability, and perishability. These characteristics have also helped to support the argument that services are different in nature from goods. Recognizing that any definition is inherently restrictive, Payne (1993) defines a service as an activity which has some element of intangibility associated with it, which involves some interaction with customers or with property in their possession, and does not result in a transfer of ownership. By introducing the idea that services are activities that involve interaction and non-transferable ownership of the acquired good, the author extends the concept and understanding of services. This perspective of services also seems to be consistent with the widespread view that a service is consumed and not owned.

Kotler (1997; Kotler *et al.*, 2016) reinforces the ownership argument by referring to a service as any activity or benefit offered that is essentially intangible in nature and does not result in the ownership of anything. Intangibility and ownership as a key characteristic of services raises a fundamental issue in services marketing. This issue which poses equally a marketing challenge is how to differentiate and perpetuate the sales of something that is physically unavailable?

Lovelock contends that “it is not always obvious what the service is and what it does for the customer because services are ephemeral” (1983: 12). According to Lovelock (1983), by identifying the target of the service and then examining how it is modified or changed by receipt of the service act, one can then develop a better understanding of the nature of the service product and the benefits that it offers. Grönroos refers to a service as a complicated phenomenon and defines it “as a process consisting of a series of more or less intangible activities that normally, but not necessarily always, take place in interactions between the customer and service employees and/or, physical resources or goods and/or systems of the service provider, which are provided as solutions to customer problems” (2007: 52). The implication of the author’s definition to the understanding of services is twofold. First, by referring to services as activities that are more or less intangible it seems to reduce the importance of intangibility as a key defining characteristic of services. In fact, Grönroos (2007) mentions three basic, and more or less generic, characteristics of services: (i) processes consisting of activities or a series of activities, (ii) the fact that they can be produced and consumed simultaneously, (iii) the customer participates as a co-producer in the service production process, at least to some extent. Second, the definition introduces the idea that a service is not an object of transaction, but rather a process aimed at providing solutions.

The idea that services involve interaction between provider and client in the form of solutions for specific problems, is of importance to the understanding of services. The fact that provider-customer interactions in a service context are very much attitudinal and behavioural, may serve as an explanation and supporting argument for the importance of culture, particularly since it is known to influence the attitudes and behaviours of individuals to perform in a certain manner.

The dichotomy tangible vs intangible seems to be inadequate for defining services (Grove *et al.*, 2003; Fisk *et al.*, 2008). This characteristic-based definition of services has also been refuted by authors like Wright (1995), Lovelock, Gummesson (2004) and Vargo and Lusch (2004a), who do not view these general characteristics (i.e. intangibility, perishability, heterogeneity) as being sufficient to differentiate services from goods. According to Moeller (2010), the limitation of the characteristic based definition can be explained by the change in focus of service marketing and the enormous advances in the development of information and communication technologies.

Supposedly, these defining characteristics would have been more consensual in a service marketing context in which the focus was predominantly on the “people” factor rather than technology. Apparently, as a result of a strong increase of technology in services, the theoretical construction around the characteristics of services has proven to be insufficient, and eventually has succumbed in favour of other ideas (Beaven and Scotti, 1990; Grove *et al.*, 2003). In spite of the controversy around the adequateness of these four service defining characteristics, Moeller advocates that it is not the “characteristics that are unsuitable, but their point of reference: services as a single entity” (2010: 360), and as a result proposes two alternative solutions: (i) find and establish new characteristic(s) and abandon the four established ones; (ii) take a more trenchant look at these characteristics so that a framework is developed to identify situations in which they are applicable.

Presenting a different conceptual point of view and approach to the study and understanding of services, Edvardsson, Gustafsson and Roos (2005) argue that describing and understanding service always relates to a perspective. According to these authors the “service definitions are all at an abstract level and may be operationalized and interpreted in a number of different ways”. Therefore, these various definitions have different meanings depending on whether they are viewed as an objective way of portraying services or as a way of constructing them in terms of value-creation. These different perspectives lead to distinct approaches in the understanding of services. While in the first approach services are perceived as activities object of exchange, in the latter service is used as a perspective on value creation. Rather than viewing services as market offerings, the solution, according to Edvardsson *et al.* (2005), is to focus on defining value-creation through service, and to emphasize value-in-use as defined and experienced by customers. This approach is consistent with the author’s interpretation of definitions as attempts to construct a way of describing services with a clear focus on what the service does for the customer instead of what it is in terms of its core characteristics or product categories.

Vargo and Lusch (2004b) state that differentiating services from goods should be abandoned and instead replaced with a strategy of understanding how these two are related. These authors view service as the common denominator in exchange and not some special form of exchange.

2.2 Culture

Culture is often found to be responsible for shaping people’s attitudes and beliefs. It is integrative in nature in the sense of bringing people together towards a common purpose. Defining culture seems to be a difficult task as it relates to a multidimensional phenomenon, encompassing multiple constituents (Chiu and Hong, 2006) - material culture, subjective culture and social culture – and definitions. However, the literature is rich in definitions and theoretical approaches for the study and comprehension of culture in its various forms and dimensions. Hence, an attempt to provide herein a thorough and systematic review of the various definitions and theoretical frameworks of culture, would prove to be an arduous and time consuming effort. Instead, a brief review is presented of some of the many definitions available in the literature.

Hofstede’s points out that culture is not a characteristic of individuals and defines the concept as the “collective programming of the mind that distinguishes the members of one group or category of people from others” (1980: 43). Sharing a similar view of culture as a collective phenomenon, rather than a characteristic of an individual, Schein (1984) refers to it as a product of joint learning. In Kroeber and Kluckhohn’s work (1952) we find the idea of culture as an abstract description of trends toward uniformity in the words, acts, and artifacts of human groups. The authors identified 164 definitions of culture which they organized into various categories (i) Descriptive: broad definitions based on content; (ii) Historical: emphasis on social heritage or tradition; (iii) Normative: emphasis on rule or way, value and behaviour; Psychological: emphasis on adjustment - culture as a problem solving device - learning and habit; (iv) Structural: emphasis on the patterning or organization of culture; (v) Genetic: emphasis on culture as a product or artefact and ideas; (vi) Incomplete definitions.

Malinowski refers to culture as the “widest context of human behaviour, the integral whole consisting of implements and consumers’ goods, of constitutional charters for the various social groupings, of human ideas and crafts, beliefs and customs” (1960:5, 36). The idea of culture as human behaviour is also mentioned by Horton and Hunt who refer to this phenomenon as “everything that is socially learned and shared by the members of a society;... a system of behaviour shared by members of a society” (1984: 545)

Barnlund (1989) perceives culture as a means by which each new generation acquires the capacity to bridge the distance that separates one life from another. Culture is also viewed as the beliefs and values shared by a given society at a given time (Ralston *et al.*, 1993). Another way of viewing culture is as a social mechanism that is capable of shaping and guiding people’s thoughts and values and exerting control over their behaviour (Pizam *et al.*, 1997).

Despite the multiplicity of definitions of culture, it seems that certain aspects tend to stem as common in all these various interpretations. First, culture is understood as a social construction and a collective phenomenon. It is shared with individuals of a specific group, living within the same social environment where it was acquired, learnt and passed to the next generation or new members. Second, culture has an influence on how people live their lives and view the world and the group with whom they share their existence as human and social beings. Third, culture is integrative in nature and instrumental to the cohesion of the group, by conferring the feeling of belonging and guiding social and group behaviour. Our view of culture is that it provides meaning to social existence and is a form of self and group orientation.

2.3 Organisational culture

Organisational culture is found to be closely related to shared values and beliefs that are capable of influencing behaviour in certain activities. Schein (1984) defines organisational culture as a pattern of shared basic assumptions that the group learned as it solved its problems of external adaptation and internal integration that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems. Gagliardi (1986) defines organisational culture as a coherent system of assumptions and basic values. Gibson and Hodgetts (1986) refer to organisational culture as the norms, attitudes, values, beliefs, and philosophies of an enterprise. A similar line of thought is found in Barney (1986), who conceptualises organisational culture as a complex set of values, beliefs, assumptions, and symbols that define the way in which a firm conducts its business. As defined by the author culture is something that confers orientation and determines how the organisation is to interact. Bilhim (2001) views culture in an organisational context as a system of shared ideas and meanings, by which the company assumes expressive forms and manifestations of human consciousness.

Organizational culture is also known to have an integrative and unifying effect, an idea that is reflected in Dowling (1993: 103) and who refers to it as the “glue which holds many organisations together”.

A more broader perspective of organisational culture is found in Hatch and Shultz (1997), involving all organisational members and which is originated and developed at all hierarchical levels, and founded on a broad-based history that is realised in the material aspects (or artefacts) of the organization (e.g. its name, products, buildings, logos and other symbols, including its top managers). To these authors the concept of culture within an organisational context includes material aspects central to the marketing-based concept of corporate identity. According to this perspective, culture plays a role in organisational identity formation and in the influence of organisational image. This seems to be an important aspect from both a service culture and marketing viewpoint. One may assume that a strong organisational identity and image rooted in a strong service culture shared by everyone in the organization is of extreme importance for the successful marketing of a service. Practice as well as sharing common beliefs and values towards superior service delivery and customer satisfaction, will surely grant the organization a strong image in the marketplace.

Another interesting view of particular importance to the study of culture in an organisational context is provided by Smircich (1983), who tends to see it not only as a product of one group's learning and shared experience, something it holds, but what the organisation is itself, a culture. This idea of an organisation having and being simultaneously a culture is equally of importance to the marketing of services. Our understanding is that a service organisation should combine these two elements. Having a service culture implies holding a set of core values and beliefs that guides and helps the organisation to be service driven in the process of service production and delivery. Whereas being a service culture is a form of identity that confers meaning and common understanding of what is to serve. From our perspective both views are complementary, yet perhaps while having a culture is more action driven, being one is more image driven and aspirational.

3. THE RELATION BETWEEN CULTURE AND ORGANIZATION

According to Martins and Terblanche, (2003), organisational culture forms an integral part of the general functioning of an organisation. The relation between culture and organizational structure and performance has been recurrently studied.

Closely tied to values and beliefs that people share on how to behave in certain activities, organisational culture can be a problem that businesses may need to deal with whenever these shared values are not aligned with what they need to increase their effectiveness, or may even limit the organization's ability to adapt to the changes in the environment (Simpson *et al.*, 2001). According to Peters and Waterman (1982), firms that reach levels of excellence are marked by strong cultures, and are referred to as examples of excellent management. Successful companies have probably built their success on their managerial values and beliefs embodied in their organisational cultures.

This form of culture should be developed to support continuous improvement and the way employees perform their work, allowing them to become more aware of the quality issue (Ojo, 2009). Kotter (2012) recognises the potential in organisational culture to enhance organizational performance.

A relation has also been established between organisational culture and competitive advantage. In fact, a firm's culture can provide sustained competitive advantage, and by implication become a source of sustained superior financial performance (Barney, 1986; Zheng, 2010). However, for a firm's culture to become a source of sustained competitive advantage it must meet the following three conditions (Barney, 1986, 1991): it must be valuable, rare and imperfectly imitable. Culture is also known to have significant impact on a firm's long-term economic performance (Kotter and Heskett, 1992).

Organisational culture and marketing performance seem to be related too. Deshpande and Webster (1989) point out that the success of any international marketing strategy depends not only on the extent of its conformity to customer cultural norms but also on the conformity with the values and beliefs of employees in various host countries. Of relevance to marketing, and particularly to services marketing, is the idea that customer orientation is part of an overall, but much more fundamental, corporate culture (Deshpande *et al.*, 1993).

In their study involving 388 companies, Sin and Tse (2000) found a positive relation between culture and marketing effectiveness. In their study there is evidence showing that organizational cultural values affect both directly and indirectly the performance of the company through its impact on marketing effectiveness.

According to Sorenson (2002), strong organisational cultures have a high level of commitment to the way in which they understand the marketplace and the world. The author also advocates that the key consequences of a strong corporate culture is that it increases behavioural consistency across individuals in a firm (Sorenson, 2002). This perception seems to be relevant in the case of services marketing. Clearly, service quality depends at large on the consistent behaviour of the service provider. The more heterogeneous the service is in relation to the firm's established standards and patterns of service production and delivery, perhaps greater will then be the variability of the level of service quality that is delivered.

Furthermore, organisational culture also seems to be related to creativity and innovation within the organisation. It affects the extent to which creative solutions are encouraged, supported and implemented (Martins and Terblanche, 2003). Lock and Kirkpatrick (1995) mention that a culture that supports creativity encourages innovative ways of representing problems and finding solutions, and favours innovators as models to be emulated. Service providers need to be not only effective and diligent in delivering high quality services, but equally innovative in the solutions they provide and in the way they approach their clients.

4. SERVICE CULTURE, CONCEPTUALIZATION AND ROLE IN SERVICES MARKETING

Technology has always been the key driver for the development of markets and the economy in general. With the increasing infusion of technology in economic activity, traditional market structures and paradigms have become obsolete in light of the changes that technology has introduced in consumers' lifestyles and economic behaviour. The demand and supply side of markets have become more connected and interactive, and as a result the human and relational factors have become preponderant in all market activities engaged between the two sides. The transaction is no longer per se the sole purpose of businesses and marketing activity, but rather the perpetuation of businesses through the development of strong relationships that bind the customer to the business. This is clearly evidenced in both the marketing of goods and services. Presently, customers expect better, faster, less costly and more customised services. These new customer expectations tell us what it means to sell a service today, and the role and importance between the "people factor", relationship building and culture in a service marketing context. In light of these new customer expectations and their role in the marketing of services, it is important to refer to Schneider and Bowen (1995) who argue that in order for an organisation to provide a quality service that is above the expectations of the clients, it must be able to comply with five key principles:

- The client is an integral part of the company, he should never be separated from the set of thoughts about what the business and how it is to be managed;
- Individuals should be selected, trained and rewarded in accordance to the quality of the service provided, bearing in mind that it is the customer that determines the quality according to their expectations;
- All employees should be given special attention regardless of being directly involved or not in the contact with the customer. This implies that poor service quality is something that in the client's mind is attributable to the organization and not just to the individual who renders it;
- The organization as a whole should follow the same customer orientation;
- The four previous recommendations must be properly coordinated in order to promote a genuine service culture.

This last principle leads to the key issue that is central to the purpose of this paper and the debate within it, service culture as a key determinant in services marketing. There is a general consensus in the marketing literature towards the idea that a strong service culture can contribute to the success of a company due to its association to factors such as increased productivity, higher employee retention rates and higher employee morale. Thus, a fundamental question is what is meant by service culture and how should it be conceptualised? According to Grönroos (1990) service culture is "a culture where an appreciation for good service exists, and where giving good service to internal as well as ultimate, external customers is considered by everyone a natural way of life and one of the most important values. According to the same author a service culture implies that the organization's employees are strongly service-focused. This leads to the conclusion that a service culture is intrinsically related to service-orientation, meaning that service-oriented companies tend to have a service culture. So service orientation as a service culture characteristic can be best described as shared values and attitudes that influence people in an organization so that interactions between them internally and with customers are perceived favourably (Grönroos, 2007). Consequently, an important ascertainment deriving from this key characteristic is that it can improve service quality as perceived by customers, and by doing so will also affect profitability positively (Figure 1).

Figure 1: Effects of a service orientation as perceived by Grönroos (2007)

(Source: Grönroos 2007)

The assertion that service orientation, and ultimately service culture, can lead to profitability, seems to be consistent with the idea found in the literature that culture has economic value for a firm.

The nature and characteristics of services demand a service oriented approach in their production and delivery. This is due to the fact that, unlike a normal good, the production of a service cannot be subject to the same level of standardization as in the production of the latter. Instead, the production process relies essentially on the provider-customer interaction during the service encounter, which in return is more attitudinally and behaviourally driven by a pre-existing set of values and beliefs. Besides, service encounters tend to be contextual, varying according to the situation that both parties are experiencing at the moment. Thus, a service-oriented culture will allow the employee to respond positively to unexpected situations by providing orientation towards customer expectations and the ability to adapt to the situation at hand.

The understanding of service culture as asserted by Grönroos (1990) has been discussed and accepted by scholars (Zeithaml and Bitner, 2000) as a result of the implications of this definition on the behaviour of the members of an organisation. First, it highlights the fact that a good service should not only be valued by the company but equally implicit and rooted in the behaviour of its members. Second, the complementary view that the concept should be extended to both the internal and external boundaries of the organization is of fundamental importance. For obvious reasons service culture implies providing a service of excellence to both internal and external customers. Treating the employee as a customer is a reflection of a true service culture that is consistent with the concept of internal marketing too. Therefore, the idea that employees are also internal customers (Cannon, 2002), with their own problems, wants and needs (Varoglu and Esser, 2006) is of significant relevance to the construct of service culture. Besides, by satisfying the internal needs of its employees the organization will be in a better position to meet the needs of external customers (Seibert and Lingle, 2007). Finally, the last implication is the possibility of the perception of a good service as a natural way of life for the organization, as a key attribute of its service culture, to be incorporated as a guiding principle or fundamental goal. Of equal relevance is the idea that a strong and dynamic service culture is important for market and business success (Edvardsson and Enquist, 2010). The relation between service culture, service orientation and service quality showcases the importance of this construct towards service marketing performance. As some studies have demonstrated, service orientation, coupled with the ability to provide quality services, can affect customer satisfaction and purchase intent (Bitner, 1990; Cronin and Taylor, 1992), thus service culture is of fundamental importance in service marketing management.

The importance of service culture to the marketing of services suggests that organizations should develop metrics and models for identifying and assessing this phenomenon. In fact, measuring marketing-related phenomenon and the development of measurement instruments, in response to particular questions, appears to be a documented practice in the marketing literature (Stewart, 1993). The reason for applying metrics and models for assessing culture in this particular context is based on the assumption that such practice confers the possibility for organizations to understand the intensity of their service culture and how it is perceived both internally and externally. Furthermore, this author also corroborates Schneider and Bowden's (1995) perspective regarding the need to identify the factors that can affect the development of a strong service culture. Finally, as referred by Guiso *et al.* (2013), promoting top customer service as a value facilitates its establishment as a norm inside the firm. Therefore, one may infer that an organisational culture that encompasses within its core values customer service orientation and excellence as a standard norm of conduct, will most probably be of significant relevance to service marketing performance and outcome.

5. FINAL CONSIDERATIONS

The fact that services have become a predominant economic activity at both a national and global level, should inevitably lead to the discussion on whether most organization truly share a form of culture and behavior that is consistent with the requirements and needs of the service sector. It is this author's view that a key requirement in service marketing is the need to interiorize that, by depending essentially on the interaction between provider and customer, services lack specific attitudes and behaviours that should be consistent with a type of organizational culture based on the primacy of the client. A culture that is an essential element for the competitiveness and differentiation of service companies and that looks upon the client as the center of the organization. .

Of not less importance is the lack of consensus found in the literature regarding the concept of service. The concept is important to understand this specific industry and for the strategic marketing management of services. In fact, despite the diversity of definitions found in the literature, not all prove to be consensual and satisfactory for the study and understanding of services. Nevertheless, there are certain aspects that seem common in most definitions found in the literature, based on which one may draw upon the idea that a service is not only an activity for the benefit of others but also the bedrock of the customer's buying process and a strategic element of great importance to the organization. Thus, it is this author's perception that the meaning and definition of service is of dual nature. A service is both a tradable activity/product and a perspective or orientation envisioned and pursued from a strategic viewpoint as a means to perpetuate sales and customer loyalty.

There is a general acceptance in the literature of the idea that culture in an organizational context is something strongly linked to the values and beliefs shared by the members of an organization, which provide a common orientation on how they should behave and perform in the presence of certain activities or situations. As a set of learned values and beliefs, culture has thus become of vital importance not only to increase organization efficacy, by reflecting a way and knowledge on how to solve a particular problem, but also as a means of differentiation, acquired through the distinctive way the problem is solved. Therefore, an organizational culture should be developed to support continuous improvement and the way the members of the organization perform their work, making them in return more aware of quality issues (Ojo, 2009). Cross-cultural studies in the area of Marketing have also suggested that culture is important for changing individuals' attitudes, values and preferences, demonstrating that cultural differences lead to different customer perceptions of service quality (Mattila, 1999). As an implication of this assumption, culture must be duly taken into account in services that involve a high degree of human contact and interaction. These types of services must be driven by a strong service culture that is perceived as such by all the members of the organisation. In fact, there is consensus in the literature that a company's success may be linked to a strong service culture, especially pertaining to factors such as increased productivity, higher employee retention rates, and higher morale.

Drawing on the main findings in the literature, one may conclude that an organisation has a service culture when the culture it holds is appropriate to the marketing of services and to this industry. This implies having a culture that is service

oriented, which is itself customer-centric too. Therefore, a service culture is “a culture where an appreciation for good service exists, and where giving good service to internal as well as ultimate, external customers is considered by everyone a natural way of life and one of the most important values (Grönroos, 1990, 2007). According to this perspective, service culture can be interpreted as a practice of a certain organisation that reflects the way it treats and serves its clients. In this context culture is a form of commitment that the organisation holds towards its employees and clients, along the intention to a service of quality and excellence (Voon *et al.*, 2009).

Lastly, considering that in a service encounter the encountered situations are sometimes distinct or even unexpected, it is of great interest to identify and assess the organisation's service culture as a means for its members to respond and adapt promptly. Hence, a service culture should be looked at from both the client and the provider's side. The relevance and aim of this approach from a services marketing viewpoint is twofold. First, it is implicit that in order for an organisation to determine whether such a culture exists it first needs to know how it is perceived by its members. Second, it is equally important to comprehend how the client perceives the organization, being itself a culture, that holds certain values and beliefs that are responsible for certain behaviours and attitudes than can determine the quality and level of service delivered. Finally, by combining these two perspectives, the organisation will be able to assess whether what it defines for itself as a service culture is consistent to what it practices both internally and externally.

RESUMO

As vocações da cidade de Santos, localizada no estado de São Paulo no Brasil, ao longo de sua história são apresentadas neste trabalho, mais especificamente na rua XV de novembro. Sua vocação passou por portuária devido à localização, comercial (sem deixar de ter a portuária) devido ao comércio do café no país e o escoamento da produção no Porto de Santos. E por fim, com a queda do café, Santos desenvolveu a vocação industrial e veraneio.

O método utilizado foi o de Henri Lefebvre, que consiste em descrição do local estudado através de observação participativa da paisagem utilizando material iconográfico. E também o analítico-regressivo que pretende analisar a realidade do local estudado com fatos passados, a fim de reconstruir estes fatos. E por fim o histórico-genético que estuda as modificações da estrutura presente ao longo do tempo e volta ao tempo atual para analisar as modificações. Relatos da história, da economia, da formação do porto e da cidade, através de dados bibliográficos e iconográficos, deram suporte a este estudo.

Ao final é tratado o tema turismo no espaço urbano como uma das soluções para revitalização do centro de Santos e rua XV de Novembro, principalmente para trazer vida para essa região tão importante do centro da cidade de Santos. Isso traz benefícios para o morador e para o visitante que conseguem ver a história de Santos nos edifícios e ruas e devolvendo vida ao centro melhora-se a segurança possibilitando a ocupação destas áreas.

Palavras-Chave: Bem-estar, Turismo no Espaço Urbano, Cidades Inteligentes, História de Santos.

1. A FORMAÇÃO DO PORTO DE SANTOS DO BRASIL COLÔNIA AO INÍCIO DO IMPÉRIO (1500 – 1870) – VOCAÇÃO PORTUÁRIA

Pedro Álvares Cabral e seus homens buscavam explorar novas terras e, em 22 de abril de 1500, ancorando em Porto Seguro, Brasil, depararam-se com uma terra rica em pau-brasil.

Por volta de 1510, a expedição de Américo Vespúcio e André Gonçalves chega à parte sul da terra, mais especificamente onde hoje é Cananéia no estado de São Paulo. Em 1534, a parte portuguesa do Brasil é dividida em Capitanias Hereditárias, uma secular estratégia geopolítica do estado português. O que hoje se divide em Santos e São Vicente era Capitania de São Vicente que foi dada a Martim Afonso. Este determina que Brás Cubas seria o capitão do povoado do Enguaguaçu, hoje Santos.

No mapa abaixo, é possível ver na ilha de São Vicente, marcado em roxo, o núcleo inicial de Santos.

Figura 1 – Mapa de Santos em 1600

Fonte: Reproduzido da *Enciclopédia Mirador Internacional*, 1980 (página 10.218), Encyclopaedia Britannica do Brasil Publicações Ltda., São Paulo/SP apud www.novomilenio.inf.br, modificado pela autora.

A facilidade de ligações com as regiões vizinhas, sobretudo com outras áreas da baixada, quer insular, quer continental foi crucial para se estabelecer o povoado naquela região, já que havia necessidade de comunicação com povoados vizinhos. Esse conjunto de oportunidades colaborou para a formação do porto e da cidade. A foto abaixo ilustra o que era o porto e sua dificuldade de receber grandes embarcações.

Figura 2 – Porto e seus trapiches

As mudanças mais significativas começaram a acontecer na cidade a partir do final do século XVIII, pois no planalto surge uma riqueza digna de exportação, o açúcar de cana. Mas até que o porto e sua área de influência comessem a se entrosar, não houve melhorias na paisagem urbana e portuária. No final do século XVIII, Santos desempenha papel de porto açucareiro numa cidade de aspectos coloniais, conforme mostra a figura abaixo.

Figura 3 – Imagem da cidade ainda colonial

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000.

O açúcar veio marcar um novo período para o porto de Santos, o renascimento de sua primeira função, a portuária. O fato de Santos estar próximo ao planalto auxiliou nesta nova fase da cidade e do porto, pois em toda a área que a Serra do Mar corta o Brasil, de norte a sul, é na altura de São Vicente o primeiro local que a ocupação penetra o planalto. O clima mais ameno em São Paulo e o fato de estar próximo a muitas tribos indígenas sendo farto abastecedor de mão-de-obra e próximo a terras férteis fez de São Paulo um sítio de incomparável superioridade, conforme afirma Prado Jr (1998).

O período colonial termina para o Brasil em 1808, embora a separação oficial date de 14 anos depois. Em 1808, fugindo das tropas Napoleônicas, a colônia portuguesa se transfere para o Brasil. Em 1822, o Brasil torna-se independente. Há um estímulo econômico para o Brasil trazido pela liberdade comercial e refletindo no urbano por meio da construção de estradas, melhoramento dos portos e o aumento da imigração. Nos mapas a seguir será possível verificar as transformações urbanas em Santos.

Figura 4 – Mapa de Santos em 1822

Fonte: Mapa base de 1822 redesenhado pela autora e servirá de mapa para indicação de fotos a seguir

No mapa acima há uma série de edifícios importantes na época: número 1 corresponde à Igreja de Santa Catarina, como em 1765; número 2 corresponde à Casa do Trem Bélico, como em 1765; número 3 corresponde aos Quartéis, como em 1765; o número 4 corresponde à Igreja Matriz, como em 1765; número 5 corresponde ao Hospital Militar / Santa Casa, que em 1765 era o Colégio dos Jesuítas; número 6 corresponde ao Palácio do Governo; número 7 corresponde à Alfândega. No lugar do Hospital, do Palácio do Governo e da Alfândega, em 1765, havia o Colégio dos Jesuítas e neste mesmo local hoje há a Alfândega; número 8 corresponde ao Forte da Vila, como em 1765; número 9 corresponde ao Pelourinho, como em 1765; número 10 corresponde ao Arsenal da Marinha, como em 1765; número 11 corresponde ao Convento e Igreja do Carmo, como em 1765; número 12 corresponde à Igreja da Misericórdia, como em 1765; número 13 corresponde à Igreja do Rosário, existente até hoje; número 14 corresponde à Casa de Câmara e Cadeia, no antigo Quatro Cantos onde havia a Casa das Beatas; número 15 corresponde à Igreja do Carvalho, inexistente em 1765 e demolida hoje; número 16 corresponde à Igreja da Graça, como em 1765; número 17 corresponde ao Convento de São Francisco, como em 1765; número 18 corresponde ao Mosteiro de São Bento, como em 1765; número 19 corresponde à Igreja de São Jerônimo, como em 1765; número 20 corresponde à Fonte do Itororó ainda preservada, como em 1765 e o número 21 à Fonte Duas Pedras também preservada, como em 1765. A principal mudança de 1765 até 1822 foi o início de uma organização administrativa da cidade com a ocupação do Palácio do Governo. a preocupação com a saúde dando origem ao primeiro hospital da vila e a vocação religiosa do santista demonstrada através da construção de muitas igrejas. O panorama da cidade pode ser demonstrado no mapa e foto abaixo.

Figura 5 – Panorama de Santos em 1822

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000.

O desenvolvimento do interior da Província de São Paulo, devido ao açúcar inicialmente, e à cultura cafeeira, que começava a dar frutos, acarretou acentuado crescimento da produção agrícola e houve a necessidade urgente de melhorar as condições do porto para o escoamento de sua produção. Assim, em 1864, tem início a construção da estrada de ferro São Paulo Railway, a primeira ligação ferroviária entre o porto de Santos e o restante da Província, e cuja inauguração se dá em 1867. A São Paulo Railway foi de vital importância para o desenvolvimento do porto e da vila de Santos.

A insignificância da cidade e do porto e seu pouco crescimento até o momento e as mudanças promissoras, devido ao início do café, são reflexo do momento histórico e econômico do nosso país e do que o ligava com o mundo, traduzidas nas transformações do porto e da cidade de Santos.

1.1 O Porto de Santos, o centro da cidade e a rua XV de Novembro – Vocação Portuária

A rua XV de Novembro como é chamada hoje, em 1765 chamava-se rua Direita, que no traçado citadino dos portugueses ruas direitas costumavam ligar o ponto principal da vila à porta de entrada da mesma vila, geralmente ao lado oposto, atravessando assim, todo o vilarejo. Nela, situam-se as principais edificações administrativas, religiosas, militares e particulares, e ligadas a ela também ficam os principais largos da povoação. Assim, acontece em Santos: a rua inicia em Quartéis, bairro de Santos onde estava a Igreja Matriz e termina no Valongo, outro bairro onde estava o Convento Santo Antônio, como é possível verificar nas fotos abaixo.

Figura 6 – Igreja Matriz

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000.

Figura 7 – Convento de Santo Antonio

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000.

Inicialmente a rua estruturou-se como espaço para os rituais da fé, em que casarões, como a Casa das Beatas, a ser apresentada a seguir, alinhavam-se ao longo do percurso que durante séculos serviu de eixo condutor às procissões que partiam da Igreja Matriz e iam até o Convento de Santo Antônio, mostrados acima. Na foto abaixo, pode ser vista a rua Direita, atual rua XV de Novembro que teve outros nomes, como rua do Comércio em 1801 e rua Antonina em 1822.

Figura 8 – Antiga rua Direita vista do Convento do Carmo em direção ao Valongo

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000.

A relação porto x cidade nesse período colonial, início do Império até a comercialização mais intensa do café, era praticamente doméstica. Cada um tinha seu trapiche e livre acesso à comercialização do seu excedente ou da sua produção. Não havia barreira entre o porto e a cidade; na verdade, não se sabia onde começava o porto e onde terminava a cidade, os dois se mesclavam.

2. A FORMAÇÃO DO PORTO DE SANTOS DO IMPÉRIO À REPÚBLICA - VELHA (1870 – 1930) – VOCAÇÃO COMERCIAL

A partir de meados da década de 1850, há uma nítida liderança do café sobre o açúcar na exportação santista. Há, então, o declínio da lavoura canavieira planaltina e, consequentemente, a diminuição da exportação de açúcar por Santos a ponto de, na década de 60, sumir, cedendo lugar ao algodão. São as várias culturas que fazem do porto de Santos um porto comercial. Em 1859, o engenheiro Mackenson Fox dá início à construção da primeira estrada de ferro em tráfego: a São Paulo Railway, hoje estrada de ferro Santos-Jundiaí. Com sua inauguração abre-se na província de São Paulo uma nova era para o Porto de Santos. Esse fato foi muito importante para a expansão da lavoura cafeeira paulista, a mais importante riqueza planaltina. Até então os transportes de mercadorias para o interior aconteciam através de tropas de muare (mulas), fazendo com que a cidade, a princípio, crescesse sentido planalto, que era por onde passavam os homens transportando mercadorias nas mulas.

O trecho abaixo exemplifica como o café e seu comércio aliado à ferrovia auxiliaram no desenvolvimento do litoral e do planalto.

“Em São Paulo, mais do que em qualquer outra província o fenômeno ferroviário produziu um verdadeiro colapso nos portos litorâneos, deixando Santos como monopolizador de todo o tráfego com o planalto, coisa que até hoje persiste. Mais do que nunca é este o momento da formação do verdadeiro binômio São Paulo - Santos que com o andar dos tempos foi-se firmando cada vez mais, à medida que o café dava força econômica à província de São Paulo que já no período republicano conheceria a era da industrialização.” (Araújo Filho, 1969)

A partir de meados do século XIX, o café torna-se a mercadoria mais importante na movimentação do porto e, também, a mais valiosa. A ferrovia, a demanda crescente pelo café na Europa e EUA, as facilidades na expansão da lavoura cafeeira pelo território paulista e novas terras sendo desbravadas fizeram de Santos o mais importante porto do país.

A maior parte da produção do café utilizava mão-de-obra escrava negra que, aos poucos, foi sendo substituída pela mão-de-obra do imigrante. Ao mesmo tempo melhorias eram planejadas para o porto, estradas de ferro eram construídas,

indústrias eram montadas. Parece estranho poder conciliar essas atividades; mas, enquanto não acontecia a abolição da escravidão, os conflitos de classe iam acontecendo.

Em 1870, o “caminho de ferro” (ferrovias instaladas para facilitar o transporte da carga do interior para o litoral e seu escoamento pelo porto) já operava havia três anos e os navios já eram movidos a vapor. No entanto, o porto de Santos funcionava de forma precária, como funcionou durante três séculos. Houve algumas melhorias, mas a carga e descarga ainda eram feitas por meio de trapiches, de construção trabalhosa e frequentemente desmanchados pelas marés, consistiam em atraso e freio para o crescimento, tanto de Santos quanto de toda a Província de São Paulo. O mapa abaixo mostra a Vila de Santos em 1878.

Figura 9 – Mapa de Santos em 1878

Fonte: Mapa base de 1878 redesenhado pela autora e servirá de mapa para indicação de fotos a seguir

No mapa acima podem ser identificadas algumas edificações: número 1 corresponde à Casa do Trem Bélico, presente até hoje, mas com outra utilização; número 2 corresponde ao Quartel; número 3 corresponde à Fortaleza; número 4 corresponde à ponte da Alfândega; número 5 corresponde à Alfândega, hoje no mesmo local; número 6 corresponde à Igreja Matriz, demolida; número 7 corresponde à Antiga Casa do Conselho, hoje uma praça; número 8 corresponde ao Convento do Carmo, presente até hoje; número 9 corresponde ao Arsenal da Marinha, hoje uma praça; número 10 corresponde à Capela do Carvalho, hoje área portuária; número 11 corresponde ao Consulado Americano, hoje área portuária; número 12 corresponde ao Consulado Italiano, hoje área portuária; número 13 corresponde ao Consulado Belga; número 14 corresponde ao Consulado Inglês; número 15 corresponde à estação de trem presente até hoje, mas como Secretaria de Turismo; número 16 corresponde ao Convento de Santo Antônio, presente até hoje; número 17 corresponde à Igreja da Graça; número 18 corresponde ao Consulado Alemão; número 19 corresponde ao teatro; número 20 corresponde à Igreja do Rosário, existente até hoje; número 21 corresponde à Câmara e Cadeia Nova, presente até hoje, mas com uso destinado à cultura; número 22 corresponde ao Mosteiro de São Bento, presente até hoje, mas como museu; número 23 corresponde à Santa Casa, hoje estabelecida em outro local; número 24 corresponde ao Consulado Português; número 25 corresponde ao Consulado Francês; número 26 corresponde ao Telegrapho Nacional.

Nesse período percebe-se que há um grande número de consulados em Santos, devido ao aumento das exportações do açúcar e, principalmente, à presença do café. Ainda não se tem um porto organizado e planejado, mas já se negociava a sua modernização.

Apesar de todas as dificuldades, em 1892 estavam prontos os primeiros duzentos e sessenta metros de cais, inaugurados com a atracação do navio inglês Nasmith, a 2 de fevereiro de 1892. O porto contava com linha férrea e armazéns. O fato foi comentado em todo o país – o modesto ancoradouro se tornava o primeiro porto organizado do Brasil. No ano seguinte, é construído o restante dos oitocentos e quarenta e seis metros de cais contratados inicialmente e, nesse mesmo ano, os

trilhos da Cia Docas de Santos são ligados aos de São Paulo Railway. Esta imagem é do cais da ferrovia São Paulo Railway, no bairro do Valongo, vendo-se o desembarque de mercadorias direto dos navios a vela para os vagões, em 1877 (a ferrovia entre Santos e São Paulo fora inaugurada dez anos antes, em 1867).

Santos inaugurou oficialmente, como foi dito anteriormente, o seu porto organizado no dia 2 de fevereiro de 1892, com um trecho de duzentos e sessenta metros lineares construído no lugar dos trapiches do até então conhecido como Porto do Bispo, conforme mapa abaixo. A inauguração ocorreu com a atracação do navio a vapor *Nasmyth* (ver foto abaixo), da armadora inglesa Lamport & Holt. O navio, construído em 1880, continuou em tráfego até 1902.

Figura 11 – Nasmyth

Enfim, a construção do porto teve grande interferência na construção das paisagens modernas de Santos. De fato, foi só quando se construíram os cinco primeiros quilômetros de cais que a cidade de Santos pôde se despir das suas roupagens coloniais e transformar-se num organismo urbano pronto a poder acrescentar à função portuária, várias outras que se foram criando, à medida que um planejamento sanitário e urbanístico (Plano Saturnino de Brito em 1908) foi-lhe dando condições. Desse planejamento sanitário-urbanístico resultou imediatamente a solidificação da Praça Comercial de Santos, particularmente no que diz respeito ao alto comércio do café, ao mesmo tempo em que a expansão urbana pôde ir se efetivando por áreas dantes alagadiças e malsãs. Concomitantemente, as relações de Santos com a Capital foram se estreitando até que parte da cidade se transformasse em área de veraneio para centenas de milhares de paulistanos e mesmo frequentadores oriundos da sua própria região.

No projeto de saneamento que desenvolve para a cidade, o engenheiro Saturnino de Brito, além de tratar das questões específicas e pertinentes a sua função, elabora também várias leis e indicações de como a cidade e de seus habitantes devem se comportar diante das doenças e epidemias, e é evidente que essas normas acabam influenciando no modo de vida dos habitantes da cidade. Até que o projeto de saneamento da cidade esteja concluído e as doenças e epidemias estejam eliminadas, os

habitantes de Santos iriam estar sujeitados a qualquer lei que, no entendimento da municipalidade, contribuísse para debelar os males que afetavam a cidade e colocavam em risco a saúde ou a vida de seus habitantes.

Figura 12 – Planta Santos 1910 com projeto de Saturnino de Brito

Esse plano reflete o momento vivido, o café estava no auge, novas culturas, como o algodão, eram produzidas. O algodão auxiliou na implantação da indústria têxtil que mudou a paisagem urbana, ou seja, a roupagem que a cidade se apresenta. Ideias modernas começam a surgir; renovar é o lema, fruto da necessidade de tornar a cidade “habitável”, já que epidemias ocorriam e muitas pessoas morriam. Até então, a função da cidade era portuária, somente regional. Com o açúcar e depois muito mais com o café a função da cidade muda e passa a comercial, não perdendo a portuária. A cidade passa a ser um negócio, portanto planejá-la e sanitizá-la significaria embelezá-la. O poder público aproveita a ideia de limpar a cidade e resolve “limpar” as pessoas e usam esse conceito para retirar pessoas de cortiços ou residências que eles consideravam “sujas” e as colocam para fora da zona de interesse dos investidores de café. Essas pessoas são literalmente expulsas das suas casas e não há plano para elas na cidade.

A cidade cresce, em 1913 há a especulação imobiliária, pois intervenções sanitárias, realizadas através do plano urbanístico de Saturnino de Brito, provocam a erradicação de cortiços, reforma de prédios, instalação de esgotos e banheiros, construção de jardins, ou seja, uma melhora na cidade e sua higienização. O automóvel e o cinema aparecem e intensifica-se a vida noturna com espetáculos, o que antes acontecia somente em espaços livres públicos esporadicamente. Aumenta o número de pessoas interessadas em morar em Santos e consequentemente melhora sua economia.

As duas avenidas que cortam a cidade a partir dos canais até a orla, Ana Costa e Conselheiro Nébias, já se encontravam abertas e equipadas com iluminação pública, direcionando o trajeto das redes coletoras de esgoto, além de aproximar a parte central da cidade e suas praias, que se tornavam, aos poucos, em alternativas de lazer.

Desde o início do século XX, o município de Santos ocupava uma extensão territorial reduzida na Ilha de São Vicente. Nesse período, a cidade era formada por uma grande planície verde que se estendia da praia do José Menino à Ponta da Praia. A cidade não dispunha de prédios, apenas dois edifícios na esquina da Av. Washington Luiz. Os bairros do Marapé, Campo Grande, Jabaquara, Macuco, Embaré e a Ponta da Praia eram quase totalmente descampados. A beira-mar era plena de mansões, ostentando a riqueza do café e do comércio portuário.

Entre 1920 e 1930, a cidade ainda não havia urbanizado mais do que 60% de sua área, portanto as questões relacionadas ao abastecimento público de água para consumo humano e para atividades produtivas não se faziam sentir de forma mais intensa, ao contrário do que ocorreria décadas depois. As regiões dos atuais bairros de Boqueirão, Embaré, Aparecida e Ponta da Praia estavam praticamente desertas, exceto pelo antigo Hipódromo do Jockey Clube Santista, próximo à Ponta da Praia, que teve as primeiras corridas disputadas em 27 de junho de 1919. Inclusive esse tipo de edificação mostra o público que morava ou frequentava Santos: uma população de alto poder aquisitivo ligado ao café. No mapa abaixo estão identificados o porto, o centro e a rua XV, em marrom, amarelo e vermelho, respectivamente.

Figura 13 – Planta de Santos em 1921

A década de 20 foi caracterizada por uma euforia econômica em função dos altos preços do café, motivando reservas cambiais para produtos importados e acarretando o sensível aumento do tráfego importador. Com 200 mil metros quadrados de armazéns e pátios de estocagem, mais que o dobro da estrutura existente em 1910, o porto contava então com ampla hinterlândia (região de influência do porto), que, além do interior do Planalto Paulista, penetrava pelo Sul de Minas Gerais, Triângulo Mineiro, Sul de Goiás e do Mato Grosso e Norte Velho do Paraná. Em 1928, o movimento de cargas foi de 3.183.809 toneladas.

O equilíbrio da balança comercial não se modificaria ainda, já que o mundo entrava na grande depressão de 1929. No porto, a única obra representativa nesse período foi a construção, na ilha Barnabé, de um cais para a movimentação de inflamáveis e combustíveis e a posterior instalação de grandes tanques para depósito, isolando a cidade do perigo de um possível incêndio. O terminal da ilha Barnabé propicia a movimentação sempre crescente dos produtos de petróleo durante o decorrer da década de 30, garantindo o equilíbrio financeiro do porto mesmo quando o setor cafeeiro, antes responsável por 90 % do movimento, entra na grande crise gerada pela superprodução.

A quebra da bolsa de Nova Iorque, seguido da fase de superprodução do café, os métodos de valorização do produto que um pouco mais de uma década queimou 80 milhões de sacas de café, dificuldades advindas da Segunda Guerra, levaram muitos fazendeiros a descer no futuro do café. Muitos venderam suas propriedades, outros entregaram a credores, e os que ainda podiam reter em suas mãos, transformavam-nas ou em pastos, ou em lavouras variadas, entre as quais o algodão tomou maior vulto, por causa da indústria têxtil que começava a crescer. A partir de 1944, nos fins do segundo conflito mundial, quando os estoques de café haviam se acabado no mundo, mercê principalmente das fogueiras que o Brasil fizera com suas reservas, novas áreas de café apareceriam, no extremo oeste paulista, norte do Paraná, no noroeste capixaba e no leste mineiro. Milhões de cafeeiros plantavam extensivamente, somado ao agravante das distâncias cada vez maiores aos portos exportadores e o problema da mão-de-obra sempre cara e difícil, além do tipo de café malcuidado e sempre inferior ao mercado de consumo, marcou o término de sua história expansionista.

2.1 Edificações da rua XV de Novembro

A criação da **Bolsa Oficial de Café** tem início em 1914, por meio de lei aprovada pelo congresso Legislativo de São Paulo, cujas funções visavam a um maior controle do comércio cafeeiro no Estado. O funcionamento é autorizado pelo decreto Estadual número 2797 de 28 de abril de 1917. Instala-se inicialmente em salão alugado no centro da cidade, na parte térrea do edifício situado na esquina da rua XV de Novembro com a rua Santo Antonio (atual rua do Comércio). A sede

própria foi inaugurada em 1922 e tinha por objetivo centralizar, organizar e controlar as operações do mercado cafeeiro, na época a principal fonte de riqueza do país. A Bolsa Oficial do Café, em Santos, traduzia-se como arquitetura típica do ecletismo que caracterizou as mais importantes obras do período.

“O local escolhido era bem próximo da primeira sede, em amplo terreno junto ao porto. Com vista para as ruas Tuiuti, Frei Gaspar e XV de Novembro, o lugar da futura bolsa possuía atributos visuais e comerciais invejáveis na geografia urbana do centro de Santos. Uma das esquinas do terreno constitui o antigo Quatro Cantos, lugar tradicional da cidade, formado pelo cruzamento da rua Frei Gaspar com a rua XV de Novembro. A morfologia curva da via nesse ponto oferecia perspectiva do terreno de resultado visual incomum na região central, elemento que não ficou insensível ao projeto. A outra esquina está voltada para o porto, a cenografia, por excelência, do embarque do café”. (Caldatto Barbosa, 2004)

A Bolsa Oficial do Café de Santos conheceu seu período áureo na década de 1920, antes que a Grande Depressão Econômica Mundial atingisse também os negócios de exportação do café, provocando até decisões como a da queima do produto em grandes montes, em 1931. São dessa época do auge dos negócios cafeeiros via porto de Santos as imagens do prédio e de seu entorno, no encontro das ruas XV de Novembro e Frei Gaspar (local outrora conhecido como os Quatro Cantos).

Figura 14 – Rua XV com Bolsa do Café ao fundo

Fonte: Imagem: acervo do cartofilista Laire José Giraud apud www.novomilenio.inf.br

Nas ruas 25 de Março (hoje XV de Novembro), 24 de Maio (hoje Tuiuti) e de São Bento e Santo Antonio (hoje do Comércio), viam-se diversos sobrados com as ombreiras de alvenaria das portas dos armazéns no andar térreo. Em geral, orlavam todas as ruas casas feias, acaçapadas, vetustas e de salientes beirais. Do Valongo ao Paquetá, serviam as praias de depósito do lixo da cidade, onde longo tempo permanecia ele a descoberto, entre o lamarão e a areia, até que os rolos verdes da preamar o arrastassem para o canal. No porto, os navios ao lado uns dos outros, desfraldando bandeiras de todas as nações, permaneciam frequentemente dias a fio na tarefa de carga e descarga. Neste período, iniciava-se a ação higienizadora e para tanto foi criada uma legislação para homogeneizar as casas com o intuito de ordenar, higienizar e embelezar.

3. FORMAÇÃO DO PORTO DE SANTOS DA REPÚBLICA DESENVOLVIMENTISTA À REPÚBLICA NEO-LIBERAL (1930 – 2006) – VOCAÇÃO INDUSTRIAL E VERANEIO

Com a queda do café e o incentivo à indústria, em 1930, a indústria Petrolífera ocupa a ilha Barnabé, iniciando assim uma ocupação da margem esquerda, antes desocupada por este tipo de uso (industrial e portuário). Começou a se perceber que havia necessidade de expandir o porto além da margem direita. Houve, em 1932 uma pequena movimentação do porto, como consequência do bloqueio militar por mais de três meses a que o porto foi submetido durante a Revolução Constitucionalista de São Paulo. Em 1939 acontece a Segunda Guerra Mundial, outra grande parada no crescimento econômico. Como resultado, entre 1942 e 1943, a movimentação de mercadorias no porto cai pela metade do que foi em 1938 e 1939. Em 1944, há ainda os mesmos quatro mil, setecentos e vinte metros de cais, de 1938. Após o término da

Segunda Grande Guerra, o índice de movimentação do porto volta a subir, mas o café começa a perder a hegemonia como principal produto de exportação do porto.

Em 1945, terminada a Segunda Guerra Mundial, o porto de Santos mantinha o mesmo cais que, somado ao da ilha Barnabé, totalizava 5214 m. Não cresceu em extensão de cais, mas melhorou a infraestrutura e alargou as faixas de cais. O porto possuía silos para grãos, esteiras transportadoras, seis empilhadeiras fixas, 128 guindastes, tanques de combustíveis líquidos e seis embarcações com capacidade para 2000 sacas/hora, além de rebocadores, dragas, ferry-boats, lanchas, tratores, vagões e locomotivas, segundo os arquivos da Codesp, Companhia Docas do Estado de São Paulo.

O fim da década de 40 e início de 50 é marcado pela indústria automobilística no planalto e via Anchieta provocando uma nova fase de evolução de Santos: turismo, surto imobiliário e inflação. Santos, na década de 1950, foi a porta de ouro do Brasil e estação balneária de milhares de veranistas que a ela afluíam. Nos fins de semana de menos movimento, desciam a serra nada menos de vinte a trinta mil pessoas para saborearem as delícias das ondas praianas desta majestosa cidade, que tem suas praias urbanizadas segundo os princípios modernistas em seus jardins, pérgulas e nos edifícios.

No fim da década de 40, Prestes Maia, engenheiro civil e arquiteto formado pela escola Politécnica em 1917, especializado nas áreas de legislação, transporte, sistema viário, pavimentação e estruturas, no momento governador do Estado de São Paulo, tem preocupação com a escala regional, pensa em sistema viário urbano para melhorias no trânsito em geral com objetivo de interligar Santos com sua região, gerando assim planos urbanísticos refletindo essa preocupação. Embora esses tenham ficado somente no papel, influenciaram os planos elaborados pela prefeitura nos anos seguintes e até hoje influenciam, por exemplo, a ideia de se construir uma via perimetral no porto, assunto discutido hoje e fruto do projeto do Prestes Maia. Esse plano é considerado por muitos o primeiro plano de desenvolvimento do Porto de Santos.

Figura 15 – Plano de Prestes Maia para Santos

Fonte: BARBOSA, Maria Valéria (org). Santos na formação do Brasil: 500 anos de história. Santos, Prefeitura Municipal de Santos: Secretaria Municipal de Cultura: Fundação Arquivo e Memória de Santos, 2000

Os anos 90 foram marcados por grandes mudanças no complexo portuário santista. As mudanças foram físicas e de mentalidade. Há uma injeção maciça de recursos através do Adicional à Tarifa Portuária (ATP), do Banco Nacional de Desenvolvimento Econômico e Social (BNDES), investimentos japoneses do chamado Fundo Nakasone e investimentos da própria Codesp. Esse fato trouxe ao porto obras de ampliação cômoda Terminal de Contêineres, a construção do cais Valongo-Paquetá e obras no Terminal de Fertilizantes.

Em 1992, foi escrita a Lei de Modernização dos Portos (lei 8.630/93), que foi sancionada e entrou em vigor em 26 de fevereiro de 1993, abrindo o caminho para a privatização dos serviços e para a mudança no sistema de trabalho vigente nos últimos 60 anos. Por causa da lei 8630 foi criado o Programa de Arrendamentos e Parcerias no Porto de Santos, o PROAPS, que objetivou o arrendamento das áreas e promover um planejamento preliminar quanto à vocação de cada área e sua afinidade com as cargas a serem movimentadas. Essa transição não foi pacífica, houve resistência por parte de empresários e

funcionários do porto, tanto que em 1998 o sistema preconizado pela lei 8.630 não tinha sido completamente implantado. A lei previa a passagem dos serviços portuários para a iniciativa privada, sendo que o terreno do porto pertence à União e não pode ser alienado, como preceitua a Constituição.

A maior parte da mão-de-obra operacional da administradora do porto, a Codesp, já passou da condição de empregada de uma empresa de economia mista para a de trabalhadores avulsos, com registro no Órgão Gestor de Mão-de-Obra Portuária do Porto de Santos (Ogmo/Santos), da mesma forma que os trabalhadores avulsos foram registrados nesse mesmo órgão. O OGMO tem uma direção colegiada entre trabalhadores, empresários e governo e foi criado a partir da lei 8.630 para prover o suprimento de mão-de-obra para as atividades portuárias, seguindo diretrizes fixadas pelas negociações entre os sindicatos patronais e trabalhistas, especialmente os acordos coletivos de trabalho assinados entre as partes.

Em 1998, é feito um novo plano diretor que é vigente até hoje e que prioriza ações no turismo, porto e comércio e prestação de serviços, que virá ao encontro do zoneamento e desenvolvimento do porto e do Alegre Centro, projetos que serão descritos mais abaixo.

Neste novo zoneamento, a rua XV de Novembro faz parte da zona central I, conforme pode ser visto na planta abaixo, e essa zona é a que agrega maior número de estabelecimentos comerciais e de prestadores de serviços, e o acervo de bens de interesse cultural, objeto de programa de revitalização urbana no qual se pretende incentivar a proteção do patrimônio cultural, a transferência de usos não conformes e a instalação de uso residencial. Além disso, a rua XV de Novembro faz parte de um dos Corredores de Desenvolvimento e renovação urbana, que são áreas públicas ou privadas onde se pretende incentivar maior adensamento mediante operações que envolvam permuta do potencial construtivo e adicional oneroso do coeficiente de aproveitamento.

Figura 16 – Planta de zoneamento de Santos de 1998

Fonte: Mapa base do Plano Diretor de 1998 redesenhado pela autora

Por causa da criação da Lei de Modernização dos Portos, lei 8.630, citada anteriormente, é elaborado pela equipe da Diretoria Comercial e de Desenvolvimento da Codesp, o Plano de Desenvolvimento e Zoneamento do Porto de Santos. Em 1997, foi feito o PDZ provisório que obrigou a Codesp a desenvolver um novo plano. Em fevereiro de 2000 a Codesp apresentou, para apreciação, o novo PDZPS ao Conselho da Autoridade Portuária CPA, que é o órgão definido pela lei 8630 que deve aprovar o plano. O zoneamento do porto por causa do arrendamento já estava praticamente feito, portanto o plano visava muito mais o desenvolvimento do Porto de Santos. Para que esse fosse aprovado, foram feitas audiências públicas envolvendo órgãos de interesse no porto e comunidade, e hoje, com o plano pronto só necessitam desenvolver mecanismos que possibilitem acompanhamento da implantação do PDZ e sua revisão periódica.

O Porto de Santos tem fácil acesso, apesar de muitos estarem truncados, em má conservação e com pouca fiscalização. Há o sistema ferroviário, rodoviário, canal de acesso marítimo, hidroviação através da Hidrovia Tietê-Paraná onde, em Perdeneiras, há transposição com a ferrovia e em Anhembi com a rodovia, além do sistema dutoviário que transporta produtos petroquímicos. Alguns desses podem ser vistos no mapa abaixo.

Figura 17 – Acessos ao Porto de Santos

Fonte: www.vivasantos.com.br

Toda a infraestrutura portuária, inclusive de transportes deve acompanhar a evolução a que o porto se propõe, modernizando-se para que o transbordo da mercadoria se faça não só com rapidez e eficácia, mas, sobretudo, com respeito ao meio ambiente. Para isso, desde 1999, a Codesp dispõe de uma superintendência de qualidade, meio ambiente e normalização. Um marco indiscutível dessa postura e respeito às normas ambientais vigentes foi a Dragagem de Manutenção, iniciada em 2005, a qual, pela primeira vez na história do país, conta com o devido Licenciamento Ambiental, o que reflete a cultura e consciência ambiental do Porto de Santos.

No PDZ foram estabelecidas diretrizes para serem cumpridas em curto prazo (dois anos), médio prazo (cinco anos) e longo prazo (dez anos). A curto prazo envolve o diagnóstico detalhado das realidades ambientais, sanitárias, patrimoniais e sociais nas áreas do porto e de influência direta deste, elaboração de planos para remediações, manejo ou melhorias destas realidades acompanhadas de cronogramas nos quais constarão as principais etapas e a conformidade à legislação ambiental.

A médio prazo, serão implantados e operacionalizados os planos citados acima. A longo prazo, serão realizadas as diretrizes que não são consideradas indispensáveis ao bom andamento da atividade portuária, mas agregam qualidade ambiental e melhorias sociais.

O Plano de Desenvolvimento e Zoneamento do Porto de Santos pretende desenvolver nas fronteiras entre porto e cidade espaços de integração, integrar nos projetos mecanismos de minimização dos impactos ao entorno mais próximo. Pretende também ampliar a participação social na tomada de decisão sobre o desenvolvimento portuário e estreitar laços entre porto, prefeitura e comunidade por meio de fóruns adequados quando no período de atualização do PDZ. Desta forma, pode-se perceber, talvez, pela primeira vez na história de Santos, que um plano é feito com a participação de todos os envolvidos com o porto e principalmente da comunidade. Isso melhora a qualidade de trabalho no porto e de vida de seus trabalhadores e moradores do entorno que esperam não sofrer mais com a movimentação de carga do porto.

As principais propostas do PDZ são a criação da avenida perimetral que é um corredor viário a circular o porto todo com a finalidade de minimizar os problemas logísticos do porto, como pode ser visto no mapa abaixo.

Figura 18 – Projeto Avenida Perimetral

Fonte: www.vivasantos.com.br

Além da Avenida Perimetral, há proposta da criação de estacionamentos para os caminhões, uma gestão do fluxo rodoviário, política permanente de dragagem de manutenção, dragagem de aprofundamento, melhoria nas ferrovias, aumento da capacidade da linha férrea na margem esquerda, desapropriações de áreas de linha férrea e favelas, remoção de favelas e invasões, parque de manobras ferroviárias na Alamoia onde hoje é o lixão, construção de mais dois berços para líquidos na Alamoia e Paquetá, reestruturação dos sistemas de abastecimento de água e esgotamento sanitário, utilização do gás natural como fonte de energia para projetos de expansão, revisão da estrutura tarifária e a criação do terminal turístico e revitalização dos armazéns I ao IV, que são os que estão na direção do centro antigo, conseqüentemente da rua XV e vão ao encontro do plano diretor e Alegria Centro, projeto que será visto adiante.

A revitalização portuária já é falada em muitos países, estes renovam suas áreas portuárias consideradas obsoletas, com o objetivo de sua revitalização ou modernização. Um projeto de revitalização deve ter como oportunidades a beleza e o valor histórico do local, considerando ainda a recuperação ambiental, o empreendimento para a região e o conhecimento tecnológico e deve possibilitar alianças e acordos que visem gerar oportunidades de uso portuário-urbano, fomentar a recuperação da atividade comercial da região, reconversão da área, fortalecer relação porto-cidade, criar pólo turístico e de áreas de desenvolvimento social, contribuir para a preservação da memória histórica, reabilitação e valorização econômica e inclusão de Santos em roteiros turísticos nacionais. A prefeitura municipal de Santos já iniciou projeto de recuperação e reciclagem de edifícios monumentos e equipamentos na região considerada, estando o projeto de revitalização portuária em sintonia com o projeto do município. Em 2003, Lula ganha as eleições e dá continuidade a reformas estruturais. Atualmente, o Porto de Santos movimentava por ano mais de 60 milhões de toneladas de cargas diversas, número inimaginável em 1892, quando operou 125 mil toneladas. Com 12 Km de cais entre as duas margens do estuário de Santos, o porto entrou em nova fase e exploração, consequência da lei 8.630/93, a privatização dos serviços e tentativa de preservação patrimonial.

4. CONSIDERAÇÕES FINAIS – TURISMO NO ESPAÇO URBANO INTELIGENTE E SUSTENTÁVEL

As cidades são produtos do turismo e segundo Jacques Wainberg que escreveu um texto no livro *Turismo Urbano* de Castrogiovanni (2001), o ambiente urbano nos ensina que a cidade deve ser vista com uma escritura, uma fala a ser interpretada pelo transeunte. Trata-se de um enigma a ser desvendado pela exploração. A percepção é estimulada pelo estranhamento causado por sua arquitetura, vias, limites, bairros, pontos nodais, marcos, avenidas, cafés e bares. É uma obra viva e seus atores móveis são seus habitantes. Há cores e odores. Hábitos e costumes. História e memória. Todo detalhe é relevante na composição do todo.

Toda cidade oferece a seu visitante uma experiência em relação ao seu ambiente. E toda cidade deseja vender a experiência da interação do visitante com a sua originalidade específica, o patrimônio propriamente dito. O passado torna o lugar mais do que um espaço, é uma experiência com o passado, com a história, mas deve ser medido, calculado e planejado, por isso o turismo é uma experiência sob controle antes de tudo e com sabor cultural em primeiro lugar. A excitação que emerge do primeiro olhar é essa disposição paisagística da cidade. O fenômeno turístico, por ser relativamente frenético e controlado no

tempo, é, em essência, fortemente visual. O turista busca, por isso mesmo, os elementos da paisagem, os espaços construídos e o movimento da vida.

As cidades turísticas têm o poder de imantação que se propaga em círculos concêntricos cada vez mais distantes. Esse poder aumenta conforme a cidade for constituída de elementos variados em microescala que provoquem os sentidos do transeunte convertendo-se em destinos de peregrinação. Se a identidade da cidade for bem constituída, ela é percebida sem ambiguidades. E esses espaços servem tanto ao morador quanto ao turista. Desta forma, o turismo é um fenômeno cultural, cruzam-se fronteiras, atingem-se os sentidos e interpõe uma caminhada à excitação.

A cidade é viva, possui sua própria identidade, apresenta um dinamismo de relações que se alteram ao ritmo de diferentes circunstâncias, portanto sempre é possível a renovação urbana, afirma Castrogiovani (2001). A cidade deve ser vista como um bem cultural, em que devem ser valorizadas as funções culturais que atendam à qualidade de vida de seus habitantes.

Segundo Boullón (2002) quando se estudou as dificuldades do homem para decifrar a paisagem natural, viu-se que ela se oferece aos olhos do observador como uma cena muito ampla, que, por sua complexidade e variedade de elementos, apresenta dificuldades para ser captada em seus detalhes. Quando é a paisagem urbana a ser estudada o caso se inverte, porque é mais fácil reconhecer uma cidade por meio de um edifício do que pelas imagens de conjunto que não o incluem.

A cidade que os turistas querem é a das ruas, praças e edifícios, e não a da representação em um papel, que só lhes serve como referência para saber em que rua está seu hotel e as distâncias aproximadas que os separam dos lugares mais importantes. A realidade urbana, interpretada como fato espacial, alcança três dimensões e chegam à quarta pelos olhos de um observador que transforma a paisagem urbana ao circular por ela.

A percepção de uma cidade não é total nem instantânea, mas se realiza no transcurso do tempo, pela soma das imagens parciais que o espaço físico transmite e que o homem registra em sucessivas vivências. É por meio dessa série de elementos formais que o homem consegue identificar e reter em sua memória, assim constrói-se a imagem da paisagem urbana. Para o habitante de uma cidade essa construção é imprescindível, pois com ela ele reconhece os lugares em que transita e se orienta.

A captação dos pontos focais de um centro turístico origina a formação de um número equivalente de imagens fortes, que ao se correlacionarem na mente dos visitantes permitem elaborar uma síntese desse espaço urbano. Ao se relacionar os pontos focais sem se levar em conta a totalidade da rede de ruas e outros milhares de edifícios sem importância, obtém-se uma nova imagem da cidade com base em sua organização focal.

Segundo Boullón (2001) ao percorrer uma cidade, o turista o faz entre pontes que atraem seu interesse e motivam sua presença obrigatória, pontos que chamaremos de áreas gravitacionais, e que se classificam em quatro tipos: estações terminais dos sistemas de transporte; zonas de concentração do empreendimento turístico e de outros serviços urbanos; atrativos turísticos urbanos e saídas para as estradas que conduzem a atrativos turísticos.

Segundo Sánchez (2003):

Uma boa infraestrutura de comunicações, no sentido amplo (rodovias, portos, aeroportos, telecomunicações) é um requisito básico para possibilitar um acesso fácil e rápido às cidades. A capacidade de se transformar em centro de cultura e de serviços pessoais de todo tipo, em centro de lazer e de esportes é um requisito complementar para fazer atrativa a qualidade de vida urbana. Na competitividade entre cidades contam também, cada vez mais, fatores como o meio ambiente e as infraestruturas educativas e culturais. Em sentido estratégico, poderíamos dizer que as cidades são como empresas que competem para atrair investimentos e residentes, vendendo em troca localizações vantajosas para a indústria, o comércio e todo tipo de serviços. (Maragall apud Benach, 1997, p. 368)

Desta forma, as cidades necessitam ser trabalhadas para que possam alcançar o mercado mundial, no sentido turístico, econômico e social. As cidades são transformadas, com a renovação urbana e conectadas aos circuitos de uma nova ordem mundial, as políticas urbanas operam e validam a mercantilização da vida social e de seus espaços. Precisa haver um consenso entre as políticas públicas para que as cidades estejam caminhando com um só objetivo.

Segundo Bienenstein (2001) apud Sánchez (2003), as parcerias entre público e privado constituem os principais pilares das novas feições e estrutura do governo urbano sintonizado na competitividade. Essas parcerias são construídas por meio de alianças e coalizões que configuram novo perfil dos governos urbanos. Esses instrumentos são voltados para a agilização da administração das cidades, visando à competitividade e otimização do aproveitamento de oportunidades de investimento e financiamento para obter várias formas de valorização e acumulação.

Uma boa cidade empreendedora necessita não só fazer boas alianças, mas também ser sustentável. As cidades necessitam ter políticas ambientais que melhorem a qualidade de vida das pessoas. É preciso haver projetos para coleta de lixo, matrizes energéticas, preservação ambiental entre outros. É necessário haver para isso também uma participação dos cidadãos, pois estes precisam participar na aceitação e aprovação dos projetos da cidade. O papel das renovações urbanas associadas à oferta cultural, museus, centros culturais, espaços de entretenimento, tem construído as principais imagens e representações da internacionalidade das urbes, vitrines dos lugares que se pretendem “mundializados”. Por trás dessas renovações urbanas que contribuem para o renascimento das cidades há uma busca da identidade do local. Como construção social, a produção da imagem da cidade está intrinsecamente ligada a representações e valores. O projeto de cidade é ação material no espaço (urbanística, cultural, econômica), junto com uma intenção de cidade, que dá conteúdo ao discurso sobre o espaço.

Santos tem criado leis e planos que têm um só objetivo, revitalizar seu centro histórico e tornar a cidade conhecida nacionalmente por sua história. Através do seu plano diretor estabelece áreas, como a zona central I onde está a rua XV de Novembro, com bens de interesse cultural, a fim de revitalizar essas áreas, protegendo seu patrimônio cultural por meio de corredores de desenvolvimento da cultura, renovando, assim, a cidade.

Ao mesmo tempo, o porto, depois de sua privatização a partir da lei 8.630/93, que visava modernizar os portos, estabelece

que nas fronteiras entre porto e cidade deve haver espaços de integração. Um exemplo é a criação da avenida perimetral que quando cruza o centro histórico passa rebaixada, possibilitando a criação de grandes boulevards. Já foi aberta licitação para ocupar os armazéns 1 ao 4 com usos voltados para o turismo, os quais poderiam ser restaurantes, áreas de compras, informações turísticas e por que não um hotel, já que nessa área existiu hotel nos momentos mais remotos da cidade.

Desde 1913 há um fluxo de turistas na cidade, sendo que esse aumentou após a construção da via Anchieta em 1950. Assim, esses projetos vêm ao encontro do projeto Alegria Centro, projeto de revitalização do centro histórico da cidade para dar força ao turismo na cidade.

Figura 19 – Calçadão da Rua XV de Novembro e seus restaurantes

Fonte: CD Santos de bem com a vida

A cidade é uma escritura que deve ser lida, restaurar esses imóveis e possibilitar que eles contêm um pouco da história da cidade é importante para o turista e para o morador, que é o ator dessa obra viva.

O visitante procura ter uma experiência com a cidade quando ele a visita. O turista busca elementos da paisagem, espaços construídos e o movimento da vida, já que é mais fácil reconhecer uma cidade pelo conjunto de obras que nela há. Assim, a cidade é um bem cultural e beneficia o cidadão dela primeiramente, melhorando sua qualidade de vida quando bem preservada. Santos necessita e merece ter um tratamento adequado de suas obras para entrar no circuito nacional e, quem sabe, internacional de cidades turísticas. Para tanto, necessita realizar melhores alianças para possibilitar o restauro das obras e incentivar os proprietários dos imóveis de interesse histórico-cultural. Desse modo, estaria se pensando não só na sustentabilidade ambiental, mas também nas social e econômica.

A sustentabilidade global é um dos grandes desafios a ser enfrentado no século XXI, sendo o desenvolvimento sustentável amplamente entendido a partir da teoria do Triple Bottom Line. Por sua vez, as cidades são o palco onde a dimensão social, econômica e ambiental se convergem com mais intensidade.

Apesar das cidades serem centros de inovação, crescimento econômico, transformação social, saúde e educação, seu crescimento traz para discussão questões sobre aquecimento global, administração de recursos, economia baseada na baixa emissão de carbono e desigualdade social. As cidades requerem soluções inovadoras em seu design, em sua governança e em sua infraestrutura de investimentos, para que possam responder essas questões de maneira apropriada (Mitchell, Casalegno, 2008 apud Rego, 2013). Assim torna-se relevante falar sobre sustentabilidade dentro do contexto urbano. A sustentabilidade deriva da percepção de que os recursos do planeta são finitos e de que o uso inadequado dos mesmos deve ser desencorajado (Leite, 2012 apud Rego, 2013).

Portanto, visando alterar das mudanças climáticas é necessária a adoção de políticas que implementem cidades sustentáveis que saibam lidar adequadamente com a economia, a sociedade e o meio ambiente (Sachs, 2008 apud Rego, 2013). A cidade sustentável, de acordo com Mark Roseland (1997) apud Rego, 2013, é o tipo mais durável de assentamento que o ser humano é capaz de construir. É a cidade capaz de propiciar um padrão de vida aceitável sem causar profundos prejuízos ao ecossistema ou aos ciclos biogeoquímicos de que ela depende. O modelo de urbanização adotado há anos pelos países, com destaque para os desenvolvidos, considera diversos recursos naturais como recursos inesgotáveis e gratuitos.

Benefícios das cidades ecologicamente inteligentes Cada vez mais é reconhecida a importância da sustentabilidade e os efeitos positivos que esta gera para a sociedade e o meio ambiente. Com isso, é importante destacar também que o desenvolvimento sustentável, aliado ao processo de urbanização das cidades, geram benefícios de diversos tipos para as pessoas. A urbanização sustentável traz, portanto, vantagens de cunho social, como a melhoria da qualidade de vida nas cidades; de cunho econômico, refletindo-se na prosperidade da economia local; e ambiental, contribuindo para a diminuição do problema de aquecimento global; entre outros (Pnuma, 2011 apud Rego, 2013).

Hoje, cidade inteligente significa cidade resiliente e sustentável, isto é, com flexibilidade e capacidade de adaptação; capaz de dar respostas rápidas e eficientes às ameaças externas, como, por exemplo, mudanças climáticas, desastres, chuvas intensas, furacões, ou, simplesmente, atender aos princípios básicos de segurança alimentar ou de qualquer outra natureza.

A inteligência da cidade inclui a identificação da vocação produtiva local, em função da cultura e de atividades econômicas

já estabelecidas, para melhor aproveitar suas potencialidades. Inclui, sobretudo, a descoberta de novas vocações, inexploradas, que poderão resultar em empregos, dinamismo econômico, investimentos públicos e privados para a melhoria das condições de vida da população.

Uma Smart City tem três focos importantes:

É sustentável: usa a tecnologia digital para reduzir custos e otimizar o consumo de recursos de modo que sua administração presente não comprometa o uso pelas gerações futuras;

É inclusiva e transparente: tem canais de comunicação diretos com os cidadãos, opera com dados abertos e permite acompanhar suas finanças;

Gera riqueza: oferece infraestrutura adequada para geração de empregos de alta qualidade, inovação, competitividade e crescimento dos negócios;

É feita para os cidadãos: usa a tecnologia digital para melhorar a qualidade de vida das pessoas e dar acesso rápido a serviços públicos mais eficientes.

Nota-se que nos quatro focos apresentados a tecnologia digital é um vetor recorrente, o que nos leva a apontar as tecnologias inerentes ao seu sucesso. Primeiramente a tecnologia nos brinda com o BigData, baseado em grandes repositórios de dados estruturados ou não. Imagina-se, por exemplo, que somente os dados coletados sobre fatores que influenciam a mobilidade urbana rendam tera Bytes de dados em curto espaço de tempo. Como dados ainda não são informações, traz-se um novo termo o *Business Intelligence*, que procura dar qualidade e importância aos dados coletados, para que governantes e dirigentes tomem as ações corretas. Porém, temos que pensar como coletar e transportar esses dados. Mais uma vez a tecnologia é um forte aliado com mecanismos robóticos e mecatrônicos de aquisição e redes velozes e com forte capilaridade ajudam nessa tarefa. Atualmente a tecnologia está madura para investirmos esforços nesse sentido, e o emprego do IoT (Internet of Things) Internet das coisas, os micro-satélites de baixa ordem, e a tão famosa rede TCP/IP (Protocolos usados na infraestrutura da Internet). Mas nem tudo está pronto, a segurança e o uso dessas informações carece de pesquisa e investimentos, pois, pessoas e organizações criminosas sempre estarão à espreita para provocar algum dano material ou econômico. Hackers e pessoas inconscientes podem gerar danos a essa arquitetura, e embora lista-se uma grande quantidade de aplicações de proteção, é comum vermos no noticiário, que uma grande empresa, ou algum governo tiveram seus dados roubados e utilizados para fins indevidos.

Santos já iniciou seu trabalho, tem a cidade toda mapeada e já possui alguns dados sobre a cidade e mobilidade à disposição de moradores, pesquisadores ou qualquer um que queira se informar sobre a cidade. Mas ainda há um longo caminho a ser percorrido.

RESUMO

Na sociedade moderna, a percepção do mundo que nos rodeia depende, em muito, da compreensão de informação de cariz numérico. A presença, constante, de dados estatísticos nas mais diversas situações da vida pessoal, social e profissional, condiciona a cidadania informada e participativa à avaliação crítica, decodificação, compreensão e uso adequado desses dados.

A tomada de consciência de que as competências estatísticas se tornaram cruciais para os indivíduos, similarmente à capacidade de ler ou escrever, promoveu a disseminação do estudo da Estatística. Em Portugal, como em muitos outros países, os estudantes estudam Estatística desde os primeiros anos do ensino básico até ao ensino secundário, contudo, muitos destes estudantes não adquirem, durante esses anos, as competências estatísticas básicas, revelando dificuldades em aspectos tão comuns e indispensáveis como a leitura e interpretação de informação estatística expressa em tabelas e gráficos ou a compreensão das medidas estatísticas.

O presente estudo pretende analisar os factores que contribuem para as dificuldades que os estudantes do ensino superior politécnico apresentam no que se refere à interpretação de gráficos estatísticos, em particular os gráficos de barras. Com base nos dados recolhidos e na revisão da literatura, os erros, cometidos na interpretação dos gráficos, foram identificados e classificados.

Palavras-chave: Gráficos, Ensino Superior, Literacia Estatística.

JEL Classification: C10, I23

1. INTRODUÇÃO

Sendo relativamente recente o reconhecimento da imprescindibilidade das competências de cariz estatístico, vulgarmente designadas por literacia estatística, são de há muito os alertas para a crescente importância da Estatística, numa sociedade onde os dados numéricos são cada vez mais abundantes e relevantes. Talvez pela sagacidade das suas palavras, provavelmente pela sua popularidade e visibilidade, é quase obrigatório citar o escritor britânico H. G. Wells (1866, 1946) quando se discute o papel de destaque que a Estatística vem desempenhando na sociedade. Quando o autor de *A Guerra dos Mundos*, *A Máquina do Tempo* e *O Homem Invisível* referiu que “No futuro, o pensamento estatístico será tão necessário, para o exercício de uma cidadania eficiente, como saber ler e escrever”, as suas palavras pareceram um enorme exagero, o que não será de estranhar pois ainda hoje há muito quem desvalorize a importância da literacia estatística, em particular, e da numeracia, em geral, mas, de facto, em meados do século XIX, havia já quem tivesse tomado consciência de que a evolução da sociedade conduziria a uma crescente necessidade de o cidadão comum possuir competências que lhe permitam lidar, adequadamente, com a informação estatística com que se depara no seu quotidiano.

Ao longo do século XX, os alertas, sobre a importância da cultura estatística, foram subindo de tom. Para tal, muito contribuiu o desenvolvimento tecnológico e o reconhecimento da utilidade da Estatística em todas as áreas do conhecimento. Como resposta à necessidade crescente de formação estatística, de investigadores e profissionais das mais diversas áreas, o ensino da Estatística expandiu-se, em poucas décadas, à grande maioria dos cursos do ensino superior.

Aos poucos, também a vida do cidadão comum passou a contar com a presença da Estatística, de forma cada vez mais visível e frequente. Vivemos actualmente numa sociedade baseada em dados, e estes estão presentes, se não em todas, em quase todas as actividades do nosso quotidiano, pelo que as competências estatísticas são hoje, também, imprescindíveis a todos quantos desejam o exercício de uma cidadania informada e participativa. O reconhecimento da formação estatística como parte imprescindível da formação cívica dos indivíduos, culminou na necessidade de alargamento do estudo da Estatística a todos os níveis de ensino.

Foi na segunda metade do século XX que os currículos escolares portugueses, do ensino secundário, passaram a incluir o estudo da Estatística, integrado no programa da disciplina de Matemática. Acompanhando a tendência internacional de

alargamento do estudo da Estatística ao ensino básico, o tema da Estatística foi introduzido progressivamente nos currículos do 2º e 3º ciclo do ensino básico, no início dos anos noventa, e no 1º ciclo do ensino básico, em 2007.

Pretendendo fazer face à constante evolução da sociedade e à forma como essa evolução se reflecte na vida dos indivíduos, as recomendações curriculares, a nível internacional, foram enfatizando a importância do reforço da literacia estatística, não só em termos de conteúdos mas também na forma de abordagem desses conteúdos. Em Portugal, as tendências internacionais têm vindo a ser acompanhadas, ainda que se levantem dúvidas da convergência das mais recentes alterações às metas curriculares de Matemática do ensino básico (MEC, 2013) e de Matemática A do ensino secundário (MEC, 2014) com o percurso trilhado até então (p.e. Henriques & Fernandes, 2015).

Apesar de o estudo da Estatística, no ensino básico e secundário, estar consolidado há já um número considerável de anos e de os alunos terem contacto com a Estatística em diversos momentos da sua formação pré-superior, existem vários estudos, tanto em Portugal (p.e. Carvalho, 2004; Boaventura, 2003) como noutros países (p.e. delMas *et al.*, 2007; delMas & Liu, 2005; Garfield, 2003; Batanero *et al.*, 1994) que identificam consideráveis lacunas nas competências de cariz estatístico dos alunos, durante a frequência e no final dos vários níveis de ensino.

Com o estudo que serve de base a este artigo pretendemos identificar as dificuldades que estudantes, à entrada do ensino superior politécnico, apresentam no que se refere a vários conceitos básicos de Estatística e Probabilidades, pertencentes aos programas da sua formação pré-superior. Com esta avaliação diagnóstica pretendemos recolher informação que nos permita compreender os factores que concorrem para as fragilidades que os alunos demonstram, no decorrer do processo de aprendizagem dos conteúdos das U.C. da área da Estatística, e nos sirva de base para a implementação de medidas correctivas, como o ajustamento dos métodos e estratégias de ensino em função das características, percursos e necessidades dos alunos. De entre os conteúdos que foram alvo dessa avaliação diagnóstica, seleccionámos, para este artigo, apenas os aspectos relacionados com gráficos estatísticos, mais precisamente a leitura e interpretação de informação expressa em gráficos de barras.

2. A LITERACIA ESTATÍSTICA

Como consequência do intenso e acelerado desenvolvimento tecnológico que a sociedade actual vem experienciando, as competências consideradas indispensáveis à vida pessoal, social e profissional diferem, consideravelmente, das exigidas há algumas décadas, que se restringiam à capacidade de ler, escrever e calcular.

Analisando o vasto leque de competências consideradas, agora, indispensáveis para fazer face à complexidade da sociedade moderna, que D'Ambrosio (1999) sintetiza em três domínios: literacia, matemacia e tecnocracia, percebe-se claramente que a alteração registada não incide apenas na quantidade de competências exigidas, mas também, e com grande ênfase, na mudança do enfoque da posse para a capacidade de usar essas competências. Fica ainda claro, tanto na colecção de competências do triunvirato de D'Ambrosio (1999), quer nas definições de literacia, no seu sentido mais lato, propostas por Kirsch *et al.* (1993), Benavente *et al.* (1996) ou Murnane *et al.* (2012), que um dos elementos fulcrais passa pelas competências necessárias para aceder, processar e comunicar informação.

Estando fora do âmbito deste trabalho a revisão das competências que os diversos autores têm cunhado como imprescindíveis, ou das competências que estes consideram necessárias para aceder, processar e comunicar informação, no geral, iremos centrar-nos nas competências direccionadas para aceder, processar e comunicar informação numérica, em particular a informação de cariz estatístico.

Hoje, mais do que nunca, grande parte da informação surge na forma de dados estatísticos ou gráficos, incluídos em notícias e relatórios que servem de base à tomada de decisão, seja profissionalmente, seja na vida pessoal e social. Inevitavelmente, parte das competências, exigidas ao cidadão de hoje, concorrem para a compreensão de argumentos baseados em dados estatísticos, ou seja, parte das competências que compõem a “nova” literacia referem-se à literacia estatística.

São inúmeras as definições de literacia estatística presentes na literatura. Destas, destacamos quatro que, no seu conjunto, achamos mostrar claramente, não só a diversidade de competências envolvidas, como o relevo que é dado à capacidade de utilizar essas capacidades na vida quotidiana.

Para Gal (2000), a literacia estatística é “a capacidade de interpretar e avaliar criticamente a informação estatística e os argumentos baseados em dados, que surgem nos diversos meios de comunicação, e a capacidade de discutir opiniões a respeito dessa informação estatística”. Particularizando um pouco mais, Garfield (1999, *apud* Rumsey, 2002) considera que a literacia estatística inclui “a compreensão da linguagem estatística: palavras, símbolos e termos. Ser capaz de interpretar gráficos e tabelas. Ser capaz de ler e dar sentido às estatísticas nas notícias, *media*, sondagens, etc”. Com base na definição anterior e noutras de outros autores, Garfield & Ben-Zvi (2007) defendem que a literacia estatística é sinónimo de “compreensão e uso das ferramentas e linguagem básica da Estatística: sabendo o significado dos termos estatísticos básicos, compreendendo o uso de símbolos estatísticos básicos e sendo capaz de interpretar diferentes representações de dados”. Watson (1997) sugere um modelo de literacia estatística com três níveis progressivos, o primeiro dos quais envolve “a compreensão básica da terminologia estatística”, o segundo que envolve “a incorporação da linguagem e conceitos estatísticos” e o terceiro em que surge “a capacidade de questionar e rebater a fundamentação de alegações estatísticas”.

Ratificado o papel central que a Estatística desempenha na sociedade moderna (Wallman, 1993), intensificaram-se os alertas para a necessidade de a educação estatística contribuir para o, efectivo, desenvolvimento da literacia estatística (p.e. Gal & Garfield, 1997) e de os currículos escolares terem como pilar as manifestações estatísticas presentes nas dimensões pessoal, social e profissional, da vida dos alunos (Schield, 2004). Esses alertas tiveram eco na reformulação dos currículos escolares um pouco por todo o mundo, estando bem patentes nas orientações dos currículos de Matemática, dos níveis de

ensino básico e secundário portugueses, onde a literacia estatística aparece como um elemento chave (Canavarro, 2015), verificando-se a coincidência entre as competências desta e muitos dos objectivos desses programas de Matemática (MEC, 2013, 2014).

Como se percebe da análise das diversas definições de literacia estatística e da forma reiterada como surge, transversalmente, nos programas de Matemática do ensino básico e secundário, a representação de dados e a sua interpretação é considerada de enorme relevância.

3. A ESTATÍSTICA NO ENSINO SUPERIOR

No ensino superior, em Portugal, a maior parte dos cursos de formação inicial integram, no seu currículo, pelo menos uma unidade curricular de Estatística (Dias & Santos, 2014). Não obstante a necessidade de adequar os conteúdos dessas unidades curriculares às necessidades específicas de cada curso, as unidades curriculares de Estatística, dos diversos cursos e instituições do ensino superior, apresentam programas algo semelhantes, visto a maior parte das ferramentas estatísticas serem de aplicação transversal a todas as áreas.

Numa tentativa de tratar o máximo de conteúdos de nível mais avançado e integrar o uso de softwares de análise de dados, em unidades curriculares com cada vez menos horas lectivas, existe a tendência para preferir a abordagem dos conceitos base da cultura estatística, por se suporem já adquiridos nos níveis de ensino anteriores.

Como comprova a nossa experiência, de quase vinte anos de leccionação de variadas U.C. de Estatística, no ensino superior politécnico e universitário, e inúmeros estudos desenvolvidos em Portugal (p.e. Carvalho, 2004; Boaventura, 2003) e internacionalmente (p.e. delMas *et al.*, 2007; delMas & Liu, 2005; Ben-Zvi & Garfield, 2004; Garfield, 2003; Batanero *et al.*, 1994), sobre as lacunas na cultura estatística, que os alunos carregam ao longo de todo o seu percurso escolar até final do ensino secundário, os alunos atingem, frequentemente, o ensino superior sem possuírem as competências estatísticas básicas, revelando dificuldades em diversos aspectos, alguns tão triviais e indispensáveis como a interpretação de informação expressa em gráficos e tabelas, o uso e interpretação de medidas estatísticas ou a tomada de decisão com base em informação de cariz probabilístico.

Cientes de que as lacunas na literacia estatística, dos alunos do ensino superior, constituirão um enorme entrave à evolução do conhecimento e raciocínio estatístico desses alunos, e de que o ensino superior será, para a esmagadora maioria dos alunos, a última oportunidade de aquisição das competências estatísticas básicas, parece-nos de enorme importância adequar as U.C. de Estatística ao perfil dos alunos que a vão frequentar, proporcionando um reforço das bases da cultura estatística desses alunos, ao mesmo tempo que se lhes dá a conhecer um leque mais alargado e avançado de métodos estatísticos.

4. OS GRÁFICOS ESTATÍSTICOS

A capacidade de sumarizar grande volume de dados e expressar as características mais relevantes desses dados, permitindo converter informação quantitativa em informação qualitativa, tornou a Estatística uma ferramenta de trabalho imprescindível, tanto para os investigadores, como para os difusores de informação social, política, publicitária ou outra.

Na tarefa de representar dados estatísticos, de forma resumida e ordenada, facilitando a sua leitura e interpretação, um dos recursos mais utilizados são os gráficos.

Apesar de o uso corrente de gráficos, para apresentar dados estatísticos, só ter ocorrido no início no século XIX (Spence & Lewandowsky, 1990), os alicerces tinham já sido lançados no século anterior, com o valioso contributo de William Playfair (1759-1823), a quem se atribui a invenção de grande parte das representações gráficas mais em voga na actualidade, como o gráfico de barras, o sectograma (gráfico em pizza), o histograma ou o pictograma (Tufte, 1983).

Apesar do reconhecimento, por muitos, da utilidade dos gráficos de Playfair, a preferência pela representação tabular de dados, em detrimento da representação gráfica, manteve-se durante muitos anos, justificada, possivelmente, pela acrescida dificuldade técnica da elaboração dos gráficos.

Beneficiando do desenvolvimento tecnológico e do aparecimento de variados programas informáticos que auxiliam na elaboração de gráficos estatísticos, o uso destes gráficos generalizou-se.

Na sociedade actual, os gráficos estatísticos estão presentes, quotidianamente, nas mais diversas situações, tendo-se tornado elementos imprescindíveis, em relatórios científicos, na política, no desporto ou na publicidade, com a finalidade de comunicação e/ou análise (Kosslyn, 1985).

A popularidade que os gráficos granjearam, deve-se, em grande parte, à sua capacidade de transmitir grandes quantidades de informação, de forma simples, rápida e atractiva. Mas esta que é a sua maior virtude, constitui também, por distintas razões, um desafio para os consumidores de informação expressa em gráficos que, não estando cientes das potencialidades e limitações desta forma de representação de dados estatísticos, poderão reter uma ideia deturpada do conteúdo do gráfico.

Sendo inquestionável a utilidade das representações gráficas de dados estatísticos, a eficácia destes gráficos fica condicionada pela adequação do tipo de gráfico aos dados a representar e à mensagem que se pretende transmitir, assim como pela legibilidade e lógica do desenho do gráfico, que permita, ao seu consumidor, a adequada interpretação dos dados nele representados.

Não obstante a multiplicidade de formatos de gráficos disponíveis actualmente, o gráfico de barras tem-se mantido no lugar cimeiro das preferências, quando se trata de representação de dados estatísticos, beneficiando da sua simplicidade e versatilidade.

Tendo como base um sistema de coordenadas cartesianas, o gráfico de barras é, tal como o nome indica, constituído por

barras (usualmente verticais) assentes no eixo das ordenadas, onde estão representados os diferentes valores da variável em estudo (que tanto pode ser uma variável qualitativa ou quantitativa). De acordo com a escala utilizada no eixo das ordenadas, a frequência (absoluta ou relativa) de cada um dos valores da variável determina a altura das barras.

4.1 A interpretação de gráficos estatísticos

Quando se organiza, descreve e analisa um conjunto de dados estatísticos desenvolve-se um processo de *transnumeração*, pelo qual se obtém nova informação, que não estava disponível nos dados iniciais, através da mudança do sistema de representação (Arteaga *et al.*, 2011). Esta *transnumeração* é evidente na representação gráfica de um conjunto de dados, pois, através da mudança de representação, é possível resumir a informação contida nesses dados, fazer comparações ou detectar tendências, o que, com base nos dados iniciais, dificilmente seria possível.

Considerando a construção de um gráfico como a codificação de informação e sua interpretação como decodificação (Cleveland & McGill, 1984), a eficácia na assimilação do conteúdo de um gráfico está dependente da capacidade de decodificação (processamento) da informação de quem o analisa e da capacidade do gráfico em transmitir a informação (p.e. Pinker, 1990; Peebles & Cheng, 2003; Shah, Freedman, & Vekiri, 2005).

Quando bem desenhado, um gráfico constitui uma poderosa ferramenta de representação e resumo de informação quantitativa (p.e. Shah, Freedman, & Vekiri, 2005), contudo o seu carácter imediatista e simplista pode também prejudicar a compreensão do seu conteúdo.

Seja pela inadequada preparação do produtor de um gráfico ou pelo carácter obscuro das intenções com que muitos dos gráficos são desenhados, são inúmeros os aspectos que podem ser esquecidos, descuidados ou intencionalmente omitidos ou adulterados nesses gráficos (p.e. Huff, 1954) e que influenciam o significado da informação que chega ao consumidor. Para que seja possível interiorizar, eficazmente, a mensagem embebida num gráfico e ter uma visão clara das pretensões de quem construiu esse gráfico, o processo de decodificação da mensagem transmitida, por um gráfico, deve envolver as mesmas competências que assistiram à sua construção (Steen, 1999).

Decorrente da disseminação do uso de gráficos, registou-se uma crescente preocupação com a identificação dos factores que envolvem a sua compreensão, repercutida em vasta investigação sobre esta temática (p.e. Galesic & Garcia-Retamero, 2011; Arteaga *et al.*, 2011; Ratwani, Trafton & Boehm-Davis, 2008; Mautone & Mayer, 2007; Friel, Curcio & Bright, 2001; Shah, Mayer, & Hegarty, 1999; Kosslyn, 1985).

De acordo com o grau de abstracção exigido, Bertin (1967, apud Wainer, 1992), Kosslyn (1985) e Curcio (1989) propõem a classificação da compreensão de um gráfico em três níveis, resumidos na tabela seguinte.

Tabela 1: Níveis de compreensão de um gráfico

Autor	Níveis de compreensão		
	Elementar	Intermédio	Superior
Bertin (1967)	Extraí dados (Relacionar um elemento de um eixo com um elemento do outro eixo).	Extraí de tendências (Identificar relações entre subconjuntos dos dados).	Analisa a estrutura dos dados (Comparar tendências ou agrupamentos e efectuar predições).
Kosslyn (1985)	Reconhece as propriedades dos elementos constituintes do gráfico. (Nível sintático)	Avalia o significado do gráfico e interpreta a informação quantitativa e qualitativa nele contida. (Nível semântico)	Procura o objectivo do gráfico e a analisa o propósito da informação transmitida (Nível pragmático).
Curcio (1989)	Lê os dados (leitura literal da representação em causa; compreensão da escala e das unidades de medida; resposta a questões explícitas; identificação e classificação das variáveis em estudo).	Lê entre os dados (interpretação e organização da informação patente na representação; construção de diferentes representações; compreensão e aplicação das propriedades de medidas de resumo; explicação do significado de valores obtidos; comparações entre os dados e respectivas representações; recurso a conhecimentos matemáticos prévios).	Lê além dos dados (extrapolação, previsão ou inferência a partir da informação contida no gráfico; capacidade de colocar questões).

Partindo destas classificações, poder-se-á considerar que o processo de compreensão de um gráfico tem duas etapas: a leitura e a interpretação, sendo que, a primeira pode ocorrer sem a segunda, mas a segunda está intimamente ligada à primeira e dela dependente.

Como decorre das definições de literacia estatística, a tomada de consciência, plena, do conteúdo de um gráfico envolve competências associadas aos níveis mais avançados da compreensão de gráficos, sendo necessária, mas manifestamente insuficiente, a simples capacidade de extracção de dados do gráfico.

Sustentando-nos nos autores anteriores (Tabela1), distinguimos a compreensão limitada de um gráfico (presente nos primeiros níveis das classificações anteriores), sintetizada no termo “leitura”, que envolve, unicamente, a capacidade de leitura literal da informação expressa no gráfico, da compreensão efectiva do conteúdo de um gráfico, sintetizada no termo “interpretação”, que envolve a leitura crítica do gráfico, através da identificação de tendências, variabilidade e possível associação nos dados representados no gráfico e detecção de falhas no seu desenho que possam distorcer a informação

transmitida.

Vejam os que diferentes autores entendem por “interpretação de um gráfico”. Friel, Curcio, & Bright (2001) consideram a “interpretação de um gráfico” como sinónimo de capacidade de extrair significado desse gráfico, reconhecendo os elementos constituintes do gráfico e a sua adequação, avaliando a influência de cada um desses elementos na transmissão da informação, traduzindo as relações estabelecidas entre o gráfico e os dados nele representados e avaliando a pertinência e adequação do gráfico.

Para Wu (2004) a interpretação de um gráfico refere-se à capacidade de formular opiniões acerca da informação expressa no gráfico e do desenho desse gráfico.

Segundo Monteiro & Ainley (2004), a interpretação de gráficos é muito mais que um simples procedimento técnico, envolvendo um vasto leque de conhecimentos, experiências e sentimentos.

4.2 Os erros de interpretação de gráficos estatísticos

Apesar do papel, indiscutivelmente, facilitador das representações gráficas na compreensão das características de grandes volumes de dados, para muitas pessoas, o processo de leitura e interpretação de um gráfico (mesmo o mais elementar) não é simples, como se percebe pelos alertas de Arteaga *et al.* (2011) para o facto de a capacidade de leitura e interpretação não se adquirir espontaneamente, e de se configurar de difícil aquisição, mesmo através do ensino. Para esta dificuldade, Galesic & Garcia-Retamero (2011) apresentam como argumento o facto de as representações gráficas de dados serem relativamente recentes na história humana, o que não possibilitou ainda que o ser humano desenvolvesse a capacidade intuitiva de compreensão de gráficos.

Marcados pela influência da capacidade de cada indivíduo na decodificação da informação contida num gráfico e da capacidade do gráfico em transmitir a informação, surgem erros e dificuldades na leitura e interpretação do conteúdo dos gráficos, associados aos vários níveis de compreensão de um gráfico.

Embora raros estudos se debrucem exclusivamente sobre a compreensão de gráficos de barras, é possível encontrar, na literatura, vários estudos, sobre gráficos em geral, onde são identificados erros e dificuldades na leitura e interpretação de gráficos de barras.

Com base nos resultados das investigações de Pereira Mendoza & Mellor (1990), Wu (2004), Watson (1997) e Arteaga *et al.* (2011) apresentamos uma súmula dos aspectos, mais comuns, envolvidos nos erros e dificuldade associados à interpretação de gráficos de barras:

- Confusão entre o valor da variável e a frequência;
- Compreensão dos valores representados nos eixos;
- Compreensão do propósito do gráfico;
- Compreensão do contexto em que surgem os dados;
- Domínio da terminologia adequada à descrição do conteúdo do gráfico;
- Comparação das alturas das barras descurando as frequências;
- Variação da disposição dos dados (barras horizontais vs barras verticais);
- Deficiente domínio de percentagens, proporcionalidade, etc;
- Erros de cálculo.

5. METODOLOGIA

Conscientes da impossibilidade de avaliar todas as competências envolvidas na literacia estatística, presentes nos programas da disciplina de Matemática dos níveis de ensino básico e secundário, direccionámos o estudo, que deu origem a este artigo, para os conceitos e técnicas estatísticas básicos que se podem considerar como a base de trabalho da maioria das unidades curriculares de Estatística leccionadas no Ensino Superior, em Portugal, e que se supõem já abordados nos níveis de ensino anteriores.

Dos conceitos e técnicas estatísticas avaliados, seleccionámos, para análise neste artigo, apenas os aspectos relacionados com a interpretação de gráficos, em particular a leitura e interpretação da informação expressa em gráficos de barras.

Tendo presentes os aspectos que, na literatura, são identificados como influenciadores da compreensão de um gráfico de barras, e as metas estabelecidas nos programas de Matemática do ensino básico e secundário, em Portugal, referentes à construção e interpretação de gráficos estatísticos, elaborámos um questionário para a recolha de dados nesta investigação.

O questionário, respondido pelos alunos durante uma aula de 120 minutos, compreende duas partes. A primeira parte, com questões direccionadas para a caracterização pessoal do aluno e do seu contacto prévio com o estudo da Estatística, em particular, o seu reconhecimento sobre a alusão a conceitos e técnicas estatísticas como: variável estatística, amostra, população, frequência absoluta e relativa, gráfico de barras, histograma, medidas de localização e medidas de dispersão. A segunda parte, composta por tarefas, estruturadas, destinadas a avaliar diferentes aspectos relacionados com as competências da literacia estatística, das quais destacamos as duas tarefas de interpretação de gráficos de barras, que a seguir descrevemos.

5.1 As tarefas

A tarefa A, cujo enunciado se apresenta na figura 1, consistia em observar/analisar um gráfico de barras, semelhante a muitos dos que surgem nos *media*, e comentar a afirmação que era feita.

Para a construção do gráfico de barras, desta tarefa, usámos informação disponibilizada pela Anecra, relativa às vendas de veículos ligeiros de passageiros, nos meses de Janeiro de 2012 e 2013, em Portugal. Com o objectivo de distorcer a leitura

do gráfico, se baseada apenas na comparação da altura das barras, o eixo das ordenadas foi truncado, passando a interceptar o eixo das ordenadas não em zero, mas num valor que proporcionasse a obtenção de uma barra cerca de duas vezes mais alta que a outra.

Figura 1: Enunciado da tarefa A

Relativamente aos níveis de compreensão de gráficos, o comentário à afirmação apresentada na tarefa compreende um grau de abstracção muito reduzido, envolvendo, predominantemente, o nível elementar de compreensão de gráficos, com a extracção/ leitura literal de dados (Berlin, 1967; Curcio, 1989), o reconhecimento das propriedades dos elementos constituintes do gráfico (Kosslyn, 1985), a compreensão da escala e das unidades de medida e a identificação e das variáveis em estudo (Curcio, 1989). Visto que, para fundamentar o comentário, seria necessário o cálculo de uma percentagem, poderemos considerar que, de alguma forma, também estava envolvido o nível intermédio de compreensão de gráficos, com o recurso a conhecimentos matemáticos prévios (Curcio, 1989). De notar que, o interesse da tarefa A se prendia, também, com a apreciação de como a manipulação do desenho do gráfico influenciava a percepção do seu conteúdo, isto é, se os alunos detectavam a alteração e como reagiam ao conflito entre a primeira impressão transmitida pelo gráfico (provocada pela alteração) e as conclusões que tirariam da análise dos valores expressos no eixo das ordenadas e calculando a diferença relativa entre os valores das vendas nos dois meses em comparação.

A tarefa B, cujo enunciado se apresenta na figura 2 (com apenas duas das cinco alíneas que compunham a tarefa), consistia em observar/ analisar um gráfico de barras, interpretar o seu conteúdo e identificar determinadas características da distribuição de frequências da variável representada.

Figura 2: Enunciado da tarefa B

Num estudo, realizado em 2016, registou-se o número diário de presenças dos utentes do serviço de Terapia Ocupacional de um hospital português. O gráfico seguinte apresenta os valores observados.

- De acordo com o contexto do problema, como interpreta a barra destacada a negro?
- Indique o mínimo, o máximo e a amplitude dos valores da variável representada no gráfico.

O gráfico de barras desta tarefa tem como base uma situação hipotética, com dados forçados que nos permitiam obter um gráfico com todas as características que pretendíamos. De destacar que o gráfico não apresenta, propositadamente, rótulos nos eixos, para avaliar de que forma esse aspecto dificulta a compreensão do contexto do gráfico, em particular a identificação da variável e população (amostra) em estudo.

Relativamente aos níveis de compreensão de gráficos, a tarefa B envolve não só o nível elementar com a extracção/ leitura literal de dados (Berlin, 1967; Curcio, 1989), o reconhecimento das propriedades dos elementos constituintes do gráfico (Kosslyn, 1985) e a compreensão da escala e das unidades de medida e a identificação e das variáveis em estudo, mas também o nível intermédio, com a avaliação do significado do gráfico e interpretação da informação quantitativa e qualitativa nele contida (Kosslyn, 1985) e a compreensão e aplicação das propriedades de medidas de resumo (Curcio, 1989).

5.2 Participantes

Neste estudo participaram 27 alunos do ensino superior politécnico que frequentaram uma unidade curricular de Estatística, pertencente ao 1º ano do seu curso. Destes, 93% (25 alunos) são do sexo feminino. Todos já tinham estudado Estatística, antes da frequência desta unidade curricular, e já tinham estudado/ ouvido falar em variável estatística, amostra, população, frequência absoluta e relativa, gráfico de barras, histograma, medidas de localização e medidas de dispersão.

6. RESULTADOS

Os registos escritos produzidos pelos alunos foram analisados e as respostas foram classificadas de acordo com a sua correcção e os tipos de erros cometidos.

Tarefa A

Entre os comentários dos 27 alunos, registaram-se 6 com respostas correctas, 10 com respostas parcialmente correctas e 11 com respostas incorrectas.

Consideraram-se parcialmente correctas as resposta que, apesar de apresentarem argumentos válidos, relativamente à discordância com a expressão “enorme aumento”, não fundamentavam a argumentação com o valor da percentagem a que correspondia o aumento verificado nas vendas de automóveis de 2012 para 2013, essa sim, demonstrativa da magnitude do aumento.

Quanto aos erros cometidos nas respostas incorrectas, verificou-se que 5 alunos não souberam calcular a percentagem em questão, considerando que um aumento de, aproximadamente, 60 veículos vendidos correspondia a um aumento de 60%, 2 alunos não detectaram a alteração que tinha sido introduzida no desenho do gráfico e atentaram apenas ao facto de

uma das barras ter mais do dobro da altura da outra, negligenciando a informação presente na escala do eixo das ordenadas, 2 alunos consideraram que o aumento de vendas de 2012 para 2013 foi grande, sem apresentarem qualquer razão para tal afirmação e 2 alunos consideraram que uma diferença de, aproximadamente, 60 veículos se poderia considerar um grande aumento, por não terem reflectido sobre qual o valor relativo associado a este aumento.

Figura 3 – Resposta parcialmente correcta (aluno 6)

Em Janeiro de 2012, venderam-se aproximadamente 6960 veículos ligeiros de passageiros em Portugal. Já em Janeiro de 2013, os veículos vendidos ultrapassaram ligeiramente os 7020.
Assim, concordo ^{em parte} com a afirmação pois foram vendidos, aproximadamente mais 60 automóveis em 2013 do que em 2012. Assim, houve sim um aumento em comparação dos dois meses, no entanto, esse aumento não foi assim tão grande.

Figura 4 – Resposta incorrecta (aluno 17)

Concordo com a afirmação, pois houve um aumento de aproximadamente 60% das vendas do carro comparativamente a Janeiro de 2012 em Janeiro de 2013.
 $7020 - 60 = 6960$

Figura 5 – Resposta incorrecta (aluno 20)

Se considerarmos que as vendas de Janeiro de 2012 é 100% em Janeiro de 2013 a percentagem de vendas aumentou mais de 200%. Daí podemos concluir que a afirmação dada coincide com os dados do gráfico.

Da classificação das respostas à tarefa A, de acordo com os níveis de compreensão de gráficos de Curcio (1989), constata-se que, apesar de a tarefa compreender um grau de abstracção muito reduzido, a grande maioria dos alunos apenas conseguiu a leitura literal dos dados, situando-se portanto no nível elementar de compreensão de gráficos, não logrando usar valores relativos para fundamentar o seu comentário à afirmação apresentada no enunciado.

Tarefa B

Na interpretação da barra destacada a negro (alínea a)), apenas 7 alunos apresentaram uma resposta correcta. Da análise das respostas incorrectas verificou-se que 15 alunos confundiram o valor da variável com a frequência (sendo que 6 destes, para além da confusão, demonstram também não compreender o conceito de frequência), 1 aluno, apesar de ter identificado a variável correctamente, demonstrou não compreender os valores expressos no eixo das ordenadas, 2 fundamentam as respostas apenas no valor da variável, desprezando a frequência que lhe está associada. Dos 27 alunos, 2 não responderam a esta questão.

Figura 6 – Resposta incorrecta (aluno 12)

A barra a pedido quer dizer que em 3 dias, 19 utentes marcaram presença no serviço de Terapia Ocupacional

Figura 7 – Resposta incorrecta (aluno 8)

A barra a pedido quer dizer que em 3 dias, 19 utentes marcaram presença no serviço de Terapia Ocupacional

Na alínea b), as respostas relativas ao valor mínimo da variável foram as que registaram maior número de acertos, 14. Das respostas incorrectas ao valor mínimo, 8 manifestavam confusão entre o valor da variável e a frequência, 1 apresentou o valor da amplitude e 4 apresentavam valores sem sentido face ao contexto. Quanto ao valor máximo, registaram-se 9 respostas correctas. Entre as respostas incorrectas, 9 manifestavam confusão entre o valor da variável e a frequência, 3 consideravam o máximo como o valor mais elevado apresentado na escala do eixo das ordenadas (29), 1 manifestava confusão entre o máximo e a moda e 2 apresentavam valores sem sentido face ao contexto. Dos 27 alunos, 3 não responderam a esta questão. No cálculo da amplitude da variável em estudo, registaram-se 9 respostas correctas. Das respostas incorrectas, 8 manifestavam confusão entre o valor da variável e a frequência, 1 determinou a amplitude desprezando o valor 0 da variável e 4 apresentavam valores sem sentido face ao contexto. Dos 27 alunos, 5 não responderam a esta questão.

O gráfico, desta tarefa, não apresentava rótulos nos seus eixos, estando a variável em estudo identificada apenas na parte textual do enunciado. Da análise das respostas, conclui-se que esta circunstância foi determinante para o desfecho da interpretação do gráfico, uma vez que a maioria dos alunos ou confundiu o valor da variável com a frequência ou interpretou erradamente as frequências, não descortinando o significado dos valores expressos no eixo das ordenadas. Este facto demonstra a dificuldade que os alunos apresentaram em desenvolver procedimentos que exijam um nível de abstracção mais elevado do que a simples leitura literal dos dados, não sendo bem sucedidos na compreensão da escala e da variáveis em estudo, ainda que estas práticas pertençam, também elas, ao nível elementar de compreensão de gráficos da classificação de Curcio (1989). Quanto aos aspectos que se relacionavam com o nível intermédio de compreensão de gráficos (determinação do mínimo, máximo e amplitude da variável), constata-se que, também aqui, a confusão entre os valores da variável e a frequência influenciou decisivamente os erros cometidos.

Figura 8 – Resposta incorrecta (aluno 7)

Indique o mínimo 1, o máximo 4 e 28 e a amplitude 3.

Figura 9 – Resposta incorrecta (aluno 8)

Indique o mínimo 1, o máximo 28 e a amplitude 27.

7. CONCLUSÕES

Ao nível do ensino superior, o estudo da Estatística é direccionado para a vertente instrumental desta ciência, enquanto suporte a estudos nos campos das ciências sociais, ciências da saúde, agricultura ou ambiente, entre muitos outros, com o aprofundamento dos conteúdos estudados nos níveis de ensino anteriores e a introdução de novas técnicas. No entanto, quer se pense na necessidade de capacitar os alunos para a realização e avaliação crítica de estudos estatísticos no âmbito da sua actividade profissional, quer se considere simplesmente a formação do aluno enquanto cidadão, componentes básicos da cultura estatística, como a interpretação de gráficos de barras, terão que estar, inevitavelmente, presentes.

Os resultados deste nosso estudo conduziram-nos a conclusões consonantes com as encontradas na literatura sobre este tema, comprovando que a existência de contactos com o estudo da Estatística não acarreta, por si próprio, a aquisição das competências básicas inerentes à literacia estatística.

No caso particular da compreensão de gráficos de barras, os alunos demonstraram limitações na capacidade de extracção de informação de um gráfico. Estas limitações acarretam entraves à interpretação do conteúdo do gráfico que não lhes permite ascender aos níveis superiores de compreensão de gráficos, impossibilitando a análise crítica do gráfico, através da identificação de tendências, variabilidade e possível associação nos dados representados ou da detecção de falhas no seu desenho que possam distorcer a informação transmitida.

A reflexão sobre os resultados deste estudo propicia-nos uma oportunidade de adequar os métodos e estratégias de ensino, implementados nas U.C. que leccionamos, por forma a responder apropriadamente à necessidade de formar cidadãos capazes de produzir, decodificar e usar, de forma consciente, informação estatística, na sua vida pessoal, social e profissional.

VULNERABILIDADES E SOLIDARIEDADES EM CONTEXTO URBANO

Ana Maria da Costa Oliveira

Professora de Serviço Social na Universidade Católica Portuguesa, Faculdade de Ciências Humanas
(anaoliveira@fch.lisboa.ucp.pt)

RESUMO

A palavra “cidade” pode assumir pelo menos dois significados, um mais relacionado com os modos de organização comunitária e outro mais relacionado com o espaço ou território. Em latim, expressa-se *civitas* para o primeiro e *urbs* para o segundo, permanecendo no nosso vocabulário como cidade e urbano. Com efeito, quando hoje se fala de “cidade” – a polis – assume-se como um modo concreto de estar no mundo, coerente com a natureza social do homem.

A cidade foi evoluindo e torna-se em algo mais de que um espaço ou lugar com grandes transformações na sua configuração. Entendida como um campo de ação onde coexistem os progressos e retrocessos sociais e onde se conjugam diferentes processos: de urbanização (industrial, demográfica e cultural), de racionalização (científica, técnica e económica), de democratização (político e social), de secularização (ético e religiosa), entre outras, a cidade assume diferentes formas, escalas e medidas mas que, como refere Galli pode oferecer ao homem muitas possibilidades de humanização, de maneira a que se possa realizar como um ser pessoal, cultural político e social, mas também pode aumentar as suas possibilidades de desumanização (cf. Galli, 2014: 42)

É neste contexto que se aborda o tema das vulnerabilidades urbanas, considerando que as mudanças da sociedade atual alteram os perfis de vulnerabilidade tornando estas situações mais presentes e transversais a todos os grupos sociais, com impacto nos indivíduos e famílias obrigando ao reequilibrar do seu lugar no mundo e das suas expectativas face ao futuro.

Palavras-chave: Cidade, Mudança Social, Vulnerabilidades, Solidariedade.

1. VULNERABILIDADES SOCIAIS EM CONTEXTO URBANO

A sociedade atual apresenta-se como uma realidade inundada pela mudança. A contemporaneidade é um tempo e um contexto marcado pela incerteza e pelo risco ao nível da vida social, no mundo do trabalho, da proteção social, das relações familiares e sociais, entre outros domínios, implicando um ajustamento quase permanente dos indivíduos a essas mudanças. Com efeito, são muitos os fatores de ordem política, económica e ambiental, que vêm abalando os pilares onde assentava a sociedade moderna criando um desequilíbrio e vazio institucional e tendo como consequência um novo tipo de relação entre os indivíduos e a sociedade. De alguma forma, mostra-se “um lado sombrio da modernidade” (Giddens, 1995), onde se assiste a profundas transformações nos modos de vida e nos valores tradicionais, suscitando formas de interligação social à escala do globo, que alteram algumas das características mais íntimas e pessoais da existência quotidiana. Verificam-se, neste contexto, vários processos de mudança, movidos por influências políticas e económicas associadas à globalização, de que a diferenciação social é uma das facetas mais visíveis, com uma crescente desigualdade social, marginalização e um esbatimento das solidariedades sociais. Estas mudanças atingem todas as esferas da sociedade e refletem-se na fragilização das categorias que pareciam estruturá-la: as diferenças de classe, a família, a separação de papéis entre homem e mulher, o desemprego estrutural, o uso político da ciência, entre outros, indiciando um processo de construção de vulnerabilidades que atingem diferentes grupos sociais, em diferentes estádios da vida (cf. Guerra e Pinto, 2015: 169).

As vulnerabilidades urbanas não são fenómenos novos, porém tem vindo a agravar-se em consequência da instabilidade financeira e de contextos caracterizados pelo crescimento do desemprego, por predisposições individualistas que fragilizam as redes sociais e avolumam situações que têm um potencial crescente para comprometer o desenvolvimento humano.

Os contextos urbanos baseados em sociedades materialistas, colocam em destaque a relação entre o que é a integração e a desintegração, enfatizando uma lógica de diferenciação, entre os que têm acesso a um conjunto de recursos e oportunidades e os que deles são privados. Os atuais contextos urbanos possibilitam um quadro favorável a processos de crescente individualismo, precariedade e em ultima instancia de exclusão, uma vez que a impessoalidade e anonimato podem expor mais as fragilidades individuais, tornando as cidades *locus* do reforço da individualização e do isolamento (cf. Amaro, 2015: 191). A desafiliação, um conceito proposto por Robert Castel em 1995, é considerada como a ultima fase do processo de marginalização e entendido como um percurso descendente, ao longo do qual se verificam sucessivas ruturas na relação do individuo com a sociedade (cf. Castel, 1995), apresenta-se como uma das faces mais sombrias dos atuais fenómenos de pobreza (Amaro e Oliveira, 2010; Oliveira, 2010). É um processo de progressiva desintegração ao longo do qual se vão quebrando os laços que ligam o individuo aos sistemas sociais, o mercado de trabalho, a família, amigos, até uma possível exclusão total com a perda de cidadania. Esta conexão ou desconexão social é uma das facetas mais visíveis das nossas cidades e é neste sentido que podemos assumir viver em ambientes de maior ou menor vulnerabilidade social.

A vida urbana atual apresenta sinais de vulnerabilidade individual, e estrutural. A vulnerabilidade indica em geral uma situação de risco perante um determinado perigo e implica um sentido de fragilidade, de pouca capacidade defensiva perante algo ou alguém. Trata-se, por um lado, de uma categoria interacionista, isto é, ninguém é vulnerável em si mesmo, mas em relação a uma determinada pessoa ou situação. Mas, por outro lado, é uma noção que se refere a uma estrutura, uma vez que

sugere alguma dependência das características dos sujeitos ou da situação, pois alguém só pode ser vulnerável se estiver numa determinada posição e não noutra (Walgrave, 2000: 88). Argumenta-se assim que as vulnerabilidades urbanas acontecem em determinados contextos sociais e que estes podem exponenciar a fraqueza dos laços sociais bem como situações de exclusão social.

As vulnerabilidades sociais que analisaremos são situações que se realizam em determinadas circunstâncias, isto é, um grupo ou um indivíduo só é vulnerável em determinadas condições, o que remete de novo para a relação entre vulnerabilidade e contexto social.

Examinando a vulnerabilidade por um prisma de desenvolvimento humano, chama-se a atenção para o risco de deterioração futura das circunstâncias e das conquistas individuais, comunitárias e nacionais. Coloca-se especial ênfase nos fatores sistémicos e persistentes de vulnerabilidade e questiona-se os motivos que levam a que alguns indivíduos superem melhor do que outros a adversidade. Indagamos também as causas estruturais que tornam algumas pessoas mais vulneráveis do que outras. As pessoas experimentam graus variáveis de insegurança e diferentes tipos de vulnerabilidade em diferentes fases do ciclo de vida.

1.1 A vida urbana e o crescente individualismo

A emergência da ideia do indivíduo como ser emancipado e livre torna-se expressão da contemporaneidade (Amaro, 2012), assumido como um sujeito emancipado mas também como um sujeito responsável pela sua própria vida. A conceção de indivíduo nas sociedades contemporâneas ganha destaque assente na ideia do percurso individual e solitário do ser humano como ser livre e emancipado e é neste sentido que Bauman considera a apresentação dos indivíduos, como uma “marca registada da sociedade moderna” (2001: 39).

Não se está perante a apologia do ser humano enquanto pessoa, como no período do Iluminismo, mas perante um processo designado por alguns autores de “individualização”, entendido como uma fatalidade a que ninguém pode escapar (Bauman, 2001; Beck e Beck-Gernsheim, 2011). A individualização surge como uma nova faceta do individualismo, uma vez que transforma a identidade humana de “dado” em “tarefa” e encarrega os indivíduos da responsabilidade de realizar essa tarefa e das consequências (assim como dos efeitos colaterais) de sua realização (Bauman, 2001: 39-40). Não se está perante a apologia do ser humano enquanto pessoa, como no período do Iluminismo, mas perante um processo designado por alguns autores de “individualização”, entendido como uma fatalidade a que ninguém pode escapar (Bauman, 2001; Beck e Beck-Gernsheim, 2011), sendo fruto das condições sociais e uma característica estrutural de uma sociedade altamente diferenciada.

Uma das consequências do acentuar do individualismo da segunda modernidade assenta precisamente na ideia de que um processo de forte individualização contribui para um processo de desintegração da cidadania, como se as pessoas se tornassem *desindividualizantes* umas para as outras. Neste processo emergem muitos indivíduos como que “flutuando na estrutura social, sem ligações ou presos por laços muito frágeis que ameaçam quebrar” (Soulet, 2006), revelando espaços de desafiliação que cruzam os processos de enfraquecimento de relações com mecanismos de precariedade laboral, relacional, social e o perigo de desintegração da cidadania, pois como refere Tocqueville, o indivíduo torna-se o pior inimigo do cidadão, isto porque as suas preocupações preenchem o espaço público, reclamado com uma legitimidade exclusiva, colonizando o público pelo privado (Bauman, 2011: xviii).

Os atuais contextos urbanos oferecem um quadro favorável a estes processos uma vez que o anonimato, a impessoalidade parecem exponenciar o sentimento de “estranhamento do outro” (Amaro, 2015: 191). A arquitetura da cidade revela esta dimensão: prédios altos, com muitos moradores que quase não se cruzam, perdendo-se a importância do “vizinho” como alguém que partilha de um espaço comum; o império automóvel que altera a concepção de mobilidade; os espaços de consumo transformados em grandes “catedrais do nosso tempo” mas que refletem ao mesmo tempo o isolamento e tornam invisíveis muitas das situações de fragilidade social.

1.2 A solidão na vida urbana

A solidão, um dos rostos da desconexão que falávamos no ponto anterior. A “solidão sofrida” referida por Machado Pais (2015) e que fala de laços sociais ausentes. Segundo o Observatório de Luta Contra a Pobreza na Cidade de Lisboa, o concelho da Grande Lisboa continua a ter o índice mais elevado de envelhecimento, mas cada vez mais assistimos a notícias sobre as pessoas morrerem em solidão. De acordo com o último censo da população portuguesa, cerca de 60% da população idosa vive só ou em companhia de outros idosos. Alguns morrem em casa literalmente abandonados, outros em instituições sem visitas frequentes. Para muitos, os animais tornam-se grandes amigos, a televisão passa a constituir parte da “família” com quem se conversa.

O grupo dos idosos é apontados por diferentes estudos sobre a pobreza e a exclusão social, como dos mais atingidos pela pobreza em Portugal, muitos por não possuírem uma reforma mínima para sobreviver. No entanto, o isolamento é o problema mais significativo, em relação aos grupos etários mais jovens, à família, aos amigos, à sociedade. Para Bruto da Costa no prefácio ao livro “Pobreza e Exclusão Social em Portugal” (2015), a cultura vigente, o estilo de vida dominante e a organização social exclui e não inclui os idosos, uma vez que não lhes fornece os meios (financeiros, mas não só) para torná-los cidadãos com capacidade de escolher livremente o que querem viver.

Mas não são apenas os idosos que vivem este sentimento. Quantos rostos se tornam invisíveis na nossa cidade? Pessoas doentes, mas também pessoas isoladas, cujas redes sociais ficam comprometidas perante os contornos da vida, alguns deles sem abrigo, outros trabalhadores pobres mas que são rostos também da nossa cidade. A perda do sentimento de pertença é um dos fatores mais associados à solidão e muitas vezes produtor de desafiliação, provocando as rupturas sucessivas que

anteriormente referenciámos. A doença, a ruptura familiar, a morte de um elemento da rede de suporte, o desemprego, são incidentes críticos que desencadeiam o desligamento até ao isolamento social.

1.3 A vida urbana e a multiculturalidade

Os nossos espaços urbanos tornam-se progressivamente espaços de multiculturalidade, num cruzamento de pessoas com traços diferentes, idiomas diferentes, cheiros e hábitos diferentes, mas onde a convivência é por vezes difícil e onde se exercem várias formas de segregação e violência. Os contextos urbanos oferecem um quadro favorável ao desenvolvimento de diferentes nichos de desigualdade, seja do ponto de vista económico, seja do ponto dos recursos ou do ponto de vista social (cf. Costa, 2012). As periferias da cidade, ou o que alguns designam como “cidade dual”, revelam bem as assimetrias entre grupos sociais e acentuam os mais diferentes níveis de desigualdade.

Por outro lado, o medo, a insegurança, propulsiona um sentimento de defesa e incentiva ao fechamento cultural. As casas, as escolas, os bairros que se constroem são para se proteger e não para unir e integrar, tornando difícil uma perspectiva de integração cultural e de uma sociedade verdadeiramente plural. Por isso mesmo, a arquitetura das cidades tornou-se defensiva: bairros fechados, grades, muros e uma série de mecanismos que restringem o contato com o outro.

Esta é outra faceta da modernidade, por um lado um indivíduo emancipado, mas ao mesmo tempo frágil e vulnerável e o resultado é o surgimento de uma série de medos. Bauman no seu livro “Confiança e Medo na Cidade” (2006) propõe dois conceitos: i) o de “mixofobia” para designar o processo que “impede a procurar ilhas de semelhança e de igualdade no meio do mar da diversidade e da diferença” (Bauman, 2006: 40) e que conduz a comportamentos segregadores; ii) e o conceito de “mixofilia” que seria o comportamento que procura a integração e a fusão da diferença que resultaria num entendimento mútuo pela experiência compartilhada. Ainda que os contextos urbanos provoquem sentimentos contraditórios, seria importante que as estratégias urbanísticas e sociais procurassem este encontro de diferenças. O desafio é recuperar a dimensão comunitária do espaço público, como forma de aprender a arte de uma coexistência segura, pacífica e amigável.

1.4 A família e o tempo sem tempo

Sendo um lugar-comum nunca é de mais afirmar que a família é o núcleo mais importante da vida social, onde se tecem as primeiras relações e a interação com o mundo exterior. Por família consideramos as diversas formas de família e não apenas a considerada como nuclear, ainda que não nos detenhamos nas definições por não considerar este o espaço para o seu desenvolvimento.

De acordo com os dados do último Censo, realizado em 2011 existiam em Portugal 4.043.726 famílias, quase o dobro de cinco décadas antes. Em cerca de um terço destas famílias existiam crianças/adolescentes e a maioria destas famílias viviam em aglomerados populacionais com mais de 20.000 habitantes. Estes dados apresentam-se com especial relevância quando falamos em vulnerabilidades sociais e contextos urbanos.

Com efeito, nas sociedades contemporâneas surgem fenómenos preocupantes associados à mobilidade e ao mercado de trabalho que tiram o espaço e o tempo da vivência e convivência familiar. Se é preocupante o impacto que a crise económica tem no bem-estar e sustentabilidade familiar, também é preocupante o impacto que tem no seu papel de lugar de afectos. Muitos são os que vivem numa zona da cidade, mas deixam os filhos em escolas localizadas noutra área da cidade, com empregos caracterizados por uma forte pressão, sujeitam-se a horários alargados e mobilizam-se no final do dia para espaços desportivos fora da sua área residencial. A mobilidade é um traço contemporâneo que exerce influência na dinâmica e comunicação familiar, como afirma João Ferrão (2015), somos verdadeiros nómadas urbanos. Parece faltar o tempo e espaço para as famílias se tornarem “família” no sentido de se constituir como espaço privilegiado de realização da pessoa, onde se vive e se transmitem valores, onde se aprende e se estimula a solidariedade entre gerações, onde se promove e desenvolvem competências relacionais.

Um dos fenómenos mais preocupantes é o aumento do isolamento das famílias, associado a situações de desvantagem social (Cordeiro, 2015), o que se deve não apenas às questões de mobilidade, mas também a situações de desemprego ou subemprego dos membros da família, conduzindo por vezes a problemas com a habitação (devolução de casas por impossibilidade de pagamento de crédito, afastamento das origens sociais e culturais com impossibilidade de intervenção da família alargada, etc.). São muitas as vulnerabilidades sociais na dinâmica das famílias muitas vezes propulsadas pelos contextos urbanos, designadamente acontecimentos como o desemprego, o prolongamento da dependência dos filhos, a frequência das reformas antecipadas, o aumento do número de pessoas idosas na família e a dificuldade de tomar conta delas (Ribeiro, 2016), que devem ser tidos em conta no funcionamento familiar (comunicação e coesão familiar, relações intergeracionais e limites familiares) e que convidam a respostas adequadas às necessidades e vivências, com uma política de reconhecimento e valorização da vida familiar.

2. CONCLUSÃO

A seleção destes temas para a reflexão sobre as vulnerabilidades sociais, prende-se com a exigência de um olhar diferente sobre os contextos urbanos, mas este texto está longe de ser exaustivo e muito menos conclusivo sobre o tema. Como foi possível analisar, sabemos que se por um lado a cidade é produtora de sociabilidades, é também um espaço de segregação e de exclusão social, sendo possível traçar diferentes vias para futura investigação.

Os contextos urbanos são palcos privilegiados de oportunidades e ameaças, esperanças e riscos, é por isso importante aprender a “contemplar a cidade”, para criar caminhos novos, para colocar perguntas: como humanizar mais a cidade? Não há melhor cidade sem cidadania e para isso devemos procurar dar respostas no local sabendo que se traduzem em influência

global, é “*glocalmente*” que se pode produzir mudança fomentando a cidadania local e global nas diferentes dimensões da vida na cidade.

Se as nossas cidades refletem as grandes mudanças sociais e nesse sentido produzem maior vulnerabilidade social, também é verdade que podem criar condições para um cruzamento de ideias, saberes, culturas que estimulem uma maior inovação societal. Assim, torna-se especialmente relevante o reconhecimento dos processos de vulnerabilidade, para compreender como desenvolver respostas que contrariem estas trajetórias, passando-se de uma cultura centrada no “eu” para uma cultura centrada no “nós”.

DETERMINANTES PSICOSSOCIAIS NO TRABALHO E SUA RELAÇÃO COM VARIÁVEIS DE SAÚDE PSICOLÓGICA EM CONDUTORES PROFISSIONAIS RODOVIÁRIOS

João Borges Lopes
Instituto Piaget
(joao.borgeslopes@hotmail.com)

RESUMO

O mundo do trabalho caracteriza-se hoje, por significativas mudanças nos últimos anos. Essas mudanças têm naturalmente consequências na saúde dos colaboradores, em contexto laboral. A atividade profissional relacionada com a condução rodoviária apresenta riscos significativos no domínio da segurança rodoviária em geral e na saúde dos condutores em particular. Em função das exigências normativas de trabalho, a saúde psicológica dos condutores tem sido afetada, levando a consequências significativas em termos de quadros clínicos de Ansiedade, Depressão e de Stresse, relacionados por um plano de controle e melhoria dos riscos psicossociais ainda pouco valorizados em Portugal pelas empresas em geral e pelas empresas de transportes em particular. Este estudo teve como objetivo, analisar a relação entre os Fatores Psicossociais e as dimensões afetivas negativas, Ansiedade e Depressão, bem como o Stresse, com intuito de prevenir os riscos psicossociais no trabalho, contribuir para a promoção e desenvolvimento da saúde psicológica dos condutores rodoviários portugueses. Os resultados revelaram relações significativas entre os fatores psicossociais no trabalho e as dimensões afetivas negativas, Ansiedade, Depressão e o Stresse. Discutem-se os limites do estudo e a necessidade de desenvolver novas investigações nesta área do conhecimento científico.

Palavras-chave: Determinantes Psicossociais, Saúde Psicológica, Condutores Profissionais.

1. INTRODUÇÃO

As mudanças profundas que têm ocorrido no contexto de trabalho, nas organizações em geral e nas empresas em particular, têm consequências na saúde física e psicológica dos trabalhadores. No cenário crescente de novas formas de organização do trabalho, a pressão exercida junto dos trabalhadores para trabalharem mais horas, a necessidade de aumentar o volume de negócios, os prazos de entrega cada vez mais reduzidos, a competitividade organizacional e empresarial centrada na redução de custos, de pessoas e de serviços, a definição de objetivos comerciais e de produção cada vez mais elevados, as mudanças organizacionais, tecnológicas e empresariais, a incerteza relativa à segurança de emprego, são alguns dos fatores que contribuem para a manutenção dos riscos no trabalho, com influência na promoção e no desenvolvimento de outros associados ao stresse, violência, assédio no trabalho, ansiedade e depressão, com impacto na qualidade de vida dos trabalhadores em termos de saúde psicológica. É necessário desenvolver mais estudos no sentido de permitir um maior e melhor conhecimento sobre as dimensões e as condições de trabalho e o seu impacto na saúde dos trabalhadores, sendo por isso, necessário relançar o debate na perspetiva global, uma vez que, esta matéria se enquadra no âmbito nacional e internacional.

1.1 Fatores e Riscos Psicossociais no Trabalho

Nos anos 70 os ambientes psicossociais sofreram mudanças significativas desde a Revolução Industrial. O ritmo das mudanças de natureza psicossocial transformaram a essência do trabalho humano (Coelho, 2010). Essas mudanças no ambiente de trabalho podem ser enquadradas em fatores causais que incluem aspetos sociais, políticos, económicos, demográficos e tecnológicos e outros fatores de âmbito mais específico relacionados com a organização do trabalho, conteúdo do trabalho, vínculos laborais, tempos de trabalho, reestruturações organizacionais. Algumas mudanças como a globalização da economia tiveram como consequência a desproteção dos trabalhadores e influência na qualidade de vida e do bem-estar psicológico dos trabalhadores. A liberalização do mercado, apoiada na globalização permite aumentar a competitividade e naturalmente as consequências para os trabalhadores em termos de tempos e condições de trabalho. A terciarização da economia desenvolveu novos riscos laborais, de natureza psicossocial, aumentando o mal-estar psicossocial, com elevados números de casos de baixas médicas motivadas por situações de crises de Ansiedade, Stresse e Depressão, observando-se a redução de acidentes de trabalho e de doenças profissionais típicas das sociedades industriais. Também as alterações sociodemográficas ocorridas com o aumento das mulheres no mercado de trabalho promoveu mudanças sociais em termos de saúde no trabalho relacionadas com o Stresse e a articulação entre o trabalho e a família (Zedeck & Mosier, 1990). O envelhecimento da população ativa replica o envelhecimento demográfico nos países desenvolvidos, principalmente na União Europeia (Ramos, 2016). Através do envelhecimento da força de trabalho surgiram novas preocupações em termos de saúde ocupacional, porque os trabalhadores mais envelhecidos são mais vulneráveis aos riscos psicossociais do trabalho (Coelho, 2010). O desenvolvimento tecnológico ao nível da automatização, robotização da produção industrial e todas as tecnologias de informação, alteraram a forma como o trabalho é desenvolvido e fundamentalmente a sua própria natureza.

No domínio da organização do trabalho considerada no âmbito de uma economia de serviços, em que a flexibilidade é considerada como regra fundamental da organização do trabalho consistindo na utilização do tempo dos trabalhadores minimizando os custos e maximizando os proveitos (Kompier, 2006, citado por Ramos, 2016, p. 67).

São múltiplos os riscos ocupacionais decorrentes da organização do trabalho, revelando sobretudo riscos de natureza psicossocial que estão relacionados com a cultura da organização ou da empresa, envolvendo aspetos da comunicação, disfuncionalidade estrutural, reduzido conhecimento do poder decisório, fracas perspetivas de desenvolvimento, grau de participação dos trabalhadores reduzido, níveis de satisfação no trabalho negativos, horários de trabalho rígidos, flexíveis, trabalho por turnos, competências relacionais enfraquecidas em termos de falta de apoio social, conflitos e violência, relações pouco saudáveis com os superiores hierárquicos e a incompatibilização nas dimensões da família e trabalho. Em termos de conteúdo de trabalho houve alterações significativas com a introdução de novas tecnologias de informação que influenciou outras alternativas de trabalho, designadamente o correio eletrónico, teletrabalho, entre outros, cuja situação desenvolveu outros aspetos em termos do aumento do trabalho em tempo parcial, trabalho temporário, a intensificação no aumento de horas extraordinárias acarreta um aumento do ritmo e da sobrecarga de trabalho, fatores e situações que contribuem cada vez mais para a diminuição da satisfação e bem-estar no trabalho, produzindo assim, maior número de casos em contexto clínico de Ansiedade, Stresse e Depressão.

Num cenário de modernidade as transformações crescentes mudaram no contexto de trabalho e no seu significado. Hoje discute-se muito a flexibilidade mas pouco se tem feito em termos das influências negativas que ela representa na saúde ocupacional, através da desregulação dos ritmos biológicos, fadiga dos trabalhadores, práticas de gestão organizacional, más condições de trabalho, articulação trabalho-família. A nova representatividade do trabalho e o seu significado apontam para novos riscos psicossociais, designados como emergentes por serem novos e crescentes. Da revisão de literatura realizada os fatores psicossociais no trabalho apresentam uma perspetiva negativa, isto é, fatores de risco para a saúde física e psicológica dos trabalhadores (Ramos, 2016).

Segundo algumas abordagens teóricas sobre os riscos psicossociais no trabalho associam-nos a causas organizacionais de stresse no trabalho (Cox, Griffiths & Randall, 2003). Estes autores, entendem que, os riscos psicossociais no trabalho estão relacionados com os fatores psicossociais, definindo-os como aspetos de toda a estrutura organizacional e da gestão do trabalho, incluindo os contextos sociais e ambientais, promotores de danos psicológicos e sociais. Existem outras abordagens que referem os efeitos e benefícios ao nível da saúde ocupacional, nomeadamente os fatores psicossociais positivos (ILO, 1986). Assim, poderemos considerar que, os fatores psicossociais podem ser negativos e positivos. Por um lado, devem ser entendidos quanto à natureza e por outro, quanto às consequências. Em qualquer dimensão (consequências), podem ser negativos ou positivos de acordo com a influência prejudicial na saúde ou como promotores da saúde e bem-estar. Quanto à natureza, podem ser negativos ou positivos em função da sua presença ou ausência. De acordo com os estudos realizados por Antonovsky (1979), os fatores psicossociais podem assumir fatores patogénicos ou salutogénicos, designados ainda por fatores de risco como negativos ou de resiliência enquanto fatores positivos.

De acordo com a categorização proposta por Leka, Griffiths e Cox (2004) e no trabalho desenvolvido por Ramos (2016), foram identificados os fatores psicossociais no contexto de trabalho, designadamente: *conteúdo de trabalho, carga e ritmo de trabalho, horário de trabalho, controlo, cultura organizacional, relações interpessoais, papel organizacional, desenvolvimento de carreira, interface casa-trabalho e características individuais*. Estes fatores podem assumir um impacto quer negativo quer positivo sobre a saúde no trabalho em geral, e na saúde psicológica em particular, em função da sua presença ou intensidade. Atualmente, existem ferramentas e instrumentos de avaliação que nos permitem medir os fatores de risco psicossocial, nomeadamente o *Copenhagen Psychosocial Questionnaire II (COPSOQ II)* de Kristensen, Hannerz, Høgh e Borg (2005). Este instrumento começou a ser criado na Dinamarca, em meados de 1990, para avaliar o ambiente psicossocial no trabalho. A versão portuguesa foi desenvolvida por Silva *et al.*, (2010b) e Silva (2012b), mantendo as mesmas dimensões do instrumento original, fixada com menos nove itens no total.

A procura constante de um equilíbrio entre os fatores humanos e as condições de trabalho permite um ambiente psicossocial positivo, mais saudável, promovendo assim, a saúde e o bem-estar no trabalho.

1.2 Saúde Ocupacional e Bem-Estar no Trabalho

A saúde no trabalho enquadra-se no âmbito da saúde em geral, podendo ser definida segundo Larson (1999) em quatro modelos conceituais: o modelo médico, o modelo da Organização Mundial de Saúde, o modelo do bem-estar e o ambiental. No modelo médico, a saúde é um estado de ausência de doença (Tetrick, 2002, citado por Ramos, 2016, p. 25). Desde a data da sua fundação, em 1948, a OMS reconheceu a saúde como um estado completo de bem-estar físico, psíquico e social e não apenas a ausência de enfermidade ou doença. Este modelo tem sido criticado devido ao conceito de *completo bem-estar*, que coloca de fora a maioria das pessoas, na maior parte do tempo, como saudáveis (Huber *et al.*, 2011). Estes autores identificaram três grandes limitações: (1) medicalização da sociedade, (2) as mudanças demográficas e a alteração da natureza da doença, (3) Operacionalização da definição de *completo* não pode ser medida. O modelo do bem-estar define que as pessoas dispõem de uma reserva de saúde, permitindo ultrapassar a doença evoluindo em termos de otimismo, como o caso dos estados de Ansiedade, Stresse e Depressão. Quanto ao modelo ambiental destaca a eficácia no desempenho dos papéis sociais relativos ao trabalho e família e nos processos adaptativos relativos às exigências impostas pelos ambientes físicos e sociais. Estes dois últimos modelos desvalorizam a ausência de doença e a existência de um completo bem-estar, funcionamento ótimo, de felicidade baseado nos pressupostos e nos paradigmas da Psicologia Positiva (Ramos, 2016).

Paralelamente, desde o início da colaboração entre a OMS e a OIT, após a reorganização desta, em 1949, a noção geral de saúde na área da saúde ocupacional, um Comité Misto da OIT/OMS, veio em 1950, definir a saúde ocupacional, como uma área de saberes multidisciplinar que tem como objetivo, promover e manter o mais elevado bem-estar físico, psíquico e social

dos trabalhadores em todas as profissões; prevenir qualquer dano causado à sua saúde pelas condições de trabalho impostas aos trabalhadores; proteger os trabalhadores no seu emprego contra riscos resultantes da presença de agentes prejudiciais à sua saúde; Colocar e manter o trabalhador num emprego adaptado às suas aptidões fisiológicas e psicológicas (Coelho, 2008).

1.3 Determinantes Psicossociais na Saúde e no Trabalho

Os determinantes psicossociais são considerados de nível intermédio sendo modificados pela estrutura macrosocial. Surgem através de relações interpessoais e atuam como fatores mediadores dos efeitos da estrutura social, no domínio da saúde dos trabalhadores, ou podendo condicionar ou modificar o estado de saúde através de estruturas sociais em que ocorrem (Martikainen & Lahelma, 2002). Neste âmbito, o ambiente psicossocial do trabalho é entendido como sendo o conjunto de influências sociais e psicossociais na saúde no contexto laboral (Cox & Griffiths, 2005). Uma vez verificadas essas influências como situação de desequilíbrio entre o conjunto de exigências laborais e as capacidades e recursos dos trabalhadores coexistem assim, tensões com o ambiente quer interno quer externo, que pode provocar respostas físicas e psicológicas alterando o estado de saúde dos trabalhadores.

Os determinantes psicossociais que exercem influência sobre a saúde são modeladas pelas características pessoais, como a personalidade, resiliência e outras suscetibilidades individuais. Os comportamentos e os estilos de vida influenciam a saúde através de hábitos como o consumo de tabaco, álcool, hábitos alimentares entre outros, em que a categoria profissional de condutores rodoviários presente neste estudo, é muito vulnerável a estes comportamentos, na perspetiva de internalização biológica. Outro aspeto importante, envolve os mecanismos psicobiológicos associados às respostas ao stresse, com efeitos em termos de sistema neuroendócrino, metabólico e imunológico (Neto & André, *in* Chambel, 2016). No entendimento da *European Commission* (2013) as doenças e outros problemas relacionados com a saúde no trabalho podem ser causados pelas condições de trabalho, e incluem problemas de natureza psicológica, para além dos problemas físicos. Alguns estudos associam o stresse no trabalho, e os fatores psicossociais à síndrome metabólica (Chandola, Brunner & Marmot, 2006). *Burnout*, Ansiedade e Depressão, relacionado com doenças cardiovasculares (Seidler *et al.*, 2014).

De acordo com a Recomendação nº 194 da OIT refere que, o risco ocupacional é causado através do stresse pós-traumático e outras doenças mentais ou alterações do comportamento, influenciando assim, a saúde psicológica. No âmbito das dimensões afetivas negativas, nomeadamente na depressão, o suicídio e o suicídio na forma tentada passaram a fazer parte das principais preocupações para as autoridades de saúde e organizações de gestão do trabalho, em toda a Europa, após o caso da France Telecom, em que ocorreram mais de 30 casos de suicídio durante dois anos. Na Bélgica e em França, o suicídio é reconhecido como acidente de trabalho desde que esteja previsto no respetivo contrato de trabalho e ocorra no local e tempo de trabalho. Em Espanha, o suicídio é considerado como acidente de trabalho desde que no histórico do trabalhador conste o registo de perturbação mental devidamente comprovada documentalmente (Neto & André, *in* Chambel, 2016). No caso de Portugal, não encontramos estudos com casos de suicídio cuja causa esteja associada a contextos de trabalho.

1.4 Riscos Psicossociais e Dimensões Afetivas Negativas na Condução Rodoviária

Durante o século XX o automóvel foi considerado o fenómeno mais relevante desenvolvendo um papel na sociedade de facilitador de deslocações e de proximidade entre locais. Existem aspetos nas pessoas relacionados com o automóvel, nomeadamente a afirmação pessoal e social, o sentimento da competição, o prestígio e a vaidade. Em função destas características e reportando à maneira de ser e de estar nas pessoas, surgem impulsos sem mediação do pensamento que leva as pessoas a atitudes e comportamentos pouco favoráveis à vida e à saúde e bem-estar.

A investigação realizada no âmbito da condução rodoviária revela que, a maioria dos acidentes de viação e outros problemas relacionados com a circulação rodoviária estão associados a causas de natureza comportamental, nomeadamente Stresse, Ansiedade e quadros clínicos de Depressão. Segundo Barros (1995), o processo de condução é determinado por um conjunto de variáveis relacionados com os elementos de trânsito rodoviário, como por exemplo, o condutor, o veículo, o meio e as normas de circulação. De acordo com um estudo realizado por Matos (1991), os acidentes de motorizada dos adolescentes não parecem ser devidos ao acaso, mas sim a um conjunto de circunstâncias individuais, familiares e psicossociais. A conjugação do risco de suicídio e da ansiedade parecem ser determinantes na média de acidentes e na tendência suicidária. Stork (1977) encara o suicídio, como uma perturbação do bem-estar e da autoestima, o que origina uma intenção de atentar contra a integridade e até a própria vida. Segundo o mesmo autor, considera que existe uma relação entre personalidade depressiva suicidária e o risco de suicídio, com os comportamentos que fazem parte do campo suicidário inconsciente, como é o caso do consumo de álcool, drogas. Outros autores (Haenal & Kielholz, 1983, citado por Matos, 1991), referem que muitas vezes a depressão está oculta sob forma de somatização e de risco autodestrutivo.

Ao longo dos tempos as relações entre as dimensões afetivas negativas, Ansiedade e Depressão, têm sido consideradas como dimensões clássicas na psicologia e na psicopatologia. A ansiedade costuma estar associada aos sintomas de Depressão. Até finais do século XIX as perturbações de Ansiedade não se separavam de outras perturbações de humor (Ribeiro, Honrado & Leal, 2004).

Watson e Clark (1995) salientam a evidência de que a Ansiedade e Depressão são difíceis de diferenciar empiricamente. Numa investigação anterior, Clark e Watson (1991), propõem um modelo tripartido em que os sistemas de Ansiedade e Depressão se agrupam em três estruturas básicas. A primeira é designada por *distress* ou afeto negativo, incluindo sintomas inespecíficos, que são experimentados tanto em sujeitos deprimidos como ansiosos e incluem ainda o humor deprimido e ansioso, irritabilidade. Para além deste fator inespecífico a Ansiedade e a Depressão constituiriam as outras duas estruturas, com a tensão somática e a hiperatividade, como específicas da Ansiedade, e a anedonia e a ausência de afeto positivo, específicas da Depressão. A operacionalização do modelo designado de tripartido levou à construção de medidas e originou o instrumento *Depression Anxiety Stress Scale* (DASS) de Lovibond e Lovibond (1995). O estudo fatorial realizado pelos

autores apresentou um novo fator que incluía os itens discriminativos das duas dimensões, a Ansiedade e Depressão. Estes itens referiam-se a dificuldades em relaxar, tensão nervosa, irritabilidade e agitação. Este novo fator foi designado pelos autores de “Stresse”. A versão portuguesa é denominada por Escalas de Ansiedade, Depressão e Stresse (EADS), adaptada por Pais-Ribeiro, Honrado, & Leal, (2004). A versão de 21 itens, designada por EADS-21, propõe-se medir os mesmos construtos do mesmo modo que a versão de 42 itens.

Portugal foi em 2011 considerado um dos países europeus com maior prevalência de perturbações mentais, com maior incidência nas perturbações de ansiedade e de humor (Wang *et al.*, 2011). De acordo com os dados publicados pela Direção Geral de Saúde em 2013 (DGS, 2013), Portugal é um dos países europeus com maior prevalência de perturbações mentais, em termos de ansiedade (16,5%) e perturbações depressivas (7,9%). A Ansiedade pode ser entendida como uma resposta adaptativa do organismo, caracterizada por um conjunto de alterações fisiológicas, comportamentais e cognitivas, que se traduzem num sinal de perigo ou ameaça para a saúde psicológica das pessoas (Ribeiro, 2005).

Quanto à depressão, a Organização Mundial de Saúde, caracteriza esta perturbação pela tristeza, perda de interesse, baixa autoestima. Enquanto estado afetivo, a depressão representa a tristeza normal da vida psíquica que, quando em níveis elevados, constitui-se como um sinal de alerta para o desenvolvimento de estados depressivos.

Relativamente ao Stresse, Selye (1951) considera que, os acontecimentos de vida stressantes podem precipitar episódios de Ansiedade e de Depressão, bem como levar a respostas características de stresse. O stresse pode ser entendido como um processo gerado por uma resposta não específica do indivíduo a um stressor interno ou externo. O mesmo autor chamou a resposta orgânica aos stressores como Síndrome de Adaptação Geral, composta por três fases: alerta, fase de energia devido à produção de adrenalina, resistência, fase de manutenção da homeostasia, exaustão, terceira e última fase em que existe persistência e intensidade dos fatores de stresse quebrando a resistência. Nesta última fase, surgem perturbações para além das físicas (problemas cardíacos), surgem problemas de saúde mental e psicológica, em termos de Depressão e de Ansiedade.

No contexto de trabalho, o cenário não é diferente tendo em conta os indicadores e as causas associadas em grande parte, a problemas de natureza ocupacional. Reconhecendo que existem diferentes fatores do trabalho que têm implicações na saúde e bem-estar dos trabalhadores, é necessário que sejam analisados os fatores específicos que podem ser causadores de doença e stresse, desenvolvendo aqueles que promovem a saúde e o bem-estar no trabalho.

Tendo como base a revisão de literatura, entendemos que a investigação nesta área ainda não é abundante, apesar dos desenvolvimentos teóricos verificados na área da Psicologia da Saúde Ocupacional serem significativos, na última década. Sendo uma área do conhecimento científico ainda recente tem adquirido elevada maturidade, revelando um corpo teórico robusto com efeitos práticos. Ao longo do século XX, conheceram-se alguns contributos da Psicologia para a área da prevenção de riscos ocupacionais, de natureza psicossocial. Em 1943 e 1965 Maslow referiu que só indivíduos psicologicamente são poderiam estar motivados para o trabalho e que ambientes repressivos, incluindo ambientes de trabalho, poderiam levar os trabalhadores a atingir o seu potencial máximo de capacidade de produção. Em 1948, Likert criou o primeiro Instituto de Investigação Social, na Universidade de Michigan, onde se começaram a desenvolver os primeiros contributos para a Psicologia da Saúde Ocupacional. O primeiro estudo e grande contributo para esta área, foi desenvolvido por Robert Karasek em 1979, sobre “*o papel das exigências do trabalho e a autonomia de decisão e saúde psicológica dos trabalhadores*” (Coelho, 2008).

Outro grande contributo, ficou a dever-se à publicação da Diretiva – Quadro da União Europeia sobre Segurança e Saúde no Trabalho, em 1989 (Diretiva nº 89/391/CEE), que veio consagrar o novo paradigma de Saúde Ocupacional. Em 1990, nos EUA, a *American Psychology Association* (APA) e o *National Institute of Occupational Health* (NIOSH) criaram a nova área da Psicologia, designada por Psicologia da Saúde Ocupacional, através da primeira conferência internacional sobre o trabalho e o bem-estar, em Washington. Em 1996, é criado, no âmbito da APA, *The Journal of Occupational Health Psychology* (JOHS). (Coelho, 2008).

Em termos de investigação, destacamos alguns autores pioneiros em estudos de grande interesse para a área da Psicologia da Saúde Ocupacional, como Steve Sauter, Murphy e Joe Hurrell, cujo trabalho desenvolvido, “*Prevention of workrelated psychological disorders: A national strategy proposed by the National Institute for Occupational Safety and Health*” foi publicado em 1990, na revista *American Psychologist*, nº 45, p.p. 1146-1158 (Coelho, 2008).

O estudo aqui apresentado insere-se no âmbito da Psicologia da Saúde Ocupacional, procurando analisar a relação entre os determinantes psicossociais no trabalho e as dimensões afetivas negativas (ansiedade e depressão) e o stresse, numa população específica como é o caso dos condutores profissionais rodoviários. Nesta classe profissional existem algumas categorias mais vulneráveis à exposição de riscos psicossociais e a quadros clínicos de Ansiedade, Depressão e Stresse, do que outras. Contudo, de modo geral esta problemática está presente na maioria dos profissionais deste setor de atividade. As cargas e ritmo de trabalho, os horários, relações interpessoais, interface casa-trabalho e as características individuais e organizacionais, parecem ser os fatores psicossociais no trabalho com maior prevalência nos condutores, assim como o Stresse e a Ansiedade, levando em casos mais graves a estados depressivos, com implicações no absentismo por motivo de doença, recorrendo a situações de baixa médica (Burton, 2010).

O presente estudo é de caráter exploratório, tendo como objetivo estudar a relação entre os fatores psicossociais no trabalho e as dimensões afetivas negativas (ansiedade e depressão) e stresse, no sentido de compreender em que medida os fatores psicossociais no trabalho estão associados a quadros clínicos de Ansiedade, Depressão e a situações de Stresse Ocupacional, fatores e situações de desenvolvimento de riscos psicossociais no trabalho. Procurámos analisar como se relacionavam os fatores psicossociais no trabalho e as dimensões da Ansiedade, Depressão e Stresse entre si, o sexo a idade, assim como a antiguidade na profissão. (Burton, 2010).

De modo a analisar a relação entre as variáveis propostas para este trabalho, apresentamos de seguida o respetivo estudo empírico.

2. MÉTODO

2.1 Participantes

A seleção da amostra para o presente estudo teve como pressuposto, incluir adultos portugueses do grupo de condutores profissionais rodoviários de transportes de mercadorias de longo curso (TIR), em situação ativa de emprego, cuja antiguidade na profissão fosse igual ou superior a três anos, residentes na zona centro de Portugal Continental.

Participaram 63 condutores profissionais rodoviários, dos quais 61 (96,83%) pertencem ao sexo masculino e 2 (3,17%) do sexo feminino, com idades compreendidas entre 50 e os 72 anos, tendo sido a amostra recolhida em clínicas de Leiria, Batalha e Figueira da Foz, no momento de avaliação psicológica para efeito de revalidação da carta de condução, grupo 2, nas categorias C e CE (DL 138/2012). Estes participantes são, maioritariamente, casados (n=58, 92,06%), com filhos (n=57, 90,48%), estando atualmente a trabalhar a tempo inteiro (n= 63, 100%). Recorreu-se a uma amostra não aleatória, tendo sido utilizada a técnica de amostragem de conveniência.

2.2 Instrumentos de Medida

O questionário *Copenhagen Psychosocial Questionnaire II – (COPSOQ II)* na versão original de Kristensen, Hannerz, Hogh e Borg (2005), começou a ser criado em meados de 1990 em resposta à solicitação de questionários padronizados e validados para medir o ambiente psicossocial do trabalho por parte de profissionais da saúde ocupacional dinamarqueses. Como nenhum dos questionários existentes, dinamarqueses ou internacionais, abrangia todos os fatores psicossociais do trabalho necessários, os investigadores do Instituto Nacional de Saúde Ocupacional dinamarquês decidiram criar o seu próprio questionário.

Existem três versões do COPSOQ: uma longa, para fins de investigação científica, uma média, para uso dos profissionais de saúde ocupacional, e uma curta, para autoavaliação dos trabalhadores e para locais de trabalho com menos de 30 trabalhadores. Inicialmente, o COPSOQ longo incluía 141 questões distribuídas por 30 escalas representativas de 20 dimensões psicossociais do trabalho, a saber: cinco relativas às exigências do trabalho, cinco sobre organização e conteúdo do trabalho, oito sobre relações interpessoais e liderança e duas da interface trabalho-indivíduo (Ramos, 2016).

A versão portuguesa desenvolvida por (Silva *et al.* 2010b, 2012b), versão média mantém as mesmas dimensões do instrumento original sendo fixada com menos nove itens no total. Os autores da versão portuguesa asseguram que o instrumento respeita a estrutura e conteúdo da versão original dinamarquesa, com a devida adaptação para Portugal (Silva, 2012b).

O COPSOQ II – versão média é um questionário de autorresposta composto por 76 itens avaliados através de uma escala tipo Likert de cinco pontos. Com exceção do item 61, referente à saúde geral, cotado numa escala de qualidade (*de deficitária a excelente*), todos os itens são classificados em termos de frequência (*de nunca/quase nunca a sempre*) ou intensidade (*de nada/quase nada a extremamente*). Todos os itens são cotados no sentido da escala de resposta, salvo os itens 42 e 45, que são cotados inversamente. As normas de utilização definidas para a população portuguesa recomendam o cálculo da média dos itens de cada escala. O programa informático para cotação e apresentação dos resultados distribui as classificações de cada escala em tercis, com pontos de corte nos valores de 2,33 e 3,66, os quais definem os mesmos níveis interpretativos acima descritos a propósito do questionário original, representados pelas cores verde, amarelo e vermelho. Os resultados são interpretados fator a fator. O instrumento não fornece um índice único, uma vez que o conceito avaliado é multidimensional. Existem dados normativos para a população portuguesa com os quais se podem confrontar os resultados obtidos em diferentes estudos desenvolvidos por investigadores portugueses (Silva, 2012b, citado por Ramos, 2016).

Este instrumento é constituído por 8 dimensões teóricas, 29 escalas e 76 itens (cf. Quadro 1).

Quadro 1. Dimensões, Escalas e Itens do Instrumento COPSOQ - II

Dimensões	Escalas	Itens
Exigências Laborais	Exigências Quantitativas	1, 2, 3
	Ritmo de Trabalho	4
	Exigências Cognitivas	5, 6, 7
	Exigências Emocionais	8
Organização do Trabalho e Conteúdo do Trabalho	Influência no Trabalho	9, 10, 11, 12
	Possibilidades de Desenvolvimento	13, 14, 15
	Significado do Trabalho	51, 52, 53
	Compromisso com o Trabalho	54, 55
Relações Sociais e Liderança	Previsibilidade	16, 17
	Recompensas (reconhecimento)	21, 22, 23

	Clareza do Papel	18, 19, 20
	Conflitos de Papel	24, 25, 26
	Qualidade da Liderança	36,37,38,39
	Apoio Social de Superiores	30, 31, 32
	Apoio Social de Colegas	27, 28, 29
Interface Trabalho-Indivíduo	Insegurança no Trabalho	60
	Satisfação no Trabalho	56, 57, 58, 59
	Conflito Trabalho-Família	62, 63, 64
Valores no Trabalho	Confiança nos Superiores	43, 44, 45
	Confiança nos Colegas	40, 41, 42
	Justiça	46, 47, 48
	Comunidade Social no Trabalho	33, 34, 35
Personalidade	Autoeficácia	49, 50
Saúde e Bem-Estar	Saúde Geral	61
	Stresse	69, 70
	<i>Burnout</i>	67, 68
	Problemas em Dormir	65, 66
	Sintomas Depressivos	71, 72
Comportamentos Ofensivos	<i>Bullying</i>	73, 74, 75, 76

Adaptado de Silva (2012b)

A consistência interna das novas escalas do COPSOQ II foi testada através do Alfa de Cronbach, tendo-se obtido valores superiores a 0,70 para todas as escalas da versão média (Pejtersen *et al.*, 2010). A versão média portuguesa apresentou valores de consistência interna em linha com os dos instrumentos originais, entre 0,60 e 0,90 em termos de Alfa de Cronbach. De forma global, podemos afirmar que existem evidências suficientes para concluir que, o COPSOQ II através das diferentes escalas que o constituem revela boa consistência interna, quanto ao tamanho e nacionalidade, quando medido pelo Alfa de Cronbach, ou seja, regista-se elevada intercorrelação entre os itens das escalas, considerados como aspetos diversos mas unitários do mesmo constructo.

A *Escala de Ansiedade, Depressão e Stresse* (EADS-21; Pais-Ribeiro *et al.*, 2004) visa avaliar os sintomas associados à Ansiedade, Depressão e stresse em jovens adultos e adultos portugueses. É constituída por 21 itens, agrupados em três subescalas, constituídas por 7 itens cada. Segundo Lovibond e Lovibond (1995) as escalas foram desenvolvidas de modo que os fatores começaram por ser definidos em termos de consenso clínico e posteriormente foram refinadas em termos empíricos nomeadamente com recurso a técnicas de análise fatorial.

A escala ficou assim organizada em termos de três subescalas:

Ansiedade é constituída por (a) Excitação do Sistema Autónomo (itens 2,4,19), (b) Efeitos Músculos Esqueléticos (item 7), (c) Ansiedade Situacional (item 9) e, (d) Experiências Subjetivas de Ansiedade (itens 15, 20). A subescala designada por *Depressão* é constituída por Disforia (item 13), (f) Desânimo (item 10), (g) Desvalorização da Vida (item 21), (h) Auto depreciação (item 17), (i) Falta de Interesse ou de Envolvimento (item 16), (j) Anedonia (item 3), e (K) Inércia (item 5).

A subescala *Stresse* é constituída por (l) Dificuldade em Relaxar (itens 1 e 12), (m) Excitação Nervosa (item 8), (n) Facilmente Agitado/Chateado (item 18), (o) Irritação/Reação Exagerada (itens 6, 11) e, (p) Impaciência (item 14).

Cada item consiste numa frase, uma afirmação, que remete para sintomas emocionais negativos experimentados nos últimos 7 dias. Todos os itens são avaliados através de uma escala de tipo Likert, de 4 pontos: (0 – “não se aplicou nada a mim”, 1 – “aplicou-se a mim algumas vezes”, 2 – “aplicou-se a mim muitas vezes”, e 3- “aplicou-se a mim a maior parte das vezes”). A cotação é dada pela soma dos resultados dos 7 itens, obtendo-se uma nota para cada subescala com um resultado mínimo de 0 e máximo de 21. As notas mais elevadas correspondem a estados afetivos mais negativos. Os itens da EADS-21 foram selecionados de modo que possam ser convertidas nas notas da escala completa de 42 itens multiplicando a nota por dois. Os resultados relativos à consistência interna revelaram Alfas de Cronbach elevados para as três subescalas (ansiedade

= 0,74; depressão = 0,85; stresse = 0,81). Verificou-se que a magnitude de correlação item escala a que pertence, corrigida para sobreposição é semelhante para as versões de sete e 14 itens (Pais-Ribeiro *et al.*, 2004).

2.3 Procedimentos de Recolha e Análise de Dados

Este estudo pretende contribuir para uma maior e melhor compreensão dos fatores psicossociais no trabalho e sua relação com as dimensões afetivas negativas (ansiedade, depressão) e stresse, com impacto nos riscos psicossociais no trabalho de condutores profissionais rodoviários, grupo profissional que, pelas suas características e natureza da profissão são muito vulneráveis a problemas associados ao stresse ocupacional, estados de ansiedade e quadros depressivos, como consequência da influência dos fatores e determinantes psicossociais em contexto laboral.

Os participantes foram convidados a responder a um questionário Sociodemográfico seguido de dois instrumentos de avaliação: (1) *Copenhagen Psychosocial Questionnaire II – (COPSOQ II)* na versão original de Kristensen, Hannerz, Hogh e Borg (2005), tradução e adaptação para Portugal por Silva *et al.*, 2010b, Silva, 2012b), que avalia os fatores psicossociais no trabalho; (2) Escala de Ansiedade, Depressão e Stresse (EADS-21) de Pais-Ribeiro *et al.* (2004), visando a avaliação de sintomas emocionais vivenciados nos últimos 7 dias. Os participantes responderam aos instrumentos no momento da avaliação psicológica de condutores profissionais rodoviários de mercadorias, de longo curso (TIR), para efeito de revalidação da carta de condução do grupo 2, categorias C e CE. Inicialmente, os dados obtidos através da EADS-21 foram utilizados para avaliar as propriedades psicométricas da versão portuguesa do instrumento, bem como analisar as diferenças entre variáveis sociodemográficas, antes de estudar a relação com os fatores psicossociais no trabalho. O mesmo procedimento foi efetuado com o COPSOQ II, no sentido de analisar previamente as propriedades psicométricas do instrumento.

Realizou-se uma análise descritiva das respostas dos 63 participantes no estudo, bem como da consistência interna de cada uma das dimensões constantes em cada um dos instrumentos (COPSOQ II e EADS – 21). A análise de fiabilidade dos itens de cada dimensão efetuou-se recorrendo ao Alfa de Cronbach como coeficiente de consistência interna.

A avaliação de ambos os instrumentos foi efetuada com uma análise fatorial exploratória (AFE) com extração dos fatores pelo método de componentes principais, seguida de uma rotação varimax onde se retiraram os fatores com valor próprio superior a 1, e a respetiva percentagem de variância retida. Para efeito de avaliação da validade da Análise Fatorial Exploratória (AFE) e adequação da amostra, foram utilizados o Kaiser-Meyer-Olkin (KMO) e o teste de esfericidade de Bartlett. Relativamente à estrutura fatorial da EADS-21, é esperada a identificação de três fatores – Ansiedade, Depressão e Stresse, correspondendo ao Modelo Tripartido desenvolvido por Clark e Watson (1991), em que a escala se sustenta teoricamente. Todos os fatores deverão apresentar níveis de consistência interna elevados, analisados através do Alfa de Cronbach, à semelhança do que se verificou no estudo de adaptação portuguesa (Pais-Ribeiro *et al.*, 2004).

É esperada a existência de diferenças estatisticamente significativas nos valores de Ansiedade, Depressão e Stresse, em função do sexo e da idade.

Relativamente à estrutura fatorial do COPSOQ II é esperada a identificação do número de fatores conforme Quadro 1. Todos os fatores deverão apresentar níveis de consistência interna elevados, analisados através do Alfa de Cronbach, à semelhança do que se verificou no estudo de adaptação portuguesa (Silva, 2012b).

Estima-se a existência de correlações significativas entre os fatores psicossociais no trabalho e os valores de Ansiedade, Depressão e Stresse.

A análise comparativa entre os grupos das variáveis sociodemográficas sexo e idade, com relação à EADS-21 foi realizada com o teste Mann-Whitney e o teste de Kruskal-Wallis. Para a análise das correlações entre os Fatores Psicossociais e os níveis de Ansiedade, Depressão e Stresse foi utilizado o coeficiente de correlação de Pearson.

A análise descritiva, análise de fiabilidade dos índices, AFE e os testes referidos foram efetuados com recurso ao software SPSS, versão 23.0 para Windows (Nie, Hull & Bent, 1968).

3. RESULTADOS

3.1 Resultados Descritivos da EADS – 21

Os resultados relativos à dimensão Ansiedade revelam valores acima da média, sendo que os valores mínimo e máximo da resposta por item se situam entre 0 e 3, face a uma amplitude teórica do somatório das respostas por dimensão de 0-21. A análise da distribuição de frequências e percentagens de resposta pelos quatro pontos da escala de Likert, permite verificar que os participantes utilizaram todos os pontos da escala. O valor obtido relativo à análise da consistência interna da subescala foi de ($\alpha=0,87$), o que no entender de Pestana e Gageiro (2003) é uma consistência interna boa uma vez que, o valor de Alfa de Cronbach pertence ao intervalo (0,80 – 0,90).

No que concerne à dimensão Depressão revelam valores acima da média, sendo que os resultados mínimo e máximo se situam entre 0 e 3, face a uma amplitude teórica do somatório das respostas por dimensão de 0-21. A análise da distribuição de frequências e percentagens de resposta pelos quatro pontos da escala de Likert, permite verificar que os participantes utilizaram todos os pontos da escala. O valor obtido relativo à análise da consistência interna da subescala foi de ($\alpha=0,88$), o que no entender de Pestana e Gageiro (2003) é uma consistência interna boa uma vez que, o valor de Alfa de Cronbach pertence ao intervalo (0,80 – 0,90).

Em termos da dimensão Stresse revelam valores acima da média, sendo que os resultados mínimo e máximo se situam entre 0 e 3, face a uma amplitude teórica do somatório das respostas por dimensão de 0-21. A análise da distribuição de frequências e percentagens de resposta pelos quatro pontos da escala de Likert, permite verificar que os participantes utilizaram todos os pontos da escala. O valor obtido relativo à análise da consistência interna da subescala foi de ($\alpha=0,85$),

o que no entender de Pestana e Gageiro (2003) é uma consistência interna boa uma vez que, o valor de Alfa de Cronbach se situa entre o intervalo (0,80 – 0,90). Estes resultados evidenciam ser os sintomas de stresse os mais vivenciados pelos participantes deste estudo, embora não faça parte das dimensões afetivas negativas, de acordo com o quadro teórico.

3.2 Análise Fatorial Exploratória

Os resultados obtidos através da Análise Fatorial Exploratória mostram uma estrutura fatorial com 3 fatores, cujo valor do KMO é de 0,92, teste de esfericidade de Bartlett $\chi^2 = 2643,96$; $p < 0,001$ e variância total explicada de 57,07%, o que indica uma muito boa adequabilidade da AFE. Todos os itens da EADS-21 têm comunalidade superior a 0,30 não existindo nenhum item com peso fatorial igual ou inferior a 0,40.

3.3 Análise de Diferenças

Para efeito da análise de diferenças, foram aplicados previamente os testes de ajustamento de *Kolmogorov-Smirnov* e de *Shapiro-Wilk* para testar a normalidade e o teste de *Levene* para testar a homogeneidade, no sentido de serem garantidos os pressupostos para aplicação de testes estatísticos paramétricos ou não paramétricos, tendo-se verificado que a estatística a utilizar é a estatística não paramétrica.

Os resultados da análise de diferenças entre o sexo feminino e o sexo masculino com relação às dimensões Ansiedade, Depressão e Stresse realizada através do teste *Mann-Whitney*, revelam não haver diferenças estatisticamente significativas entre os sexos em nenhuma das três dimensões estudadas, conforme Quadro 2.

Quadro 2. Diferenças entre Ansiedade, Depressão e Stresse em Função do Sexo

Dimensões	Sexo	<i>M</i>	<i>DP</i>	<i>U</i>	ξ	<i>p</i>
Ansiedade	F	2,92	3,21	6738,5	-0,764	0,468
	M	2,94	3,32			
Depressão	F	3,23	3,27	6501,5	-1,388	0,174
	M	2,98	3,90			
Stresse	F	5,79,	3,76	6247,0	-1,507	0,104
	M	4,06	3,11			

Nota. $P \leq 0,05$

Relativamente à idade, os resultados do teste de Kruskal-Wallis revelam que, nas dimensões Ansiedade, Depressão e Stresse não existem diferenças estatisticamente significativas nos diferentes grupos etários, tendo em consideração o nível de significância de $p \leq 0,05$. Contudo, as evidências estatísticas mostram que, a partir dos 40 anos de idade os valores médios são mais elevados em qualquer das dimensões. Na dimensão Ansiedade, o grupo etário com idade compreendida entre 40 e 49 anos, o valor médio é de 4,60 ($\chi^2(3) = 8,15$; $p < 0,05$). Na dimensão Depressão, o mesmo grupo etário apresenta o valor médio de 5,72 ($\chi^2(3) = 10,76$; $p < 0,05$). Em relação à dimensão do Stresse e considerando o mesmo grupo etário, o valor médio situa-se em 7,51 ($\chi^2(3) = 11,66$; $p < 0,05$). O quadro 3 apresenta os restantes valores médios por cada dimensão do estudo.

Quadro 3. Diferenças entre Ansiedade, Depressão e Stresse em Função dos Grupos Etários

Dimensões	Grupo Etário	<i>M</i>	<i>DP</i>	$\chi^2(3)$	<i>p</i>
Ansiedade	20-29	3,83	3,32	5,72	0,67
	30-39	3,82	3,43		
	40-49	4,60	3,56		
	≥ 50	7,61	3,86		
Depressão	20-29	2,51	2,13	4,07	0,29
	30-39	3,69	3,64		
	40-49	5,72	5,37		
	≥ 50	4,48	3,53		
Stresse	20-29	6,71	4,57	5,49	0,32
	30-39	6,83	3,63		
	40-49	7,51	3,85		
	≥ 50	7,07	4,33		

Nota. $P \leq 0,05$

3.4 Análise da Relação Entre Variáveis do Estudo

Para efeito da análise da relação entre as variáveis do estudo (fatores psicossociais no trabalho e as dimensões afetivas negativas e stresse), foi usado o coeficiente de correlação de Pearson, conforme resultados descritos no Quadro 4.

Na avaliação da magnitude das correlações foi utilizada a convenção de Pestana e Gageiro (2003), os quais sugerem que se considere uma associação *muito baixa* sempre que o coeficiente de correlação é inferior a 0,20; *baixa* entre 0,20 e 0,39; *moderada* entre 0,40 e 0,69; *alta* entre 0,70 e 0,89 e *muito alta* entre 0,90 e 1,0.

Pela análise dos resultados podemos verificar que, existem correlações significativas entre alguns fatores psicossociais no trabalho, as dimensões afetivas negativas e o stresse, o que poderá contribuir para desenvolver riscos psicossociais no trabalho.

Tendo por base as dimensões teóricas dos fatores psicossociais no trabalho (cf. Quadro 1), os resultados das análises correlacionais permitem observar associações significativas entre os fatores psicossociais no trabalho, as dimensões afetivas negativas e o stresse. Destacam-se as correlações positivas com significado estatístico entre as Exigências Quantitativas, a Ansiedade ($r = 0,76$) e o stresse ($r = 0,85$), o que significa que, as exigências quantitativas estão associadas aos problemas de Ansiedade e de Stresse respectivamente, dos condutores profissionais rodoviários. Outras associações significativas são observadas nas variáveis, Ritmo de Trabalho, com a variável Stresse ($r = 0,71$), Exigências Cognitivas com maior significado na relação na Ansiedade ($r = 0,81$), Exigências Emocionais com Ansiedade ($r = 0,74$) Stresse ($r = 0,73$). As Exigências Emocionais estão associadas à Depressão ($r = 0,52$). Conclui-se assim que, a dimensão das Exigências Laborais estão positiva e significativamente correlacionadas com os estados de Ansiedade, Depressão e com o Stresse, podendo assim, influenciar negativamente a saúde psicológica e o bem-estar no contexto laboral.

Na dimensão, Organização e Conteúdo do Trabalho, existem relações positivas entre Fatores Psicossociais no Trabalho, a Ansiedade, Depressão e o Stresse. Destacam-se a correlação positiva com significado estatístico entre o Significado do Trabalho e o Stresse ($r = 0,49$), Compromisso com o Trabalho com a Ansiedade ($r = 0,71$), o Compromisso com o Trabalho e o Stresse ($r = 0,63$).

No que concerne à dimensão, Relações Sociais e Liderança, o fator Recompensas está negativamente correlacionado com a Ansiedade ($r = -0,74$), associado com a Depressão ($r = -0,81$) positivamente correlacionado com o Stresse ($r = 0,78$). O fator Apoio Social dos Superiores está negativamente correlacionado com a Ansiedade ($r = -0,68$), Depressão ($r = -0,71$) e positivamente correlacionada com o Stresse ($r = 0,86$). O Apoio Social de Colegas está igualmente associado negativamente com a Ansiedade ($r = -0,54$) e positiva e significativamente com o Stresse ($r = 0,62$).

A Interface Trabalho-Indivíduo é outra das dimensões em estudo e que é constituída por outros fatores psicossociais, como a Insegurança no Trabalho que se encontra positiva e significativamente correlacionada com a Ansiedade ($r = 0,78$). A Satisfação no Trabalho está associada à Ansiedade, Depressão e Stresse. De salientar que, existe uma correlação positiva e significativa entre o Conflito Trabalho-Família, a Ansiedade ($r = 0,54$) Depressão ($r = 0,72$) e o Stresse ($r = 0,76$).

Quanto aos Valores no Trabalho, os resultados revelam correlações maioritariamente moderadas entre a Confiança nos Superiores e o Stresse ($r = 0,62$), Confiança nos Colegas e o Stresse ($r = 0,61$), entre Justiça, Depressão ($r = 0,60$) e Stresse ($r = 0,73$).

A Autoeficácia é o fator psicossocial inserido na dimensão da Personalidade, não se verificando qualquer relação significativa do ponto de vista estatístico.

A Saúde e Bem-Estar constitui a dimensão central do propósito deste estudo. Alguns Fatores Psicossociais no Trabalho estão de forma positiva e significativamente relacionados com a Ansiedade, Depressão e com o Stresse. A Saúde em Geral está correlacionada com a Ansiedade ($r = 0,73$), Depressão ($r = 0,63$) e com o Stresse ($r = 0,61$). O Stresse por sua vez, associa-se positivamente à Ansiedade ($r = 0,64$), Depressão ($r = 0,54$) e ao Stresse ($r = 0,80$). O *Burnout* é um fator relacionado positivamente com a Ansiedade ($r = 0,67$), Depressão ($r = 0,57$) e com o Stresse ($r = 0,72$). O fator Problemas em Dormir revela um resultado muito positivo e significativo do ponto de vista estatístico, com o Stresse ($r = 0,81$) e significativo com a Depressão ($r = 0,67$). Os resultados mostram ainda que, os Sintomas Depressivos estão de forma positiva e significativamente correlacionados com a Depressão ($r = 0,84$) e como o Stresse ($r = 0,73$).

O fator *Bullying* inserido na dimensão de Comportamentos Ofensivos, não apresentam resultados em termos de relação significativa com a Ansiedade, Depressão e com o Stresse.

Assim, de forma conclusiva e através dos resultados da análise correlacional, verifica-se que, existe uma relação positiva e significativa entre os Fatores Psicossociais no Trabalho e as dimensões afetivas negativas, a Ansiedade, Depressão e o Stresse. Em função das características da tipologia da amostra de participantes neste estudo, os resultados parecem indicar o sentido de que, os Fatores Psicossociais no Trabalho podem contribuir de forma significativa para os quadros clínicos de Ansiedade e Depressão, assim como para estados psicológicos associados ao Stresse, proporcionando a origem e o desenvolvimento de Riscos Psicossociais no Trabalho, nos grupos profissionais em geral e nos condutores profissionais rodoviários, em particular.

Quadro 4. Correlações Entre os Fatores Psicossociais no Trabalho, a Ansiedade, Depressão e Stresse

Fatores Psicossociais no Trabalho	N	Ansiedade	Depressão	Stresse	Dimensões
Exigências Quantitativas	63	0,76**	0,48	0,85**	Exigências

Nota. * $p < 0,05$; ** $p < 0,01$; ns: não significativo.

4. DISCUSSÃO

Este estudo teve como principal objetivo analisar a relação entre os Fatores Psicossociais no Trabalho e as dimensões afetivas negativas, Ansiedade e Depressão, assim como o Stresse, em condutores profissionais rodoviários. Considera-se que a maioria dos participantes desta investigação são quase na totalidade sujeitos do sexo masculino, vai de encontro ao que é descrito na literatura (Murray, 1998), sabendo que, o foco tem sido dado ao risco da condução, da sinistralidade rodoviária, mas ainda é pouco frequente haver debates, discussões e poucos estudos que alertem os empresários de transportes rodoviários de mercadorias de longo curso, que é necessário pensar e refletir sobre as causas dos acidentes na estrada, que poderão em parte estar associados a outros fatores, atitudes e comportamentos inerentes ao trabalho do condutor, sua natureza, condição física, psíquica e social, , cujos Riscos Psicossociais no Trabalho quando não são avaliados e valorizados podem constituir uma forte ameaça para a saúde e bem-estar dos profissionais de condução rodoviária.

Ainda que seja um estudo exploratório preliminar, contribuiu em grande medida para compreender a necessidade de continuar a estudar a problemática bem como o tipo de população, face a diversas situações vividas e sentidas no exercício da profissão.

Em relação às variáveis Risco e Saúde Física e Psicológica, quanto maior o risco menor o sentimento de saúde em

geral. Esta relação poderá estar associada às vivências de risco que podem ter consequências ao nível físico e psicológico, levando os profissionais da condução rodoviária a adotar atitudes e comportamentos, estilos de vida para muitas das vezes tentarem superar dificuldades relacionadas com níveis elevados de Ansiedade e Stresse, recorrendo a hábitos de fumar intensamente, consumo de álcool e outras substâncias, alimentação enfraquecida, poucas horas para descansar, dormir e lazer, vida sedentária e separação psicológica em termos familiares, ficando semanas longe de casa, da família, como é o caso deste tipo de profissionais que participaram no presente estudo (Parker *et al.*, 1998). Trata-se de condutores profissionais rodoviários de mercadorias de longo curso (TIR).

Os resultados descritos apontam para a existência de uma relação significativa entre os Determinantes Psicossociais no Trabalho e as dimensões afetivas negativas, Ansiedade e Depressão, bem como o Stresse, tendo em conta a amostra de condutores profissionais rodoviários de mercadorias de longo curso (TIR), participantes desta investigação.

De acordo com os resultados, a análise de diferenças permitem concluir que, ao nível de significância de $p \leq 0,05$, não existem diferenças entre homens e mulheres relativamente à Ansiedade, Depressão e Stresse (Quadro 2). Quanto à idade, os resultados descritos apontam para valores médios mais elevados nas três dimensões, Ansiedade, Depressão e Stresse situam-se a partir de 40 anos (Quadro 3).

De salientar que, os Fatores Psicossociais no Trabalho parecem estar associados e estabelecem uma relação significativa com as dimensões afetivas negativas, Ansiedade, Depressão, assim como o Stresse, conforme conclusão de estudos anteriores (Cox & Griffiths, 2005; Burton, 2010). Verifica-se também que, os Fatores Psicossociais no Trabalho estão fortemente e positivamente correlacionados com as dimensões Ansiedade e Stresse. Estes resultados vão ao encontro de outros estudos realizados com as mesmas variáveis, no contexto ocupacional como contributo para o desenvolvimento da saúde e qualidade de vida e bem-estar no trabalho em geral.

Existe evidência empírica que revela a relação entre a saúde ocupacional e a conservação de recursos (Taris, 2006), bem como a relação entre a síndrome de Burnout e a conservação de recursos (Hobfoll & Freedy, 1993; Hobfoll & Shirom, 1993). Alguns estudos, relevantes evidenciam que o consumo de tabaco, uma alimentação pouco saudável, a inatividade física, sedentarismo e abuso de álcool constituem as principais causas de morbilidade decorrentes do comportamento em todas as profissões em geral e nos condutores profissionais rodoviários em especial. Existem evidências epidemiológicas de que estes fatores de risco comportamentais contribuem para o desenvolvimento de doenças crónicas como diferentes tipos de cancro, diabetes de tipo II e doenças cardiovasculares (Mokdad, Marks, Stroup & Gerberding, 2004). Além de afetarem a saúde física, alguns destes comportamentos e hábitos de vida, como a inatividade física e uma alimentação rica em açúcar, têm efeitos na saúde mental e psicológica, nomeadamente na Depressão (Cavill, Kahlmeier & Racioppi, 2007) e na esquizofrenia (Peet, 2004).

Os efeitos da não adoção de comportamentos e hábitos de vida recaem igualmente sobre a saúde profissional, dos condutores rodoviários, sendo uma má saúde física, objetiva ou percebida, considerada responsável, a par de elevados níveis de stresse, por níveis elevados de absentismo (Bauer *et al.*, 2007). Outros estudos encontraram benefícios psicológicos e sociais no envolvimento em atividades culturais e desportivas (Eime, Young, Harvey, Charity & Payne, 2013). Em relação à saúde mental e psicológica, não se encontraram diferenças ao nível de perturbações psiquiátricas entre condutores profissionais e outras profissões, apenas foi encontrada uma maior probabilidade de perturbação de ansiedade e stresse no sexo masculino e, entre os mais velhos (Peet, 2004).

Para além do bem-estar associado ao trabalho, outros estudos referem os efeitos na forma como os condutores profissionais relacionam o trabalho e a família com o seu bem-estar subjetivo (Mullen, Kelley & Kelloway, 2008). O trabalho e a vida familiar dos trabalhadores em geral e dos condutores profissionais em particular têm sido considerados duas áreas interdependentes e de maior investimento na vida adulta (Kanter, 1977). Compatibilizar as duas dimensões é compreender que os benefícios não é só para o próprio trabalhador, como também para as organizações e para Portugal.

A Fundação Europeia para a Melhoria das Condições de Vida e do Trabalho considera o equilíbrio entre a vida profissional e pessoal um dos pilares de análise obrigatória quando se pretende avaliar a qualidade de vida dos indivíduos (EUROFOUND, 2014, citado por Chambel, 2016).

Respostas para uma Condução Rodoviária Sem Risco em Ambiente de Trabalho Saudável

5. CONSIDERAÇÕES FINAIS

A prevenção dos riscos psicossociais e a promoção da saúde e bem-estar no trabalho, exige da parte das entidades governamentais e empregadores e outros atores sociais, um conjunto de respostas em termos do diálogo social, implementação de políticas de prevenção que permitam diminuir ou eliminar as consequências negativas dos riscos psicossociais no trabalho.

Os determinantes sociais da saúde exercem os seus efeitos ao longo da vida. O sistema português e a legislação existente permite o enquadramento e o reconhecimento de muitas doenças causadas por fatores psicossociais.

A investigação desenvolvida nesta área do conhecimento, revelou que se pode potenciar e promover as organizações saudáveis através de estratégias práticas tendo por base a Psicologia da Saúde Ocupacional e a Psicologia Organizacional Positiva, que consiste na promoção e desenvolvimento de níveis de positividade de todos os colaboradores.

Para uma melhor compreensão do stresse e dos riscos psicossociais relacionados com o trabalho requer boa formação de todos os profissionais que estão confrontados com a prevenção dos riscos psicossociais. Cada vez mais são os colaboradores que se queixam dos efeitos nocivos do seu trabalho na sua saúde psicológica. Estes problemas, que atingem grandes áreas do trabalho, desde dos impactos organizacionais, nomeadamente os níveis de produtividade e absentismo.

Outro aspeto relevante, enquadra-se ao nível das políticas sobre o emprego, a progressão na carreira como fatores de

gestão das causas e consequências da insegurança de emprego, uma vez que esta insegurança influencia a saúde e bem-estar dos trabalhadores.

Assim, as mudanças profundas que têm ocorrido no mundo do trabalho têm consequências na saúde e qualidade de vida no trabalho. Neste contexto, é necessário relançar o debate sobre as condições de trabalho e o seu impacto na saúde, segurança dos trabalhadores, bem-estar e qualidade de vida no contexto laboral, sendo urgente introduzir nas empresas, organizações e em toda a comunidade de trabalho, a obrigatoriedade da figura do Psicólogo do Trabalho, como contributo para a prevenção dos riscos psicossociais no trabalho, promovendo e desenvolvendo a saúde psicológica no trabalho.

Referem-se as limitações deste estudo, nomeadamente o tamanho da amostra, sendo necessário promover outros estudos, com amostras mais representativas, com mais variáveis sociodemográficas e outras, associadas à saúde psicológica.

ABSTRACT

The organizational environment is characterised by forces which affect the dynamics and the organizational competitiveness. These factors influence the strategy of the organization and its objectives. In this context, professional satisfaction adopts a growing interest in understanding quality of professional life, strategic management and organizational performance. Greater job satisfaction contributes to the professional finding meaning in his professional activity and adopting positive attitudes towards organizational performance.

In this perspective, the article purposes to verify if there are differences between socio-demographic, professional, training and labour variables related to the level of satisfaction of the teachers that belong to the Institute of Education Sciences, as well as to know the level of satisfaction of these professionals.

The results show that the level of teachers' satisfaction is positive and allows to understand the determinants of teachers' satisfaction and their mastery in strategic management of human resources and organizational competitiveness.

Keywords: Strategic Management, Professional Satisfaction, Public Higher Education, Organizational Competitiveness.

JEL Classification: M10, M31

1. INTRODUCTION

The globalization of markets has meant that organizational competitiveness is more daring, both by reducing costs, improving quality, increasing productivity, and by constant innovation and knowledge. As a consequence, organizations have implemented an organizational culture that favors high performance, with particular attention to human resource management as an essentially strategic issue. When it comes to strategic human resource management, it refers to "designing and implementing a set of internally consistent policies that ensure that the company's human capital contributes to achieving business objectives" (Huselid, Jackson and Schuler, 1997: 172). This view states that not only the different human resources management practices and policies must be closely interlinked, but also aligned with the organization's overall strategy. The growing interest in strategic management of human resources reveals the progressive concern with people, considered as the key resource for organizational success, whether private or public organizations (Mendes, 2012).

The management of human resources is based on the affectation of the behavior of the people and their correlation with the institutional objectives. The management of the employees, their planning, their direction and leadership, and their control are closely related to the dimensions perceived by the workers. Validating dimensions that promote job satisfaction is building a set of determinants that can be evaluated in the context of Human Resource Management in order to maximize value for the professional and for the institution. This study was carried out for teachers of the Higher Institute of Education Sciences of Sumbe (ISCED). Tries to observe the job satisfaction of these professionals, and to relate the variables associated to this condition (sociodemographic, professional context, training context and work context).

Professional activity occupies most of the time of workers, and undoubtedly takes on a remarkable importance in the life of the active population. For this reason, it is extremely important that the workplace provides well-being, since this satisfaction shows a direct connection with the other areas of workers' lives. According to Grace (1999), job satisfaction comprises an attitude or emotion that assumes concrete meaning in behaviors and opinions uttered. Barros and Cunha (2010) affirm that it is the activity that determines the set of all the actions (thoughts, feelings and emotions) that characterize human behavior at work. There are several studies that show that job satisfaction has an effective effect on the productivity of organizations, on the well-being of employees and also on the various dimensions that are directly or indirectly associated

with people, both in the labor and personal fields. Several dimensions were indicated in order to ascertain professional satisfaction: working and health conditions, job security, achievement, autonomy, relationship, prestige and remuneration. Professional satisfaction can be assessed by different approaches and in different environments. Job satisfaction has become increasingly important because it is pointed out as a variable, implicitly and explicitly, that is linked cumulatively to the productivity and personal fulfillment of workers. Greater professional satisfaction contributes to the professional finding meaning in their work activity and adopting positive attitudes towards institutional development.

Despite the existence of a multiplicity of studies that deal with the subject of professional satisfaction, there are minimum studies that study the professional satisfaction of teachers, particularly in Angola. It is intended, therefore, to contribute in some way to the widening of knowledge and to the enrichment of the Angolan and international bibliography.

In this sense, the purpose of this study is to examine the determinants of ISCED job satisfaction and understand which aspects are more valued by these professionals in their work environment. The present study supposes a reflection about the way in which the sociodemographic variables, of professional context, of training context and of work context influence the level of professional satisfaction of the professors of ISCED. Thus, it is crucial that ISCED understands what its teachers expect and has a duty to promote such measures, evidently within the parameters admissible and practicable by the institution.

This article is organized in 5 sections. In addition to the present introduction, there is a section with the theoretical framework, another with the supporting methodology of the whole study. Following is the section where the results achieved with the satisfaction of ISCED professionals are displayed and analyzed. Finally, the main conclusions and contributions of the present study are highlighted.

It is hoped that this study will contribute to a better understanding of the job satisfaction of higher education teachers in order to allow ISCED to define strategies and adopt intervention measures that favor the well-being, the expectation of teachers and promote simultaneously, the better institutional competitiveness and the quality of education.

2. THEORETICAL BACKGROUND

In the current context of globalization, organizational strategic management and particularly human resources management reveal the progressive concern with people, seen as the key factor for excellent performance and organizational competitiveness. In addition to the usual sources of competitive advantage, people have come to be seen not as a mere organizational resource that should be managed like other resources, but rather as the strategically most important “resource” for gaining competitive advantage. In the search for this advantage, the contribution requested to the human resources management is in the capacity of production of added value, representing this capacity, the implementation of certain strategic activities of human resources management (Mendes, 2012).

The realization of this research on the job satisfaction of teachers and non-teachers makes it possible to understand the perception of these professionals about this reality, to know what motivates them and what their expectations, and through this knowledge to improve their productivity and efficiency, as well as Quality of education. Lobos (1978) argues that so many managers and social researchers believe that if labor dissatisfaction were reduced, human barriers to production would be eliminated and transformed into a force that would promote improved performance and consequently productivity.

With regard to the professional of the higher education, the way in which he feels and faces his work, determine categorically the success and the quality of the education. Because it is a profession that is dynamized particularly in the field of human relations, the satisfaction in the workplace becomes essential. In fact, teaching is a profession that has undergone changes and restructurings in the sense of achieving excellence in teaching. With the growing development of communication and information technologies, education professionals need constant updating so as not to compromise professional competence and the quality of teaching and service delivery to students and the community.

According to the two-factor theory developed by Frederick Herzberg there are two types of factors that affect the satisfaction of human needs, classified as hygienic factors and motivational factors. Hygienic factors are factors related to the working environment or living conditions; the motivational factors are those that can promote active attitude and job satisfaction (Alpay and Verschoor, 2014; Wei and Junyan, 2015). The motivation and the particular interest in this subject were triggered, above all, by the supposed relationship between teacher satisfaction and professional performance. In this paper it will be present the results of a study by Locke (1969) and Cure and Rodrigues (1999), Judge, Thoresen, Bono and Platten (2001), (Aiken, Clarke, Sloane and Caetane, 2010; Moura, 2012; Azevedo, 2012; Leite, 2013) that point to an implicit link between job satisfaction and the high performance of its professionals. According to Mezomo (2001), an organization with satisfied employees has a potential advantage, since it generally attracts the best, reduces staff turnover, increases productivity, reduces costs, improves image vis-à-vis the community and Gains competitiveness.

The senior management of a higher education institution has an important role in creating job satisfaction, identifying which factors cause satisfaction and/or dissatisfaction, and use those data to identify strategies that lead to improved situations that are less satisfactory. As a result, job satisfaction has a significant impact on employees' commitment to organizations, work performance, and motivation (Machado-Taylor, Meira Soares and Gouveia, 2010; Machado-Taylor *et al.*, 2016).

3. METHODOLOGY AND RESEARCH HYPOTHESES

This research deals with the professional satisfaction of the teachers who work in ISCED, and intends to understand some of the determinants that influence, how the teacher feels in the workplace and how he perceives his profession. In order to answer to the main objective, the following research hypotheses (HI) were established:

- HI₁: There are differences in the average values of job satisfaction for sociodemographic characteristics;
 HI₂: There are differences in average values of job satisfaction for the level of training;
 HI₃: There are differences in average values of job satisfaction for professional category;
 HI₄: There are differences in average values of job satisfaction for the labor characteristics;
 HI₅: There are differences in average satisfaction values in each leadership practice for each leadership style;
 HI₆: There is a direct positive relationship between satisfaction dimensions and overall satisfaction.

In order to answer to the main objective of the present study, an anonymous and confidential questionnaire survey was applied to ISCED teachers, divided into two parts. First part, consisting of a previous questionnaire, the questions were elaborated by the researchers, including sociodemographic, professional, training and labor variables, among others. A second part consists in the CAF Model 2006, Common Framework for Quality Assessment of the Common Administrations of the European Union (CAF). After data collection, the database was constructed, processed, processed, analyzed and interpreted.

Initially, in order to describe and characterize the study sample, an exploratory descriptive analysis of the data was performed according to the nature of the variables under study. Statistical measures were used: absolute frequencies, relative frequencies, mean, standard deviation, bar graphs, in order to describe the characteristics: sociodemographic, professional, labor and satisfaction manifested by the respondent.

Subsequently, in order to perform the necessary inferential analysis, it was applied the parametric tests, to understand the differences between means and the relationship between variables, whenever possible, and when the assumptions for their application were not violated, and when this is not possible non-parametric tests.

The relationship between variables of the first part of the questionnaire with the dimensions of the Satisfaction with Work scale, namely: Overall satisfaction of employees with the institution (SGFI); Satisfaction with management and management systems (SGSG); Satisfaction with working conditions (SCT); Satisfaction with Career Development (SDC); Levels of motivation (SL); Satisfaction with leadership style (SEL); Satisfaction with top leadership style (SELT); Satisfaction with leadership style of intermediate level manager (SELI); Satisfaction with hygiene, safety, equipment and service (SCHSES); Satisfaction with the current remuneration system (SSRV) will allow to establish the predominant determinants of satisfaction with work in these professionals.

4. FINDINGS

4.1 Sociodemographic characterization

Table 1 presents the sociodemographic characteristics of the respondents under study. The sample size is composed by 39 professors, who carry out teaching duties at ISCED.

Still, based on the information in the below table, 61.5% (24) of the respondents are male and 38.5% (15) female. Regarding age, 23% (9) of individuals are aged up to 30 years, 43.6% (17) are between 31 and 40 years old and 33.4% (13) are over 40 years old. In terms of nationality, 87.1% (34) of the respondents are Angolan, 10.3% (4) of the respondents are Cuban and one is Vietnamese. Regarding marital status, 46.2% (18) are single, 46.2% (18) are married/union in fact, one is divorced and two widowed. Most of the respondents, 74.4% (29) and 25.6% (10) of the respondents do not have children. Regarding the qualifications, it was verified that 51.3% (20) finished the master's degree, 23.1% (9) of the respondents are licensed and only 25.6% (10) have a PhD. Regarding the employment relationship, 74.4% (29) stated that they were employees and 25.6% (10) were effective.

Table 1. ISCED teachers profile

Variables		n	%
Gender	Male	24	61,5
	Female	15	38,5
	<i>Total</i>	<i>39</i>	<i>100</i>
Age	Up to 30 years	9	23,0
	From 31 to 40 years old	17	43,6
	Equal or greater than 41 years	13	33,4
	<i>Total</i>	<i>39</i>	<i>100</i>

Nationality	Angolan	34	87,1

	Master	20	51,3
	Doctor	10	25,6
	<i>Total</i>	<i>39</i>	<i>100</i>
Job link	Effective	29	74,4
	Collaborator	10	25,6
	<i>Total</i>	<i>39</i>	<i>100</i>

4.2 Results of the Sociodemographic Dimension

This section presents the results obtained regarding the satisfaction of ISCED teachers in the dimensions assessed by the CAF scale. In this subchapter we present the results of the dimensions of the CAF scale according to the sociodemographic dimension. Regarding the gender of the respondent, it is verified that in all dimensions of the CAF scale, the average values obtained for women are higher than the average values obtained for men. The following are the dimensions: Satisfaction with management and management systems (SGSG), women with a mean value of 3.44 and men with an average of 2.95; Satisfaction with career development (SDC), with a mean in the female of 3.66 and a mean of 2.87 in the male; Satisfaction with the hygiene, safety, equipment and service conditions (SCHSES), with an average of 2.71 for females and 2.29 for males. The following are the dimensions: Satisfaction with working conditions (SCT), Satisfaction with career development (SDC), Satisfaction with leadership style (SEL), be it top leadership (SELT) or intermediate leadership (SELI) and SCHSES that the observed differences between men and women are statistically significant, with women being the most satisfied. Regarding the satisfaction with the current remuneration system (SSRV), both genders are similarly satisfied, with a mean of 3.08 for females and 3.04 for males.

The results of the dimensions of the CAF scale for teachers according to the age group of the teacher show that the employees aged up to 30 years had higher mean values of satisfaction in SGSG (3.16), SCT (3.26), SDC (3.28), NM (3.96), SEL (3.79), SELT (3.75) and SCHSES (3.54). By the application of the ANOVA test it is concluded that the observed differences are statistically significant in the SSRV dimension, with the teachers older than 40 years who are more satisfied (3.15) and by the Tukey multiple comparison it is concluded that the Differences between individuals between the ages of 31 and 40 and the remaining age groups. In the remaining dimensions the differences observed are not statistically significant.

Regarding the nationality of the respondent, the results obtained show that in all dimensions the average values obtained for employees with a nationality other than Angolan are higher than the average values obtained for Angolan employees. The following stand out: SGFI, non-Angolan with mean value of 3.54 and Angolan with a mean of 3.20; SCT with a mean of 3.54 in non-Angolan and 2.98 in Angolan, SCHSES with an average value of 2.71 in non-Angolan and 2.29 in Angolan, SSRV, with a 3.65 non-Angolan average and 2.67 In Angola. The SGFI, SCT, SCHSES and SSRV dimensions show that the observed differences between Angolans and non-Angolans are statistically significant, with non-Angolan employees being the most satisfied.

The results of the dimensions of the CAF scale according to whether or not the child has children shows that the institution's teachers who did not have children were, on average, more satisfied in the dimensions: SGFI (3.36), SGSG (3.16), SDC (3.21), NM (4.11), SEL (3.59), SELT (3.49) and SELI (3.69). In the remaining dimensions, employees with children presented the highest results, namely in SCT (3.19) and SSRV (3.27). By applying the Student's t-test it is concluded that the observed differences are statistically significant in the SSRV dimension, with those with children who were significantly more satisfied. In the other dimensions, the observed differences are not statistically significant.

Based on all the information that was previously mentioned and taking into account the first hypothesis of research it is verified that this first hypothesis was not validated.

4.3 Dimension Training Results

The results of the dimensions of the CAF scale according to the literary qualifications of the respondents reveal that the teachers with literacy at the master's/doctoral level have higher average levels of satisfaction in all dimensions. By the application of the Mann-Whitney test it was concluded that the differences are statistically significant in the dimensions: SGFI, SGSG, SCT, SEL, SELT and SELI.

With regard to the results of the dimensions of the CAF scale according to the facility that the institution offers to make the respondent frequent training, it is verified that in all dimensions, with the exception of the SSRV dimension, the average values obtained by the respondents who stated that they are easy to attend training were higher than respondents who stated that they did not have an easy time attending training. The SGSG, SCT, SDC, SEL, SELT, SELI, and SCHSES dimensions were analyzed in the the dimensions of satisfaction due to the ease of attending training, for which it was concluded that the differences are statistically significant. In other words, teachers who feel that the institution is easily trained in their area of work are clearly more satisfied. Thus, the second hypothesis of research was confirmed.

4.4 Results of the Professional Dimension

The results of the dimensions of the CAF scale as a function of the teachers' work link show that in all dimensions, with the exception of SCHSES, the average values obtained for the employees are higher than the average values obtained for the employees. However, at a significance level of 5%, it is concluded that the differences are not statistically significant. The third hypothesis of research can be said that it is not validated since there was insufficient statistical evidence to corroborate it.

4.5 Results of the Work Dimension

The results of the dimensions of the CAF scale according to the reasons that led the teacher interviewed to work at the institution show that the teachers who invoked the interest/experience reasons to work at the institution had higher average satisfaction values in all dimensions. By applying the Mann Whitney test it was concluded that the differences are statistically significant in the SEL, SELI and SSRV dimensions. With regard to the results of the dimensions of the CAF scale depending on the possibility of re-choosing the same institution to work. Teachers who stated that they would choose the same institution to work showed the highest average levels of satisfaction in all dimensions of the scale. On the other hand, teachers who stated that they would not choose the same institution to work had the lowest average levels of satisfaction in all dimensions, except for the SGFI, MN and SSRV dimensions, whose lowest satisfaction values belong to teachers who did not know if they would choose the same institution again. It should be noted that in the SGSG, SCT, SDS, SCHSES and SSRV dimensions the average levels of satisfaction presented by employees who would not choose the institution and those who did not know if they would choose are up to 3 points. By the application of the ANOVA Test it was concluded that the differences are statistically significant in the dimensions: SGFI, SGSG, SCT, SDC, SEL, SELT, SELI and SSRV. By Scheffé's multiple comparison it was concluded that the significant differences occur between the respondents who would return and those who would not return to work in the institution. As regards the fourth hypothesis of investigation, it can be said that it is validated once enough statistical evidence has been recorded to corroborate it.

4.6 Result of management practices for the different leaderships

It was noted that in general the focused initiatives are identified by the majority of respondents at both top-level and intermediate levels. At the top leadership stand the initiatives: "Demonstrates commitment to the process of change" and "Delegates competencies and responsibilities"; "Which showed levels of agreement slightly higher than the intermediate leadership. In the remaining initiatives the agreement of its existence is slightly superior in the intermediate leadership.

The table below shows the characterization of the satisfaction with the leadership practices (top and intermediate) of the ISCED institution's teachers. It was observed that for all the focused initiatives the average levels of satisfaction are close between top leadership and intermediate leadership, and there are no statistically significant differences between the two types of leadership. With the exception of the "Delegate competencies and responsibilities" initiative, all other initiatives have slightly higher average satisfaction scores in the lead. In this sense, the fifth hypothesis of research was not corroborated.

Table 2. Characterization of satisfaction with the leadership practices (top and intermediate)

Dimensions	Activity	Mean	Standard deviation	<i>tStudent</i> Test	p-value
Lead through example	Top Manager	3,47	1,13	-0,861	0,393
	Intermediate manager	3,61	1,05		
Demonstrates commitment to the process of change	Top Manager	3,44	1,09	-0,444	0,659
	Intermediate manager	3,49	1,15		
Accepts constructive criticism	Top Manager	3,22	1,10	-1,913	0,061
	Intermediate manager	3,46	1,16		

Accepts suggestions for improvement	Top Manager	3,51	1,07	-1,158	0,252
	Intermediate manager	3,64	1,13		
Delegates powers and responsibilities	Top Manager	3,71	1,18	0,252	0,802
	Intermediate manager	3,68	1,12		
Stimulates people's initiative	Top Manager	3,44	1,19	-0,375	0,709
	Intermediate manager	3,49	1,14		
Encourages mutual trust and respect	Top Manager	3,36	1,23	-0,629	0,532
	Intermediate manager	3,46	1,25		
Ensures the development of a culture of change	Top Manager	3,44	1,22	-0,358	0,721
	Intermediate manager	3,49	1,17		
Promotes training actions	Top Manager	3,63	1,32	-0,616	0,541
	Intermediate manager	3,73	1,11		
Recognizes and rewards individual and team efforts	Top Manager	3,24	1,15	-1,120	0,267
	Intermediate manager	3,41	1,16		
It suits the treatment given to people, needs and situations	Top Manager	3,25	1,27	-1,301	0,198
	Intermediate manager	3,47	1,22		

4.7 Characterization of the Job Satisfaction Scale

The results obtained for the dimensions of the CAF scale are presented in this section. For each dimension its average was calculated based on the number of items that integrate each dimension. The scale used to measure the items was Likert's 5-point, where 1 corresponds to Very dissatisfied and 5 to Very Satisfied.

By analyzing the values presented in Figure 1 it is possible to observe the average level of satisfaction of the respondents in all dimensions as well as the dispersion of results. It is verified that, with the exception of the SCHSES and SSRV dimensions, the average satisfaction recorded was close to or higher than 3.5 and that the dispersion values in all dimensions are small. It can be said that the employees of the institutions under study are generally satisfied. Table 3 complements and reinforces this satisfaction.

Figure 1. Summary of global mean and overall standard deviation of dimensions

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system.

Table 3 presents the results of dimension characterization. It is observed that in terms of internal consistency this varies from good to very good, since the smallest Cronbach Alpha coefficient is 0.837 and the highest is 0.976.

In table 3 it can be observed that the empirical average values obtained are higher than the theoretical average value (3 points), except for the dimension Satisfaction with hygiene, safety, equipment and service (SCHSES) (average of 2.46 points) and Satisfaction dimension With current remuneration system (SSRV) the average obtained (3.06 points) is slightly higher than expected. It can be stated that, considering only the average values obtained, it is possible that the respondents are minimally satisfied in the dimensions: Overall satisfaction of the employees with the institution (SGFI), Satisfaction with management and systems of management (SGSG), Satisfaction with the conditions of (SCT), Satisfaction with Career Development (SDC), Levels of Motivation (NM), Satisfaction with leadership style (SEL), Satisfaction with top leadership style (SELT) and Satisfaction with leadership style of Manager (SELI).

Table 3 Characterization of the dimensions evaluated in the CAF questionnaire

Dimensiones	Alpha Cronbach	Empirical minimum	Mean	Standard deviation
SGFI	0,893	1,44	3,33	0,81
SGSG	0,933	1,11	3,11	0,91
SCT	0,894	1,13	3,19	0,87
SDC	0,830	1,60	3,18	0,87
NM	0,929	1,25	3,82	1,02
SEL	0,965	1,27	3,48	0,88
SELT	0,947	1,00	3,43	0,95
SELI	0,959	1,45	3,54	0,97
SCHSES	0,867	1,00	2,46	0,77
SSRV	0,823	1,00	3,06	1,00
Satisfaction	0,976	1,75	3,25	0,71

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system

In order to complement the study, the correlation analysis was performed between all dimensions and also the weight of each dimension in the overall satisfaction (Table 4). It was necessary to produce the Spearman's correlation coefficients because the normality assumption in all dimensions was not verified. Table 4 shows the coefficients with a value greater than 0.70, which shows a strong relation. Thus, it can be said that the associations between: SGFI and SGSG; SCT and SGSG; SDC with SGSG; SEL with SGSG, SCT and SDC; SELT with SGSG, SCT, SDC and SEL; SELI with SEL are strong. Regarding the overall satisfaction, the strongest and statistically significant contributions are of the dimensions: SEL, SGSG, SDC, SCT, SELT and SGFI, with correlation coefficients above 0.80. In this sense, it can be said that there is a direct positive relationship between the dimensions of satisfaction and overall satisfaction, so the sixth research hypothesis is confirmed.

Table 4 Spearman's correlation coefficients

Dimensions	SGFI	SGSG	SCT	SDC	NM	SEL	SELT	SELI	SCHSES	SSRV	Satisfaction

Satisfaction											1

SGFI - Overall satisfaction of employees with the institution; SGSG- Satisfaction with management and management systems; SCT - Satisfaction with working conditions; SDC- Satisfaction with career development; NM - Levels of motivation; SEL - Satisfaction with leadership style; SELT - Satisfaction with top leadership style; SELI- Satisfaction with the managerial style of intermediate level manager; SCHSES - Satisfaction with hygiene, safety, equipment and service conditions; SSRV - Satisfaction with the current remuneration system; Satisfaction - overall average satisfaction. a - significant correlation coefficient at 5%; b - significant correlation coefficient at 1%. Spearman correlation coefficient.

5. CONCLUSIONS

As final considerations, it is intended to summarize the information discussed in previous sections, also explaining the limitations of the study as well as the possible directions for future research. According to Almeida (2003), any organization is a result of its human capital and, of course, does not exist if there are no people. In this sequence, the strategic management of human resources has been adopting new roles, from a management of only administrative and bureaucratic personnel, with concerns centered only on compliance with the legislation, a management of human resources with more strategic orientations, focused on Valuation of human capital, motivation and job satisfaction (Mendes, 2012). In this research it can be said that meet the view of Mezomo (2001), who argues that no organization is successful, that is, it achieves objectives without the effort and reciprocal commitment of all workers, who must work as a team, in the search for and operationalization of the objectives, which are added to improve organizational performance. Any organization with satisfied employees has the potential to add benefits, as it typically attracts the best, reduces staff turnover, increases productivity, reduces costs, improves image vis-à-vis the community, and gains competitiveness. The present study was based on a reflection on how sociodemographic variables, professional context, training context, work context and leadership context determine the level of job satisfaction of ISCED teaching professionals. At the same time it provided the knowledge of the image that the teachers perceive of the higher education institution where they carry out activity. This knowledge allows identifying the reasons for mismatches and nonconformities and their consequences in order to implement measures that promote the desired transformations and satisfaction.

This research proposes, regarding sociodemographic variables and job satisfaction, that:

- Female professors always declared a superior satisfaction than male professors;
- Professionals with lower age had higher satisfaction than those of the highest age groups, except for satisfaction with the current remuneration system (SSRV), which showed higher satisfaction among older teachers;
- Marital status did not significantly influence teacher satisfaction;
- Professors without children showed higher satisfaction than those with children, except in the SSRV dimension;
- Non-Angolan professors presented greater satisfaction than Angolan professors.

Respecting the professional variables in job satisfaction, it can be conclude that:

- Professors with ties to the institution were slightly less satisfied than the collaborators, although the differences observed in each dimension were not statistically significant;
- Regarding the salary, teachers satisfied with this, presented higher levels of professional satisfaction.

Concerning the variables of training in job satisfaction, it can be conclude that:

- Professors with higher academic qualifications presented greater satisfaction;
- Professors who stated that they were able to attend training were more satisfied than those who did not have the opportunity to attend training.

Regarding labor variables and job satisfaction, it can be concluded that:

- Professors who invoked the interest/experience reasons to work at the institution showed higher satisfaction values.
- Professors who stated that they would choose the same institution to work showed the highest average levels of satisfaction in all dimensions of the scale.

About variables leadership and job satisfaction, it can be concluded that:

- Professors satisfaction levels are close to top leadership and intermediate leadership;
- Professors have slightly higher satisfaction in all intermediate leadership initiatives, with the exception of the “Delegate Competencies and Responsibilities” initiative that delights the top leadership.
- Professors performing ISCED functions were moderately satisfied (empirical average of 3.25 and standard deviation of 0.71).

Given the results obtained, it can be affirmed that it was possible to relate sociodemographic variables with the degree of professional satisfaction of ISCED teachers and thus contribute to a better understanding of the influence of satisfaction on improving the competitiveness and performance of this institution. The results obtained aim to highlight the relation between age and job satisfaction, where it was observed that the group of subjects over 40 years of age showed the highest degree of job satisfaction in the SSRV dimension. The statistical analysis applied to the data of this study with respect to the age group proves that the hypothesis is only validated in the SSRV dimension, because in this dimension the results obtained showed significant differences being the teachers between the ages of 31 and 40 which were significantly different from the others (less satisfied). In the remaining dimensions, the observed differences between age groups were not statistically significant. The results achieved converge with satisfaction theories, particularly with the pyramid theory of Maslow's needs, which identifies one of the needs as security (stable employment, social protection), which in this study can be observed in

the determinant of the link with the organization. Which allows to conclude that although the satisfaction of individuals with fixed-term contracts is slightly higher than the actual teachers, the differences observed in each dimension were not statistically significant. It is believed that the labor bond factor did not present the clearly superior result in favor of the effective state because the collaborating professors are foreign professionals with remunerations much higher than the salaries earned in their countries of origin (Cuba and Vietnam). This raises the discussion about considering this fact in the design of policies and strategies of Management and more specifically Human Resources Management (HRM). The purpose of the reflection is to impose flexibility, adaptability and availability, without there being a compromise between the employee and the organization in the long term. In recent years there has been a growing choice of organizations for forward contracts and services, in a clear adaptation to the demands of global society and to internal and external policies that affect organizations economically and socially. In this context, it is essential that human resource managers remain alert to employee signals. In this investigation it can be concluded that the professionals pay particular attention to the values and attitudes of their managers and leaders, both intermediate and top. To this extent, it is believed that this study can contribute to a reflection on how to contribute to the construction of a better and healthier society, inside and outside the organizations, where the values that identify the professionals as human beings, dignified, respectful, ethical, supportive, and do not get run over by negative attitudes such as selfishness, egocentrism, rivalry. It is assumed that this scenario is possible since greater job satisfaction contributes to the employee finding meaning in their professional activity and adopting positive attitudes towards institutional development. Successful organizations are known to take pride in practicing excellent HRM and for their part, the professionals are proud and “wear the jersey of the organization” leading these organizations to success. This study reveals that ISCED’s teaching staff are globally satisfied and this satisfaction has contributed directly to improving the teaching quality and competitiveness of this institution. It is recommended to the management, particularly to HRM, a greater participation and involvement of the teachers in the institutional decision, especially in the decision making related to the teaching, so that this involvement, stimulates a greater satisfaction and consequently, to promote a better performance in the teaching. A greater commitment of the management bodies and the intermediate directors, covering these professionals, enhances a better communication and institutional valuation.

The main limitation of the study is related to the sample size. Although the collection of data has not proved easy, it is intended that future research may involve larger samples, extended to other professional categories and institutions, comparing professional satisfaction between teachers and non-teachers, national and Countries.

RESUMO

Crianças e jovens em situação de acolhimento apresentam uma história de vida caracterizada por situações de risco psicossocial que, tendencialmente, aumentam a vulnerabilidade individual. As Instituições de acolhimento têm como função a educação, mas também a proteção desses menores, face a qualquer forma de violência, nomeadamente a de abuso sexual. Neste trabalho apresenta-se um Projeto de intervenção, ainda em curso, em Instituições de acolhimento de crianças e jovens que visa contribuir para diminuir vulnerabilidades e promover capacidades na área da educação sexual, como forma de prevenir o abuso sexual. A intervenção ocorre por meio de um programa de formação e desenvolvimento de competências com oito crianças dos 8 aos 11 anos, com atividades lúdico- pedagógicas na área da Educação Sexual com todas as crianças acolhidas e por uma formação breve sobre sexualidade e sexualidade infantil para ajudantes de lar. A avaliação da intervenção das oito crianças, em termos de ganhos na capacitação para o estabelecimento de relações saudáveis, é realizada através de instrumentos psicológicos; dados sobre efeitos das atividades lúdico-pedagógicas são obtidos com base em registos dos profissionais da Instituição; a formação breve é avaliada através de questionário.

Palavras-chave: Abuso Sexual, Sexualidade, Prevenção.

1. INTRODUÇÃO

Segundo a Organização Mundial de Saúde (OMS) a sexualidade caracteriza-se por uma energia que motiva o Ser Humano a procurar amor, contacto, ternura, intimidade, integrando-se no modo como este se sente, move, toca e é tocado (2001). Influencia os seus pensamentos, sentimentos, ações e interações e, por isso, influencia também a sua saúde física e mental (Pontes, 2011). Podemos ainda dizer que a sexualidade é também influenciada por variáveis biológicas, psicológicas e sociais, pelo que não é vivida de igual forma em todas as fases do ciclo da vida e em todas as sociedades e culturas.

Neste artigo interessa-nos incidir sobre a sexualidade na infância, uma vez que o foco do nosso trabalho é a proteção do normal desenvolvimento sexual da criança e a prevenção de situações que o perturbem. Para entendermos de que forma esse desenvolvimento pode ser perturbado, importa perceber o que o caracteriza. Segundo López e Fuertes (1999) a sexualidade na infância caracteriza-se por órgãos genitais pouco desenvolvidos, quantidade muito pequena de hormonas sexuais no sangue, sensações de prazer sem significado específico e práticas sexuais baseadas em motivações muito diferentes das dos adultos. Vários autores identificam que estas práticas ocorrem por imitação de comportamentos de pares e adultos, curiosidade sexual, desejo de conhecimento do próprio corpo e do corpo de outros e, ainda, por procura de prazer (Marques, Vilar & Forreta, 2002; Fávero, 2003). São descobertas e vivências caracterizadas pela curiosidade, pela exploração divertida, espontânea e consensual, dirigida a si própria ou a crianças da mesma idade, que permite a aprendizagem da própria sexualidade, do corpo, dos sentimentos e dos afetos (Marques, Vilar & Forreta, 2002; Fávero, 2003; Robert & Jacob, 2006).

É um direito da criança o respeito pela sua sexualidade, cabendo ao adulto permitir-lhe conhecer atividades sexuais próprias da sua idade (Berman, 2010). Contudo há adultos que são inapropriados em relação à sexualidade infantil, por exemplo, por serem descuidados em relação aos seus próprios comportamentos sexuais, expondo-os à criança, ou por promoverem comportamentos erotizados nos mais novos, não os protegendo de conteúdos sexuais impróprios para a sua idade. Estes comportamentos, por vezes, são também adotados por jovens que, ao terem um desenvolvimento psicosexual mais adiantado do que a criança, fazem uso de uma relação de poder ou controlo para satisfazer os seus próprios desejos em detrimento do bem-estar daquela (Aguilhas, Figueiredo, Alexandre & Cifuentes, 2016).

Quando um jovem ou um adulto assume comportamentos que comprometem o desenvolvimento sexual da criança, podemos falar em abuso sexual. Com efeito, este conceito é definido pela OMS (2006) como o envolvimento da criança em

atividades sexuais que não compreende totalmente, para as quais é incapaz de dar o seu consentimento informado e não está preparada do ponto de vista do seu desenvolvimento. No Código Penal Português (Rocha, 2013) os atos sexuais que caracterizam o abuso sexual infantil podem envolver comportamentos de natureza diversa, como sejam carícias, masturbação, cópula, coito anal, coito oral ou a introdução vaginal ou anal de partes do corpo ou objetos. Pode ainda abranger outros comportamentos de importunação, tais como exposição a pornografia, utilização da criança para produção de material pornográfico, telefonemas obscenos, exibicionismo ou favorecimento, facilitação ou fomento da prática da prostituição infantil.

O abuso sexual é uma realidade social muito grave e complexa, com relevantes prejuízos para a saúde física e psicológica das vítimas (Magalhães, 2010). Uma criança sexualmente abusada pode apresentar comportamentos sexuais desequilibrados, de natureza compulsiva, agressiva, incluindo comportamentos erotizados próprios de adultos (Finkelhor, 1986; Navais & Britto, 2013). As suas atividades sexuais podem ser dirigidas a outras crianças mais novas e vulneráveis, não sendo consensuais, mas sim baseadas na força e coerção (Sanderson, 2005). É também frequente que apresente conhecimentos sexuais inapropriados para a idade (Schaefer, Rossetto & Kristensen, 2012; Florentino, 2015). As consequências psicológicas do abuso sexual variam de acordo com a idade da vítima e do agressor, o grau de relação entre ambos, a duração e frequência do abuso (Furniss, 1993; Beutler, Williams & Zetzer, 1994; Trickett & Putnam, 1998; Putnam, 2003; Mateus, 2012; Maria, 2012) a personalidade da criança, o tipo e a gravidade do ato e as reações do ambiente.

Quando uma criança vive num contexto onde alguma área do seu desenvolvimento está gravemente comprometida, por omissão ou ação dos seus pais ou responsáveis legais, pode ser necessário o Estado intervir, sendo a Institucionalização a última das respostas legalmente previstas para assegurar a proteção do seu desenvolvimento (Carvalho, 2013).

Nestes casos compete às Instituições de acolhimento substituírem temporariamente a família de origem, assumindo o significado de família junto dos menores que acolhem (Alves, 2007) configurando um ambiente reparador securizante e organizador do psiquismo dos menores. Devem configurar um ambiente reparador (Teixeira, 2009). Fornecendo-lhes um adequado suporte, tendo em vista o seu desenvolvimento biopsicossocial, (Carvalho, 2013) através de ações estruturadas que colmatem necessidades decorrentes do contexto adverso no qual aqueles se encontravam anteriormente ao acolhimento. Acreditamos que muitas das crianças que se encontram institucionalizadas, independentemente do motivo maior que levou a esta situação, foram expostas, em algum momento, a diferentes formas de abuso relacionado com a sua sexualidade. Esta nossa convicção prende-se com a falta de supervisão e proteção a que estas crianças estiveram expostas, tornando-as mais suscetíveis e vulneráveis a estes perigos. Assim, é importante que profissionais, habilitados para o efeito, desenvolvam práticas educativas com estes menores (Yano & Ribeiro, 2011) no âmbito da sexualidade, as quais ajudem aqueles a viver a sua sexualidade de forma positiva e segura.

Neste sentido, a Equipa de Apoio Técnico ao acolhimento Residencial de Crianças e Jovens do Instituto de Segurança Social dos Açores (ISSA) considerou importante a realização de ações de educação afetivo-sexual e prevenção de abusos nos Lares de acolhimento da ilha de São Miguel. Para tal solicitou a colaboração da Associação para o Planeamento Familiar e Saúde Sexual e Reprodutiva – Açores (APFSSR-Açores). Esta é uma associação, particular, sem fins lucrativos que tem entre os seus objetivos a promoção da educação e o aconselhamento sobre sexualidade, por forma a ajudar as pessoas a fazerem escolhas livres e conscientes ao nível da sua vida sexual e reprodutiva e a promoção da formação e do treino de profissionais para a abordagem das questões ligadas ao planeamento familiar e à educação sexual.

2. EDUCAR SOBRE SEXUALIDADE

A sexualidade é uma dimensão fundamental da vida humana, com uma função reguladora da saúde física e emocional (Volpi & Leszczynski, 2008). Expressa-se em práticas e desejos ligados à afetividade, ao prazer, aos sentimentos e ao exercício da liberdade individual (Ramiro, 2013).

“Estar informado sobre sexo, sobre sexualidade ou sobre saúde sexual e reprodutiva é antes de mais um Direito! Um Direito de mulheres e homens, raparigas e rapazes... um Direito de todos e de todas!” (Associação para o Planeamento da Família, s/d).

A educação sexual pode ser dividida em informal e formal. A primeira caracteriza-se pela aprendizagem com os outros através da observação direta, no contacto com as figuras parentais, outros familiares, educadores, professores, pares e com os meios de comunicação social em geral, ocorrendo de forma espontânea e não intencional. Já a educação sexual formal caracteriza-se por ações estruturadas e intencionais, que visam a aquisição de conhecimentos e o desenvolvimento de competências (Marques, Vilar & Forreta, 2002; Vieira, 2009), essenciais para a vivência plena, livre e responsável da vida afetiva, pessoal e social (Amor Pan, 1997). Estas duas formas de educação sexual complementam-se, isto é, por um lado, as crianças e os jovens precisam de amor e apoio no seu ambiente social e familiar para desenvolverem a sua identidade sexual, mas também precisam adquirir conhecimentos específicos, atitudes e competências, que devem ser transmitidos por profissionais habilitados para o fazer (OMS & Federal Centre for Health Education, 2010).

Está bastante fundamentada e justificada a necessidade de práticas de educação sexual, promotoras da vivência positiva da sexualidade. A educação sexual formal é cada vez menos encarada como a realização de atividades com carácter predominantemente informativo sobre saúde reprodutiva (Marques, Vilar & Forreta, 2002), sendo cada vez mais pensada no formato de ações que identificam a sexualidade como uma componente positiva do desenvolvimento pessoal, cujas expressões contribuem para o bem-estar pessoal e relacional e não só para a reprodução (Berman, 2010).

No ano 2010, foram desenvolvidas diretrizes para Educação em sexualidade na Europa, sob a orientação do Centro Federal de Educação em Saúde (BzGA) da Alemanha, do Centro Colaborador da OMS e do Escritório Regional da OMS para a Europa, segundo as quais, é necessária uma abordagem holística baseada numa compreensão da sexualidade como uma

área do potencial humano. Neste sentido, deve ajudar as crianças e os jovens a desenvolverem competências essenciais para autodeterminarem a sua sexualidade e os seus relacionamentos, sendo essencial também para a autoproteção das crianças e jovens perante possíveis situações de risco.

Ainda em 2010, a Organização das Nações Unidas para a Educação, a Ciência e a Cultura (UNESCO) publicou um documento de orientação técnica internacional sobre educação em sexualidade desenvolvido juntamente com o Fundo de População das Nações Unidas (UNFPA), a OMS e Fundo das Nações Unidas para a Infância (UNICEF), bem como com o Secretariado do Programa Conjunto das Nações Unidas sobre o VIH/SIDA (ONUSIDA) e uma série de peritos independentes e especialistas de todo o mundo. Este documento baseou-se na perspetiva de que as crianças e os jovens necessitam de deter informações e desenvolver habilidades na área da educação em sexualidade, tendo em conta que existem muitas ameaças ao seu bem-estar que assumem múltiplas formas, incluindo relacionamentos abusivos, riscos à saúde associados à gravidez precoce indesejada, exposição a Doenças Sexualmente Transmissíveis (DSTs), inclusive VIH, ou estigma e discriminação devido à orientação sexual. Foi fundamentado em dezenas de estudos realizados em todo o mundo e apresenta diretrizes para a elaboração e aplicação de programas e material didático em educação para a sexualidade.

Estes exemplos de orientações internacionais, a uma escala mundial, demonstram que educar sobre sexualidade é uma preocupação global. Através do relatório “*Sexuality Education in Europe*” de The Safe Project (2005) e do relatório “*Policies for Sexuality Education in the European Union*” (2013), do Parlamento Europeu, pode-se conhecer a designação geral da educação sexual e existência (ou não) de orientações curriculares mínimas, em vários países, dados que apresentamos na tabela 1.

Tabela 1: Designação geral da educação sexual e orientações curriculares por país

Em Portugal, a educação para a sexualidade ganhou destaque, a partir de 1980, através da Associação para o Planeamento Familiar (APF) (<http://www.apf.pt/>). Esta Associação nasceu em 1967 e foi a organização pioneira, no nosso país, do planeamento familiar nos anos 60 e 70 do século XX, e da educação sexual nas escolas, mais tarde, nas décadas de 80 e 90. Recordamos que nesta década diversas organizações conservadoras, incluindo algumas associações de pais, opunham-se publicamente à educação sexual, pressionando o Ministério da Educação para não desenvolver intervenções nesta área. Contrariamente aos grupos conservadores da época, a maior parte dos pais apoiava as ações sobre educação sexual nas escolas. Para a APF era crucial mostrar à sociedade portuguesa que os progenitores e os agentes educativos das crianças deveriam ser encarados como parceiros na educação sexual (Vilar, 2011). Em 1984 foi criada e aprovada a primeira lei nas escolas, a qual assumiu a educação sexual como uma necessidade e um direito das crianças, jovens e das famílias (Lei n.º 3/84 - Direito à Educação Sexual e ao Planeamento Familiar). Na referida lei definia-se o papel do Estado como garante do direito à educação sexual e preconizava-se a inclusão de conhecimentos científicos sobre anatomia, fisiologia, genética e sexualidade humana, adequados aos vários níveis de ensino. Contudo, esta lei nunca chegou a ser regulamentada na sua parte relativa à educação sexual (<http://www.apf.pt/>).

Desde 2010, em Portugal Continental, a educação sexual em meio escolar tem carácter obrigatório e destina-se a todos os alunos que frequentam estabelecimentos de ensino básico e secundário da rede pública e estabelecimentos da rede privada e cooperativa com contratos de associação. Dois anos depois, na Região Autónoma dos Açores, foi publicado o decreto legislativo regional n.º 8/2012/A, que fixa o regime da educação para a saúde em meio escolar e no qual consta, além do carácter obrigatório, que a educação afetivo-sexual pretende, de uma forma estruturada e sustentada, que os alunos desenvolvam conhecimentos e adquiram competências, atitudes e comportamentos adequados à saúde afetivo-sexual e reprodutiva. Contribuindo para a diminuição dos comportamentos de risco e para o aumento dos fatores de proteção em relação à sexualidade.

Ainda a nível regional, dados sobre a intervenção na promoção da saúde em contexto escolar, relativo ao ano letivo 2014/2015, revelam que foram realizadas 679 sessões de educação afetivo-sexual e reprodutiva em 175 escolas da Região, o que dá uma média de 4 sessões por escola. Pode-se também verificar que o ciclo de ensino menos abrangido por sessões de educação para a saúde é o 1º ciclo. O relatório relativo ao ano letivo 2015/2016 indica que foram realizadas mais sessões num total de 774, bem como, ocorreram mais sessões de educação para a saúde no 1º ciclo, de 10% do total das sessões passou para 26%. Estes relatórios não especificam as temáticas a trabalhar, que profissionais dirigem as sessões de cada temática, quem dirige as sessões de educação afetivo-sexual, bem como quantas horas de educação afetivo-sexual beneficia cada criança ou jovem no ano letivo (Direção de Serviços de Promoção de Hábitos de Vida Saudáveis, 2016).

Quanto à prevenção do abuso sexual na Região, a APFSSR-Açores realizou, ano letivo 2015/2016, 49 sessões, de 90 minutos cada, em Escolas do 1º ciclo do ensino básico e em Instituições Particulares de Solidariedade Social (IPSS's), dirigidas a crianças com idades compreendidas entre os 8 e os 10 anos, tendo sido abrangidas um total de 1082 crianças. Mesmo assim, considera-se que as crianças nos Açores não estão a beneficiar de uma real capacitação para a proteção face ao abuso sexual.

3. ABUSOS SEXUAIS DE MENORES

3.1 Incidência do abuso sexual a nível mundial, nacional e regional

Um estudo da UNICEF (2006) conclui que a violência contra as crianças acontece em qualquer lugar, ou seja, em todos os países e sociedades e em todos os grupos sociais. Conclui, ainda, que em todo o mundo há falta de dados sobre a violência contra as crianças, situação que impede e compromete a compreensão do problema, para além de fazer notar que os números disponíveis estão muito aquém da dimensão do fenómeno.

O abuso sexual infantil é considerado pela OMS (2003) como um dos maiores problemas de saúde pública. Dados desta organização estimam que 150 milhões de meninas e 73 milhões de meninos, menores de 18 anos de idade, sofreram relações sexuais forçadas ou outras formas de violência física e sexual. Estimam ainda, que 1.8 milhão de crianças por ano estão envolvidas em sexo comercial, forçadas a fazê-lo, quando são vendidas à escravidão sexual por famílias pobres desesperadas, ou por rapto e tráfico.

Pesquisas em países europeus indicam que 6.36% de meninas e 1.15% de meninos sofreram experiências sexuais abusivas antes dos 16 anos. Dados dos Estados Unidos da América revelaram índices mais elevados de prevalência, onde 32.3% das mulheres e 14.2% dos homens sofreram abuso sexual na infância (Briere, 2003).

O relatório *Hidden in Plain Sight*, realizado em 2014 pela UNICEF, baseado em dados de 190 países, é a maior compilação feita até hoje sobre a violência contra as crianças, dando a conhecer a escala impressionante dos abusos físicos, sexuais e emocionais. Dos seus resultados salienta-se que cerca de 120 milhões de raparigas com idade inferior a 20 anos, em todo o mundo (cerca de 1 em cada 10), foram sujeitas a relações sexuais forçadas ou outro tipo de atos sexuais forçados. Salienta-se ainda, a referência a menores a viverem em países de elevado rendimento não estarem isentos de perigo de violência sexual. Como exemplo, é referido o caso da Suíça onde, em 2009, 22% de raparigas e 8% de rapazes com idades entre os 15 e os 17 anos tinham vivido pelo menos uma experiência ou incidente de violência sexual envolvendo contacto físico. No entanto, neste país, a forma mais comum de violência sexual, para ambos os sexos, ocorre no espaço virtual. É também referido o caso dos Estados Unidos, onde, em 2011, registaram taxas de vitimização sexual prolongada em raparigas e rapazes entre os 14 e 17 anos na ordem dos 35% e 20%, respetivamente.

Em Portugal, a população em geral passou a estar mais desperta para a temática dos abusos sexuais de crianças desde que a mesma passou a ser um assunto comum nos noticiários e nos jornais, sobretudo com o caso das crianças abusadas na Casa Pia de Lisboa, que se tornou público em Novembro de 2002 (Ornelas & Maria, 2010).

Um estudo retrospectivo realizado por Mateus no ano 2012, com uma amostra de 200 sujeitos de nacionalidade portuguesa, com idades compreendidas entre os 18 e os 30 anos de idade, residentes no distrito de Lisboa, verificou que a prevalência de abuso sexual nos inquiridos foi de 14.5%, constatando-se uma taxa superior no género feminino (15.9%) comparativamente ao género masculino (11.7%). A maioria dos participantes sobreviventes de abuso sexual infantil identificou como agressor uma “pessoa conhecida, mas não amiga” e indicou que o abuso ocorreu, sobretudo, entre os 8 anos e os 10 anos de idade. Quanto ao tipo de abuso, a indicação prevalecente foi a de que envolveu algum tipo de contacto físico (70.5%), embora também se registassem situações abusivas que não envolveram contacto físico (29.5%).

Uma outra investigação realizada por Moleiro em 2014, com uma amostra de 200 sujeitos de nacionalidade portuguesa, com idades compreendidas entre os 18 e os 25 anos de idade, residentes nos distritos de Lisboa e Évora, revelou que a prevalência de abuso sexual nos inquiridos foi de 16.0%, constatando-se uma taxa superior no género feminino (17.0%) comparativamente ao género masculino (13.8%). A maioria dos participantes sobreviventes de abuso sexual infantil identificou como agressor “amigos” ou “pessoas conhecidas, mas não amigas” e indicou que o abuso ocorreu, sobretudo, entre os 9 e os 12,9 anos de idade.

Dados relativos à atividade das Comissões de Proteção de Crianças e Jovens (CPCJ) permitem uma noção do número de casos de abusos sexuais de crianças comunicados a estas Entidades. As CPCJ são instituições oficiais não judiciais com autonomia funcional que visam promover os direitos da criança e do jovem e prevenir ou pôr termo a situações suscetíveis de afetar a sua segurança, saúde, formação, educação ou desenvolvimento integral. Segundo o Relatório de Avaliação da Atividade das CPCJ referente ao ano 2015, das situações de perigo comunicadas em Portugal nesse ano, 759 foram de abuso sexual, representando 2.0% do total de comunicações. Em comparação com o ano anterior, verifica-se que aumentou o número destas comunicações, tendo no ano 2014 existido 694 comunicações de abuso sexual (1.8% das comunicações totais). Em 2015 o abuso sexual é a oitava causa que motiva a intervenção das CPCJ.

Focalizando nos Açores, segundo dados não oficiais das situações sinalizadas às CPCJ no ano 2015, 31 delas foram de abuso sexual. De acordo com os dados registados pelas polícias portuguesas (PJ, GNR e PSP), relativos aos crimes contra a liberdade e autodeterminação sexual, especificamente no que diz respeito aos casos de abuso sexual de criança, adolescente e menores dependentes, o número de crimes desta natureza tem vindo a aumentar entre 2011 e 2015, de 61 crimes para 98 crimes (Pordata, 2015).

Face a todos os dados anteriormente apresentados, sobre a prevalência e a incidência dos abusos sexuais de crianças, importa referir que, estes permitem conhecer a quantidade de crimes participados e comunicados, mas não são inteiramente fiáveis, uma vez que deixam escapar um elevado número de ocorrências silenciadas. (Berliner, 1995; UNICEF, 2006; Bruck, Ceci & Shuman, 2005; Mateus, 2012). Não deixam de ser relevantes, na medida em que evidenciam a necessidade de serem desenvolvidos programas de prevenção nesta área.

3.2. Programas de prevenção de abusos sexuais na literatura

A intervenção preventiva tem como principal objetivo fornecer aos indivíduos e/ou a grupos específicos conhecimentos e competências necessárias para lidarem com riscos de vária natureza. A intervenção pode incidir sobre diversificados contextos, nomeadamente individual, familiar, escolar e comunitário (National Research Council and Institute of Medicine, 2009), com vista à redução de fatores de risco e à promoção e desenvolvimento de fatores de proteção.

No que diz respeito ao abuso sexual, preveni-lo envolve educar para a sexualidade, abordando com as crianças, desde cedo, noções de violência e de autoproteção que garantam o seu direito de dizer “não” aos contactos sexuais do/a agressor e de revelar a situação a alguém de sua confiança (Brino & Williams, 2008; Maria, 2012). Vários estudos revelam que crianças bem informadas sobre temas de educação-sexual são menos vulneráveis a situação de risco em comparação com crianças desinformadas, na medida em que estas últimas podem ser mais facilmente coagidas a manter o segredo sobre a violência (Brino & Williams, 2008).

A dimensão preventiva da educação sexual está relacionada com o desenvolvimento de habilidades, tais como comunicação, negociação, expressão dos próprios sentimentos, e formas de lidar com situações indesejadas (Brino & Williams, 2008). Segundo Wurtele (2002), a partir da década de 80 do século passado multiplicaram-se os programas de prevenção dos abusos sexuais de crianças. Estes tinham como finalidade alterar as competências e os conhecimentos das crianças, através da intervenção em grupo conduzida em contextos educativos, bem como enfatizavam que a responsabilidade dos abusos sexuais nunca é da criança. Para esta autora, os programas preventivos devem ter como base o modelo dos 3 “R’s”: Reconhecer, Resistir e Reportar, bem como devem ser uma intervenção alargada, envolvendo os pais e professores, mas direcionada para o fortalecimento da vítima (criança) (Daro & Donnelly, 2002; Wurtele, 2002).

Historicamente, a prevenção dos abusos sexuais da criança distingue-se da prevenção do abuso físico e da negligência, em dois aspetos essenciais: (1) direciona-se, sobretudo, para as potenciais vítimas e não para os potenciais agressores e (2) dá ênfase à prevenção primária, em alternativa à prevenção secundária ou terciária. O contexto educativo foi sempre eleito como privilegiado para a aplicação de programas de prevenção do abuso sexual (Henriques, 2008; Maria, 2012) por permitir abranger mais público-alvo, bem como, por eliminar o estigma de que algumas famílias estariam mais em risco do que outras (Daro, 1994).

Finkelhor (2008) concebeu um estudo de avaliação de programas de prevenção focados nas vítimas de abuso sexual e verificou que, embora seja importante trabalhar com aquelas a prevenção dos abusos, considera mais eficaz a utilização de estratégias que envolvem a comunidade. Segundo este autor, os programas de prevenção devem ser direcionados aos pais/cuidadores, crianças, professores, profissionais de saúde e polícias, fornecendo a toda a comunidade informação para que possam detetar situações de abuso e atuar de forma ajustada perante uma denúncia.

A análise de diversos programas de prevenção demonstra que existem temas frequentemente abordados com as crianças, como por exemplo, saberem identificar possíveis abusos sexuais e outras situações abusivas, dizerem “não” ou evitarem abordagens não desejadas, relatarem a situação a um adulto de confiança, aprenderem que a culpa/responsabilidade dos abusos nunca é da criança, identificarem toque adequado de um toque inadequado, distinguirem bom segredo e um mau segredo e reconhecerem estratégias que reduzam a possibilidade do abuso (Maria, 2012).

Quando se pretende avaliar o impacto de um programa de prevenção pode-se colocar as seguintes questões: “estará o programa a alcançar os objetivos e as metas a que se propõe?”, “o que difere nos participantes após estarem envolvidos no programa?”. A avaliação de resultados dos programas de prevenção recai, habitualmente, sobre a análise ao nível de conhecimentos, atitudes, competências ou comportamentos (Schewe & Bennett, 2002 citado por Susana, 2012).

Barron e Topping (2008, p. 34) afirmam que “evidências apoiam a conclusão de que a maioria das crianças beneficia com programas de prevenção, através da aprendizagem de conceitos, do aumento do conhecimento e da aquisição de habilidades de autoproteção”. Em Ornelas e Maria (2010), encontra-se uma análise sumária feita por Wurtele (2002) sobre resultados de várias investigações que procuraram analisar o impacto de programas de prevenção dos abusos sexuais, obtendo-se várias categorias: ampliação de conhecimentos, desenvolvimento de competências, redução da incidência dos casos de abusos sexuais.

A investigação na área da prevenção do abuso sexual sugere a necessidade de uma intervenção mais sistemática e menos pontual e que os conteúdos sejam enquadrados em projetos mais globais de prevenção e educação para a sexualidade e para a saúde (Melo, Martins, Sampaio, Baptista & Antunes, s/d; Barron & Topping 2008; Kenny, Thakkar-Kolar, Ryan & Runyon, 2008) nos quais as crianças tenham um papel ativo/participativo (Wurtele, 2002; Barron & Topping 2008; Kenny, Thakkar-Kolar, Ryan & Runyon, 2008).

4. HISTÓRIA DO PROJETO DE EDUCAÇÃO AFETIVO-SEXUAL E PREVENÇÃO DE ABUSOS EM SÃO MIGUEL – AÇORES

A educação sexual possibilita, com credibilidade, aumentar o conhecimento, discutir sentimentos e atitudes, bem como elevar as capacidades individuais e de grupo para tomar decisões responsáveis (Sampaio, 2010). Muitas das crianças em situação de acolhimento institucional viveram anteriormente em contexto de insegurança, com pouca supervisão e informação, condição que as tornou mais suscetíveis e vulneráveis a situações de risco ao nível da sua sexualidade e que violam o seu direito de obter um desenvolvimento sexual sadio (Yano & Ribeiro, 2011). Com vista à estruturação da resposta ao pedido Equipa de Apoio Técnico ao Acolhimento Residencial de Crianças e Jovens do Instituto de Segurança Social dos Açores (ISSA) foi realizada uma pesquisa do estado da arte sobre programas e instrumentos nacionais e internacionais que prevenissem o abuso sexual e facilitassem a promoção de uma sexualidade saudável. Foi, também, realizado um levantamento de necessidades de intervenção com as crianças das Instituições de acolhimento da ilha de São Miguel, através de um questionário. Este foi respondido pelos profissionais de 7 Instituições.

Foram entregues às equipas de profissionais (ajudantes de lar e técnicos), de cada Instituição, três questionários:

- Questionário de recolha de informação sobre as áreas da educação sexual prioritárias para a intervenção. Foram sugeridas seis áreas e os profissionais poderiam acrescentar outras, ordenando-as da mais à menos prioritária;
- Questionário de recolha de informação sobre historial de intervenções de educação sexual realizadas nas Instituições;
- Questionário de recolha de informação sobre o número de crianças com historial de abuso sexual prévio ao acolhimento e de situações de abuso sexual entre menores dentro das Instituições, desde 2010 até ao momento.

Com este levantamento constatou-se que nenhuma Instituição detém um projeto estruturado no âmbito da educação para a sexualidade. Das 7 Instituições 1 nunca foi abrangida por intervenções na área da educação sexual, as restantes foram alvo de intervenções muito pontuais, maioritariamente de curta duração (entre 2 a 5 sessões) e dirigidas às crianças e jovens. Apenas 1 Instituição realizou 3 ações dirigidas à equipa educativa e às ajudantes de lar.

Quanto às áreas consideradas prioritárias pelos profissionais para a intervenção, estes ordenaram em primeiro lugar a demonstração positiva de afeto, seguindo-se o desenvolvimento de noções de respeito pelo seu corpo, a identificação de situações abusivas relacionadas com a intimidade, o estabelecimento de limites de respeito pelo outro (noção de privacidade e intimidade), a distinção e identificação de bom toque e mau toque e, por último, a distinção de emoções e formas de as expressar.

Relativamente às situações de crianças acolhidas com historial de abuso sexual e de situações de abuso entre menores nas instituições, foram identificadas 41 situações na totalidade dos casos.

4.1 Objetivos

Com base nas informações recolhidas a partir do levantamento efetuado e da revisão do estado da arte, a intervenção foi denominada de *Projeto de Educação Afetivo-Sexual e Prevenção de Abusos* e foram definidos objetivos direcionados para as crianças e para as ajudantes de lar.

Em relação às primeiras, pretende-se a capacitação para:

- Reconhecer diferentes emoções e as suas manifestações no corpo e no comportamento;
- Distinguir bom toque e mau toque;
- Diferenciar bons e maus segredos;
- Identificar a noção de privacidade e intimidade relativas ao corpo;
- Pedir ajuda a adultos, em situações ativadoras de medo, preocupação, tristeza, desconforto;
- Responder assertivamente perante situações sociais problemáticas.

Em relação às segundas, pretende-se que sejam capazes de:

- Expressar conhecimentos sobre sexualidade, especificamente sexualidade infantil;
- Distinguir entre exploração normal do desenvolvimento sexual infantil e situações abusivas;
- Realizar atividades de educação sexual com todas as crianças da Instituição.

4.2 Escolha dos materiais lúdico-pedagógicos de prevenção

Na pesquisa efetuada ao nível da literatura pretendeu-se encontrar Projetos e materiais lúdico-pedagógicos já testados e avaliados para a prevenção do abuso sexual, ou seja, práticas de intervenção apoiadas empiricamente com indicação de resultados da sua eficácia.

Selecionou-se o Projeto Integrado de Prevenção do Abuso Sexual (PIPAS), implementado na Casa Pia de Lisboa, entre 2013 e 2011, pela ARISCO/Novos Alvos, Instituição para a Promoção Social e da Saúde. Esta escolha deveu-se a características do Projeto PIPAS que iam ao encontro dos nossos objetivos e contexto de intervenção, nomeadamente, ter

sido construído para a população portuguesa, constituído por materiais lúdico-pedagógicos muito apelativos e desenhados para a prevenção do abuso sexual junto dos jovens e crianças abrangidos pela ação Casa Pia de Lisboa, quer em regime de internato quer de semi-internato. Também alguns dos seus pressupostos vão ao encontro da visão das responsáveis pelo Projeto de Educação Afetivo-Sexual e Prevenção de Abusos, nomeadamente, por considerar que a prevenção do abuso sexual deve ser encarada numa perspetiva integradora, através do desenvolvimento de competências mais globais e não numa perspetiva específica centrada no abuso, e que a prevenção deve ser dirigida, além do grupo-alvo constituído por crianças e jovens, à instituição como um todo. Este passo é feito através da mobilização e envolvimento dos profissionais, em processos formativos associados à intervenção a implementar.

O PIPAS assenta num conjunto de 4 materiais, direcionados ao desenvolvimento de competências sócio emocionais em torno da sexualidade: “A Quinta do Queria Ser” (pré-escolar); “O Caminho para Vila do Porto” (6 aos 8); “A Vila do Porto” (8 aos 12 anos) e “A Grande Travessia” (acima dos 12 anos). Para garantir uma continuidade entre materiais que transmitisse a noção de um processo gradual de desenvolvimento a ARISCO/Novos Alvos criou uma narrativa comum a todos, através de um mundo imaginário que contempla um Continente (*Adultis*) e uma ilha (*Infantia*) separados por um mar (*Adoles*) recheado de imprevistos, riscos, oportunidades e ameaças. Nesta realidade particular os adultos concentram-se no Continente onde vivem e trabalham, enquanto as crianças são enviadas precocemente para Ilha *Infantia* onde crescem num contexto natural, sob o acompanhamento de adultos mais velhos (os senhores idosos) que, pela sua idade, conquistaram o direito a uma vida mais descansada e menos marcada pelas obrigações de produção e de eficácia. Como consequência do seu processo maturativo as crianças atingem a idade e a competência que lhes permite iniciar o caminho para se juntarem de novo ao mundo dos adultos. É um caminho longo, arriscado e cheio de desafios/obstáculos (Melo, Martins, Sampaio, Baptista & Antunes, s/d; Alvarez, Marques-Pinto, Miranda, Melo, Baptista, Duarte, Raimundo & Marôco, 2010).

De entre os vários materiais que constituem o PIPAS, a equipa da ARISCO orientou-nos na escolha daquele que melhor correspondia aos nossos objetivos, sendo selecionado o material “O Caminho para Vila do Porto”. Trata-se de um jogo de tabuleiro – tipo “jogo da glória” – onde o jogador, individualmente ou em grupo, percorre um caminho onde encontra casas que o beneficiam e/ou o prejudicam no seu objetivo de chegar à meta (chegar à Vila onde poderá entrar na escola de navegadores e aprender a navegar no mar (*Adoles*)). Este caminho parte de cinco quintas distintas que confluem para um cruzamento (o carvalho) a partir do qual o trajeto é comum para os vários jogadores ou as várias equipas (Alvarez, Marques-Pinto, Miranda, Melo, Baptista, Duarte, Raimundo & Marôco, 2010).

À componente lúdica, assim criada, é aliada a componente informativa, integrando no jogo as “Casas do Pote”, onde os jogadores são confrontados com situações face às quais deverão mobilizar os seus recursos ao nível da tomada de decisão e gestão de problemas. Os desafios das Casas do Pote integram cinco temas (desenvolvimento físico, higiene, comunicação, dinâmica de grupos e tomada de decisão). A escolha dos temas baseou-se em diferentes propostas de organização de Programas de educação sexual em contexto escolar (Melo *et al.*, s/d).

As duas técnicas da APFSSR-Açores, responsáveis pela construção da intervenção nos Açores, receberam uma formação de 14 horas, da ARISCO/Novos Alvos, para a utilização do material e adaptação deste a outras faixas etárias, nomeadamente até aos 11 anos. Esta adaptação deveu-se ao facto de pretendermos abranger crianças dos 6 aos 11 anos o que implicaria a aquisição de dois materiais distintos. Com a adaptação foi-nos possível utilizar o mesmo material para as várias faixas etárias.

Após formação e aquisição dos materiais para a intervenção, construiu-se o Projeto de Educação Afetivo-Sexual e prevenção de abusos. Nesta fase foram tidas em conta as conclusões preliminares da avaliação do PIPAS (avaliação de resultados para o material Vila do Porto), com vista a colmatar algumas das limitações apontadas. Estas conclusões indicaram que as medidas mais sensíveis, nas condições de aplicação do material Vila do Porto, foram as relativas às competências emocionais e sociais das crianças e menos as relativas à auto-estima global e corporal ou conhecimentos sobre o abuso sexual. Podendo este resultado ter sido determinado pela possibilidade do conteúdo das sessões ter enfatizado mais umas competências do que outras (Alvarez *et al.*, 2010). Por este motivo, no Projeto de Educação Afetivo-Sexual e Prevenção de Abusos, estabeleceram-se as áreas de intervenção para cada sessão, num total de duas sessões dedicadas a cada uma.

As conclusões apontaram também para a necessidade de um número mínimo de sessões (12), que permitisse uma progressão no grau de profundidade das temáticas e o aumento das competências das crianças e jovens (Alvarez *et al.*, 2010). Foi neste sentido que o Projeto de Educação Afetivo-Sexual e Prevenção de Abusos estipulou a realização de 12 sessões. Ainda assim, foi necessário aumentar a intervenção para 16 sessões, com vista a assegurar essa progressão e profundidade.

De seguida apresenta-se a implementação do Projeto.

4.3 Implementação do Projeto de Educação Afetivo-Sexual e Prevenção de Abusos

O Projeto de Educação Afetivo-Sexual e Prevenção de Abusos foi apresentado, pelas técnicas da APFSSR-Açores, ao Instituto de Segurança Social dos Açores (ISSA) e aprovado para implementação nas Instituições de acolhimento de crianças e jovens da ilha de São Miguel. Após aprovação foi realizada a apresentação deste às equipas técnicas das várias Instituições de acolhimento.

A intervenção é dirigida a crianças dos 8 aos 11 anos dos Lares de acolhimento da Ilha de São Miguel, prevendo-se a possibilidade de alargar a intervenção a outras Ilhas. De acordo com dados do Relatório de caracterização anual da situação de acolhimento das Crianças e Jovens (CASA), do ano 2015, estavam a residir em Lares de acolhimento nesse ano, na Região Autónoma dos Açores, 335 crianças e jovens. Dados não oficiais indicam que atualmente na Ilha de São Miguel estão acolhidas 167 crianças e jovens entre os 0 e os 21 anos de idade, sendo que a maioria dos menores acolhidos encontram-se entre os 14 e os 18 anos. A faixa etária das crianças abrangidas pelo Projeto, ao nível do programa de formação, foi determinada pela fase escolar, sendo crianças que já possuem uma linguagem desenvolvida e capaz de expressar ideias e narrativas na ordem cronológica dos fatos, bem como espera-se que já tenham suficiente domínio da leitura e da escrita.

Estes dados são importantes para a avaliação que se pretende realizar uma vez que, deve ser adequada à população-alvo e, nem sempre é fácil encontrar instrumentos adequados e desenhados especificamente para a idade pré-escolar ou início do 1º ciclo (Denham & Burton, 2003; Epstein *et al.*, 2009).

O Projeto encontra-se atualmente em aplicação na primeira Instituição, desde Novembro de 2016. Antes do seu início foram necessárias reuniões com a equipa técnica, nas quais foi possível conhecer a história do acolhimento de cada criança, constituir o grupo alvo do programa de formação e calendarizar as sessões de acordo com os horários da Instituição e os horários escolares de cada criança.

O programa de formação com recurso ao material “O Caminho para Vila do Porto” está a abranger um grupo de 8 crianças da Instituição, 3 do sexo masculino e 5 do sexo feminino, com idades compreendidas entre os 8 e os 13 anos. A criança com 13 anos foi incluída tendo em conta que está avaliada com o défice cognitivo. A intervenção foi estruturada em 16 sessões de 90 minutos cada, realizadas uma a duas vezes por semana.

Para além do programa formativo para as crianças, o Projeto é também constituído por uma intervenção específica com dez ajudantes de lar, composta por parte formativa e uma parte prática e ainda, de forma mais pontual, uma intervenção dirigida a todas as crianças acolhidas na Instituição.

Em seguida passamos a apresentação das diferentes atividades.

O Programa é composto por três tipos de atividades:

- Formação através de jogo lúdico-pedagógico com o grupo-alvo (dos 8 aos 13 anos);
- Formação às ajudantes de lar;
- Atividades de educação afectivo-sexual para todas as crianças acolhidas na Instituição.

4.3.1 Formação através de Jogo Lúdico-Pedagógico com um grupo-alvo

O jogo é destinado às crianças e foca-se no desenvolvimento de competências que permitam àquelas uma vivência saudável da sexualidade e permite a exploração de um conjunto de temas, dinâmicas e momentos de reflexão que facultam uma crescente consolidação das aquisições, ligadas à sexualidade, essenciais nesta faixa-etária (Novos Alvos, 2005a). O jogo é o centro da sessão, a qual gira em volta de dinâmicas resultantes deste.

Foi estruturado inicialmente com 12 sessões de 90 minutos cada, no entanto, no decorrer da intervenção foi alterado para 16 sessões, tal como referido anteriormente. Esta alteração prendeu-se com a necessidade de mais momentos para aplicação de instrumentos psicológicos de avaliação pré e pós-intervenção, por estes serem muitos extensos tornando-se cansativo para as crianças. Foi ainda necessário realizar 2 sessões prévias à aplicação do jogo, para trabalhar com as crianças a coesão de grupo, o respeito por si e pelo outro e regras de funcionamento do grupo.

Segue-se a estrutura do Programa de formação, por sessão:

1ª Sessão:

- Apresentação das dinamizadoras (apresentação individual a cada criança);
- Aplicação dos instrumentos de avaliação, para definição da *base line*.

2ª Sessão:

- Aplicação dos instrumentos de avaliação, para definição da *base line* (conclusão).

3ª Sessão:

- Dinâmicas de quebra-gelo e de conhecimento interpessoal;
- Avaliação final da sessão.

4ª Sessão:

- Dinâmicas de coesão de grupo;
- Avaliação final da sessão.

5ª Sessão:

- Início do jogo: apresentação da narrativa do jogo (história e personagens com destaque para a personagem principal, o Capitão-Mor);
- Construção das regras de funcionamento do grupo;
- Constituição de equipas e escolha da quinta de cada equipa;
- Construção das quintas;
- Avaliação final da sessão.

6ª Sessão:

- Temática Gestão de emoções (cartas do pote sobre emoções e casas complementares com dinâmicas sobre emoções);
- Avaliação final da sessão.

7ª Sessão:

- Continuação da temática Gestão de emoções;
- Avaliação final da sessão.

8ª Sessão:

- Temática Conhecimento corporal e autoimagem (cartas do pote sobre desenvolvimento físico e casas complementares com dinâmicas sobre o corpo);
- Avaliação final da sessão.

9ª Sessão:

- Temática da Higiene (cartas do pote sobre desenvolvimento físico, higiene e casas complementares com dinâmicas sobre o corpo e higiene);
- Avaliação final da sessão.

10ª Sessão:

- Temática Competências de comunicação assertivas e de tomada de decisão (cartas do pote sobre comunicação, tomada de decisão e casas complementares com dinâmicas de comunicação e prevenção do abuso sexual);
- Avaliação final da sessão.

11ª Sessão:

- Continuação da temática Competências de comunicação assertivas e de tomada de decisão;
- Avaliação final da sessão.

12ª Sessão:

- Temática Promoção de relações interpessoais saudáveis (cartas do pote sobre dinâmicas de grupos e casas complementares com dinâmicas de prevenção do abuso sexual);
- Avaliação final da sessão.

13ª Sessão:

- Continuação da temática Promoção de relações interpessoais saudáveis;
- Avaliação final da sessão.

14ª Sessão:

- Final do jogo: entrada na Escola de Navegadores da Vila do Porto onde as crianças conhecem pessoalmente a personagem principal, o Capitão- Mor, o qual fala com as crianças sobre os desafios ultrapassados no caminho e sobre as maiores dificuldades das equipas e entregará os certificados de participação;
- Avaliação final da intervenção.

15ª Sessão:

- Aplicação dos instrumentos de avaliação final.

16ª Sessão:

- Aplicação dos instrumentos de avaliação final (conclusão).

4.3.2 Formação destinada às ajudantes de lar

Às ajudantes de lar é oferecida uma formação breve sobre sexualidade, sexualidade infantil e prevenção, composta por 3 sessões de 90 minutos, de modo a que aquelas possam expandir as atividades realizadas com o grupo mais restrito de crianças a todas as outras que também se encontram acolhidas na Instituição, a partir de um guião orientador que lhe é facultado. As sessões decorreram no contexto do Lar.

Segue-se a descrição de cada sessão.

1ª Sessão

- Apresentação das formadoras e das ajudantes de lar através de dinâmicas de quebra-gelo;
- Reflexão sobre o pedido para elaboração do Programa de educação afetivo-sexual e prevenção de abusos.
- Partilha com as profissionais dos resultados do levantamento inicial de necessidades, como ponto de partida para a sensibilização e mobilização destas para o envolvimento participativo no Programa.
- Abordagem à sexualidade com recurso a dinâmicas de grupo e *brainstorming*.

2ª Sessão

- Reflexão sobre diferenças na sexualidade entre as fases do desenvolvimento humano e sobre a distinção entre contacto sexual exploratório e contacto sexual abusivo (abuso sexual) no âmbito da sexualidade na infância.
- Reflexão sobre a prevenção do abuso sexual nas rotinas diárias da Instituição, nomeadamente sobre as estratégias já utilizadas pelas profissionais.
- Reflexão sobre estratégias facilitadoras do debate e diálogo entre ajudantes de lar e crianças, sobre sexualidade.

3ª Sessão

- Apresentação e exploração dos materiais do Jogo “O Caminho para a Vila do Porto”.

- Reflexão sobre a aplicabilidade de 4 atividades de educação afetivo-sexual nas rotinas da Instituição, por forma a serem dinamizadas pelas ajudantes e de abrangerem todas as crianças, durante o período de intervenção com o grupo-alvo do programa formativo.
- Preenchimento do “questionário de avaliação da formação”.

4.3.3 Atividades de educação afetivo-sexual para todas as crianças acolhidas na Instituição

Estas atividades foram desenhadas pelas técnicas responsáveis pela intervenção e constituem um guião orientador facultado às ajudantes de lar, para que elas possam estender o tipo trabalho realizado com as crianças em pequeno grupo a todas as outras crianças da Instituição. Desta forma todas as crianças acolhidas foram abrangidas pelas mesmas temáticas que estavam a ser trabalhadas com o grupo-alvo do programa de formação, ou seja, área das emoções, autoimagem e conhecimento corporal, relações interpessoais e assertividade e tomada de decisão.

Para cada temática, a Instituição foi decorada com materiais alusivos à mesma, como forma de motivar a adesão dos participantes. Foi entregue às ajudantes um guia de atividade, de apoio à dinamização com as crianças e respetiva calendarização. No final da atividade as profissionais preencheram uma folha de registo de avaliação da mesma.

Segue-se a descrição das atividades realizadas.

1ª Atividade: Área das Emoções

O Barómetro das Emoções. Esta atividade tem por objetivo promover a partilha de emoções entre crianças e ajudantes de Lar. O barómetro contém a fotografia de criança, por grupo a que pertence. Neste sentido foram elaborados três barómetros (um para cada grupo de crianças). Decorreu durante cinco dias, no final de cada um destes dias as ajudantes juntaram as crianças e refletiram através do barómetro como se sentiram nesse dia e porquê. Na reflexão final as ajudantes transmitiram às crianças a importância de partilharem as suas emoções, boas ou menos boas.

2ª Atividade : Área da Auto-imagem e Conhecimento corporal

A minha silhueta, o meu corpo. Esta atividade tem por objetivo facultar a compreensão das crianças sobre todas as partes do corpo e a sua importância, pelo que devem todas ser bem cuidadas e que sobre estas se deve falar com naturalidade. Remete-se para um assunto sério, que tem a ver com a saúde. As ajudantes depois de preparadas através da formação breve sobre sexualidade dialogam com as crianças sobre a existência de partes do nosso corpo que são privadas e porquê. A partir de duas silhuetas, as crianças identificam as diferentes partes do corpo da rapariga e do rapaz, desenharam as partes em falta e taparam as zonas privadas do corpo (de cada silhueta) com roupa interior em papel, entregue para o efeito.

3ª atividade: Área das Relações interpessoais

6 dias especiais: dia de ajuda; dia da partilha; dia do elogio; dia do agradecimento; dia do carinho; dia do pedido de desculpa. Nesta atividade as ajudantes convidam as crianças a refletir sobre a importância de cada dia especial e porque é especial. A reflexão é feita em grupo no final de cada dia. As ajudantes promovem a partilha no grupo sobre como cada um passou o dia na relação com os outros (reflexão sobre os comportamentos desse dia). A reflexão final é dirigida à importância de tratar bem os demais, de que forma o podem fazer e como se sentem quando são bem tratados pelos outros.

4ª atividade: Assertividade e Tomada de decisão

Aprender a posicionar-se. Esta atividade tem por objetivo a reflexão sobre a existência de diferentes opiniões, perante as mesmas situações ou circunstâncias, por parte de diferentes pessoas. As crianças são questionadas em relação a diversas situações, sobre as quais têm de se posicionar e justificar a sua decisão. A reflexão final incide sobre o saber justificar o porquê das próprias opiniões.

4.4 Instrumentos de Avaliação

A avaliação das três vertentes do Projeto é feita a partir de diferentes instrumentos, que passamos a nomear.

Junto das crianças intervencionadas utilizam-se os mesmos instrumentos do Projeto PIPAS:

- **Questionário Sobre Emoções** (Assessment of Children's Emotion Skills de Schultz *et al.*, 2004), adaptado para a população portuguesa por Alves, 2006;
- **Questionário de Relações Interpessoais** (Children's Assertive Behavior Scale de Michelson e Wood, 1982), versão portuguesa adaptada pelo serviço de Aconselhamento Educacional da FPUL;
- **Questionário Como é que eu Sou** (Self-Perception Profile for Children, de S. Harter, 1985) adaptado para a população portuguesa por Faria e Fontaine, 1985;
- **Questionário Sabemos Proteger-nos?** (de F. Lopez e A. Sánchez, 1997), traduzido por Alvarez, 2007.
- Utilizaram-se ainda procedimentos complementares de registo:
- **Ficha de descrição e avaliação de cada sessão** (preenchido pelas dinamizadoras após cada sessão);
- **Grelha de observação de comportamentos das crianças na sessão** (preenchido pelas dinamizadoras após cada sessão);
- **Ficha de avaliação da sessão** pelas crianças (sol, o que mais gostaram na sessão; lua, o que menos gostaram e nuvem, o que aprenderam na sessão), (preenchido pelas crianças abrangidas pelo programa de formação);
- **Questionário de avaliação final da intervenção** (o que aprenderam em cada temática), (preenchido pelas crianças abrangidas pelo programa de formação);

Para perceber os efeitos da ação de formação junto das ajudantes de lar e das ações dirigidas ao grande grupo recorre-se a:

- **Questionário de avaliação de formação** (respondido pelas Ajudantes de Lar);
- **Questionário de opinião sobre as atividades lúdico-pedagógicas aplicadas a todas as crianças acolhidas** (preenchimento pelas ajudantes de lar).

Como o Projeto ainda está em fase de realização, não dispomos de resultados objetivos.

5. REFLEXÕES FINAIS

Na implementação do nosso Projeto temo-nos deparado com algumas dificuldades de natureza distinta.

Uma primeira dificuldade é referente aos comportamentos das crianças, com relações entre si marcadas por muita violência quer verbal quer física. Esta situação levou-nos a realizar duas sessões, prévias ao início da aplicação do jogo, para trabalharmos a coesão e as regras do grupo. Como já referimos anteriormente, as crianças não estavam habituadas a funcionar como grupo, por pertencerem a diferentes valências da Instituição, pelo que, esta situação de trabalho em pequeno grupo pode ter contribuído para o aumento dos conflitos. A partir da 6ª sessão do jogo, e tendo em conta que os conflitos se mantinham, optámos por solicitar a comparência de uma ajudante. Esta opção teve um impacto moderadamente positivo nos comportamentos e relacionamento das crianças, reduzindo ligeiramente os conflitos. Auscultadas sobre esta situação, as crianças expressaram que a presença das ajudantes seria benéfica, pois os comportamentos desadequados seriam alvo de castigo, o que não deixa de ser sintomático sobre o tipo de funcionamento com que habitualmente convivem.

Uma segunda dificuldade reporta-se à compatibilização de horários, entre equipa de dinamizadoras, ajudantes e crianças, para a realização das sessões. Em relação às crianças, há que atender aos horários escolares, das atividades extracurriculares e a situações inesperadas, tais como visitas de familiares. Em relação às ajudantes, há a considerar o trabalho por turnos diurno e noturno. Todas estas contingências obrigam, por vezes, a alterações na calendarização inicialmente programada.

Contudo, o balanço, realizado ainda numa base intuitiva, é favorável. Parece-nos que as crianças gostam das atividades e demonstram interesse na história/narrativa do material, embora possam beneficiar mais do conteúdo do Jogo “O Caminho para a Vila do Porto” se houver oportunidade de, primeiro, trabalhar com elas as questões comportamentais e relacionais. Isto implica a oportunidade de realização de um número mais alargado de sessões. Também nos parece que as ajudantes de lar aderiram à formação e estão empenhadas na sua ação junto do restante grupo de crianças. Podemos, então, presumir que houve uma boa adesão à intervenção por parte de toda a comunidade da Instituição, o que nos estimula para prosseguir com o Projeto, analisando objetivamente os resultados e introduzindo os reajustamentos que venham a ser considerados úteis e frutíferos na educação Sexual, como forma de prevenir o abuso sexual.

PSICOLOGÍA DEL LENGUAJE DIPLOMÁTICO Y POLÍTICO

Edgar Galindo

Departamento de Psicologia, Centro de Investigação em Educação e Psicologia, Universidade de Évora
(ecota@uevora.pt)

RESUMEN

Este artículo es un análisis del lenguaje en la diplomacia y la política desde el punto de vista psicológico, dirigido principalmente al lenguaje oral. Su objetivo no es analizar la enorme bibliografía existente sobre el tema, sino las aplicaciones de la teoría de los actos del habla (TAH) en la práctica diplomática y política. Se explican las técnicas de reconocimiento de los signos de división social, uso de los pronombres personales para expresar “clusividad”, estrategias de conciliación y “escuchar activamente”. Se abordan las estrategias de formulación y reformulación (*framing* y *reframing*) y otras, así como la comunicación no verbal en el contexto del lenguaje oral. Los casos son explicados con ejemplos tomados de la historia reciente. En conclusión, se afirma que la psicología puede hacer una contribución importante para analizar sistemáticamente las diferentes formas de expresión usadas en la política y en la diplomacia, así como también para aplicar estos conocimientos a fin de enseñar a dominarlas en el entrenamiento de negociadores, mediadores, líderes, diplomáticos y políticos.

Palabras clave: Psicología del Lenguaje, Teoría de los Actos del Habla, Psicología Política, Relaciones Internacionales.

1. INTRODUCCIÓN

El lenguaje es la herramienta principal del diplomático y del político. La diplomacia utiliza un lenguaje propio, en el cual las omisiones son tan importantes como las menciones, en el que a menudo es necesario leer el mensaje entre líneas. Sería para nosotros sumamente difícil comprender una nota diplomática enviada a un país lejano en 1950, pues el contexto es la clave para comprender el contenido. Es imprescindible conocer el contexto histórico, político y social de un país y una región en un momento determinado para aquilatar el significado real de un intercambio de mensajes.

En lo que se refiere al lenguaje de los diplomáticos, Nicolson (1964) explica brillantemente el arte de redactar documentos: Si un gobierno declara que «no puede mantenerse indiferente ante el acontecimiento x», significa que va a intervenir en el acontecimiento x; si el gobierno dice que «observa con preocupación» el acontecimiento, significa que está listo para dar un paso decisivo. De esta manera, dice Nicolson, los diplomáticos tienen la posibilidad de prevenirse uno al otro, sin amenazas directas. Desgraciadamente, dice, estas maneras tienen la desventaja de que no son comprendidas por mucha gente. Kowaljew (1980) subraya papel del lenguaje en las relaciones entre los estados, mostrando cómo la formulación de una frase puede determinar eventos políticos; por ejemplo, la tormenta provocada por de Gaulle durante su visita a Canadá (1967), cuando exclamó desde el ayuntamiento de Montreal “¡Viva Quebec libre!”. En la diplomacia, las palabras, habladas o escritas, nunca son tomadas a la ligera. Estas son algunas de las razones que han originado el lenguaje rígido y ceremonioso de la diplomacia, en el que cada palabra, cada punto y cada coma han sido pensados y repensados minuciosamente antes de expresarlos.

A pesar de los avances de la tecnología de las comunicaciones, los gobiernos del mundo se comunican principalmente por escrito y a través de “notas verbales”. La lógica es obvia: solamente lo que está escrito cuenta verdaderamente a la hora de ajustar cuentas

No obstante, el lenguaje oral y la comunicación no verbal han ganado preponderancia en la diplomacia y en la política en general a través del auge de los medios de comunicación. En consecuencia, el lenguaje oral y su componente contextual, la comunicación no verbal, merecen un análisis detallado. En este artículo abordaremos principalmente la parte oral del lenguaje, aunque muchas de nuestras afirmaciones valen también para la escritura.

El análisis del lenguaje ha sido uno de los dominios históricos de la psicología política, como puede apreciarse en una de las obras pioneras en la materia, *Language of Politics* del propio creador de la psicología política, Harold Lasswell (Lasswell & Leites, 2011/1949). Un abordaje de esta interesante obra, que constituye el origen de los procedimientos de análisis de la propaganda política y de la comunicación de masas en general, nos permitirá comprender las premisas, los objetivos y los métodos del análisis del lenguaje político desde la perspectiva de la psicología.

El libro quiere demostrar que es posible comprender el poder político a través de la comprensión del lenguaje y que el lenguaje de la política puede ser estudiado con métodos cuantitativos. Para los autores, la propaganda es un poderoso instrumento para influir sobre las masas y conseguir apoyos sin violencia. En la introducción, los autores analizan el papel del lenguaje en la historia. En la época clásica el lenguaje era un instrumento de la verdad y una herramienta para la persuasión, la oratoria era cultivada como un arte y la acción colectiva dependía de los resultados de debates abiertos; por esa razón, los filósofos sofistas crearon reglas prácticas para el discurso. En la Edad Media, el sermón se convierte en un instrumento que trasciende la instrucción religiosa para convertirse en instrumento de control de las masas. Con la invención de la imprenta, el poder del lenguaje como vehículo de transmisión de ideas se diversifica para dar poder a la escritura, pero en el siglo XX, con el cine y la televisión, el lenguaje oral y sus componentes gestuales adquieren de nuevo enorme relevancia. En consecuencia, dicen los autores, el lenguaje ha sido desde siempre parte de la política, pero todavía queda mucho por saber sobre la función

práctica del lenguaje. Debemos distinguir varias funciones del lenguaje, de acuerdo con las intenciones del que lo usa y los efectos que se logran sobre los oyentes:

Cuando el objetivo es influir en el poder y hay un impacto sobre el poder, estamos hablando de la función política del lenguaje. (Lasswell & Leites, 2011/1949, p. 8).

Así, abordan dos características del lenguaje, la semántica y la sintáctica. La semántica política examina los términos, los eslógans y las doctrinas desde la perspectiva del oyente, o sea, estudia cómo han sido recibidos. La sintáctica política estudia las relaciones gramaticales y lógicas del propio discurso. El material a estudiar es el discurso de los políticos, ya sea el actual o bien el pasado, a través de registros conservados. En la semántica de la política hay dos aspectos de interés que deben ser estudiados, uno es la apariencia de lo que se dice y el otro el estilo al decirlo. En este contexto es evidente la necesidad de un estudio objetivo del lenguaje, a fin de mejorar la práctica del discurso en la política y en otros ambientes. En consecuencia, los autores proponen un conjunto de métodos científicos para el estudio del lenguaje político, incluyendo el análisis del contenido, el tratamiento de la validez, la fiabilidad y la elección de muestras.

A partir de este libro, se han publicado miles de estudios sobre el lenguaje en la política y en los medios de comunicación. Estos análisis son hoy una herramienta común en las ciencias de la comunicación y las ciencias políticas. En este artículo no analizaremos la abundante bibliografía existente, sino las contribuciones prácticas de la psicología a la diplomacia y a la política en el campo del lenguaje.

La psicología del lenguaje puede aportar mucho para ayudar a los diplomáticos y políticos a dominar el lenguaje. Esto significa en primer lugar mostrarles la naturaleza de la lengua y luego proporcionarles un conjunto de herramientas para comprender mejor a los demás y para manejar su propio discurso.

Una teoría especialmente interesante para los diplomáticos y políticos por sus aplicaciones prácticas, es la llamada “*Speech Act Theory*” de Searle (1969), que ha sido traducida como “Teoría de los actos de habla” (TAH). Es un tratamiento filosófico del lenguaje basado en Ludwig Wittgenstein, quien argumenta que las palabras son acciones y no sirven únicamente para nombrar las cosas.

La actualidad de la TAH es evidente en publicaciones recientes como Martínez-Flor y Usó-Juan (2010), que hacen una revisión de los campos de investigación y aplicación más connotados, como la comprensión de las normas sociales, la conversación, la conducta de saludar y responder a saludos, el establecimiento de buenas relaciones sociales, la enseñanza de estrategias para manifestar desacuerdos o rechazos cortésmente, el lenguaje en ambientes de trabajo y en contextos interculturales, así como de aspectos metodológicos como la recolección y el análisis de datos. No obstante, hasta donde sabemos no se ha abordado la aplicación de la TAH en la diplomacia y la política como en este artículo. Entramos entonces, en un campo de análisis teórico relativamente nuevo, en donde analizaremos también aspectos prácticos.

En términos generales, la TAH sostiene que al realizarse una expresión verbal (hablar), no solamente se describen objetos y se externan afirmaciones, sino que se realizan acciones. Las órdenes, por ejemplo, implican siempre hacer algo. Lo mismo sucede con las promesas de hacer algo o los avisos preventivos, que implican cambios concretos en la realidad, si se hace o no se hace algo. Hablar no es solamente emitir sonidos, sino que constituye un conjunto de acciones que incluyen palabras, gestos, contextos, intenciones, lo dicho y lo no dicho. Al mismo tiempo, las palabras tienen fuerza de acciones. Las palabras de un juez tienen fuerza legal y las de un gobierno fuerza política; así cuando una nación “previene” a otra, o le “exige” o la “condena”, no se trata únicamente de palabras, sino de hechos con consecuencias graves. Podemos decir, entonces, que las comunicaciones diplomáticas no son un medio para un fin, sino un fin en sí mismas: Los diplomáticos controlan el mundo a través del lenguaje.

La TAH hace una distinción entre el acto de decir algo, lo que se hace al decirlo y lo que se logra al decirlo. Cada uno de estos aspectos tiene su nombre técnico: Un “acto locutivo” se refiere a lo que se dice, un “acto ilocutivo” a lo que el hablante hace cuando dice y un “acto perlocutivo” se refiere a lo que se ha logrado como resultado de lo que se dijo. Un análisis más profundo de estos términos y de sus implicaciones trasciende los objetivos de este artículo, por lo que me limitaré a exponer los aspectos de la teoría que tienen implicaciones prácticas.

La sola emisión de palabras no nos da suficiente información para comprender lo que se está haciendo al decirlo. Es necesario ir más allá de lo que se dice para comprender las intenciones del hablante. Al mismo tiempo, es importantísimo identificar las consecuencias de lo dicho: La diferencia entre una promesa y una mentira es lo que sucedió después de decir algo.

La TAH distingue también entre actos discursivos directos y actos discursivos indirectos. Los actos discursivos directos incluyen menciones explícitas, como “pido”, “exijo”, “prevengo”, o introducen lo que se va a decir como “por medio del presente...”, “con este documento...”. Un buen ejemplo son los preámbulos de tratados internacionales que se inician con las palabras: Los gobiernos de A y B, “plenamente convencidos de...”, “deseosos de...”, “acuerdan...”

En los actos discursivos indirectos, la intención del hablante debe ser inferida de su contexto. Una sola frase puede tener diferentes significados, dependiendo de su contexto, de manera que la comprensión del significado depende de la comprensión del contexto en que se dijo. El contexto abarca una amplia gama de factores, pues se refiere al conocimiento de los valores y creencias del hablante, el propósito de la afirmación, las características del auditorio a que se dirige, la dinámica entre los interlocutores, factores culturales, cultura general del hablante, etc. Entre los factores contextuales destaca la comunicación no verbal que veremos más adelante. Así, por ejemplo, Ting-Toomey (2005) ha estudiado la función de los gestos faciales en la comunicación y afirma que las culturas individualistas tienden a ser directas, mientras que las colectivistas suelen ser indirectas¹, llenas de sutilezas expresadas en gestos faciales sólo comprensibles dentro de su contexto cultural; en consecuencia, el conocimiento del contexto es esencial para la comunicación.

¹ Para mayor información sobre la importancia de los factores culturales en la diplomacia, véase Galindo (2013)

De manera que debemos partir del principio de que no es importante lo que la gente dice, sino lo que quiere decir, lo cual exige un importante esfuerzo de interpretación por parte del escucha, o del lector, dentro del cual la comprensión del contexto es fundamental. Basándose en la TAH, Skinner (2002) ha escrito un análisis de lo que “quiso decir” Maquiavelo en su obra famosa, partiendo del contexto socio-político de la época.

Así una expresión como “todos están de acuerdo” puede ser una simple constatación de lo que sucede en una sala, para informar al auditorio del hecho, o puede ser interpretada como una pregunta para ser confirmado el hecho, o un aviso para otros que no están presentes. Al mismo tiempo, una intención puede ser expresada de diversas maneras; por ejemplo, el hecho de que todos estén de acuerdo puede formularse como “todos están de acuerdo”, “hay acuerdo general”, o “concordamos sin excepción”, incluso también con palabras aparentemente opuestas “veo que se avecina un gran debate” (en tono de broma).

A veces, el propio hablante puede dejar en la incertidumbre el significado de su expresión con un fin determinado, como ocurre en el caso de la metáfora, la ambigüedad, la sugestión, la implicación y la cortesía. El manejo de la ambigüedad es un arte y, a veces, una necesidad.

Por otro lado, no debe olvidarse que no basta con que el hablante formule con una cierta intención su lenguaje, pues existe un amplio margen para que el interlocutor capte el contenido: el mensaje puede ser incomprendido. Así, Luntz (2007) llama la atención hacia el hecho de que todo mensaje es susceptible de interpretaciones múltiples: Lo importante no es lo que se dice, sino lo que se escucha. Por esa razón, cuando hablamos debemos corroborar constantemente si nuestro mensaje ha llegado. El peligro de ser malinterpretado es constante, sobre todo en la política y la diplomacia, de ahí la enorme importancia del contexto.

Hay empero un elemento más que determina el que las palabras tengan el poder de la acción, a saber, que el hablante esté investido de autoridad. Así, la frase “lo condeno a dos años de prisión” tiene fuerza legal pronunciada por un juez, pero no la tiene si la dice un lego. La autoridad se tiene por la posición que se ocupa, pero también se puede perder, sobre todo cuando se toma en cuenta la integridad a los ojos de otras personas. Esta situación es especialmente importante en el contexto de negociaciones internacionales, donde la autoridad de los negociadores debe ser incuestionable. La autoridad puede perderse también cuando una orden o una recomendación no es cumplida; justamente uno de los dilemas de las Naciones Unidas es que no tiene medios para imponer el cumplimiento de sus decisiones, lo cual desgasta su autoridad constantemente. En la TAH, se parte del supuesto de que una declaración se vuelve acción cuando el hablante tiene autoridad para ser obedecido o hacerla cumplir.

Cabe preguntarnos qué interés tienen estas consideraciones para la práctica de la diplomacia y la política.

En primer lugar, las competencias que menciona la TAH pueden ser entrenadas. Si sabemos que lo importante no es lo que la gente dice, sino lo que quiere decir, esto implica otra manera de escuchar, para comprender mejor. Si sabemos que se logra una mejor comprensión entendiendo el contexto, en un proceso de inferencia que toma en cuenta todos los factores relevantes presentes en la locución, podemos aprender a reconocer esos factores. Si sabemos que el hablante puede sufrir malentendidos y malinterpretaciones, es necesario entrenar técnicas para asegurar la comprensión por parte del oyente. Asimismo, es posible aprender a reconocer la estrecha relación entre los actos de habla, la autoridad y la integridad, para identificar los casos en los que hay una alta probabilidad de que las promesas sean incumplidas, las amenazas vacuas y las apologías falsas. En resumen, el dominio de las herramientas que proporciona la psicología del lenguaje puede mejorar el trabajo de los diplomáticos y de los políticos. En las páginas siguientes pasaremos revista a los tópicos más relevantes para explicar los aspectos prácticos que nos interesan: estrategias de conciliación, recursos retóricos, el uso y mal uso de la ambigüedad, el recurso a lo que no se dice, la reformulación de mensajes, el “escuchar activamente” y la comunicación no verbal.

2. ESTRATEGIAS DE CONCILIACIÓN

La psicología del lenguaje nos puede enseñar maneras de proceder en un intercambio verbal, a fin de manejar nuestro lenguaje con objetivos precisos. Algunas técnicas son: reconocimiento de los signos de división social, uso de los pronombres personales para expresar “clusividad”, estrategias de conciliación y “escuchar activamente”.

Comenzaremos por el reconocimiento de los signos de alerta que indican desacuerdos entre las partes. Luego analizaremos la tendencia a excluir al otro, para ver después cómo se puede buscar la unidad y la inclusión del otro, o sea, la aplicación de estrategias de conciliación.

En la diplomacia, es importante eliminar los desacuerdos, justamente porque su interés principal es lograr acuerdos. Una forma común de discusión desagradable es el recurso a las referencias personales, pues éstas se refieren casi siempre a la imagen, que suele ser muy importante. Responder en el mismo nivel a una provocación de este jaez significa entrar en una dinámica de escalada. La mejor estrategia podría ser llamar la atención hacia lo inadecuado de tales expresiones. Sin embargo, en un contexto político el problema es que la mala impresión creada difícilmente se borra. Negar el contenido es entrar en un debate desagradable y peligroso. Ignorarlo puede ser interpretado como una aceptación de culpa. La mejor solución es aceptar o no aceptar el comentario malévol y, más tarde, tratar de salvar la cara ante el interlocutor.

Otra forma desagradable es la descontextualización, en la cual una expresión determinada es mostrada fuera de su contexto con propósitos agresivos. Cambiar el contexto para hacerlo absurdo es un procedimiento común en la parodia, la sátira, la ironía y el chiste², aunque no necesariamente son desagradables. El modo como se recurre a alguno de ellos determina si resulta ofensiva o no. Aquí entra en juego la intención del hablante, que puede usar una afirmación aparentemente agradable para producir desagrado. El humor es al mismo tiempo inclusivo y exclusivo, porque implica reírse con alguien (el *ingroup*)

² Un ejemplo es el chiste argentino que corría en tiempos de crisis: “Argentina estaba al borde del abismo y con el actual gobierno dio un paso hacia adelante”.

de alguien (el *outgroup*), por ende, siempre se ríe uno a expensas de otro. Éste es el peligro de usar el humor en las relaciones diplomáticas. La mejor solución parece ser reírse de uno mismo, aunque también entraña peligros.

Como mostraron Tajfel y Turner (2004), el ser humano parece tener una tendencia especial que lo hace ver el mundo dividido entre “los míos” y “los demás” (*ingroup* & *outgroup*); su teoría de la identidad social sostiene que el ser humano categoriza a los demás en grupos, para identificarse luego con uno y derivar de ahí su pertenencia, su estabilidad y su autoestima. Este proceso implica también la creación de prejuicios hacia los extraños, que nos hace ver mejores a los nuestros y atribuir defectos a los otros. La psicología del lenguaje muestra correlatos lingüísticos que fundamentan la tendencia humana a promover al *ingroup* en detrimento del *outgroup*. Uno es el uso de los pronombres. Las palabras “nosotros”, “nuestros” y “nos” implican un sentimiento de pertenencia a un grupo, con exclusión de los demás.

Los psicólogos han creado el término “clusividad” para nombrar esta primera persona del plural, ya que denota al mismo tiempo el uso inclusivo y el exclusivo que es característico de los idiomas indoeuropeos. Por supuesto, este “nosotros” puede variar ampliamente: “nosotros creemos que...” (los lectores), “nosotros los españoles”, “nosotros (los de un partido)”, “nos el rey”. Muchos de estos usos incluyen un elemento que fomenta la unidad de un grupo a expensas de otro y, por tanto, tienen un fin ideológico.

El uso del “tú” en singular o plural muestra muchas semejanzas. En ambos casos se establece una relación de solidaridad dentro del *ingroup*: En ambos casos, el uso del pronombre hace un enunciado implícito sobre la relación entre las partes.

La tercera persona (él, ella, ellas, ellos) es utilizada con frecuencia para representar a “los otros”, pero en un contexto negativo, que puede llegar a ser peyorativo o denigrante. El “ellos” puede ser utilizado para denotar a un otro inespecífico, sin cara, sin nombre, visto con desconfianza y culpable de crímenes.

Así, el simple uso de los pronombres puede tener cargas emocionales concretas, que es necesario interpretar para manejar propositivamente el lenguaje. Superar estos problemas de división significa buscar recursos para combatir el desacuerdo, dicho en términos psicológicos, estrategias de conciliación basadas en la reformulación del enunciado (*reframing*) y en el escuchar activamente.

La primera estrategia en este sentido es tomar a los miembros del *outgroup* como individuos y establecer una relación cordial con ellos, concentrándose en problemas personales, aspiraciones e intereses, que comúnmente son semejantes en todos los seres humanos. La segunda es la búsqueda de un terreno común, en donde existan afinidades por encima de las diferencias religiosas, políticas o lingüísticas. La definición de un terreno común significa definir objetivos compartidos para lograr en el futuro. La tercera estrategia es ampliar el círculo de la “clusividad”, en el sentido de que el “nosotros” incluya un círculo cada vez más amplio.

La cuarta es la técnica de escuchar activamente, que implica el uso de la paráfrasis, la reformulación reflexiva y el esclarecimiento para devolver al hablante su mensaje con la señal de que ha sido recibido correctamente. El objetivo es lograr la mayor comprensión posible de la otra parte, a fin de crear un ambiente de apertura, confianza y colaboración para resolver malentendidos y disputas. Parte de las premisas de que una relación implica reciprocidad entre las partes y de que la construcción de una buena relación implica atención hacia la otra parte. Su ventaja es que constituye un procedimiento concreto que ha demostrado su eficacia.

Escuchar activamente es una pieza fundamental del diálogo y el diálogo con socios cada vez más diferenciados y forma parte de la diplomacia moderna. En un interesante artículo, Riordan (2004) subraya la necesidad de crear un nuevo paradigma para la política exterior, que incluye el diálogo del gobierno con la amplia gama de los miembros de la nueva sociedad civil, lo cual requiere de una actitud abierta y modesta, donde el saber escuchar es importantísimo.

En las próximas páginas, veremos como el hablante puede aplicar otras estrategias de formulación y reformulación (*framing* y *reframing*) para persuadir al público de sus ideas.

3. LA RETÓRICA: RECURSOS RACIONALES (COGNITIVOS)

Ahora analizaremos otras formas de formulación usadas para persuadir al oyente; son técnicas de sugestión y retórica. Las primeras herramientas que veremos son las que apelan al poder de la razón (afirmar, encasillar y usar categorías semánticas). Luego veremos el papel de las emociones en este proceso, revisando el uso las connotaciones y las metáforas. Estamos entrando en el campo de la vieja retórica griega.

Apelar a la razón y a la emoción es el método por excelencia de los buenos oradores políticos. Muchas llamadas a la razón tienen gran poder de convencimiento debido, precisamente, a su contenido emocional. Al mismo tiempo, el uso de términos cargados de valor emocional es el resultado de una elección racional. En el caso de la diplomacia, la persuasión es el resultado de la combinación adecuada de ambos elementos para lograr un cambio de conducta en la otra parte.

Lo primero que debemos saber es que la formulación de una frase es un factor determinante, de manera que dominar la formulación de los enunciados es una técnica para manejar propositivamente el lenguaje de la emoción y la razón. Para mostrar la importancia de la formulación, voy a citar un chiste que circulaba en América Latina en los años ochenta:

¿Cuál sería el encabezado para comentar la historia de Caperucita Roja en los diversos diarios del país?:

- 1) ‘Niña atacada en el bosque: una muestra más de la inseguridad reinante en el país’ (diario de la oposición).
- 2) ‘Todos los cuerpos policiales a la caza del asesino de Caperucita’ (diario adicto al régimen).
- 3) ‘El asesinato de una niña en el bosque relanza el debate sobre la seguridad ciudadana’ (diario liberal centrista).
- 4) ‘La violó, la mató y la devoró’ (diario amarillista).
- 5) ‘Niña atacada y muerta por vestir de rojo’ (diario comunista).
- 6) ‘Otro caso de mujer atacada por atreverse a andar sola en el bosque’ (diario feminista).

Obviamente, se trata de una broma que utiliza la exageración como herramienta, pero en estos ejemplos son notorias las connotaciones, implicaciones, metáforas y sugerencias implícitas utilizadas por el formulador para lograr su objetivo. Algunas de estas técnicas son menos explícitas en la realidad; así, un paquete de medidas económicas del gobierno puede ser anunciado como “Medidas para mejorar la economía del país”, o “Medidas para tratar de evitar la crisis inminente”, o “Medidas para salir de la crisis”.

Sabiendo cuál es la función de la formulación (*framing*), podemos aplicar diversas técnicas para reformular los enunciados (*reframing*).

Además de las tres estrategias de conciliación que tratamos anteriormente uno de los recursos de formulación más socorridos es apelar a los valores del propio grupo (*ingroup*). El buen orador es un gran conocedor de los valores y los tabúes de su grupo. Esta técnica es especialmente eficaz si logra además trazar una línea divisoria con respecto a los otros (*outgroup*). Un ejemplo contundente es el estribillo de la radio alemana durante el Tercer Reich: *Aus Deutschland, auf Deutsch, für die Deutschen* (“Desde Alemania, en alemán, para los alemanes”). Un recurso menos controvertido es apelar a las aspiraciones compartidas; presentar una visión del futuro en la que todos, oyentes y hablante, están de acuerdo: “La patria que todos queremos...”, “La Europa del futuro...”

Otros recursos son la afirmación, la argumentación preventiva (reconocimiento y contraargumento), apelar a la autoridad, apelar a la emoción, el encasillamiento, el descubrimiento selectivo, la “clusividad”, el uso de la música del lenguaje, la reparación, las categorías semánticas, y la credibilidad.

Todas ellas pueden usarse igualmente en un proceso de reformulación.

La afirmación consiste en presentar algo como verdad incontrovertida, con una introducción como “Todos sabemos que...”, “Lo importante es...”, “La verdad es que...”, seguida de una frase cuya veracidad, en realidad, no es tan clara. Un analista político experimentado presta especial atención a este tipo de frases, a fin de descubrir los objetivos implícitos del hablante.

La argumentación preventiva consiste en reconocer la postura de la oposición mostrando comprensión e incluso simpatía, para mostrar a continuación que en las condiciones actuales, lo correcto es hacer otra cosa (lo que yo propongo). Una de las ventajas de este recurso es que el hablante da la impresión de ser una persona bien informada y reflexiva que ha pensado mucho en lo que está diciendo.

Apelar a la autoridad es un recurso típico del orador político y religioso. Los creyentes pueden citar la biblia o el corán. Un político americano cita a Washington, un venezolano a Bolívar y un portugués a Fernando Pessoa. Al hacerlo, el hablante crea un marco de referencia en que él mismo está incluido junto con el héroe citado, al tiempo que se cubre con su aura de sabiduría, legalidad, amor a la patria y deseo de emulación. Es también una forma de dar legitimidad a la propia posición, ya que se apoya en frases que son aprobadas y compartidas por la mayoría de los oyentes.

Apelar a la emoción cumple una función semejante en términos de que el hablante crea un marco de miedo, indignación, fe o responsabilidad colectiva en la que se incluye e incluye a los oyentes. Usualmente, las emociones son provocadas mediante el uso de imágenes o metáforas que impresionan al auditorio. Las metáforas tienen el efecto de pequeñas historias en una cápsula y pueden ser evocadas con una sola palabra. En la política son conocidas expresiones como “holocausto” o “apartheid”, que generan emociones irrefrenables.

El encasillamiento tiene que ver con las actitudes y los estereotipos. Presentar estereotipos ante un auditorio es una herramienta muy común, sobre todo en tiempos de guerra. Durante la Segunda Guerra Mundial, la propaganda nazi presentaba a los judíos como sub-humanos, mientras la propaganda americana mostraba a los japoneses y a los alemanes como seres sanguinarios que era necesario exterminar. En tiempos de la Guerra Fría, era común deshumanizar a “los rojos” o a “los capitalistas”. En el siglo XXI, la retórica anti-musulmana retoma muchos de los elementos clásicos de la deshumanización: describir al enemigo como inhumano es el primer paso para justificar cualquier medida en su contra, incluyendo las inhumanas.

El encasillamiento puede ser positivo. Así, es común que los políticos americanos presenten a su país como “la patria de la libertad” y los franceses gustan de verse como “la cuna de la ilustración”; en tiempos de la intervención americana en Irak, Saddam Hussein convocaba a su gente llamándola “el pueblo más antiguo de la tierra”.

Las características más notorias del encasillamiento son la revelación selectiva, la generalización y la simplificación.

En la revelación selectiva, el hablante selecciona ejemplos que apoyan su argumentación, pero omite otros hechos que la contradicen. Así, un político americano puede presentar a su país como gran defensor de los derechos humanos poniendo como ejemplo la Declaración de los Derechos del Hombre y del Ciudadano, pero omite mencionar los bochornosos hechos de Guantánamo.

En las generalizaciones y las simplificaciones es evidente el papel de los estereotipos. Generalmente es políticamente más redituable presentar historias en blanco y negro, con buenos y malos, que ofrecer al auditorio la ocasión de fijarse en detalles. “Los judíos”, “los negros”, “los rojos”, “los capitalistas”, “los burgueses”, “los imperialistas”, “los gringos”, “los enemigos de la libertad”, “los enemigos del pueblo”, “los musulmanes” son palabras que permiten generalizaciones y simplificaciones útiles en el discurso político poco diferenciado. La experiencia histórica muestra que recursos como éstos pueden tener éxito en determinadas circunstancias socio-políticas.

En el encasillamiento encontramos numerosos ejemplos de “clusividad”. Así, el “nosotros” puede incluir a nuestro grupo y los demás grupos (nuestro pueblo y los demás pueblos) o puede incluir solo a nuestro grupo (nuestro pueblo, sin los otros), excluyendo a todos los demás. De hecho, en algunos idiomas no europeos existen dos formas de “nosotros”, una incluyente y otra excluyente. En las lenguas indoeuropeas no existen formas diferentes, pero sí herramientas semánticas que permiten al hablante hacer la distinción entre los dos tipos de “nosotros”; el buen orador manipula con maestría estas herramientas. En muchos discursos podemos observar el uso del “nosotros” (o “nuestro”) en ambos sentidos. Por ejemplo, cuando un político portugués habla de “nuestro mar” no se está refiriendo a un recurso que es propiedad de toda la especie humana, sino al de

su país con exclusión de los otros. Sin embargo, cuando se refiere a “nuestros problemas con el calentamiento global”, está aludiendo a toda la humanidad.

Las propiedades musicales del lenguaje, como la rima, la aliteración, la repetición y el quiasmo tienen un papel primordial en la comunicación. El sonido armonioso de la lengua da al oyente la impresión de que está escuchando la verdad. Los sonidos armoniosos que se repiten como letanía o refrán crean un efecto convincente que trasciende al contenido racional de las palabras. La técnica de aderezar el lenguaje con armonía es antiquísima; la encontramos en los cantos religiosos de todo el mundo, desde la antigua India hasta la iglesia cristiana contemporánea. En la política encontramos muchos ejemplos de musicalidad que pretenden aumentar el poder del lenguaje. Así, en tiempos de la Guerra Fría los americanos anticomunistas decían “*better dead than red*”; los nacionalistas franceses acuñaron el eslogan “*Ni bleu, ni rouge: bleu, blanc, rouge!*”; en el mundo hispanoamericano es famoso el grito “el pueblo unido jamás será vencido”; los portugueses, viejos lobos de mar, dicen “*de Espanha, nem bons ventos nem bons casamentos*”.

El quiasmo es una venerable figura retórica que consiste en repetir palabras o expresiones en sentido inverso, manteniendo la simetría en la siguiente cláusula, pero manipulando el sentido: “vivir para trabajar o trabajar para vivir”. Es famosa la frase de John F. Kennedy en su discurso de toma de posesión (20 de enero de 1961): “...no preguntes lo que tu país puede hacer por ti, pregúntate lo que tú puedes hacer por tu país”. Se dice que el poder del quiasmo se deriva de su capacidad de inducir a la reflexión, de su fuerte contenido filosófico expresado en pocas palabras y de su musicalidad.

La reparación significa componer lo descompuesto y reedificar lo destruido. Es una estrategia de formulación orientada hacia el futuro que conlleva el mensaje de que todo se compondrá y regresará a su sitio correcto si los oyentes actúan como dice el hablante. Encontramos algunos ejemplos históricos en el discurso de Winston Churchill ante la Cámara de los Comunes del parlamento británico, en los albores de la Segunda Guerra Mundial (13 de mayo de 1940):

No tengo nada más que ofrecer que sangre, sudor y lágrimas. Tenemos ante nosotros un calvario de la más penosa naturaleza. (...) Ustedes se preguntan: ¿Cuál es nuestro objetivo? Puedo contestarlo en una palabra: La victoria.

Actualmente se ha popularizado en la lingüística y las ciencias cognitivas el enfoque de la teoría de los prototipos, que se opone al esquema clásico aristotélico de las categorías semánticas. En vez de las categorías aristotélicas que son claras, definidas y mutuamente excluyentes, las nuevas categorías no tienen límites claros, sino que pueden ser definidas constantemente.

En la teoría de los prototipos (Rosch, 1975), se propone una categorización graduada en la que algunos miembros son más centrales que otros. En consecuencia, no es un modelo basado en definiciones (como en la lógica aristotélica), sino una noción graduada de categorías. El ejemplo más citado de una categoría aristotélica es el de “ave”, definido como un animal que vuela, tiene plumas y pico; esta definición tiene el problema de que deja fuera a los pingüinos y a las avestruces, que no vuelan, pero tienen pico y plumas, y por otro lado puede incluir a los murciélagos, que vuelan pero no tienen pico ni plumas.

El ejemplo más citado de categoría prototípica es “mueble”, que incluye una gran cantidad de objetos, donde algunos son más centrales que otros; así, los experimentos muestran que “silla” es un elemento central, mientras que “teléfono” es miembro periférico de la categoría. La teoría de los prototipos sostiene que los miembros de una categoría se agrupan en torno de prototipos (“los mejores ejemplos”); ahora bien, los miembros de la categoría tienen estatus diferentes. Volviendo a nuestros ejemplos, una golondrina es un ejemplo ideal de “ave”, en torno del cual se agrupan otros que se alejan cada vez más del ejemplo ideal: calandria, garza, pavo, gallina, perdiz, pingüino.

La ventaja de las definiciones prototípicas es que son flexibles (siempre se pueden incluir nuevos miembros) y adaptables (las nuevas inclusiones pueden ser negociadas), además de que reflejan el uso normal del lenguaje moderno, en el que es común recurrir a expresiones como “en términos estrictos” o “en términos amplios”; la desventaja es que se abre el camino a toda suerte de ambigüedades.

En una obra reciente, Rogers y McClelland (2008) proponen una teoría sobre la adquisición, la representación y el uso del conocimiento semántico, cuyo sustrato es un conjunto de cambios de unidades neurológicas --ergo, en el sistema nervioso central-- que se producen en respuesta a la experiencia; de esta manera pretenden explicar fenómenos como la diferenciación de conceptos, el agrupamiento de unidades en categorías coherentes y la asignación de propiedades diferentes a conceptos diferentes.

Cabría preguntarnos ahora que tiene que ver esta disquisición lingüística y filosófica con la práctica de la persuasión y la reformulación de frases. El hecho es que un buen retórico crea nuevas categorías semánticas con propósitos definidos. La “guerra santa” de los musulmanes es un buen ejemplo, con su equivalente, “guerra justa” en el mundo cristiano: no se trata de cualquier guerra, sino de una categoría de guerra que se hace moralmente aceptable a través de una redefinición que sirve a los propósitos del orador. Dicho de otra manera, el hablante escoge categorías semánticas para reformular un concepto; un ejemplo son palabras como “daños colaterales”, término acuñado durante las guerras de la antigua Yugoslavia, para denotar a las víctimas civiles de los ataques de la OTAN. El objetivo de este neologismo es, evidentemente, minimizar el efecto que tienen en la opinión pública la muerte de gente inocente en los bombardeos. Otro ejemplo es el llamado de Saddam Hussein al pueblo iraquí para librar “la madre de todas las batallas” durante la Guerra del Golfo Pérsico en 1991.

Estos términos suelen operar a un nivel subliminal, por lo cual es importante percibirlos conscientemente, mediante la herramienta de las categorías semánticas, para conocer la influencia que ejercen sobre nuestro pensamiento y el de otras personas.

En consecuencia, dicen Rogers y McClelland, el significado es algo negociable y los negociadores son los hablantes de una comunidad lingüística. Es importante que los diplomáticos y los políticos tengan estos hechos en cuenta.

Terminaremos nuestro análisis con el recurso retórico llamado “credibilidad”, que los griegos llamaron “*ethos*”. La credibilidad del hablante es un reflejo de su autoridad, su conocimiento y las evidencias que muestran que es lo que pretende

ser. Todo buen orador hace lo posible por mostrar que merece estar donde está y recurre para ello a herramientas que son aceptadas en su cultura. En los Estados Unidos, por ejemplo, un candidato a un puesto público debe presentarse como creyente, honesto, respetuoso de las leyes, marido fiel y buen padre de familia. Cualquier demostración de que es deshonesto (p.ej. evade impuestos) o ha sido infiel puede destruir su credibilidad y, por ende, su carrera política. Si bien la credibilidad se refiere principalmente a una característica del hablante, el término se usa también para referirse a las creencias y los valores que caracterizan a una comunidad, nación o ideología. En este caso, el uso de la credibilidad tiene un enorme potencial emocional.

La consecuencia más importante de la revisión que acabamos de hacer de los recursos retóricos es que todos ellos pueden ser aprendidos mediante un programa de entrenamiento adecuado.

4. LA RETÓRICA: RECURSOS EMOCIONALES (*PATHOS*)

Continuamos nuestro análisis con las herramientas retóricas que recurren a la emoción (el “*pathos*” de los griegos), como son las falacias lógicas, las “historias en cápsula”, la metáfora y la manipulación de la inferencia. Debemos empero aclarar que no hay una división tajante entre los recursos emocionales y los racionales.

Una falacia lógica no es un pensamiento erróneo, sino un conjunto de recursos del lenguaje de gran fuerza emocional utilizados en el discurso político y en la propaganda. El más común es apelar al miedo, la adulación, el odio, el orgullo, la compasión, la solidaridad, la culpa o la reverencia para conmover al auditorio.

Una falacia común en la política es la “pregunta capciosa”, consistente en plantearla de tal manera que la respuesta implica una reconocimiento de algo: “¿Por qué mataste a tu esposa?”

Otros ejemplos de falacias lógicas son los ataques personales (referirse a particularidades del oponente y no al tema en discusión), los falsos dilemas (crear la ilusión de que hay sólo dos opciones, donde existen varias), la pendiente jabonosa (argumentar que dar un paso en una dirección lleva inevitablemente a otros pasos y al desastre), la causa falsa, la diversión (desviación del sujeto de discusión), las falsas analogías y las generalizaciones apresuradas.

Las historias en cápsula son narraciones emotivas que impulsan al oyente a la acción. Tienen básicamente cinco componentes: una emoción (la emoción del hablante y la que provoca en el oyente), un problema que a todos preocupa, un protagonista con un punto de vista (que el oyente debe compartir o rechazar), una propuesta de cambio y, por último, un momento de toma de conciencia que señala el camino para llegar al cambio; generalmente, el relato se basa en mitos y se desarrolla en metáforas (Lakoff, 1991). Lo interesante de estas historias es que pueden ser cortas como una palabra o largas como ensayo. El político usa estas historias para encandilar al oyente, capturar su imaginación y darle una directiva; el relato estructura eventos de una cierta manera, crea cohesión de grupo e invita al oyente a identificarse con los personajes y los valores del narrador; apela, por tanto, a la imaginación y a la identificación del o los oyentes. Los componentes más importantes de la historia son las connotaciones y las metáforas.

En la semántica se distinguen dos componentes del significado, la denotación y la connotación. La denotación se refiere a la relación que tiene una palabra con la realidad (objetos o acontecimientos, o atributos de objetos o acontecimientos), mientras que la connotación se refiere a los significados secundarios asociados con la palabra. Un ejemplo muy querido de los analistas es la persona que lucha contra el régimen establecido de un país determinado; se le pueden aplicar las denotaciones de “insurgente”, “rebelde”, “opositor”, “sedicioso”, “patriota” o incluso “terrorista”. Pero la connotación de cada una de estas palabras es muy diferente; en cada caso, el significado político es diferente; así, los miembros de Al Fatah de Yasser Arafat fueron considerados terroristas o luchadores de la libertad, según el punto de vista del hablante.

En la diplomacia es evidente el uso selectivo de los términos al referirse a una situación determinada. Tomemos el caso hipotético de una guerra civil en el país A, que merece la atención del país X:

- “El Gobierno de X observa con preocupación los acontecimientos en A e insta a las partes a ...”
- “El gobierno de X observa con preocupación los acontecimientos en A e insta al Gobierno de A y a los rebeldes...”
- “El Gobierno de X observa con preocupación los acontecimientos en A e insta al Gobierno de A y a los insurgentes...”

En cada caso, la connotación de los opositores es claramente diferente. En el primero, el Gobierno de X da al Gobierno y a los opositores el mismo estatus; en el segundo, los opositores son simples rebeldes; en el tercero está implícito un reconocimiento a las razones de los opositores. Cada término evoca emociones diferentes en los oyentes.

La elección de los términos correctos es una de las tareas más minuciosas de la diplomacia. Así, el uso del nombre “Malvinas” o “*Falkland*” para referirse a las islas del Atlántico Sur implica una clara toma de posición en el conflicto entre Gran Bretaña y la Argentina.

La metáfora es una figura retórica muy conocida en las ciencias literarias que consiste en denominar algo a través de su semejanza con otra cosa. En nuestros términos, la importancia de la metáfora es que es capaz de encerrar toda una historia en unas palabras: tomemos como ejemplo a Macomber (1975), que llama a la diplomacia “el juego de los ángeles”.

Ahora bien, contra la opinión de algunos críticos literarios que opinan que la metáfora añade colorido a lo que se dice, sin afectar la sustancia, los teóricos de la TAH sostienen que esta figura crea una realidad y mueve a la acción. Así, por ejemplo, designar a un grupo de gente como “terroristas” o “defensores de la libertad” tiene claras consecuencias en la práctica: La metáfora y la analogía ayudan al hablante a estructurar la realidad y guían su conducta real; en otras palabras, la manera como se formula un tema determina cómo y quién va a actuar con respecto a ese tema. Además, las metáforas convincentes determinan qué políticas van a ser aprobadas, pues tienen la función de vincular al oyente individual con el mundo político (o diplomático) proporcionándole una vía para ver relaciones que de otra manera no percibiría fácilmente.

Uno de los autores más interesantes en este campo, George Lakoff, llama la atención hacia la importancia de comprender el papel de la metáfora:

El discurso sobre ir o no a la Guerra del Golfo fue un panorama de metáforas. (...) Baker vio a Saddam Hussein 'pisando nuestra línea económica vital' (...) Bush lo retrató ocupando un 'bastión' en nuestra economía (...) Schwarzkopf caracterizó la ocupación de Kuwait como 'una violación' en curso. El Presidente dijo que los EUA estaban en el golfo para "proteger la libertad, proteger nuestro futuro y proteger al inocente" (...) Es vital, literalmente vital, comprender justamente el papel que ha tenido el pensamiento metafórico para llevarnos a esta guerra. (Lakoff, 1991, p. 1).

Las metáforas son ambiguas por naturaleza porque su contenido se comunica en buena medida a través de lo que no se dice y no a través de las palabras dichas explícitamente.

La manipulación de la inferencia consiste en hacer al oyente llegar a las conclusiones que quiere el hablante, sin que aquel se percate, mediante el uso de una red de presuposiciones, preguntas capciosas, connotaciones prejuiciadas, metáforas e historias en cápsula.

Podemos observar que el lenguaje es capaz de influir en el oyente no sólo a través de su cabeza, sino también de su corazón: cognición y emoción son los dos componentes que confluyen para cambiar la conducta en una dirección determinada.

5. AMBIGÜEDAD Y CONTEXTO

La TAH considera que la definición del contexto en la interpretación del lenguaje y el reconocimiento del papel central de la ambigüedad son parte de la nueva perspectiva, en la que el lenguaje no solamente describe la realidad, sino que la recrea.

Es difícil definir la ambigüedad. Podemos decir que es una expresión capaz de generar al menos dos significados diferentes o un enunciado que puede dar lugar a reacciones diferentes. La realidad nos muestra que hay diferentes tipos de ambigüedades: ambigüedad en sentido estricto (homofonías), ambigüedad en sentido amplio (vaguedad de referencia, o historias en cápsula), y ambigüedad en ambos sentidos.

Para comprender la ambigüedad, el factor más importante es el contexto. Así, mientras más definido sea un contexto, menores las posibilidades de que surjan ambigüedades. Por esa razón, el citar fuera de contexto es un procedimiento sencillo para desacreditar a un político o a un diplomático.

Los teóricos de la TAH consideran que la ambigüedad y, por ende, la subjetividad son parte consustancial del lenguaje político:

No puede haber un mundo de eventos distinto de la interpretación de los observadores (...) la ambigüedad y la subjetividad no son desviaciones ni patologías (...) constituyen el mundo político. (Edelman, 1988, p. 95).

En el lenguaje diplomático, la ambigüedad es tan importante como la precisión. La falta de precisión puede ser una virtud en determinadas circunstancias. La precisión tiene las desventajas de que puede ser ofensiva, puede generar rechazo y hostilidad y puede reducir el espacio para maniobrar diplomáticamente. La ambigüedad tiene las desventajas de que puede dar lugar a disputas sobre la interpretación de un texto y puede causar una pérdida de confianza no sólo en una persona, sino también en un grupo de personas (un equipo negociador o una nación), lo cual es un grave problema en las relaciones diplomáticas.

Con todo y sus desventajas, el objetivo principal de la ambigüedad es crear espacio de maniobra, en el tiempo y en el espacio, para la diplomacia. La ambigüedad permite interpretaciones múltiples, por lo cual puede acomodar opiniones divergentes. Gracias a ella es posible que dos partes mantengan posiciones irreconciliables en la realidad y, sin embargo, logren un compromiso por escrito. En términos políticos esto es importantísimo, pues el mismo mensaje puede ser llevado a diferentes auditorios con interpretaciones convenientes, permitiendo así al hablante "no perder la cara". Por otro lado, la ambigüedad permite ganar tiempo, a fin de lograr mejores acuerdos en el futuro, o para generar diferencias de interpretación que pueden ser la base de acuerdos en circunstancias cambiantes.

El arte de la diplomacia consiste, precisamente, en usar inteligentemente las dos cosas en los contextos adecuados.

Existen varios tipos de ambigüedad:

- 1) La homofonía: "ético" y "hético", o "deshecho" y "desecho".
- 2) La polisemia: "estado" puede ser un país, una entidad federativa, una condición física o una condición de salud.
- 3) El ámbito de aplicación: "mujeres, niños y hombres enfermos" (¿"enfermos" se refiere a todos o solamente a los hombres?)
- 4) La vaguedad; un ejemplo conocido es la declaración del gobierno americano sobre la "política de una China" (febrero de 1972), a propósito de la polémica entre la República Popular China y la República China (Taiwán): "Los Estados Unidos reconocen que todos los chinos en ambas márgenes del Estrecho de Taiwán sostienen que hay sólo una China y que Taiwán es una provincia de China".
- 5) La señalización: Uso de acciones para comunicar un mensaje; como abandonar una sala de sesiones como forma de protesta.
- 6) Lo que no se dice: Se trata de un mensaje encerrado entre las palabras.

El tema de lo que no se dice merece un tratamiento especial: no en balde alguien definió la diplomacia como "el arte de decir algo cuando no hay nada que decir y de no decir nada cuando hay algo que decir". Lo no dicho es un aspecto central,

pues el lenguaje oral tiene numerosos espacios vacíos que tienen una función comunicativa; la ironía, el humor y el doble sentido se nutren de estos espacios. Lo que no se dice funciona como un vínculo entre el hablante y su entorno verbal. Lo no dicho tiene la ventaja, o desventaja, de que su existencia puede ser negada. El hablante puede siempre recurrir a testimonio o a registros para demostrar que “no lo dijo”, o “no fue esa mi intención”. Asimismo, tiene la característica de que permite una manipulación de la inferencia, pues el hablante puede dar lugar a sugerencias, connotaciones, analogías, metáforas y ambigüedades basadas en lo no dicho para manipular al oyente.

Un recurso muy común, que en la literatura recibe el nombre de parataxis, es la unión de dos oraciones sin conjunción evidente entre ellas que indique una relación lógica. Un ejemplo de esta práctica en la política es la conocida frase de George W. Bush: “Saddam Hussein es una amenaza para nuestra nación. El 11 de septiembre cambió el pensamiento estratégico de cómo proteger nuestro país” (Bush, 2003)³; la falta intencional de un vínculo entre ambas frases invita al oyente a inferir que Saddam Hussein fue el responsable de los ataques.

Todos los tipos de ambigüedad que hemos revisado pueden aparecer simultáneamente.

6. COMUNICACIÓN NO VERBAL

Los elementos no verbales son parte constitutiva del contexto del lenguaje. Los trabajos de psicólogos como Mehrabian (1972, 1981) muestran que hay básicamente tres elementos que intervienen en una comunicación directa entre dos personas, a saber, las palabras, el tono de voz y la expresión facial (la conducta no verbal). Para que tenga lugar una comunicación eficaz entre dos personas, especialmente de las emociones, las tres partes del mensaje tienen que apoyarse mutuamente. Si falta congruencia, el oyente puede percibir dos mensajes diferentes, con la consiguiente irritación. La parte no verbal es tan importante para comunicar los sentimientos y las actitudes, que si hay una incongruencia entre ella y las palabras, se producen problemas en la interacción; por ejemplo, cuando una persona dice algo evitando el contacto visual, tendemos a creer que miente; otro ejemplo es el orador que transmite sus ideas al auditorio no solamente a través de las palabras, sino también a través de indicios no verbales que revelan su convicción.

La conducta no verbal participa también en el proceso de comunicación, a través de mensajes visuales que son enviados a través de gestos, expresiones faciales, contacto corporal, contacto visual, postura o movimientos corporales⁴. Veremos cómo funcionan algunas de estas categorías en la comunicación, no sin antes subrayar que el mensaje contenido por las formas de conducta que vamos a mencionar pueden variar de una cultura a otra (véase Galindo, 2013).

Las expresiones faciales son un medio de comunicación por excelencia, ya que el control preciso que ejerce el ser humano sobre la boca, los labios, los ojos, la nariz, la frente y el mentón posibilita miles de expresiones de felicidad, tristeza, enojo, miedo, sorpresa, disgusto, vergüenza, angustia e interés que son más o menos universalmente reconocidas (Ekman, 2003).

La postura puede comunicar el grado de atención de una persona, la diferencia de estatus entre los participantes y el grado en que uno gusta del otro. Posturas como estar encorvado, abrir las piernas, adelantar los hombros o cruzar los brazos indican sentimientos y actitudes hacia otra persona. Algunas envían un mensaje positivo durante el proceso de comunicación, como el inclinarse hacia adelante. Por el contrario, cuando alguien está hablando con otro y mira constantemente al piso o al techo, muestra desinterés por la conversación. Una postura correcta sería inclinarse hacia adelante para escuchar y mantenerse erecto al hablar (Pease y Pease, 2004).

Los gestos son movimientos hechos con las manos, los brazos, la cabeza, los ojos o el cuerpo como un todo; como asentir, aumentar la abertura de los ojos o pestañear. Hay un conjunto de gestos convencionales, específicos de cada cultura, que pueden usarse en vez de palabras, como agitar la mano para decir adiós en nuestro medio. Algunos gestos son complementarios, en el sentido de que aparecen acompañando al lenguaje oral para modificar su significado.

El contacto visual, puede indicar interés, atención y dedicación. Cuando una persona está interesada, sus pupilas se dilatan. La duración del contacto visual es un dato significativo: mientras más largo, mayor el interés. La falta de contacto visual en una situación social suele indicar desinterés. Por esa razón, las personas observan constantemente la cara y los ojos del otro en busca de señales positivas o negativas (Ekman, 2003).

El tacto es un sentido que, además de proporcionar información sobre superficies y texturas es un componente importante de la comunicación, pues determina el grado de intimidad física entre la gente. El tocarse, como medio de comunicación, incluye darse la mano, besar (mejilla, mano, labios), dar palmadas en la espalda y apretar el brazo. Obviamente, existen también el “tocarse” como conducta sexual y como forma de violencia, que incluye empujar, jalar, golpear, patear, etc.

No obstante, los expertos citados consideran que también existe un proceso de comunicación no verbal a través de objetos, artefactos y contextos físicos que tienen un significado, como la ropa, los espacios arquitectónicos, o bien objetos que confieren rango o prestigio (medallas, bandas, uniformes, collares, bastones, togas, incluso portafolios y material de escritorio). Por ejemplo, la ropa es un indicio no verbal, pues contiene en principio información sobre la personalidad de la persona, su origen y su nivel financiero; pero también puede indicar la cultura, el humor, el nivel de confianza, los intereses, la edad, la autoridad, los valores y la identidad sexual del usuario. Las otras personas siempre reaccionan a estos indicios.

El espacio en que tiene lugar la comunicación es otro factor no verbal. El espacio que media entre el hablante y el oyente influye en la manera como se percibe el mensaje. Los estudiosos del tema consideran que el espacio puede ser dividido en cuatro categorías principales: íntimo (2 a 45 cm), social (45 a 122 cm), personal (122 a 365 cm) y público (más de 365 cm) (Pease y Pease, 2004). Todos tendemos a defender nuestro espacio íntimo cuando alguien se nos acerca demasiado.

Argyle (2013) cree que existen códigos no verbales que usa el ser humano para establecer y mantener las relaciones interpersonales, los cuales tienen cinco funciones primarias: 1) expresar emociones, 2) expresar actitudes interpersonales, 3)

³ “Saddam Hussein is a threat to our nation. September 11 changed the strategic thinking for how to protect our country.” (Bush, 2003).

⁴ La visión puede ser sustituida por otras formas de percepción en el caso de los ciegos, como por ejemplo, movimientos corporales percibidos a través de ruidos.

acompañar el lenguaje aportando indicios de comunicación, 4) presentarse a sí mismo (la propia personalidad) y 5) cumplir rituales (como los saludos). Por ejemplo, la persona manifiesta su cercanía interpersonal a través de acciones verbales llamadas conductas de inmediatez, como sonreír, tocar, posturas corporales abiertas y contacto visual. En resumen, Argyle sostiene en sus numerosas obras que el contacto visual, las expresiones faciales, el tono de voz, las posturas y los gestos determinan la interacción social que tenemos con los demás, de una manera más o menos inconsciente.

Obviamente, estos hallazgos científicos han despertado el interés de muchos otros psicólogos y existen innumerables líneas de investigación. Por ejemplo, el trabajo de Remland y Jones (2005) sobre la distancia interpersonal, la orientación del cuerpo y el tocarse.

Las capacidades no verbales parecen ser importantes para el desarrollo del individuo; de ellas depende el éxito para iniciar y mantener una interacción social, para desarrollar relaciones interpersonales y para manejar impresiones, elementos imprescindibles para el desarrollo del individuo en ambientes empresariales, políticos y diplomáticos. Lo más importante, para los objetivos de este artículo es la constatación de que estas capacidades pueden ser aprendidas mediante procedimientos de entrenamiento psicológico (Riggio y Feldman, 2005).

Actualmente la comunicación no verbal se ha convertido en un fecundo campo de investigación de la psicología, con publicaciones propias, como el *Journal of Non Verbal Behavior*; sus recomendaciones para el entrenamiento de competencias sociales han hallado aplicación no sólo en la psicología, sino también en la educación, la administración de empresas, el trabajo social y, por supuesto, la diplomacia y la política.

7. CONCLUSIÓN

Al analizar las competencias que debe tener un buen diplomático, Macomber (1975) concluye no hay buenos negociadores natos, pues negociar es una aptitud que se adquiere con el entrenamiento. No podemos más que concordar con Macomber. Podemos agregar que los programas para enseñar las competencias de negociar, mediar y resolver conflictos en contextos internacionales, tal como se enseñan en el Proyecto de Negociación de Harvard (Fisher y Ury, 1991; Fisher, Kopelman y Schneider, 1994), contienen entrenamientos para la “percepción del conflicto”, “asumir el punto de vista del otro”, “análisis del lenguaje”, “los motivos personales” y “posiciones e intereses”. La negociación es básicamente un proceso de comunicación. Es decir que cada participante debe ser capaz de hablar claramente y escuchar con atención, identificando correctamente lo que se dice, cómo se dice y qué se omite. Al mismo tiempo, el participante debe tener claro que su conducta de escuchar puede favorecer o perturbar el proceso. Por ello, el primer paso en la negociación es resolver los problemas de comunicación. Pese a que todos los aspectos de la comunicación son muy subjetivos, los psicólogos han podido crear métodos para mejorarla. En este campo, destacan los trabajos de Gordon (2001), cuyo método general para mejorar la comunicación ha encontrado aplicación en numerosos ambientes, incluyendo la resolución de conflictos. Es el autor de técnicas como las de “escuchar activamente” y la reformulación de mensajes que revisamos en las páginas anteriores.

Las aptitudes de hablar y escuchar –incluyendo la comunicación no verbal– son tan importantes que reciben una atención especial en el entrenamiento de diplomáticos, negociadores, mediadores y, obviamente, políticos.

Para terminar, cabe reiterar que la psicología y la psicolingüística pueden hacer una contribución importante para ayudar a los diplomáticos y a los políticos a comprender el lenguaje, a dominar las diferentes formas de expresión y a resolver situaciones conflictivas; así, ha creado métodos de entrenamiento derivados de los conocimientos arriba revisados, a fin de mejorar las habilidades de las personas en esos ámbitos.

ABSTRACT

World population is increasing. According to recent forecast it is expected that in approximately 30 years, planet's population will reach 10 billion people. At the same time, climate change, urban growth and unsustainable agricultural practices will contribute for considerable losses on the arable land available, causing serious problems to the production-consumption balance. In this regard, recent studies foreseen significant impacts on agricultural lands both in terms of productivity and in terms of environmental sustainability. In this scenario, agricultural modernization is pointed out as a crucial step to overcome forthcoming difficulties. Precision agriculture management systems (PA), Smart Agriculture (SA) procedures, normalized difference vegetation index (NDVI) techniques and unmanned aerial vehicles (UAVs) appear as feasible options to help solving these issues. However, their use needs to be reinvented and tested considering different parameters in order to ascertain both the environmental and the economic impact of these new technologies not only in agricultural production, but also on their impact on agricultural sustainability.

This paper intends thus to contribute to a better understanding of the impact of precision agriculture throughout the use of UAVs and NDVI techniques in maize production under Mediterranean conditions, presenting specific data obtained through the application of the aforementioned techniques on specific farms located on Extremadura - Spain, in order to ascertain the benefits of these methods not only in ecologic but also in economic and productivity aspects. The obtained results may, with the necessary care and adaptations, be extrapolated to other regions of similar characteristics in the Mediterranean basin and can be a tool for improving resource management thus augmenting the use of these methods. The obtained results, based on these methods highlights the fact that an efficient combination of UAVs and NDVI techniques enable important savings in productivity factors, promoting sustainable agriculture both in ecological and economic terms.

Keywords: Precision Agriculture, UAVs, NDVI, Sustainable Agriculture.

JEL Classification: R58

1. INTRODUCTION

World population is increasingly growing. It is expected that in approximately 30 years, planet's population will grow from 7.200 to 10.000 million (Dolgonosoy, 2016 and FAO, 2015). At the same time, climate change, urbanization and agricultural overexploitation will contribute for considerable losses on the arable land available for food production, causing serious problems in the production-consumption balance (Bruce *et al.*, 2013; Foley *et al.*, 2005; Guerra *et al.*, 2016; Li, Wu and Qian 2016; Prosdocimi *et al.*, 2017 and Yang, 2016).

Several studies predict the significant impact of these changes on agricultural lands both in terms of productions and in terms of farm income, pointing out that modernization processes are crucial in order to surpass these difficulties (Amjath-Babu *et al.*, 2016; Graveline, 2016; Grundy, 2016 and Zhang). In this scenario, precision agriculture, normalized difference vegetation index (NDVI) techniques and unmanned aerial vehicles (UAV) or Remotely Piloted Aircraft Systems (RPAS) appear as feasible options to help solving these issues. In fact, precision agriculture, a farming management model based on observing, determining and responding to inter and intra-field productive variability enables the definition of a decision

support system (DSS) for specific farm management with the goal of optimizing returns on inputs while preserving resources (McBratney, Whelan and Ancev, 2005).

Still, even if NDVI has been used for over forty years, it is a fact that just recently, technological advances in UAV and RPAS technology offered new opportunities for assessing agricultural plot experiments using UAV/RPAS imagery. Vegetation indices (VIs) based on aerial images (Figure 1) derived from consumer-grade cameras became a simple and cheap alternative compared to VIs derived from other type of devices as is the case of proximal (on-ground) sensors (Rasmussen *et al.*, 2016).

Nevertheless, few studies concentrate on the feasibility of these technologies for small-scale corporations, considering not only their cost, but also the necessary knowledge to obtain, treat and process the information gathered bearing in mind the use of these devices. To address this problem serious involvement will be required, both by agricultural specialists and farmers in order to assess the impact of these new methods not only economically but also environmentally.

2. MATERIALS AND METHODS

Several scientific methods have been used through the present research, including indirect and direct methods and tools. The methodological approach was divided into three main phases (Figure 1), ending with a Cost-Benefit | Cost-Efficiency analysis regarding the feasibility and success of using the PA techniques in corn production in Mediterranean regions.

Figure 1. Methodological approach scheme

Since the study required not only the use of specific technology throughout the research, but also the collection of data during farm activity in which it was essential to have a very well established protocol, so that the research did not cause any inconvenient on farming activities. In this regard, the general research methodology (Figure 3) was divided in three main sections related to case study/property selection, to the collection and analysis of data related to the selected property, and to the definition of a flight plan that enabled the collection of NDVI information useful to develop a prescription plan and a cost-benefit analysis both from environmental and economic perspective.

2.1. Study area

The properties in which the study was developed are located on Spain on the county of Estremadura which is located along the Portuguese border (Figure 2).

Property A – irrigated parcel of 19,8 hectares dedicated to the production of corn;

Property B – irrigated parcel of 17,4 hectares dedicated to the production of corn.

According to the collected data the average annual rainfall is nearly 480 mm, most of which during the season of coolest temperatures ranging from October to March. The maximum monthly average temperature corresponds to July in which temperature reaches 24.7 °C and the minimum average temperature corresponds to January with 8.8 °C (Loures *et al.*, 2015). According to the *Koppen* classification the study area corresponds to a *Csa* climate, characterized by hot dry summers and cool wet winters.

Figure 2 – Study area - localization map of the selected farms

According to Nunes *et al.* (2016), generally the study area might be defined as very heterogeneous regarding geology; still hipercalcine and basic rocks are the most representative ones (Loures *et al.*, 2015). Regarding agricultural production olive orchards with 35% (*Olea europaea*), cornfields with 20% (*Zea mays*) and tomato and garlic plantations both with 15% (*Lycopersicon esculentum* and *Allium sativum*, respectively) are the most representative crops produced in the region (Nunes *et al.*, 2016). According to the World Reference Base of the FAO Soil Resource (WRBSR) (FAO, 2006) 3 different soil types, the fluvisols, luvisols, and cambisols represent the soils present on the analyzed farms.

2.2. Used technologies/equipments

Considering the objectives of the research a multi-rotor drone with two sensors was equipped with a RGB and a NIR camera, with the purpose of elaborating different vegetation indices and showing the agronomic variability that exists within agricultural and production parcels. The specific equipments used in order to obtain this data are specified after.

2.2.1 RPAS

The system with which the flights were completed is a RPAS - Model DJI Phantom 3 professional. This RPAS, owned by AgPrecision, incorporates a flying electric propulsion system with vertical take-off and landing capability, which has advanced technology onboard, reason why it presents a considerable flight stability through a built-in GPS, equipped with a multispectral sensor capable of taking data from the Near Infrared Spectrum Region (NIR).

2.2.2 Cameras/sensors

The images were taken by two different sensors: a RGB (Visible Spectrum) and a NIR (MAPIR).

2.2.3 Image processing

The subsequent processing of the images to develop a coherent mosaic used both for the product in RGB as for the NIR, was realized by means of services of image processing in the cloud, since it was considered that the advantages offered by this type of service when compared to the processing in a desktop equipment are very outstanding, both for processing speed as for quality of the results. The *Dronedeploy* cloud processing service (www.dronedeploy.com) was the selected one. Once the different cloud imaging products were obtained, different spatial analyzes were performed using the free open source GIS desktop software - QGIS 16.0.

3. RESULTS AND DISCUSSION

The obtained results as it will be shown after, considered both the data collected according to the pre-established protocol and the data provided by farmers regarding prior campaigns. In fact, though there is a lot of research available regarding precision agriculture (Auernhammer, 2001; Castle, Lubben and Luck, 2016; Lowenberg-DeBoer, 2015 and Yost *et al.* 2016), there is no precise information regarding feasibility studies towards the effectiveness of the use of these management procedures considering cost-benefit analysis.

Regarding *Property - A*, the collected data highlighted that an area of 0,3hectares was left we no seeding in a property with less than 20 hectares. Coupling the collected data with the production data recorded on previous campaigns, in which the highest average production levels of the plot were approximately 15T/ha, in areas where the plants presented high vigorosity, and the lowest levels around 12 T/ha in areas where the vigorosity was moderate, it is possible to perform an estimation of the expected production according to the NDVI map (Figure 3).

Figure 3 – Property A - seeding failure and production estimation map based on NDVI indexes

The elaborated map based on the average productions of previous campaigns enabled us to develop a table based on standard productions according to NDVI information, in which it was possible to ascertain the differences between potential and expected productions both in terms of weight and cost. In this case, the collected data enabled us to verify that the differences in terms of potential and expected production will be of approximately 33,3T, which in terms of economic productivity represents, considering the price for tone of corn published by MAGRAMA (Ministry of Agriculture and Fisheries, Food and Environment) for the 2016/2017 season (175.6€) approximately 5852.7€, as presented in table 1.

In the event of seeding failure, the result is obvious. The flight must be done during the germination season, so that according to the size of the faults it is possible to verify the feasibility of performing a reseeding considering a cost-benefit analysis. Considering the average cost of a flight (500€ on properties of less than 50ha), the potential benefits of applying these technologies can easily be realized, even on a smaller scale properties where cost of flight, data analysis and prescription plan is much higher. These results are in fact very relevant, since they contradict the idea that these type of technology is only feasible for large properties.

Table 1: Corn productivity analysis

Variables	Area (Ha)	Potential production (15T/ha)	Potential production (€)	Expected production (T)	Expected production (€)	Balance
0 T/ha	0,38	0,00	0,0 €	0,00	0,0 €	0,0 €
10 T/ha	0,95	14,20	2.493,1 €	9,47	1.662,1 €	-831,0 €
12 T/ha	5,19	77,90	13.679,8 €	62,32	10.943,8 €	-2.736,0 €
14 T/ha	13,02	195,24	34.284,7 €	182,23	31.999,1 €	-2.285,6 €
15 T/ha	0,01	0,18	32,4 €	0,18	32,4 €	0,0 €
TOTAL	19,5	287,5	50.490,0 €	254,2	44.637,3 €	-5.852,7 €

Regarding *Property - B*, it was possible to evaluate resource economy, considering the goal to promote an effective reduction on the use of fertilizers in corn production. Though the assessed property presented some limitation related to the use of

an irrigation system based in 10 sectors, it was clear that the use of the collected NDVI results, would enable an effective reduction on the use of fertilizers (Table 2), while fostering productivity.

Figure 4 – Property B - NDVI indexes per irrigation sector

The benefits of using the precision agriculture technologies under analysis in this study are evident (Table 2), considering that instead of the traditional 230 units of nitrogen (32N nitrogen solution) per hectare, that normally were applied undifferentiated throughout the property, the fertilization plan, proposed a distinguished dose plan for each sector which allowing to maintain productivity, enabled a reduction of 211 units of nitrogen in a parcel of less than 20 hectares. Besides the natural cost reduction, augmenting productivity, this measure enabled an effective gain in terms of environmental cost, since there was a reduction of approximately 5% on the overall use of fertilizer.

Table 2: Fertilization plan Reduction of fertilizer use in corn production

Sector	Area (ha)	Prescription N (L/ha)	Consumption (L)
<i>Traditional application</i>	<i>19,29</i>	<i>230</i>	<i>4437</i>
<i>Proposed application</i>	<i>19,29</i>	<i>variable</i>	<i>4216</i>
1	0,48	240	116
2	2,42	220	532
3	3,36	230	774
4	2,42	210	508
5	3,7	200	739
6	2,41	210	506
7	1,82	230	419
8	2,03	230	466
9	0,21	240	50
10	0,44	240	105

4. FINAL REMARKS

The obtained results, based on the assessment methods used throughout this research highlight the fact that an efficient combination of UAV/RPAS and NDVI enable important savings in productivity factors, promoting sustainable agriculture both in ecological and economic terms. The use of UAVs and GIS would facilitate not only to diagnose failures with greater efficiency in plots, where by the foot it would be almost impossible. the performed study reinforces the fact that precision agriculture constitutes a very important agricultural management procedure that contrarily to generalized ideas is also feasible in small farms. This fact is corroborated by the obtained results, since the costs inherent to the use of these technologies generally, largely surpassed by the economic and environmental benefits that would be gained with the introduced recommendations. Still, it is important to mention that the obtained data used for comparison was collected in the farms in previous campaigns.

The developed analysis enabled us to conclude that the use of aerial images and NDVI, though not used in this research, might serve to acquire important information to identify nutrition disorders, diseases in plants, plus the presence of weeds

or pests in the field, utilities, that considering the world needs to produce more food, enable not only the increase of productivity, but also to mitigate nutrition and disease problems with relative ease, constituting a crucial step towards sustainable agriculture not only in environmental but also in economic terms.

The obtained results create a momentum for the development of further studies regarding the use of precision agriculture techniques in small farms, for which precision agriculture procedures are generally considered not feasible and too costly from a cost-benefit analysis perspective.

ACKNOWLEDGEMENTS

The authors would like to acknowledge financial support given by National Funds provided by FCT- Foundation for Science and Technology through project UID/SOC/04020/2013, and the support given to Luis Loures as a Post-Doc fellow at GORSAS (Research Group on Soils, Water and Sediments Management, Conservation and Recovery) – Universidad de Extremadura, throughout his postdoctoral research.

ABSTRACT

Our heritage is preserved in museums, places of learning where educational activities are especially relevant. We shall use the museum as a resource for teaching a historical period characterised by overseas conquests and the change in medieval cartography.

We propose a historical re-enactment where students assume the role of leading figures of the time, researching them and their context thanks to the museum's resources, to represent a single event marked by the figure, in this case, of Prince Henry the Navigator (*Infante* Don Enrique of Portugal).

Nautical charts, cartography, stargazing ... are some of the contents we will be working on. Through investigation, the students answer questions such as: What shape would the world be to the society of the day, how is a map made, what were the instruments used to guide them, what routes were discovered, and their impact in shaping present-day reality. This way, they weigh up the technical advances that made the long late-mediaeval expeditions possible and learn about the cultural and economic exchanges took place through the opening of new routes.

This proposal is framed within the possibilities available in the Social Science teaching research line working on heritage preserved in museums.

Keywords: Museum, Heritage Education, Emotional Intelligence, History.

1. INTRODUCTION

Ter consciência da nossa inelutável condição de herdeiros é ter consciência histórica.

A. R. Mendes

This study is based on the potential of heritage to educate, a patrimony which in our case we find inserted in a space, the museum. To develop this proposal, we set out from the importance of Heritage Education for the comprehensive development of individuals, favouring the attainment of skills/competencies associated with emotional intelligence. These skills are related on the one hand with the ability of individuals to know themselves, learn to identify and manage their emotions, to regulate them, reflect on the feelings created and act critically and flexibly towards other viewpoints. These are defined as intrapersonal skills in emotional intelligence models.

On the other hand, interpersonal skills are described as the social abilities of the individual to relate, empathise, recognise emotions in others, control social relations, act with civic responsibility and cooperate in their community context, while living in a complex and increasingly multicultural society. Education is the backbone of social life, which should lay the foundations for the development of a well-rounded knowledge that encourages citizens to reflect and relate to each other, coexisting socially with a responsible, thoughtful, active and committed attitude.

Educational contexts are increasingly diverse, based on a new concept of teaching that goes beyond the classroom. The teaching and learning process is moving ever more frequently to alternative spaces in a territory that contextualizes the social reality of students.

The city thus becomes a stage that allows different concepts of educational spaces, configured as a platform for comprehensive, multidisciplinary and holistic learning, with infinite resources that can and should be used as teaching tools. To this end, it becomes a space at the service of education in all its contexts. One of these, within which this proposal is framed, is museum space and the options it provides for the development of activities focused on knowledge, identification, assessment, transmission and dissemination of the heritage object as a reference for individual and social identity.

In our work, we highlight the role of this non-formal education area, the museum, at the service of formal education, where it becomes the seat of wisdom which the education system can and should use for development of the teaching and learning process.

To this end, we link three key ideas; on one hand, the notion of the museum as a dynamic space whose purpose is to educate. On the other, the concept of heritage education as a tool underpinning the teaching and learning process, and finally, the notion of emotional intelligence, understood as the skills/abilities the individual needs to live in society.

To this end, based on the construction of a theoretical framework for these concepts, we put forward a proposal related to best practices, with a view to achieving a critical and responsible citizenry able to live in a cooperative, participatory and democratic society.

Heritage education, emotional intelligence and the museum are the cornerstones on which our didactic proposal is based, in what is intended as yet another step towards the use of our past to let us understand our present and help build the future.

2. HERITAGE EDUCATION

Ninguém educa ninguém, ninguém se educa a si mesmo, os homens se educam entre si, mediatizados pelo mundo.

Pedagogía do Oprimido. Paulo Freire

Heritage plays a key role in the world we live in. Studying patrimony helps us build knowledge favouring the understanding of our reality and provides us with the necessary tools to assess and transform it. Through its assimilation, a process of cultural literacy is initiated (Parreiras, Grumberg, and Queiroz, 1999), leading us towards the assimilation of cultural, historic and social processes affecting humanity in its attempts to comprehend its existence. What is the human being without memory? To respond to this question, we define heritage education.

Since the 90s, many research works have focused on heritage education. In Spain, studying the interpretation and understanding of heritage began to be encouraged based on the works by Prats (1997), Estepa, Domínguez and Cuenca (2001) or Calaf (2009), among others, both in formal and informal contexts within the field of Social Science Didactics. Cuenca and Martín (2009) state that heritage education is a theoretical-practical foundation that enables the implementation of actions or projects aimed at spreading patrimonial knowledge and the interpretation and understanding of the heritage references of every society.

On the basis of the cited research, heritage is no longer understood as merely an asset used as a resource in teaching and learning processes, or, in the case of non-formal education, as an exhibition object “unattainable” in the eye of the beholder. This is where heritage education comes to be considered a scientific discipline, an area of study within the social sciences, leading towards integral education of persons, the construction of critical and responsible citizens with emotional attitudes towards patrimony.

Copeland (2009) affirms that heritage brings society closer to knowledge from its own past experience, ideas and processes, raising awareness of causes and consequences and providing different approaches to the resolution of conflicts within democratic society. In this sense, heritage education fosters an understanding of how the values of cultural patrimony and ethics influence peoples’ decisions and actions.

In our work, we set out from a conception of heritage from its symbolic and identity perspective, encompassing not only artistic, historical and monumental patrimony. This way, we consider heritage in its several variants and typologies from a holistic and integrative standpoint. To this end, we understand heritage education through a globalising, inclusive and symbiotic approach, where patrimony is seen as educational content.

Once the concept is defined, we must apply it, as we understand it to be a means to achieve an end. And this is not unique, as we may talk of several objectives, among which we highlight the following. Heritage education enables us to:

- Understand the heritage asset as a resource that generates identity. We are the people with the power to identify ourselves with an asset, perceiving it thus as part of our individual social history. Heritage is not in objects, but in the minds of people (Fernández-Salinas and Romero, 2008: 19).
- Foster affective attitudes towards the heritage asset, in such a way that commitment arises to its defence and protection. Querol (2010) emphasises the importance of recognition and appreciation of cultural property by society in order for its protection and conservation to make sense.
- It lets you understand how the values of cultural heritage and ethics influence peoples’ decisions and actions. It develops opinions on cultural questions and how they affect political economic and environmental issues. (Copeland, 2009: 15)
- Understand the present for the source of future standpoints, considering heritage as a legacy that stimulates critical and reflective awareness of beliefs and social identities.
- Encourage the development of tolerance criteria towards other lifestyles, cultural empathy, solidarity and intellectual autonomy (Cuenca, Estepa and Martín, 2011). This in turn encourages the valuation of multiculturalism as a symbol of cultural and social wealth.
- Comprehend past and present societies, understanding heritage assets as witnesses and sources for analysis. It is the historian (the person) who creates the document and gives the indications, the vestiges, the status of source (Ginzburg, 1976) (Figure 1).

Heritage is part of human beings, their environment and everyday life, permeating the territory they inhabit; it must therefore be integrated in society (Romero, 1998). Whether an object, natural scenery, a historical or archaeological space, a piece of music, a work of art or an architectural element... All are likely to be deemed heritage and all are closely related with

human beings in their daily lives. As long as an emotional attachment is formed both individually and collectively, generating identity relationships between a person or community with the asset in question, it is considered heritage.

We therefore consider that heritage education must also be integrated within teaching/learning processes, both in formal and non-formal education. The disciplinary, methodological and curricular barriers must be overcome, promoting critical and reflective knowledge of the social and natural environment (Estepa, Wamba and Jiménez, 2005) and favouring the individual's integral development.

Figure 1: Applying lessons learned. Based on - Parreiras, M^a. L., Grumberg, E. and Queiroz, A. (1999)

3. EMOTIONAL INTELLIGENCE (EI): EDUCATING IN EMOTIONAL COMPETENCIES ON THE BASIS OF HERITAGE

Out-of-control emotions can make the smartest people stupid.

Daniel Goleman (2009)

Emotions are part of human life. They are primary and inherent and we are in continuous connection with them. Everything around us, tangible and intangible, elicits feelings and emotions. Identifying, using, understanding and managing one's own emotions is one of the challenges for humans, as beings able to educate the many facets of their personality at different stages of development throughout their existence.

The concept of emotional intelligence (EI) is nothing new. It is defined as a hypothetical construct in the field of psychology created by Salovey and Mayer in 1990 and popularised by Goleman in 1995. But previously, in the 20s, researchers such as Thorndike (1920) had already set out the basis by conceptualising as "social intelligence" the ability to understand people and act accordingly in human relations. Salovey and Mayer (1990 and 1997) assimilated EI as part of *social intelligence*, including abilities that mark individual differences in the way emotions are perceived, valued and expressed. It includes the skill of being able to control one's own emotions and those of others, the ability to identify them and the capacity to use this information as a guide to our thoughts and actions. Because, although the importance of human beings' cognitive abilities is undeniable, it is the emotions that orchestrate our lives and our surroundings. Combining both would mean increasing our flexibility to adapt and resolve everyday conflicts. The term reached the height of its popularity after publication of the best seller *Emotional Intelligence* by Goleman in 1995, in which he defined EI as the human ability to understand/comprehend emotions (one's own and those of others) and steer them towards ways of acting that make it possible for us to achieve better outcomes (Figure 2).

Figure 2. Emotional Intelligence models. Own creation

When talking about EI, we must not confuse the term with *emotional competence* and/or *emotional education*. The fact of having a high EI does not mean that the person has acquired the necessary competencies to achieve greater development, but rather that they are equipped to develop them.

Emotional competencies consist of a set of acquired knowledge items, capacities, skills and attitudes which are closely related to personal experience (Figure 3). They rely on stimulation from the surroundings in order to manifest, focusing on the interaction between person-environment. The purpose of emotional competencies is to put the potential of EI into practice, so as to achieve outstanding performance of the individual in all personal and social areas.

Figure 3. Emotional competencies. Own creation based on Goleman's model (1995)

Once the concept is defined, we pose the following question: How can we favour the development of emotional competencies through Heritage Education?

We set out from the principle that emotion arises from the interaction between person and environment. Within this environment, the unquestionable and permanent presence of heritage in all its typologies stands out. We may or may not recognise it, which means that in order to value it we must identify it as such and assume it as our own, as a symbol of our identity.

Among other authors, we highlight the perception of Santacana (2007), who talks about the capacity of heritage to make an impact on the mind, causing different feelings and excitement. These emotions will be different depending on the person and the heritage element observed. And knowledge is an indispensable condition to be able to value, feel and make it ours.

For, what colour are emotions? How do we identify, define, assume and control them?

We understand that through Heritage education, patrimony may become a vehicle for personal motivation encouraging the acquisition of inter- and intra-personal competencies, thus “giving colour” to these emotions inspired by the object. For Bisquerra (2008: 63) Emotions are reactions to information (knowledge) we receive in our relations with the environment. So, we understand that the main function of emotion is to motivate behaviour, insofar as an emotion triggers a reaction - voluntary or involuntary - and thus an action. For an emotion to be controlled, it must be recognised, understood and defined. Consequently, one of the aims of heritage education is to identify these reactions, favouring actions focused on the notable achievement of coexistence from a personal, citizen and social perspective.

On the other hand, we highlight the potential of heritage education to further the understanding of the various events leading up to the current configuration of reality, its causes and consequences. The goal is the development of social skills such as empathy, respect, flexibility, adaptability, compromise, commitment, cooperation... avoiding actions against what we understand as an inclusive and responsible citizenship.

The final aim is to achieve a state of personal and social well-being, so that heritage is constituted as a vehicle whereby this ideal status can be achieved.

We may become emotional when faced with an artwork, a text, an image, a story, a landscape... (Figure 4) so we must develop the capacity to be thrilled by beauty, and this involves knowledge and educating about heritage. Our proposal is presented as a way to construct learning experiences around heritage objects that help spread knowledge of our history, assessing the achievements of our society through study. Moreover, our intention is that the approach to these cultural assets should trigger emotions. The aim is to identify and work with/on them towards the achievement of emotional competencies.

Figure 4. *Emotions. Own development*

4. THE MUSEUM: A SPACE FOR KNOWLEDGE INTEGRATION

The museum space has abandoned its traditional static and merely expository conception to make way for open and dynamic spaces. This process has come hand-in-hand with opening up to another type of visitor, far removed from the traditional, erudite or specialist. Now, our visitors' interests cover a broad spectrum; everything from simple entertainment to wishing to increase their knowledge. The relation of humans with the environment, with the cultural and natural heritage (Pinheiro, 2015: 55) is becoming increasingly necessary.

For J. Ballart (2008: 19), the museum is Any permanent public institution that preserves collections of objects whose purpose is education. This is the area in which our proposal is developed, closely related with heritage education as leitmotif. In this work, the museum becomes the central space where knowledge is developed, transporting the public to contexts which, for their importance, are key to building a personal and collective identity. Thus, the exhibit, understood in a holistic and integrated manner, takes on a symbolic-identitarian value for the observer, promoting its knowledge, valuation, conservation and communication. The heritage element becomes resource, object and content (Cuenca, Estepa and Martín, 2011), a means to heritage education and an end in itself, as an agent potentially bearing identity values.

The museum is a privileged space in which to frame the relationship between people and patrimonial assets, a space that allows visitors to establish a direct, personal and emotional communication with the exhibits, in parallel to the primary interest of the museum, aimed at the general public. This communication establishes, in the words of A. Rechená (2011: 176), *a ligação entre o passado e o presente* thanks to those objects which *têm uma função de documento com valor simbólico*. In the introduction to this article we acknowledge the role of the museum in heritage education, although it is still occasionally treated as a space for passive transmission of knowledge, one-way and without interchanges.

Another different question is whether the museum manages to encourage the visitor to consider interpreting what is exhibited, regardless of the modality adopted to do so. Knowing whether it feels the need to question or question itself, in a process of assimilation that sets out from a “taught” history, with the connotations and limitations that this implies, and ideally, encourages the questioning of the facts, their interpretation and their inclusion in the personal imagination. Voltaire

(1774: 177-178), wrote that “this” History *attempts to discover what were the dominant radical vice and virtue of a nation; why it has been powerful or weak at sea (...)*.

We interpret the museum in its educational role as a space that allows the realisation of actions aimed at construction by the spectator of the present based on the past. The museum is seen, therefore, as a key to achieving a historical awareness, construction of the past per se through exploration of the cultural assets we find there. This historical awareness comes partly conditioned by the family and cultural surroundings, and of course the school, as recalled by Lee (2004), the place where we learn about a version of the past. *We see according to what we know and make sense according to what we see. This way, we construct our meanings, but not definitively. The construction of meanings depends on how we relate the past with the present*” (Hooper-Greenhill, 1999: 13).

And this question is essential part of heritage education. There is increasing awareness of the possibilities offered by the museum as an educational space in which to carry out innovative and dynamic proposals that arouse emotions in the visitor/student. Students, with suitable guidance, can develop their own knowledge through this resource, constructing a meaningful learning to the extent that they are involved in the process. The communication process established between the visitor and the museum has been covered and described by Martín (2012). In her doctoral thesis, she stresses the importance of the research focused on the analysis of activities and materials that museums and heritage institutions to offer school audiences, and which guides the current practical proposal, under the title: “A voyage in time. History in the Museum: educational space for a dynamic intervention”.

5. THE OBJECT AS A DYNAMIC TOOL FOR INTERVENTION

One of the main knowledge areas that can be developed in the museum is Social Sciences. Our proposal revolves around an age that can take on a life of its own in the museum space - the era of great transoceanic voyages. For example, the working proposal features 14th century Portugal, focusing on the figure of Enrique, Infante de Sagres.

There is no doubt about the primacy identified with Portugal in those initial ocean voyages, nor its importance and relevance in subsequent events, such as the meeting of two worlds which changed the world view.

The heading of our proposal is as follows: *A Voyage in Time. Constructing a history in the Museum*.

Some of the questions we wish to answer are as follows: What was the image of the world in the 14th century? How was it represented? What were mankind’s concerns about it? How did technical progress affect nautical projects? What consequences did it have on the current global setup? Can analysing past events help us resolve current questions? Can museum exhibits help us respond to these questions?

The possibilities offered by the museum space allow us to adapt this project to different educational cycles. The aim is to promote awareness of heritage, mimicking it to transport ourselves to a particular period of history.

To achieve our goal, we propose a number of activities:

- Initially: Introducing the working theme, contextualising the contents to be developed. To this end, once in the museum, we shall ask the students a series of questions to assess their preconceptions. What is a museum? What objects can we find in them? Why are they preserved? What do they represent in our history? What is heritage? What is it for? Can help us to answer the question “Who was Infante Don Enrique”? How important were the 14th century expeditions for Portugal? And for the world? What do we know about the instruments used by the navigators? What is an astrolabe? And a nautical chart?...

Then, we explain to the students how the session will be carried out. We shall visit the museum to get acquainted with this space and the objects it contains and which are of interest for the workshops that will make up the project.

- In development: We construct, research, learn... The class will be divided into work groups, giving each one a task to carry out (Figure 5).

Figure 5: Task distribution: activities development. Own development

Following this research activity, information will be pooled to set out a frame of reference that allows a global overview of our voyage. Next, we shall prepare the instruments, from the most basic to the most complex, depending on the students' educational level, that we will have seen in the museum: nautical chart, quadrant, model ship, compass, ships log, apparel, gear ... and give them voice.

- **Synthesis:** We pool all the information from the tasks performed. We compile what is learnt and draw conclusions. To disseminate our work, we present the object prepared to the public, tell their story, explain their use and introduce them in the context proposed.

As a synthesising activity, in subsequent sessions we can perform a historical re-enactment, which would require some basic research to enable us to understand what the different characters in our story were like and how they lived, related to each other and thought. This will let us put the instruments created into practice, giving way to an action-research process that allows a significant and comprehensive learning experience.

6. HISTORICAL RE-ENACTMENT AS A TEACHING RESOURCE

The use of alternative scenarios for the development of teaching and learning processes is becoming increasingly commonplace. We find an evolution of learning environments in the formal field ranging from the exclusive use of an ordinary classroom to the utilisation of different installations in the locality (library, parks, museums, etc.). On the other hand, the range of activities proposed expands into new types of proposal, leaving behind approaches using only the textbook approach through curricular material.

In our work, we propose an innovative and dynamic activity, which by proposing several tasks guided by an innovative and alternative methodology such as action-research, will be completed in what is known as historical re-enactment.

We set out from the concept of historical re-enactment as an educational, recreational, cultural and social activity based on the re-enactment of various aspects, events, that occurred in the past. To this end, we try to reproduce the atmosphere of a given era.

From the educational point of view, the proposal of these activities is enriching, as the students have the main and fundamental role in constructing the necessary knowledge, which provides them with a comprehensive overview of historical events. To carry out the historical re-enactment, students must be fully introduced in the period to be represented, studying the day-to-day life, ideologies, beliefs, society, economics, language, literature, musical works and other aspects. Given the complexity of this proposal, several activities must be carried out to achieve it, such as documenting; investigating sources such as literature, art, historical studies; drawing up the instruments needed for dramatization, clothing, to reconstruct a particular event, etc. In short, all those activities aimed at development of historical recreation of the selected period. (De Paz and Ferreras, 2010).

To carry out a historical re-enactment proposal, it must be scheduled and carefully planned by the educational team taking part. The wide variety of activities described should be developed from a multidisciplinary teaching and learning approach covering several fields of study. We must not lose sight of the educational objectives, which must be incorporated into the curriculum development of the centre that proposes it.

Through the implementation of these proposals, the students acknowledge their own identity, tradition, history and heritage. Prats (2001) or Buesa (2001) consider the importance of Heritage as a gateway to the past and as such, it forms part of the development of an individual's own personal and social identity. Moreover, Copeland (2009) highlights the importance of heritage for citizen training and construction of personal and global identities. Through action-research, the students reconstruct their history, acknowledging their heritage, learning to appreciate and value it, thus proceeding to adopt a positive and active attitude in relation to its protection and conservation.

Action-research makes it possible for the students to enter into the conceptual, procedural and attitudinal contents, thus conforming their integral development. Working with educational contents in an integrated manner favours the student's personal and social growth, guiding them to words becoming aware of their own reality as global citizens, assuming the importance of coexistence in community.

7. REFLECTIONS

The importance of conceptualising museums as dynamic spaces is becoming increasingly evident. In them, the general public and students in particular can construct a meaningful learning through contact with the primary heritage object. The museum gives us the chance to contextualise our project by basing it on heritage.

If we understand the heritage education as the relationship between goods and people (Fontal, 2013), the museum becomes the ideal space for the construction of knowledge. The object acquires the status of source for the teaching and learning of Social Sciences.

To this approach must be added the potential of heritage education for achieving personal and social skills related to the development of emotional intelligence. Proposing activities where personal relationships are the basis of research is critical to the student's intrinsic development. Two cornerstones for the formulation of identity are thus combined: heritage education and emotional education.

We present an innovative proposal where history, museum, heritage education and school come together in a project to enable the knowledge of the past to help us understand the present and equip us with tools for the future.

RESUMO

A Teoria da Mente assume importância na explicação do mecanismo que permite a reflexão, compreensão e predição tanto do próprio comportamento, como do outro. Entre os vários modelos, o mais estudado é o que diferencia duas componentes: a sócio-percetiva (capacidade para decodificar o estado mental dos outros) e a sócio-cognitiva (capacidade de raciocinar acerca dos estados mentais dos outros).

Os indivíduos com Ansiedade Social parecem ter dificuldade em prever com exatidão os estados mentais dos outros. Este estudo tem como objetivo verificar a existência de um compromisso na leitura de pistas sociais em indivíduos identificados como socialmente ansiosos. Deste modo, compararam-se as respostas de indivíduos socialmente ansiosos e não ansiosos numa prova de leitura de pistas sociais, procurando avaliar o compromisso, ao nível da dimensão sócio-percetiva.

O estudo foi efetuado em dois momentos: no primeiro recolheram-se 177 respostas para apurar indivíduos com ansiedade social. O segundo incluiu a aplicação de uma bateria de provas, para aplicação de critérios de exclusão da amostra final. A amostra final ficou composta por 39 participantes.

Contrariamente ao preconizado pela teoria, os principais resultados não demonstraram a existência de défices na leitura de pistas sociais nos indivíduos socialmente ansiosos, o que pressupõe que o défice observado na literatura talvez tenha origem na dimensão sócio-cognitiva.

Palavras-chave: Teoria da Mente, Ansiedade Social, Défices, Sócio-percetiva.

1. INTRODUÇÃO

A interação humana baseia-se na capacidade de lermos e interpretarmos os comportamentos dos outros. Esta habilidade integrante da cognição social, que estrutura a forma como percebemos, interpretamos e explicamos os estados mentais e comportamentos dos outros, denomina-se Teoria da Mente.

A Teoria da Mente compreende um mecanismo inato que permite ao ser humano refletir; compreender e prever o seu próprio comportamento, assim como o comportamento do outro.

O estudo da Teoria da Mente ganhou amplitude com a exploração do conceito num estudo realizado com chimpanzés (Premack & Woodruff, 1978). A aplicação das provas que implicavam a Teoria da Mente permitiu compreender que estes animais possuíam as mesmas capacidades do ser humano para inferir acerca dos estados mentais dos outros e do próprio, sem serem diretamente observáveis.

Ao longo do tempo, a Teoria da Mente acabou por se estruturar e ser desenvolvida sob diversas perspetivas. A principal teorização acerca desta capacidade evidencia duas distintas componentes: a sócio-percetiva e a sócio-cognitiva (Tager-Flusberg & Sullivan, 2000). A sócio-percetiva relaciona-se com a integração de pistas no contexto social, fazendo referência a avaliações rápidas acerca do estado mental dos outros, através de simples expressões faciais e corporais, por exemplo. A sócio-cognitiva refere-se à capacidade de raciocinar acerca dos estados mentais dos outros, de forma a dar-lhes sentido.

Todavia, o estudo acerca da Teoria da Mente levou a que houvesse uma necessidade de aprofundar o conhecimento acerca da mesma. Dado o facto de ser uma capacidade humana, procurou-se estabelecer uma ligação entre o desenvolvimento da Teoria da Mente e a maturação do indivíduo (Carpendale & Lewis, 2004; Scholl & Leslie, 1999; Carlson, Moses, & Hix, 1998). Assim, diferentes teorias emergiram e expuseram várias perspetivas. Por um lado, a abordagem sócio-construtivista coloca a socialização como fator determinante. Por outro lado, outros teóricos salientam a importância do desenvolvimento das funções executivas. Também existe a possibilidade de se relacionar com a maturação de certos mecanismos neurológicos.

O crescente interesse em compreender a importância que esta habilidade assume na vida do ser humano permitiu a exploração e desenvolvimento de provas que permitissem a avaliação desta capacidade. Consequentemente, assumem-se

algumas provas como relevantes para avaliar a Teoria da Mente, como por exemplo o *Reading The Mind in the Eyes Test* (Baron-Cohen, Wheelwright, Hill, Raste, & Plumb, 2001), o *Faux Pas Test* (Stone, Baron-Cohen, & Knight, 1998) e o *TOM Picture Stories Task* (Brune, 2003).

A Teoria da Mente está interligada não só com o próprio indivíduo, mas também com o contexto social, necessitando assim o sujeito de procurar apreender o que o ambiente apresenta. Contudo, esta nem sempre é uma tarefa simples. Uma das condições passíveis de modificar a forma como apreendemos as pistas sociais, criando um défice na Teoria da Mente, é a Perturbação de Ansiedade Social (Hezel & McNally, 2014). Esta perturbação pode produzir dificuldades na avaliação que é feita pelos indivíduos acerca de comportamentos, desejos, atitudes e crenças dos próprios e dos outros, no contexto social. Mais precisamente, os indivíduos ansiosos processam os estímulos ou situações de forma enviesada, avaliando-se a si mesmos de modo mais negativo e considerando que os outros também se avaliam de forma mais negativa. Para além disso, podem existir outros fatores condicionantes, que conjugados com a Ansiedade Social, podem ter influência na Teoria da Mente. Deste modo, a capacidade da Teoria da Mente em indivíduos que manifestem a presença de Ansiedade Social pode apresentar défices que acabam por influenciar o indivíduo no contexto social.

O estudo da Teoria da Mente é, assim, um tema atual e com a necessidade de explorar as consequências das falhas deste mecanismo importante para a vida social do ser humano.

O objetivo deste estudo é verificar se existem défices ao nível da componente sócio-percetiva da Teoria da Mente em indivíduos com Ansiedade Social. Este objetivo será operacionalizado através de um estudo *quasi-experimental*, em que se pretende avaliar a capacidade de análise das pistas sociais de indivíduos socialmente ansiosos, tendo como base um grupo de controlo de indivíduos não ansiosos.

Inicialmente será apresentado um breve enquadramento teórico acerca da Teoria da Mente e a própria evolução do conceito em diversas áreas. Em seguida, será exposto o método utilizado para a prossecução do objetivo deste estudo, sendo posteriormente apresentados os resultados obtidos. Por fim, será apresentada uma breve discussão sobre os resultados obtidos e apresentadas sugestões para estudos futuros.

2. ENQUADRAMENTO TEÓRICO

Os estudos com animais (e.g. Köhler, 1925) foram criando o caminho para o conhecimento que temos hoje acerca da Teoria da Mente. O surgimento deste termo foi cunhado pelo estudo de Premack e Woodruff, em 1978, no qual, através da resolução de problemas, foi possível observar que os chimpanzés, tal como os humanos, tinham a capacidade de inferir acerca dos estados mentais dos outros e dos próprios.

A partir da definição do conceito da Teoria da Mente, a comunidade científica interessou-se cada vez mais pelo seu estudo. Era emergente compreender como esta capacidade se desenvolvia e o impacto que tinha na vida do ser humano.

Começou-se por explorar através de pequenas tarefas a capacidade de inferir acerca de falsas crenças em populações de diferentes faixas etárias (e.g. Carpendale & Lewis, 2004; Keyser, Linn, & Barr, 2003; Scholl & Leslie, 1999; Carlson *et al.*, 1998). Salienta-se que o primeiro estudo conduzido com crianças foi por Wimmer e Perner (1983), que concluíram que as crianças à volta dos quatro anos eram capazes de prever uma ação com base numa falsa crença. Para além disso, a Teoria da Mente foi abordada em diferentes populações clínicas, como por exemplo em indivíduos com autismo (e.g. Baron-Cohen, Leslie, & Frith, 1985; Colle, Baron-Cohen, & Hill, 2006; Montgomery *et al.*, 2016), com esquizofrenia (e.g. Corcoran & Frith, 2003; Brune, 2005; Couture, Penn, & Roberts, 2006), com Perturbação de Ansiedade Social (e.g. Samson, Lackner, Weiss, & Papousek, 2012; Hezel & McNally, 2014), entre outros. Estes, por sua vez, permitiram aos investigadores compreender os obstáculos que se relacionam com a Teoria da Mente e proporcionar um maior conhecimento acerca da forma de lidar com défices nesta capacidade.

A incidência do foco na Perturbação de Ansiedade Social em estudos da Teoria da Mente prende-se com o facto de os défices poderem ser significativos para o indivíduo e poderem condicioná-lo. Um dos modelos cognitivistas basilares que auxilia a compreensão da Perturbação de Ansiedade Social foi explorado por Rapee e Heimberg (1997). Este modelo é percecionado como um ciclo que o indivíduo, numa situação social, forma uma representação mental da sua própria aparência e do seu comportamento que são observáveis pelo outro(s), a partir da memória a longo prazo, de pistas internas e externas. São, então, canalizados os seus recursos atencionais tanto para a representação criada, como para qualquer ameaça percebida no ambiente envolvente, que pode advir da comparação entre esta mesma representação e do que seria expectável socialmente. Por sua vez, é gerado um julgamento da probabilidade e das consequências de uma avaliação negativa por parte do(s) outro(s) e iniciam-se sintomas de ansiedade em diversos níveis: comportamental, cognitivo e físico. Simultaneamente, são percebidas estas pistas internas e os indicadores de uma avaliação negativa. Em seguida, é iniciado de novo o ciclo.

No que diz respeito à relação entre a Perturbação de Ansiedade Social e a Teoria da Mente, verifica-se que existe um condicionamento no momento de interpretar as pistas sociais. Os sujeitos com este diagnóstico interpretam os estímulos neutros ou ambíguos de forma mais ameaçadora do que os sujeitos não ansiosos, afetando, deste modo, a Teoria da Mente (Hezel & McNally, 2004). Todavia, pode ocorrer a possibilidade de se verificar comorbidade com a depressão, dada a estreita relação com a Perturbação de Ansiedade Social (Inoue, Yamada, & Kanba, 2006; Beesdo *et al.*, 2007; Wang *et al.*, 2008; Washburn, 2012; Kircanski, Joormann, & Gotlib, 2015).

Como ser social, o Homem necessita de analisar as pistas sociais que lhe permitem interpretar o mundo envolvente. Assim, a existência de défices na Teoria da Mente necessita de ser estudado, de forma a compreender a sua origem e a explorar as possibilidades de colmatar os mesmos.

2.1 A Teoria da Mente

A Teoria da Mente é um mecanismo que permite o desenvolvimento e a integração dos indivíduos, tornando-os capazes de perceber e explicar aquilo que os próprios e os outros estão a sentir ou a pensar, de modo a compreender e prever o comportamento (Hezel & McNally, 2014). Esta capacidade permite a criação de inúmeras conceções acerca do outro, mais precisamente dos seus estados mentais e também a explicação dos seus comportamentos passados e antecipação e predição das suas ações futuras (Keyser, Lin, & Barr, 2003). Não é em vão que se crê que a Teoria da Mente constitui um mecanismo inato que evoluiu a partir de vários processos cognitivos preexistentes no ser humano, que acabaram por contribuir para o seu desenvolvimento, isto é, para o desenvolvimento da capacidade de mentalização. Algumas das funções, inerentes a esta capacidade, incluem a habilidade de distinguir entre entidades animadas e inanimadas, a habilidade de partilhar atenção seguindo fixamente outro agente, a habilidade de representar ações dirigidas aos objetivos e a habilidade de distinguir entre as próprias ações e as dos outros (Gallagher & Frith, 2003). Torna-se, assim, um auxílio fundamental na interação humana e social, constituindo um alicerce fundamental na condição humana.

A capacidade para compreender o comportamento dos outros, no que diz respeito aos seus objetivos e crenças, requer a existência de algumas expectativas sobre os mesmos objetivos e crenças. Estas expectativas derivam do conhecimento geral que se tem acerca do mundo, do conhecimento acerca daquela pessoa e das próprias observações daquilo que a outra pessoa faz (Gallagher & Frith, 2003).

Apesar da Teoria da Mente ser uma capacidade automática do ser humano, o seu desenvolvimento está ligado à maturação do sujeito. (e.g. Keyser *et al.*, 2003; Frith & Frith, 2003).

Autores como Uta Frith e Christopher Frith (2003) constataram que as crianças com apenas um ano e meio de idade já são capazes de entender que os outros têm intenções, sendo capazes de tomar atenção e de prever o seu comportamento através de pistas comunicativas. Mesmo antes, por volta dos doze meses de idade, podem ser evidentes algumas aquisições como a representação dos agentes de forma separada, de objetivos e do significado de alcançar os objetivos (Frith & Frith, 2003).

Entre os dezoito meses e os dois anos de idade pode-se observar o desenvolvimento da verdadeira compreensão da atenção partilhada, da imitação deliberada, da apreensão da intenção do adulto que transmite uma mensagem verbal e uma possível compreensão de falsas crenças a um nível implícito (Frith & Frith, 2003).

Por volta dos cinco anos já há uma evolução das capacidades inerentes à Teoria da Mente (e.g. Keyser *et al.*, 2003). Contudo, a capacidade para interpretar os estados mentais dos outros desenvolve-se com a idade, estando esta associada ao desenvolvimento de algumas funções cognitivas como a linguagem, a memória, o autocontrolo e a representação temporal (Sodian & Kristen, 2010; Perner & Lang, 1999); assim como a funções executivas mais específicas, como a memória de trabalho, a inibição ou desinibição do controlo e a flexibilidade cognitiva (Carlson, Koenig, & Harms, 2013).

Por volta dos seis anos, quando é iniciada a frequência da escola, as crianças já são capazes de observar que os outros podem não saber acerca de algo que eles próprios sabem (Marvin, Greenberg, & Mossler, 1976) ou de que os outros podem ter falsas crenças (Perner, Leekam, & Wimmer, 1987; Wimmer & Perner, 1983; Zaitchik, 1991). Já por volta dos oito anos, a criança é capaz de perceber que a pessoa que está aparentemente desocupada com o exterior pode continuar preocupada com a sua atividade mental interior; sendo explicada pela compreensão do curso da atividade construtiva mental e da ideia intuitiva do fluxo da consciência (Sodian & Kristen, 2010).

Face à génese do desenvolvimento da Teoria da Mente, emergem diferentes teorias. Alguns teóricos descrevem os estágios do desenvolvimento, como no caso de Bartsh e Wellman (1995). Estes autores afirmaram que o primeiro estágio ocorre por volta dos dois anos, quando as suas predições são realizadas com base nos desejos. Por sua vez, o segundo estágio é desenvolvido aos três anos de idade, no qual são passadas a ter em conta as crenças. Por último, um ano mais tarde, as crianças começam a compreender que as crenças podem ser enquadradas nos desejos e que, consequentemente, podem motivar o pensamento e o comportamento humano.

A abordagem sócio-construtivista (Carpendale & Lewis, 2004) postula que o desenvolvimento da Teoria da Mente ocorre através da socialização, iniciando-se com a relação entre bebé e mãe, progredindo para a tríade entre bebé, mãe e objeto.

Outros teóricos desenvolvimentistas afirmam que a evolução da Teoria da Mente está dependente das capacidades executivas, uma vez que a aquisição de competências como o planeamento, a memória de trabalho ou o controlo inibitório constituem aspetos que se encontram relacionados com a compreensão dos estados mentais (i.e. Teoria da Mente) [Hughes, 1998]. Ainda existe outra teoria que indica que o desenvolvimento decorre aliado à maturação de sucessivos mecanismos cognitivos específicos e modulares (Scholl & Leslie, 1999).

Alguns estudos na área da neurologia apontam para o facto de certas regiões do cérebro responderem quando é solicitado aos indivíduos que infiram acerca do estado mental de outro indivíduo e quando são levados a refletir acerca do seu próprio estado mental (Samson *et al.*, 2012). Estas descobertas sugerem a hipótese de existir uma base biológica comum para o processo mais elementar de inferir acerca dos estados internos (Gentilli *et al.*, 2009; Oberman & Ramachandran, 2007). Acredita-se que as áreas implicadas na Teoria da Mente tratam-se do córtex anterior paracingulado, o sulco temporal superior e ambos os pólos temporais (Gallagher & Frith, 2003). Existem algumas evidências que comprovam esta hipótese, como o facto de, na presença de ansiedade social, estes circuitos apresentarem défices que se encontram relacionados tanto com a cognição social, como com a avaliação do seu próprio estado mental (Gentilli *et al.*, 2009).

2.2 As componentes da Teoria da Mente

A Teoria da Mente pode ser subdividida em duas componentes, mais precisamente a componente sócio-percetiva e a sócio-cognitiva (Tager-Flusberg & Sullivan, 2000). A primeira compreende a capacidade de descodificar o estado mental dos outros baseando-se na informação disponível e observável, através de pistas sociais. A segunda traduz-se na capacidade

de raciocinar acerca dos estados mentais dos outros, de modo a inferir ou predizer as ações dos outros. De forma mais aprofundada, Tager-Flusberg e Sullivan (2000) descreve a componente sócio-percetiva como estando mais relacionada com a perceção e conhecimento do próprio sujeito, permitindo-lhe distinguir entre objetos e pessoas e, ainda, realizar julgamentos rápidos acerca dos estados mentais dos outros com base em expressões faciais e corporais. No que diz respeito à componente sócio-cognitiva, esta engloba a compreensão, mediante um sistema representacional (Tager-Flusberg & Sullivan, 2000) que depende das capacidades cognitivas, como por exemplo a linguagem.

O ser humano tem a capacidade de reconhecer os outros através das características faciais e do tom de voz, o que lhe confere um comportamento social adaptado (Zilbovicius *et al.*, 2006). Para além disso, o ser humano é capaz de, através da face, não só reconhecer, mas também categorizar emoções, denotar a configuração dos lábios de modo a interpretar aquilo que a face está a transmitir (Langton, Watt, & Bruce, 2000). A interpretação do olhar também auxilia no comportamento social, pois regula muitos dos aspetos relacionados com este, tal como discernir quando é a sua vez de falar através do fornecimento de informação, na expressão de intimidade e no exercício do controlo social (Klinke, 1986).

É importante para o ser humano dar sentido às ações do outro, com o intuito de conseguir prever o que fará a seguir (Langton *et al.*, 2000). Segundo o modelo de Baron-Cohen (1997) existem quatro componentes associados que permitem a leitura do meio social. Estes componentes são o detetor de intencionalidade, o detetor da direção do olhar, o mecanismo de atenção partilhada e o mecanismo da Teoria da Mente. O primeiro é um mecanismo de perceção primitiva, que interpreta os estímulos de movimento, analisando os desejos e objetivos. O segundo deteta a presença do olhar, depois calcula a direção do olhar com base na posição da íris e atribui um estado mental ao “ver” que os olhos estão direcionados para si ou para outros objetos ou agentes. O terceiro mecanismo tem como principal função identificar quando o próprio e outro estão a prestar atenção à mesma coisa. Por sua vez, a Teoria da Mente complementa este processo, na medida em que permite inferir uma gama de estados mentais através de comportamentos observáveis. Este conhecimento do estado mental é integrado e pode ser utilizado para explicar e prever o comportamento.

Todavia, no meio social, todas as pistas funcionam como importantes para desvendar tanto o próprio comportamento, como o dos outros e para auxiliar na toma de decisões relativamente à atenção. Estas pistas englobam, como referido, a direção do olhar, o movimento da cabeça e o movimento da boca, o que faz referência tanto a aspetos verbais, como a aspetos não-verbais (Allison, Puce, & McCarthy, 2000).

Existem algumas evidências que apontam para o facto dos indivíduos com défices na Teoria da Mente apresentarem um viés atencional para estímulos negativos (Ribeiro & Fearon, 2010), bastante evidente no processamento de expressões faciais.

2.3 Défices na Teoria da Mente

A deteção das dificuldades inerentes à utilização da Teoria da Mente acaba por permitir uma melhor compreensão de determinadas alterações cognitivas e comportamentais.

A existência de défices na Teoria da Mente pode prejudicar o desempenho social dos indivíduos, sendo evidente em casos de presença de autismo (Baron-Cohen, 1990; Baron-Cohen & Belmonte, 2005; Baron-Cohen *et al.*, 1985; Frith, 1989) e de esquizofrenia (Brune, 2005; Couture *et al.*, 2006).

O autismo trata-se de uma perturbação biológica que se parece caracterizar por um défice seletivo na Teoria da Mente, que é capaz de explicar muitos dos défices de comunicação, socialização e imaginação que se manifestam em indivíduos com esta perturbação (Gallagher & Frith, 2003).

No caso dos indivíduos com esquizofrenia, estes experienciam as situações sociais de forma diferente, comparativamente àqueles que não possuem a perturbação (Lysaker *et al.*, 2010). Alguns sintomas como os delírios de referência e os delírios de perseguição são caracterizados por uma má interpretação do comportamento ou das intenções de outra pessoa; sendo assim estes sintomas o resultado de um défice na Teoria da Mente. Os pacientes com este diagnóstico apresentam um comportamento muito semelhante aos pacientes com autismo, no que diz respeito à Teoria da Mente (Corcoran, Mercer, & Frith, 1995).

No que diz respeito à Perturbação de Ansiedade Social, com a presença de défices na Teoria da Mente, são evidentes algumas dificuldades, como a interpretação e o raciocínio acerca das intenções dos outros, o que incrementa a ansiedade experienciada em situações sociais (Hezel & McNally, 2014). Deste modo, existe uma acrescida importância em compreender de que forma esses défices afetam os indivíduos com Perturbação de Ansiedade Social, permitindo explorar formas de alterar essa condição.

A depressão é uma perturbação que também pode afetar o desempenho em tarefas da Teoria da Mente, podendo até decorrer pela presença da Perturbação de Ansiedade Social. Assim sendo, é importante verificar a existência de comorbilidade de modo a compreender adequadamente o que implica os défices na Teoria da Mente. No que diz respeito à depressão, o estudo do impacto desta na Teoria da Mente ainda é um tema pouco explorado e que demonstra resultados inconclusivos e contraditórios. Todavia, o estudo de Wolkenstein, Schönenberg, Schrim e Hautzinger (2011), demonstrou que na componente sócio-percetiva, isto é, na descodificação do estado mental dos outros, não ocorrem défices significativos em indivíduos deprimidos; porém estes demonstram uma maior precisão a detetar os estímulos negativos. Já na componente sócio-cognitiva, ou seja, no raciocínio do estado mental dos outros de forma a formar uma razão válida para esse estado, os indivíduos depressivos revelaram défices no que diz respeito à Teoria da Mente. Deste modo, torna-se pertinente aprofundar esta questão e entender de que forma a Teoria da Mente pode estar afetada pela presença desta perturbação.

Concluindo, devido à abrangência do tema da Teoria da Mente, torna-se emergente a necessidade de explorar os seus efeitos e consequências, de modo a compreender como se processam e como afetam o desempenho social e cognitivo.

2.4 A Perturbação de Ansiedade Social

A ansiedade é gerada pela exposição a situações de *stress*, estando relacionada com perceção do estímulo, por parte do indivíduo, ou pela forma como este avalia a situação. No caso concreto da Perturbação de Ansiedade Social, esta é caracterizada por um medo persistente e pelo evitamento de situações sociais (Hezel & McNally, 2014).

A Perturbação de Ansiedade Social é marcada por um viés cognitivo, tanto no início como na manutenção da perturbação, isto é, existe uma monitorização desadequada dos recursos cognitivos e atencionais ao interpretar o estímulo ou a situação social (Constans, Penn, Ihen, & Hope, 1999). Esta perturbação engloba um conjunto de três componentes. O primeiro diz respeito aos aspetos somáticos e cognitivos que se ativam através da perceção ou interpretação do perigo que constitui determinada situação social para o indivíduo; evidenciados através do rubor, taquicardia, sudação e dificuldades de concentração, por exemplo. Por sua vez, estes sintomas aumentam ainda mais a ansiedade pela maior perceção de perigo que decorre daquela situação, acabando por criar um ciclo. A segunda componente faz referência à atenção auto-focada, que consiste numa focalização acentuada através da observação e monitorização exaustiva e pormenorizada relativa a si mesmo enquanto objeto social; colocando em evidência os sintomas somáticos e cognitivos, que acabam por acentuar os sintomas e por levar ao processamento inadequado dos sinais de comunicação emitidos pelos outros. O último componente associa-se à criação de uma impressão ou imagem de si próprio, que pressupõe que corresponde à forma como os outros o vêem ou pensam acerca dele; o que revela que a sua atenção se centra nos seus sintomas somáticos e cognitivos e não nos sinais e informações acerca de como o outro o pode perceber (Pinto-Gouveia, 2000). Para além disso, os altos níveis de ansiedade social estão associados a um fraco desempenho em testes de cognição social (Sutterby *et al.*, 2012).

O estudo realizado por Hezel e McNally (2014) sugere que os indivíduos com Perturbação de Ansiedade Social interpretam estímulos neutros e ambíguos como mais ameaçadores do que as pessoas não ansiosas. Para além disso, os indivíduos com Perturbação de Ansiedade Social percebem-se a si mesmos de forma mais negativa e acreditam que são avaliados de forma negativa socialmente. Assim, é possível depreender que a Perturbação de Ansiedade Social pode ter repercussões negativas a Teoria da Mente, uma vez que as pessoas ansiosas acabam por avaliar com dificuldade os estados mentais dos outros. Deste modo, o presente estudo tem como finalidade avaliar se a ansiedade social afeta o desempenho em tarefas da Teoria da Mente.

3. OBJETIVO

O estudo da Teoria da Mente tem sido amplamente investigado em diversas áreas, de forma a compreender o seu impacto no quotidiano do ser humano.

De acordo com os estudos neurológicos efetuados (e.g. Gallagher & Frith, 2003; Samson *et al.*, 2012), verificou-se que a presença de ansiedade social condiciona algumas áreas cerebrais que estão associadas à Teoria da Mente; tanto a nível da cognição social, como também na avaliação do seu próprio estado mental.

A componente sócio-percetiva baseia-se nas pistas sociais para prever o comportamento humano. Assim, a Teoria da Mente, que compreende esta componente, permite observar e prever os comportamentos sociais. Torna-se, deste modo, necessário compreender se esta componente é afetada pela presença da ansiedade social.

Os défices na Teoria da Mente encontram-se, muitas vezes, associados à presença de perturbações psicológicas. A literatura tem colocado em destaque várias perturbações, como o autismo, a esquizofrenia, a ansiedade social e a depressão. Assim, a partir do presente estudo, procura-se verificar se a ansiedade social influencia o desempenho na Teoria da Mente.

O presente estudo tem como objetivo averiguar a existência de diferenças nas provas que avaliam a Teoria da Mente entre indivíduos que manifestam a presença de ansiedade social e indivíduos não ansiosos; tendo em conta a componente socio-percetiva. Mais precisamente, pretende-se verificar a existência de um compromisso na leitura de pistas sociais em indivíduos ansiosos.

Deste modo, espera-se que o grupo de indivíduos com ansiedade social apresentem défices na leitura de pistas sociais, comparativamente ao grupo de controlo.

4. METODOLOGIA

Foi realizado um estudo de natureza quantitativa, com um desenho de estudo *quasi-experimental*. Este tipo de estudo empírico implica a manipulação das variáveis independentes, fazendo com que a amostra não seja aleatória, dada a necessidade de obter uma amostra de controlo e uma amostra que apresentasse ansiedade social. Assim, neste caso, foi controlado o grau de ansiedade (variável independente) dos participantes, através da constituição de dois grupos: um grupo com ansiedade social e outro sem ansiedade social.

As variáveis dependentes envolvidas neste estudo foram a idade, o género, a escolaridade, a profissão, a nacionalidade, o estado civil, o rendimento familiar, os dados psiquiátricos, o nível de ansiedade e as pontuações obtidas nos diferentes testes aplicados.

4.1 Amostra

Os participantes foram recrutados na Universidade do Algarve, assim como através de um questionário *on-line* à população em geral. A técnica de amostragem utilizada foi não probabilística por conveniência.

No total, na primeira fase do estudo, foram avaliados 177 participantes, com idades compreendidas entre os 18 anos e

os 65 anos, tanto do sexo feminino como masculino. No que diz respeito aos fatores de exclusão, estes centraram-se na presença de doença neurológica ou psiquiátrica.

Na segunda fase do estudo, foi possível recrutar apenas 39 participantes, segundo os fatores de exclusão e a disponibilidade individual.

4.2 Instrumentos

Com o objetivo de caracterizar a amostra, foi utilizado um questionário sociodemográfico, que incluía informações sobre a idade, género, escolaridade, profissão, nacionalidade, estado civil e rendimento familiar. Para além disso, foi utilizado também um questionário sobre questões psiquiátricas, que fazia referência a informações clínicas, como situações de acidentes vasculares cerebrais (A.V.C.), de epilepsia ou a existência de algum diagnóstico neurológico, psiquiátrico ou um psicológico.

A Escala de Ansiedade e de Evitamento em Situações de Desempenho e de Interação Social (EAESDIS; Pinto-Gouveia, Cunha, & Salvador, 2003) foi adaptada para a população portuguesa a partir do *Social Interaction and Performance Anxiety and Avoidance Scale*. É um instrumento que avalia o grau de ansiedade e de evitamento experienciado em situações sociais concretas. É constituído por 44 itens e para cada uma destas situações apresentadas é solicitado ao participante que avalie o desconforto ou ansiedade gerado, através de uma escala de 1 a 4 (1-Nenhum; 2-Ligeiro; 3-Médio; 4-Severo) e, para além disso, que indique o grau de evitamento perante a situação (1-Nunca; 2-Às Vezes; 3-Muitas Vezes; 4-Quase Sempre). No final, o participante deve ainda indicar cinco situações, das apresentadas, que lhe provoquem mais ansiedade (Pinto-Gouveia, 2000). No que diz respeito à cotação do instrumento, esta é feita através da soma dos itens assinalados pelos participantes, variando segundo a escala (de 1 a 4). A soma da cotação é feita tanto para a subescala de ansiedade, como para a subescala de evitamento perante as situações apresentadas, de forma independente. A pontuação total representativa de cada uma das subescalas de ansiedade ou de evitamento pode variar entre 44 e 176. Para a subescala de ansiedade, o ponto de corte situa-se em 115 e para a subescala de evitamento situa-se em 105, sendo apenas considerada a primeira para o estudo em questão. Acrescenta-se que este instrumento, para a subescala de ansiedade, apresentou uma elevada consistência interna ($r = 0,95$) em ambas as amostras (“normais” e fóbicos sociais); e para a subescala de evitamento, a amostra “normal” evidenciou uma consistência interna de $r = 0,94$ e a amostra de fóbicos sociais apresentou $r = 0,87$. Apesar da subescala de ansiedade demonstrar valores mais altos, ambas as subescalas apresentam uma boa fiabilidade temporal e discriminam a população de fóbicos sociais dos doentes com outros distúrbios ansiosos e da população normal (Pinto-Gouveia; Cunha & Salvador, 2003).

As Matrizes Progressivas de Raven (Série E) [Raven & Raven, 2001], originalmente denominado *Standard Progressive Matrices* (Bandeira, Alves, Giacometti, & Lorenzatto, 2004), foi adaptado para a população portuguesa por Simões (1994; cit in Almeida, 2009). É um instrumento que tem como objetivo a avaliação da capacidade mental geral. A última série deste instrumento contém doze itens. Cada item contempla um retângulo com um desenho, no qual falta uma parcela e em seguida são apresentadas oito hipóteses como resposta para completar a parcela em falta. Deste modo, o participante deve escolher de entre as hipóteses possíveis, aquela que pode ser considerada a resposta correta para completar o desenho. Relativamente à cotação, cada item respondido corretamente pelo participante obterá um ponto, podendo assim o resultado final variar entre 0 e 12 pontos. A pontuação total é observada de acordo com a escolaridade do participante. Quanto à consistência interna, os coeficientes de precisão variam entre os 0,80 e 0,93 (Almeida, 2009).

O *Beck Depression Inventory II* (BDI-II; Beck, Steer, & Brown, 1996, cit in Steer, Ball, Ranieri, & Beck, 1999) foi adaptado para a população portuguesa por Fernando Brochado e Ana Brochado (2008). É um instrumento que avalia a presença de sintomatologia depressiva. Consiste num questionário de autorresposta, com 21 questões que englobam itens relativos à tristeza, pessimismo, fracassos passados, perda de prazer, sentimentos de culpa, sentimentos de punição, auto-desinteresse; auto-criticismo, pensamentos suicidas, choro, agitação, perda de interesse, indecisão, desvalorização, perda de energia, mudança nos hábitos de sono, irritabilidade, mudanças de apetite, dificuldades de concentração, cansaço ou fadiga e perda de interesse sexual. Em cada item são apresentadas quatro a seis frases, das quais os participantes têm de selecionar aquela que melhor descreve a forma como se têm sentido nas duas últimas semanas, incluindo o dia atual. Por sua vez, essas frases refletem a gravidade do sintoma que está a ser avaliado, variando de 0 (baixo) a 3 (alto) a sua pontuação. Deste modo, os resultados totais podem apresentar-se entre 0 (mínimo) a 63 (máximo). De acordo com Beck, Steer e Brown (1996; cit in Brochado & Brochado, 2008), as pontuações globais de 0 a 13 revelam sintomatologia depressiva “mínima”; de 14 a 19 refletem sintomatologia depressiva “ligeira”; de 20 a 28 fazem referência a sintomatologia depressiva “moderada” e as pontuações acima de 29 representam sintomatologia depressiva “grave” ou “severa”. Salienta-se que este instrumento parece apresentar uma boa consistência interna, relativamente aos 21 itens, exibindo um valor de 0,89 (Brochado & Brochado, 2008).

O *Reading the Mind in the Eyes Test* (RMET; Baron-Cohen et al., 2001) foi adaptado à população portuguesa por Sousa (2010; cit in Sousa, 2012). Consiste numa prova que permite detetar emoções complexas a partir de pouca informação, na medida em que utiliza um conjunto de 36 imagens de olhares de indivíduos, com quatro palavras para opções de resposta. Assim, é solicitado ao participante que, das quatro opções, escolha apenas uma, sendo a que melhor descreve o que a pessoa na imagem está a sentir ou a pensar. Cada resposta correta assinalada pelo participante obtém um ponto e cada seleção de um estímulo distrator obtém 0 pontos. Deste modo, as pontuações totais podem estar distribuídas entre 0 e 36 pontos (Guimarães, 2013). No que diz respeito à validade discriminante, este instrumento revela-se independente de constructos como a inteligência, apresentando o valor de $r = 0,99$ (Baron-Cohen et al., 2001; cit in Sousa, 2012).

4.3 Procedimento

O processo de recolha de dados foi conduzida em duas fases distintas.

A primeira fase tinha como objetivo caracterizar a ansiedade e evitamento social dos participantes. Após terem dado por escrito o consentimento informado para participação nas duas fases do estudo, os participantes preencheram um questionário sociodemográfico e de historial clínico. Em seguida, completaram em autorrelato a Escala de Ansiedade e de Evitamento em Situações de Desempenho e de Interação Social (EAESDIS).

No segundo momento avaliativo, os participantes foram selecionados e, em seguida, foram contactados. De acordo com a disponibilidade individual, agendou-se a realização do procedimento experimental.

Os participantes foram informados acerca da duração média do procedimento e preencheram o consentimento informado, assim como o questionário sociodemográfico e sobre o historial clínico.

Em seguida, foram aplicadas as Matrizes Progressivas de Raven, mais precisamente, a série E, de modo a efetuar uma breve avaliação cognitiva. Os itens foram apresentados individualmente e foi solicitado ao participante que indicasse qual a resposta que considerava a mais correta para cada um. As respostas foram anotadas pelo examinador.

Posteriormente, foi efetuado o *Beck Depression Inventory II* (BDI-II), de modo a identificar a existência de comorbilidade. Foi solicitado que o participante lesse com atenção a instrução. O participante teve de responder a vinte e uma questões, de acordo com a forma como se tinha sentido nas últimas duas semanas, incluindo o dia atual.

Por último, procedeu-se à aplicação do *Reading The Mind in The Eyes Test* (RMET). Foi explicado a cada participante que teria de observar os pares de olhos apresentados individualmente, ler as quatro palavras que rodeavam os pares de olhos e escolher aquela que melhor descreveria o que a pessoa estaria a pensar ou a sentir. Para além disso, foi indicado que poderia consultar o glossário, caso não soubesse o significado de alguma palavra. Assim, realizou-se com cada participante um exemplo prático e depois de verificar que a prova tinha sido entendida, cada participante completou a prova de forma autónoma, assinalando as suas respostas na folha de respostas.

5. RESULTADOS

Na primeira fase do estudo foram recolhidos 177 questionários que correspondiam a uma amostra composta por 62,1% mulheres, maioritariamente solteiros (92,7%), com uma média de idades de 22,95 anos (DP=6,806) e com uma média de anos de escolaridades correspondente a 15,06 anos (DP=2,139). Acrescenta-se que 50% da amostra apresenta um rendimento mensal até 1200 euros por agregado familiar.

De acordo com o questionário que averiguava a existência de problemas de saúde verificou-se que nenhum participante apresentou um historial de Acidentes Vasculares Cerebrais. No entanto, foi verificado que um dos participantes sofreu de epilepsia, 9% já havia recorrido a consultas de neurologia, 7,9% já haviam consultado um psiquiatra, assim como já haviam sido diagnosticados com algum tipo de psicopatologia, sendo a mais comum a depressão e ansiedade.

Para verificar o grau de ansiedade em situações sociais foi utilizada a Escala de Ansiedade e de Evitamento em Situações de Desempenho e Interação Social. Foram somadas todas as respostas dadas aos diversos itens e, a partir destas, foram obtidos dois *scores*, um que indicava o desconforto e/ou ansiedade e outro a frequência de evitamento em situações sociais. O ponto de corte para a ansiedade situa-se em 115 pontos e para o evitamento em 105 pontos, mas para a seleção dos elementos para a segunda fase de recolha de dados, foi apenas considerado o ponto de corte para a ansiedade.

No que diz respeito aos valores obtidos pelos participantes na escala de ansiedade, a média de respostas situou-se nos 93,07 pontos (DP=21,47), sendo que a pontuação mínima correspondeu a 50 pontos e a pontuação máxima foi de 137 pontos. Acrescenta-se que dos 177 participantes, 25 pontuaram acima dos 115 pontos na escala de ansiedade social, dos quais 6 eram homens e 19 eram mulheres.

Foram comparadas as diferenças das médias de homens e de mulheres como se pode ver na tabela 1.

Tabela 1 - Diferenças de médias da ansiedade social entre homens e mulheres

Grupo	Média	Desvio-padrão	Mann-Whitney
Homem	136,33	17,154	U=41,500 , p=0,333
Mulher	128,74	10,038	

Apesar dos homens apresentarem uma média mais elevada para a ansiedade social, homens e mulheres não diferem significativamente na pontuação da escala de ansiedade social.

Depois de contactados todos os participantes, de modo a realizarem o conjunto de provas que contemplavam a segunda parte do estudo, foi apenas possível recolher uma amostra com um total de 39 participantes, com idades compreendidas entre os 18 anos e os 54 anos (M=23,32; DP= 8,100), dos quais 59,5% eram do sexo feminino.

Dos 39 participantes que efetuaram a segunda parte do estudo, a maioria eram solteiros (94,6%), havendo apenas 2 indivíduos que eram casados ou encontravam-se em união de facto. A maioria dos participantes apresentavam um rendimento até 1200 euros do agregado familiar (35,1%) e, ao nível das habilitações literárias, os participantes apresentavam uma média de 14,95 anos de escolaridade (DP=1,943).

No que diz respeito ao questionário de questões psiquiátricas, verificou-se que a amostra não apresentou nenhum historial relevante, o que permitiu cumprir os critérios de exclusão.

Todos os participantes não ansiosos foram contactados para fazerem parte do grupo de controlo, sendo que apenas 24

aceitaram participar na segunda parte do estudo. Também todos os participantes ansiosos foram contactados, mas apenas 15 indivíduos aceitaram participar, dos quais 3 eram homens e 12 eram mulheres. Apresentaram uma média de idades de 22,13 (DP=8,061) e com anos de escolaridade compreendidos entre 13 e 19 anos (M=14,87; DP=2,295). Para além disso, apenas se verificou que um indivíduo era casado, sendo a restante amostra solteira (93,3%) e a maioria apresentou um rendimento familiar até 1200€ (33,3%). Salienta-se que o nível de ansiedade variou entre os 115 pontos e os 144 pontos, com uma média de 129,40 (DP=9,745).

A partir das Matrizes Progressivas de Raven, que permitiram avaliar de uma forma mais simples a capacidade cognitiva, verificou-se que nenhum dos participantes apresentou défices cognitivos. A média situou-se nos 7,26 (DP=2,863), o que indica que, em geral, a maioria dos participantes acertaram em mais de metade dos itens. Para além disso, como é possível observar na tabela 2, não existem diferenças significativas entre não ansiosos e ansiosos nos resultados obtidos nas Matrizes Progressivas de Raven.

Tabela 2 - Diferenças de médias entre não ansiosos e ansiosos nas Matrizes Progressivas de Raven

Grupo	Média	Desvio-padrão	Mann-Whitney
Não ansioso	7,62	2,700	$U=143,000, p=0,296$
Ansioso	6,67	3,109	

No que diz respeito ao Inventário da Depressão de Beck, foi possível constatar que a maioria apresentou ausência de depressão (N=24) e apenas dois (5,1%) manifestaram depressão grave. Dado que as pontuações variavam entre 0 e 44, a média da amostra correspondeu a 10,59 (DP=9,661). Quando os resultados da amostra são analisados relativamente ao facto de os participantes serem ou não ansiosos, verifica-se que existem diferenças significativas (Tabela 3), pois os ansiosos apresentam pontuações superiores neste Inventário.

Tabela 3 - Diferenças de médias entre não ansiosos e ansiosos no Inventário da Depressão de Beck

Grupo	Média	Desvio-padrão	Mann-Whitney
Não ansioso	6,13	5,220	$U=314,500, p=0,000$
Ansioso	17,73	10,944	

De forma a avaliar a componente sócio-percetiva utilizou-se o *Reading the Mind in the Eyes Test*. Verificou-se que as pontuações obtidas pelos participantes foram desde os 20 pontos até aos 33 pontos, com uma média de 26,90 (DP=3,016). Apesar das variâncias iguais não serem assumidas, não é possível identificar diferenças significativas entre não ansiosos e ansiosos (Tabela 4).

Tabela 4 - Diferenças de médias de acertos entre não ansiosos e ansiosos no *Reading The Mind in the Eyes Test*

Grupo	Média	Desvio-padrão	Mann-Whitney
Não ansioso	27,04	3,520	$U=167,500, p=0,721$
Ansioso	26,67	2,059	

De uma forma geral, os acertos foram sempre superiores (>20) aos erros na amostra total; excetuando o item 23, em que houve 19 acertos e 20 erros.

De acordo com a tabela 5, é possível verificar que o grupo de ansiosos realizaram mais erros na prova, comparativamente ao grupo de não ansiosos.

Tabela 5 - Percentagem de acertos em cada item entre não ansiosos e ansiosos

Item	Não Ansioso	Ansioso	Item	Não Ansioso	Ansioso
1	64,0%	36,0%	19	65,3%	34,8%
2	58,6%	41,4%	20	63,3%	36,7%
3	64,0%	36,0%	21	63,3%	36,7%
4	58,1%	41,9%	22	63,2%	36,8%
5	62,5%	37,5%	23	57,9%	42,1%
6	75,0%	25,0%	24	66,7%	33,3%
7	65,2%	34,8%	25	60,7%	39,3%
8	59,4%	40,6%	26	60,6%	39,4%
9	65,5%	34,5%	27	61,5%	38,5%

10	66,7%	33,3%	28	57,6%	42,4%
11	53,6%	46,4%	29	69,2%	30,8%
12	60,0%	40,0%	30	58,8%	41,2%
13	55,9%	44,1%	31	58,6%	41,4%
14	62,1%	37,9%	32	59,4%	40,6%
15	63,9%	36,1%	33	64,7%	33,3%
16	60,0%	40,0%	34	66,7%	33,3%
17	53,6%	46,4%	35	72,7%	27,3%
18	59,5%	40,5%	36	58,6%	41,4%

Todavia, após a realização do teste do *qui-quadrado* a cada um dos itens da prova em questão e uma análise detalhada, foi possível compreender que a ansiedade é independente do resultado obtido no item (i.e. acerto ou erro). Apenas no item 6 verificou-se que a ansiedade se associa ao resultado obtido (, refletindo diferenças entre as frequências observadas e as frequências esperadas.

Posteriormente, foram analisados os itens em que se constatarem menos acertos por parte dos participantes. Comprovou-se que, entre o grupo de ansiosos e o grupo de não ansiosos, as diferenças apresentam-se como quase significativas ($U=113,500$; $p=0,054$). Esta constatação coloca a possibilidade de a ansiedade poder ter algum efeito negativo no desempenho da Teoria da Mente.

Com base num estudo piloto dirigido por Harkness, Sabbagh, Jacobson, Chowdrey e Chen (2005), com uma amostra de 12 mulheres, é possível agrupar as diversas emoções correspondentes aos 36 itens do *Reading the Mind in the Eyes Test* de acordo com três valências: negativas, positivas e neutras (Tabela 6).

Tabela 6 - Lista de itens do *Reading the Mind in the Eyes Test* de acordo com a valência emocional

Valência	Item	Adjetivo	Item	Adjetivo
Negativa	2	Infeliz	23	Desafiador
	5	Angustiado	26	Hostil
	11	Arrependido	27	Cauteloso
	14	Acusatório	34	Desconfiado
	17	Duvidoso	35	Nervoso
	22	Preocupado	36	Suspeitoso
Positiva	1	Brincalhão	21	Sonhador
	6	Sonhador	25	Interessado
	16	Pensativo	30	Galanteador
	20	Amigável	31	Confiante
Neutra	3	Desejoso	15	Contemplativo
	4	Insistente	18	Decidido
	7	Desconfortável	19	Hesitante
	8	Desanimado	24	Absorto
	9	Preocupado	28	Interessante
	10	Cauteloso	29	Refletivo
	12	Cético	32	Sério
	13	Expectante	33	Apreensivo

No nosso estudo, verificou-se que, na amostra global, os participantes identificaram corretamente uma média de 8,67 emoções negativas (DP=1,938); uma média de 6,03 emoções positivas (DP=1,246) e uma média de 12,21 emoções neutras (DP=1,750). No que diz respeito às diferenças entre o grupo de ansiosos e o grupo de não ansiosos, constatou-se que não existem diferenças significativas, tanto ao nível das emoções negativas ($U=190,500$; $p=0,765$), como ao nível das emoções positivas ($U=161,000$; $p=0,598$) e das emoções neutras ($U=167,000$; $p=0,721$).

6. DISCUSSÃO

Para conseguir compreender e dar sentido às intenções e comportamentos pessoais e dos outros, o ser humano desenvolveu várias estratégias cognitivas. A Teoria da Mente constitui uma dessas estratégias, que se desenvolve com a maturação cognitiva (Sodian & Kristen, 2010), facilitando a adaptação ao meio em que está inserido (Gallagher & Frith, 2003).

São vários os modelos que procuram esclarecer a Teoria da Mente. Fazendo referência à sua evolução ao longo do tempo, emergem algumas explicações, como a afirmação de que a socialização é um fator determinante (Carpendale & Lewis, 2004); que são as capacidades executivas que refletem o desenvolvimento da Teoria da Mente (Carlson *et al.*, 1998) ou que são os mecanismos neurológicos que influenciam o seu desenvolvimento (Scholl & Leslie, 1999). No que se refere ao funcionamento do próprio mecanismo, pode-se salientar a teoria de Baron-Cohen (1997) que compreende quatro componentes (o detetor de intencionalidade, o detetor de direção do olhar, o mecanismo de atenção partilhada e o mecanismo da Teoria da Mente). No entanto, a classificação mais reconhecida é a que assume a divisão em dois níveis, mais precisamente, na componente sócio-percetiva (descodificação dos estados mentais dos outros através de pistas sociais) e na componente sócio-cognitiva (raciocínio acerca dos estados mentais dos outros) [Tager-Flusberg & Sullivan, 2000]. Apesar de ambas componentes utilizarem estratégias que estão interligadas, poderão existir comprometimentos distintos quer na leitura das pistas quer na racionalização dos estados mentais. Desta forma, parece relevante que os estudos se enfoquem sobre uma ou outra estratégia, compreendendo onde se situa o défice ao nível da Teoria da Mente e contribuindo para a sua discussão.

Por exemplo, as perturbações psicológicas parecem ser um fator condicionante na Teoria da Mente (e.g. Corcoran, Mercer, & Frith, 1995; Gallagher & Frith, 2003; Lysaker *et al.*, 2010; Wolkenstein *et al.*, 2011). Particularmente, na Perturbação de Ansiedade Social, os indivíduos parecem avaliar as situações sociais e os comportamentos de forma mais negativa, supondo-se que o problema assenta em dificuldades na interpretação de pistas sociais observáveis (Hezel & McNelly, 2014).

O presente estudo tem como objetivo avaliar a existência de diferenças nas provas que avaliam a Teoria da Mente, entre indivíduos que manifestavam a presença de ansiedade social e indivíduos não ansiosos. Isto é, pretende-se verificar se existe um compromisso de leitura de pistas sociais em indivíduos identificados como ansiosos sociais.

Foram recolhidas 177 respostas voluntárias à Escala de Ansiedade e Evitamento em Situações de Desempenho e de Interação Social, de forma a categorizar os participantes de acordo com o seu nível de ansiedade social. Foram contactados todos os participantes que apresentassem um *score* superior ao nível de corte para dimensão a ansiedade social e também participantes com *scores* inferiores. Procurou-se manter a equidade de género. Contudo, o nível de respostas positivas para continuar a participar no estudo foi diminuto, verificando-se uma grande mortalidade da amostra.

A amostra final do estudo foi constituída por 39 participantes, que cumpriam os critérios de inclusão, dos quais 15 estavam identificados como ansiosos sociais.

Através das Matrizes Progressivas de Raven foi possível verificar a homogeneidade cognitiva dos participantes, pois nenhum evidenciou défices cognitivos e não se encontraram diferenças entre ansiosos e não ansiosos. Esta ausência de diferenças entre os grupos permite sugerir que os resultados obtidos não se devem a possíveis diferenças cognitivas.

Relativamente ao Inventário de Depressão de Beck, verificou-se a existência de uma relação significativa entre o facto de os indivíduos manifestarem depressão e estarem identificados como socialmente ansiosos. Ou seja, existe a possibilidade da perturbação de Ansiedade Social poder estar relacionada com a depressão. Tal facto é corroborado pelo estudo de Beesdo e colaboradores (2007), que indica que a ansiedade social é um preditor do risco de depressão. Todavia, os indivíduos que evidenciaram a presença de depressão deveriam ter sido retirados, mas a dada a dimensão da amostra final, estes sujeitos foram mantidos.

Para além do referido anteriormente, a depressão tem na sua génese as dificuldades a nível social (Wang *et al.*, 2008), o que acaba por interligar estas duas perturbações. Acrescenta-se que estudos como os de Inoue e colaboradores (2006) e de Wang e colaboradores (2008) demonstraram que podem ocorrer défices na Teoria da Mente aquando a existência de diagnóstico de depressão. Inclusivamente, o estudo de Kircanski e colaboradores (2015) colocou em evidência que existe uma forte comorbidade entre a Perturbação de Ansiedade Social e a depressão, que apresentam défices significativos na componente sócio-percetiva da Teoria da Mente.

No que diz respeito ao *Reading the Mind in the Eyes Test*, de uma forma geral, as respostas constituíram mais acertos do que erros nos diversos itens dos testes. Para além disso, não foram detetados resultados significativos, o que pode indicar a inexistência de défices ao nível da componente sócio-percetiva na amostra recolhida; tanto no grupo de controlo, como no grupo de ansiosos sociais. Estes resultados não suportam os resultados obtidos no estudo de Hezel e McNally (2014), no qual os indivíduos com ansiedade social apresentaram défices significativos em comparação ao grupo de controlo nas tarefas relacionadas com a Teoria da Mente, isto é, os indivíduos com ansiedade social foram significativamente menos precisos a identificar os estados mentais no *Reading the Mind in the Eyes Test*. Também no estudo realizado por Washburn (2012), os participantes socialmente ansiosos tiveram um pior desempenho no *Reading the Mind in the Eyes Test* do que os indivíduos sem ansiedade social. Todavia, salienta-se que as amostras de ambos os estudos designados anteriormente eram significativamente maiores do que a do presente estudos: o estudo de Hezel e McNally (2014) contava com uma amostra de 80 participantes (40 indivíduos sem ansiedade social e 40 indivíduos com ansiedade social) e o estudo de Washburn (2012) obteve uma amostra total de 109 participantes, divididos por quatro grupos (41 indivíduos no grupo de controlo, 36 indivíduos com perturbação de depressão major, 9 indivíduos com perturbação de ansiedade social e 23 indivíduos com comorbidade).

Assim, os resultados obtidos no *Reading the Mind in the Eyes Test* mostram que não existem diferenças significativas entre os dois grupos, o que pode sugerir que a ansiedade social não afeta a Teoria da Mente. Contudo, é necessário ter em consideração o facto de a amostra ser bastante pequena, o que pode ter ditado os resultados encontrados.

No que concerne ao desempenho na prova que avalia a Teoria da Mente, ao nível das respostas dos participantes, pode-se depreender que o grupo de participantes ansiosos apresentaram mais dificuldades em realizar a prova, evidenciando mais erros na atribuição do estado mental representado. Numa análise mais aprofundada, verificou-se que as diferenças eram quase significativas nos itens em que ocorreu um maior número de erros, o que ressalta o facto de existir a possibilidade dos participantes ansiosos efetuarem uma análise das pistas sociais de um modo mais cuidado e atento. Esta aparente tendência de respostas poderá ser explorada em estudos futuros.

Nos resultados obtidos no *Reading the Mind in the Eyes Test* procurou-se também verificar se os diversos tipos de emoções (positivas, negativas e neutras) apresentavam respostas distintas, em cada um dos grupos. Tornou-se emergente a exploração do facto de existirem diferenças na avaliação com carácter emocional efetuada por indivíduos com ansiedade social, na medida em que existem estudos que apresentam resultados controversos. No presente estudo, não foram detetados diferenças significativas entre os grupos ao avaliarem os diferentes pares de olhares, consoante a valência emocional.

Segundo estudos efetuados, os participantes socialmente ansiosos são mais precisos a identificar emoções do que os não ansiosos, existindo um viés consoante a valência emocional (Arrais *et al.*, 2010; Machado-de-Sousa *et al.*, 2010). Por outro lado, outros estudos concluíram que não existem diferenças entre grupos de controlo e os grupos com ansiedade social, na avaliação de expressões com valência emocional (Merckelbach, van Hout, van den Hout, & Mersch, 1989; Philippot & Douilliez, 2005). O mesmo aconteceu no estudo efetuado por Washburn e colaboradores (2016), que não identificou um efeito significativo da valência emocional em nenhum dos quatro grupos (indivíduos com ansiedade social, indivíduos com ansiedade social e depressão, indivíduos com depressão, e indivíduos sem historial de ansiedade social nem de depressão).

Todavia, o *Reading the Mind in the Eyes Test* constitui um teste que assume que o estado mental pode ser avaliado apenas com a informação disponível na região do olhar e que os indivíduos **são sensíveis a essa informação; mas no desenvolvimento deste teste não foi tido em conta o facto destas expressões apresentadas serem genuínas ou de pose** (Jonhston, Miles & McKinlay, 2008). Sem este critério de acuidade, é necessário ter cuidado a retirar conclusões. Apesar do autor do teste indicar que os défices no desempenho podem ser explicados como uma consequência da inability em identificar o estado mental dos outros, pode existir outra explicação, como o facto de os indivíduos não partilharem as normas sociais ou as crenças estereotipadas (Jonhston *et al.*, 2008). Inclusivamente, segundo Jonhston e colaboradores (2008), o *Reading the Mind in the Eyes Test* acaba por ser uma forma de avaliar as normas sociais, em vez de avaliar a acuidade na perceção social.

A forma como foram aplicadas as diferentes provas no nosso estudos e, consequentemente, os resultados obtidos podem estar relacionados com a ansiedade de desempenho, isto é, os participantes podem ter sido mais cautelosos nas respostas, uma vez que o tempo de resposta não era limitado nem contabilizado. Assim, a medição do tempo poderia ser um factor importante a ter em atenção, podendo até ser explorado em estudos futuros.

É importante compreender as causas e a extensão que os défices da ansiedade social podem assumir, principalmente na leitura de pistas sociais em contexto de situação real. Deste modo, a utilização de um instrumento interativo poderia constituir um auxílio no estudo.

O facto de não terem sido encontrados resultados significativos que eram objetivados no estudo, pode dever-se a diversos fatores. Em primeiro lugar, a amostra acabou por limitada, tanto relativamente ao número de participantes, como no que diz respeito ao número de homens e de mulheres. Em segundo lugar, dado que a aplicação das provas ocorreu em dois momentos distintos acabou por ter uma menor adesão por parte dos participantes no estudo. Por último, a duração da aplicação das provas no segundo momento do estudo acabou por diminuir o interesse em participar e a própria desistência de alguns voluntários.

Para estudos futuros sugere-se que seja reformulado o método de recolha de participantes e se estruture de forma diferente a aplicação das provas, de modo a diminuir o tempo de aplicação das mesmas e procurando efetuar o processo num único momento. Para além disso, seria relevante possuir um maior número de participantes pertencentes aos dois grupos (i.e. ansiosos e não ansiosos) no estudo e, também, obter mais participantes do sexo masculino, de forma a ser possível realizar uma análise mais aprofundada.

RESUMO

Um dos principais desafios dos sistemas europeus de ensino superior é conseguir articular esquemas de acreditação que atendem a propósitos nacionais de fortalecimento de qualidade e aumento da competitividade e, também, a perspectivas de internacionalização derivadas da integração europeia.

Através deste estudo pretendia-se analisar se as três Instituições possuem uma política estruturada de qualidade assim como uma estratégia de internacionalização. Para tal foram aplicadas entrevistas institucionais assim como questionários a 475 estudantes, da área da educação, nas três Instituições. Os resultados demonstram que há estruturas definidas para a garantia da qualidade e uma preocupação em manter e reforçar os níveis de qualidade alcançando posições proeminentes em rankings internacionais como o U-Multirank nos principais indicadores: Ensino, Investigação, Cooperação com a Sociedade e Internacionalização. Os resultados demonstram, ainda, uma preocupação em prestar serviços de qualidade ao seu público internacional (recursos humanos e materiais), uma ativa participação em projetos de investigação e de cooperação internacionais, o aumento da mobilidade de estudantes e pessoal *incoming & outgoing* (docente e não docente), o que demonstra uma grande aposta destas Instituições em relação à sua Internacionalização. Por outro lado, os alunos mostraram alguma preocupação quanto ao seu papel efetivo na Garantia da Qualidade Institucional.

Palavras-chave: Educação, Instituições de Ensino Superior, Avaliação e Qualidade, Internacionalização.

JEL Classification: I23

1. INTRODUÇÃO

As instituições europeias de ensino superior aceitaram assumir o papel principal na construção do “Espaço Europeu do Ensino Superior”. Comprometeram-se a assumir a responsabilidade de coordenar políticas que permitam estabelecer e promover o sistema europeu do ensino superior em todo o mundo.

Um dos principais desafios dos sistemas europeus de ensino superior é conseguir articular esquemas de acreditação que, simultaneamente, atendem tanto a propósitos nacionais de fortalecimento de qualidade e aumento da competitividade, como também a perspectivas de internacionalização derivadas da integração europeia.

Considerando que a qualidade é essencial para o desenvolvimento da Área Europeia de Ensino Superior, é necessário apoiar medidas de certificação de qualidade a nível institucional, nacional e europeu, sendo imprescindível desenvolver critérios e metodologias comuns de certificação.

O estudo desenvolvido “*A Qualidade e Internacionalização no Ensino Superior em Portugal: um estudo de caso nas Universidades do Minho, Aveiro e Algarve*” surgiu da vontade de aprofundar estas questões, tão atuais, relacionadas com a Qualidade e a Internacionalização do Ensino Superior Europeu.

O processo de Bolonha teve, e continua a ter, um importante impacto sobre os sistemas de ensino superior dos países europeus. O mais visível é a reforma curricular, em cada país, para alcançar a implementação de créditos e ciclos acordada. A adoção de formas de garantia de qualidade académica e de sistemas de avaliação externa e de acreditação, são instrumentos essenciais de promoção da dimensão europeia de garantia de qualidade.

O XVII Governo Constitucional de Portugal identificou, como objetivos para a política de ensino superior:

- 1) a garantia da qualificação dos portugueses no espaço europeu;
- 2) a melhoria da qualidade e da relevância das formações oferecidas;
- 3) o fomento da mobilidade e da internacionalização;
- 4) o incremento da autonomia das instituições;

- 5) o desenvolvimento de uma cultura de prestação de contas;
- 6) a valorização de parcerias entre instituições nacionais e estrangeiras;
- 7) a estruturação de um sistema de garantia da qualidade reconhecido internacionalmente organizado em torno de quatro eixos, identificados com:
 - a) O alargamento da avaliação ao desempenho das instituições;
 - b) A objetivação dos critérios da avaliação, a tradução dos resultados em apreciações qualitativas, dimensão a dimensão, comparáveis entre si, e a clarificação das consequências da avaliação, quer para o funcionamento dos cursos e das instituições de ensino superior, quer para o seu financiamento;
 - c) A internacionalização do processo de avaliação, designadamente na dimensão de avaliação institucional;
 - d) A exigência de concretização, pelas instituições de ensino superior, de sistemas próprios de garantia da qualidade, passíveis de certificação.

De realçar que a criação de um sistema de garantia da qualidade do ensino superior reconhecido internacionalmente supõe uma adesão aos princípios internacionalmente aceites na matéria. Neste particular, merecem especial atenção:

- a) Os *Standards and Guidelines for Quality Assurance in the European Higher Education Area*, constantes do relatório, de Fevereiro de 2005, preparado pela *European Association for Quality Assurance in Higher Education* (ENQA) a pedido dos ministros signatários da Declaração de Bolonha;
- b) O relatório, preparado pela ENQA, a pedido do Governo Português, sobre a garantia da qualidade do ensino superior em Portugal, de Novembro de 2006, que procedeu à avaliação das práticas neste domínio levadas a cabo no âmbito do Conselho Nacional de Avaliação do Ensino Superior e formulou recomendações ao Governo sobre a organização, método e processos de um novo sistema de acreditação, conforme aos *Standards and Guidelines*;
- c) O relatório de avaliação do sistema de ensino superior português, de Dezembro de 2006, preparado pela OCDE a pedido do Governo;
- d) Os *Standards and Guidelines for Quality Assurance in the European Higher Education Area* (ESG), de Maio de 2015, apresentadas por um grupo de Instituições Europeias envolvidas nesta reformulação.

Em termos de documentos nacionais de importância para a temática abordada neste estudo apontam-se:

- e) Relatório do grupo de trabalho MADR/MEC “Uma estratégia para a Internacionalização do Ensino Superior Português: Fundamentação e Recomendações”, apresentado em Maio de 2014

Nos termos da Lei 38/2007, compete às instituições de ensino superior (IES) adotar uma política de garantia de qualidade e os procedimentos para a sua prossecução; desenvolver uma cultura de qualidade e da sua garantia e desenvolver e pôr em prática uma estratégia para a melhoria contínua da qualidade. A mesma Lei determina que os procedimentos da avaliação externa “*devem ter em conta a eficácia dos procedimentos de garantia interna da qualidade*”. Também no preâmbulo do Decreto-Lei 369/2007 define-se como um dos eixos do novo sistema de avaliação e acreditação “*A exigência de concretização, pelas instituições de ensino superior, de sistemas próprios de garantia da qualidade, passíveis de certificação*”.

A legislação reafirma, assim, que a responsabilidade pela qualidade de ensino cabe, em primeiro lugar, a cada instituição de ensino superior, à qual compete criar as estruturas e os procedimentos internos para garantir a qualidade de ensino. Competirá à A3ES apoiar as instituições na implementação dos seus sistemas internos de garantia da qualidade e proceder à realização de auditorias tendo em vista a certificação dos procedimentos internos de qualidade das instituições.

De extrema importância para este estudo foram os documentos elaborados pela A3ES, nomeadamente:

- a) Análise comparativa dos processos Europeus para a Avaliação e Certificação de Sistemas Internos de Garantia da Qualidade, 2011
- b) Sistemas Internos de Garantia da Qualidade nas Agências de Avaliação e Acreditação, 2011
- c) Manual para o processo de auditoria dos Sistemas Internos de Garantia da Qualidade nas Instituições de Ensino Superior, em regime experimental no ano letivo de 2012/2013

Para que se possa entender a internacionalização no contexto universitário, é imperativo perceber que ela não define um contexto de ação e de política que possamos assumir integralmente como novo. Antes de mais, a internacionalização integra-se no complexo processo de globalização que, juntamente com a penetração dos princípios neoliberais, tem conduzido as universidades para uma crescente tendência empreendedora e mercantilizada (Santos, 2008), a qual se encontra ligada à ideia de que o investimento em ciência e tecnologia reflete a emergência de uma sociedade do conhecimento, baseada na dependência de pessoal altamente qualificado, base do desenvolvimento económico e social (Altbach e Knight, 2007).

Ainda, de acordo com Altbach e Knight (2007), podemos argumentar que a postura global exigida às instituições é fruto das redes de interdependências que caracterizam a globalização. As universidades, cuja evolução histórica se alicerça na independência face à política e às pressões económicas, vêm-se agora equiparadas a uma empresa que gerem e procuram recursos materiais e simbólicos, capazes de sustentá-las no tempo.

Desta forma, a internacionalização, entendida como a ação de mostrar fora aquilo que é concebido internamente ou que se produz dentro de um sistema - o que não implica necessariamente envolvimento com o exterior - responde às exigências propostas por essa postura global.

A dimensão internacional do ensino e da investigação sempre foi algo presente ao longo da história (Miura, 2006; Morosini, 2006; Stallivieri, 2007), embora apenas recentemente se tenha dado atenção a este fenómeno. É possível perceber que a ideia de universidade com integração internacional, ou modelo mundial de universidade, não é nova (Knight, 1999; 2003; 2006; Knight e De Wit, 1995).

A internacionalização caracteriza presentemente grande parte das relações entre as universidades (Morosini, 2006), contribuindo para a mobilidade dos recursos humanos da ciência e tecnologia. Acima de tudo, ela é considerada como um mecanismo indispensável para o desenvolvimento das universidades (Soderqvist, 2002) e, numa escala maior, dos próprios países, pois promove a circulação de conhecimento e a cooperação, favorecendo a criação de redes.

Uma das dimensões importantes passa pelas inúmeras políticas que se constroem para a dinamização da dimensão internacional, sendo este um fator considerado na avaliação das universidades (Magalhães e Rodrigues, 2000).

A pressão para a internacionalização está, neste momento, a penetrar nos discursos e práticas dos atores envolvidos com o processo de trabalho nas universidades e suas formas de administração. Um dos mecanismos mais visíveis desta penetração consiste no incremento acelerado e detalhado dos sistemas de avaliação do desempenho institucional e individual, nos quais a internacionalização, definida de forma diversa e por vezes dispare, é um indicador fundamental.

De acordo com Sousa (2015) *“(...) repensar a educação desde a diversidade é uma necessidade e um imperativo na educação que concebemos orientada para o sucesso. A educação para a diversidade deverá reger-se por princípios que envolvam as pedagogias cooperativas, a implicação de todos na tomada de decisões, o desenvolvimento e a elaboração de projetos de trabalho e a importância dos interesses da comunidade académica.”*

Na opinião de Melero (1999), a cultura da diversidade consiste no incremento dela mesma em toda a cultura da instituição educativa. Ultrapassa a questão das adaptações curriculares, implica a procura de outro modelo, de outro sistema educativo e de outro currículo, que conheça que compreenda e respeite a diversidade. A instituição educativa da diversidade tem que ser uma instituição educativa que aprenda estratégias para a resolução de problemas da vida quotidiana de forma cooperativa e solidária.

Fernandes (2011) defende que há que admitir que o envolvimento dos estudantes nas aprendizagens não se concretiza sem a criação de condições por parte dos professores que os estimulem a interagir com os seus pares, e com eles próprios, e a refletirem sobre os conteúdos que estão a ser trabalhados, e os instigue a problematizar as situações e a sobre elas emitirem um pensamento crítico.

Ainda nesta linha de pensamento, Leite (2002b) refere que a atenção a estes aspetos pressupõe criar possibilidade para que todos possam ter as mesmas igualdades de oportunidades, e se concretize o princípio de equidade, aqui entendido como respeito pelas diferenças. Este é, em tempo de “crise económica” e de globalização da educação, um enorme desafio para os professores de todos os níveis de ensino e, de modo particular, para os que lecionam no ensino superior.

Como sublinha Cortesão (2002), *“(...) se a escola, os professores e o sistema admit (ir) em a possibilidade de que lhes cabe uma quota-parte de responsabilidade no tipo de resultados obtidos pelos alunos e portanto do êxito ou sucesso que eles têm, então o modo como se orienta o processo educativo e a avaliação adquirem outros significados”*.

Para Morosini a aprendizagem na Educação Superior precisa ser inserida em práticas voltadas ao desenvolvimento humano e social, baseadas em indicadores de qualidade. Entende-se por educação de qualidade aquela que: *“(...) considera o estudante um indivíduo, membro de uma família, de uma comunidade e cidadão do mundo, que aprende para se tornar competente em seus quatro papéis: defende e propaga os ideais de um mundo sustentável – um mundo justo, equitativo e pacífico no qual as pessoas se preocupam com o meio ambiente para contribuir a equidade intergeracional; leva em consideração o contexto social, económico e o meio ambiente e configura o currículo como o programa para refletir essas condições específicas”*. (Morosini, 2009).

De acordo com estudos feitos por Morosini (2009), a aprendizagem pautada em processos de natureza pedagógica e académica envolve qualidade do currículo, das práticas pedagógicas e da avaliação. Além disso, as discussões acerca do conceito de qualidade na Educação Superior indicam tendências enquadradas na conceção de isomorfismo, ligada à ideia de empregabilidade e à lógica do mercado global ou, de respeito à diversidade ou de equidade.

Para a Organização das Nações Unidas para a Educação, Ciência e Cultura (Unesco), a qualidade é norteadada por fatores-chave: extensão da educação, tratamento da diversidade, autonomia escolar, currículo/autonomia curricular, participação da comunidade educativa e gestão dos centros escolares, direção escolar, professorado, avaliação, inovação e investigações educativas (Morosini, 2012).

2. METODOLOGIA

2.1 Objetivos do estudo

No âmbito deste estudo foi feito um levantamento sobre as temáticas da Qualidade mas principalmente sobre o indicador da Internacionalização na medida da qualidade das Instituições de Ensino Superior.

Para tal foi necessário fazer um levantamento bibliográfico sobre as políticas e diretivas Europeias nestas matérias assim como as políticas, diretivas e legislação existentes em Portugal sobre as mesmas e fazer o seu enquadramento.

Foi feito um levantamento bibliográfico, assim como uma breve caracterização das três IES estudadas – Universidade do Minho (UM), Universidade de Aveiro (UA) e Universidade do Algarve (UALg) enquanto IES e a sua organização mas, também, enquanto Instituições que se regem pelas políticas europeias e nacionais no que respeita à Qualidade e de que modo a Internacionalização, enquanto indicador de medida da Qualidade no Ensino Superior, é efetivamente medida e que peso tem na estratégia destas Instituições.

Para a concretização deste estudo foram definidos três objetivos gerais:

- 1) Descrever as políticas europeias sobre a qualidade no ensino superior
- 2) Apresentar as políticas nacionais sobre a qualidade no ensino superior
- 3) Analisar se os indicadores de qualidade definidos pela A3ES estão presentes, ou não, na internacionalização praticada nas Universidades do Minho, Aveiro e Algarve

De modo a dar uma resposta mais completa ao terceiro objetivo geral foram definidos sete objetivos específicos:

- 1) Perceber se as IES têm definida uma política e objetivos de qualidade
- 2) Perceber de que modo as IES garantem a qualidade da sua oferta formativa e da aprendizagem dos seus estudantes
- 3) Perceber se as IES promovem, avaliam e melhoram a sua atividade científica, tecnológica e artística
- 4) Perceber se as IES estão munidas de recursos humanos que consigam responder às solicitações dos seus estudantes
- 5) Perceber se as IES estão munidas de recursos materiais adequados ao desenvolvimento das aprendizagens dos seus estudantes
- 6) Perceber se as IES dispõem de sistemas de recolha de informação e se publicitam os resultados dessa informação
- 7) Perceber de que modo as IES estabeleceram as suas estratégias de internacionalização e quais os principais indicadores de internacionalização

2.2 Instrumentos

Este estudo teve como base a análise bibliográfica de estudos já realizados sobre as temáticas do Ensino Superior, relatórios elaborados pela ENQA- *European Association for Quality Assurance in Higher Education*, legislação e diretrizes da Comissão Europeia sobre as temáticas da Qualidade e da Internacionalização na Europa, os *Standards and guidelines for quality assurance in the European Higher Education Area*, entre outra bibliografia de suporte à própria estrutura deste estudo.

Nos quadros abaixo pode-se ver sinteticamente a correlação entre os documentos de suporte à estrutura deste estudo e que estiveram na base da definição dos objetivos e dos instrumentos utilizados.

Quadro 1 – Correlação entre os *Standards and Guidelines for Quality Assurance in the Higher Education Area*, os Referenciais de Qualidade da A3ES e os Objetivos do estudo

<i>European Standards and Guidelines</i>	Referenciais A3ES	Objetivos do estudo
1.1. Política e procedimentos para garantia de qualidade	Referencial 1 - Definição da política e objetivos de qualidade	Objetivo 1 - Perceber se as IES têm definida uma política e objetivos de qualidade
1.2. Aprovação, acompanhamento e revisão periódica dos programas e prémios	Referencial 2 – Definição e garantia da qualidade da oferta formativa	Objetivo 2 - Perceber de que modo as IES garantem a qualidade da sua oferta formativa e da aprendizagem dos seus estudantes
1.3. Avaliação dos alunos	Referencial 3 – Garantia da qualidade das aprendizagens e apoio aos estudantes	
----	Referencial 4 – Investigação e desenvolvimento	Objetivo 3 - Perceber se as IES promovem, avaliam e melhoram a sua atividade científica, tecnológica e artística
----	<i>Referencial 5 – Relações com o exterior</i>	<i>Não se aplicaram questões neste ponto por não se ajustarem aos objetivos fundamentais do estudo</i>
1.4 Garantia de qualidade do corpo docente	Referencial 6 – Recursos humanos	Objetivo 4 - Perceber se as IES estão munidas de recursos humanos que consigam responder às solicitações dos seus estudantes
1.5. Recursos de aprendizagem e apoio aos alunos	Referencial 7 – Recursos materiais e serviços	Objetivo 5 - Perceber se as IES estão munidas de recursos materiais adequados ao desenvolvimento das aprendizagens dos seus estudantes
1.6. Sistemas de informação	Referencial 8 – Sistemas de informação	Objetivo 6 - Perceber se as IES dispõem de sistemas de recolha de informação e se publicitam os resultados dessa informação
1.7. Informação pública	Referencial 9 – Informação pública	
----	Referencial 10 – Internacionalização	Objetivo 7 - Perceber de que modo as IES estabeleceram as suas estratégias de internacionalização e quais os principais indicadores de internacionalização

Quadro 2 – Correlação entre os objetivos do estudo e os instrumentos usados na recolha de dados do estudo

Objetivos do estudo	Entrevista Qualidade	Entrevista Internacionalização	Questionário
Perceber se as IES têm definida uma política e objetivos de qualidade	Q1 Q24		Q1
Perceber de que modo as IES garantem a qualidade da sua oferta formativa e da aprendizagem dos seus estudantes	Q4 Q6 Q7		Q6 Q12 Q13 Q17
	Q5		Q10 Q11 Q14
Perceber se as IES promovem, avaliam e melhoram a sua atividade científica, tecnológica e artística	Q8 Q9 Q10 Q11 Q12		Q9
Não se aplicaram questões neste ponto por não se ajustarem aos objetivos fundamentais do estudo			
Perceber se as IES estão munidas de recursos humanos que consigam responder às solicitações dos seus estudantes	Q14 Q15 Q16 Q17		Q3
Perceber se as IES estão munidas de recursos materiais adequados ao desenvolvimento das aprendizagens dos seus estudantes	Q18 Q19		Q2 Q5 Q7 Q8
Perceber se as IES dispõem de sistemas de recolha de informação e se publicitam os resultados dessa informação	Q20 Q21 Q22		Q18
	Q23		Q4
Perceber de que modo as IES estabeleceram as suas estratégias de internacionalização e quais os principais indicadores de internacionalização	Q2 Q3 Q13	Todas as questões da entrevista	Q15 Q16

Como métodos de recolha de dados foram utilizados a análise documental, a entrevista e o questionário, ao passo que para o seu tratamento foram utilizadas a análise estatística e a análise de conteúdo.

2.3 Amostra

Por forma a complementar o levantamento bibliográfico e o enquadramento teórico feito sobre a temática foi necessário aferir as opiniões Institucionais sobre a mesma. Considerou-se que os órgãos que estão diretamente ligados às questões da Qualidade e da Internacionalização são os Vice-Reitores ou Pró-Reitores com esses pelouros assim como as pessoas responsáveis pelos Gabinetes de Qualidade e de Relações Internacionais, nas três Instituições.

Tal como referido anteriormente foram feitas duas entrevistas distintas neste estudo. Uma entrevista sobre a Qualidade no Ensino Superior mas aplicada ao contexto da Internacionalização, que consiste em vinte e quatro (24) questões, estruturadas de acordo com os indicadores de qualidade estabelecidos pela A3ES. Nesta entrevista foram recolhidos dois contributos da Universidade do Algarve e um da Universidade do Minho, não tendo sido possível recolher o contributo da Universidade de Aveiro. Na segunda entrevista, mais direcionada para a Internacionalização em si, composta por dezassete (17) questões, algumas delas subdivididas em sub-questões foi possível recolher um contributo em cada uma das três Instituições do estudo.

Foram, ainda, aplicados questionários aos 689 estudantes inscritos no ano letivo de 2016/2017, nos oito (8) cursos abaixo, todos eles na área da Educação, e que funcionassem nas três Instituições do estudo. Estes questionários foram aplicados presencialmente em sala de aula, aos estudantes dos cursos abaixo, num total de 475 respondentes, sendo 429 do sexo feminino e 46 do sexo masculino, encontrando-se maioritariamente na faixa etária dos 20 aos 25 anos (conforme se pode constatar pelos quadros nr. 3 e 4 e pelo gráfico nr. 1 abaixo):

- 1) Licenciatura em Educação Básica;
- 2) Mestrado em Educação e Formação;
- 3) Mestrado em Ciências da Educação;
- 4) Mestrado em Ciências da Educação e Formação;
- 5) Mestrado em Educação Pré-Escolar;
- 6) Mestrado em Educação Pré-Escolar e Ensino no 1º ciclo do Ensino Básico;
- 7) Mestrado em Ensino de Inglês no 1º ciclo do Ensino Básico;
- 8) Mestrado em Ensino do 1º ciclo do Ensino Básico e de Matemática e Ciências Naturais no 2º ciclo do Ensino Básico

Quadro 3– Número de estudantes que responderam ao questionário

Instituição	Nº total inscritos	Nº total respostas	% de respostas
Universidade do Algarve	115	76	66,09
Universidade de Aveiro	268	181	67,54
Universidade do Minho	306	218	71,24
Total	689	475	68,29

Quadro 4 – Género dos estudantes que responderam ao questionário

Género	Número de estudantes	%
Feminino	429	90,3
Masculino	46	9,7
Total	475	100

Gráfico 1 – Idade dos estudantes que responderam ao questionário

3. RESULTADOS

Tal como referido anteriormente foram definidos três objetivos gerais para este estudo e sete objetivos específicos. Para uma mais fácil compreensão a apresentação dos resultados será feita objetivo a objetivo do estudo.

No que diz respeito ao objetivo nr. 1 - *Perceber se as IES* têm definida uma política e objetivos de qualidade - os resultados obtidos da aplicação das entrevistas Institucionais assim como dos questionários aos estudantes mostram-nos que as três Instituições analisadas têm bem definidas as suas estruturas internas de garantia de qualidade, as quais se regem pelas diretivas europeias e nacionais. Uma das IES apresenta uma política interna de qualidade mais antiga e mais enraizada, sendo detentora da certificação da sua política interna de garantia de qualidade pela A3ES desde 2013, o que se pode comprovar pelas respostas obtidas às entrevistas mas também através das respostas dos seus estudantes, que se destacam pela positiva nas questões da qualidade e da internacionalização. As outras duas IES mostram que esta área é uma aposta mais recente e isso vê-se pela atualização dos Manuais de Qualidade, uns revistos no início de 2017 (UAlg) e outros recentemente elaborados e homologados, finais de 2016 (UA). Estas duas IES apresentaram os seus Sistemas Internos de Garantia de Qualidade a certificação pela A3ES em março de 2017.

Quando questionados sobre os indicadores de qualidade que as três IES consideram mais importantes quando se mede a qualidade de uma IES, as respostas dadas foram:

- os resultados dos principais rankings, nos indicadores considerados mais relevantes — Ensino, Investigação, Cooperação com a Sociedade, Internacionalização — e ao seu posicionamento relativamente às restantes IES nacionais e internacionais;
- o número de vagas preenchidas na primeira fase de acesso;
- o número de diplomados por ano/sucesso escolar;
- a integração dos estudantes na investigação e nas atividades de extensão/ a capacidade que uma Instituição tem de fazer transferência de conhecimento para a sociedade;

- a produção científica;
- a própria percepção dos estudantes com a qualidade do seu ensino;
- a capacidade de captação de estudantes internacionais;
- o percurso profissional dos nossos *alumni* que espelha a qualidade da instituição.

No que diz respeito ao objetivo nr. 2 - *garantia da qualidade da oferta formativa e da aprendizagem dos estudantes* - podemos constatar que todas as IES têm procedimentos estruturados e definidos para recolher e analisar os resultados da avaliação da qualidade do ensino aprendizagem dos seus estudantes internacionais. São aplicados questionários aos estudantes referentes aos processos de ensino-aprendizagem, sempre que finaliza uma unidade curricular, sendo que estes questionários avaliam sempre as cinco vertentes: autoavaliação do estudante; aquisição de competências; percepção dos estudantes sobre a aquisição de competências da unidade curricular em si; funcionamento em si da unidade curricular; os docentes; os recursos que teve de aprendizagem (infraestruturas e os recursos materiais). Há, para além dos questionários de avaliação da qualidade, outros procedimentos, tais como os questionários passados aos estudantes internacionais, por parte dos Gabinetes de Relações Internacionais que são questionários globais que medem o grau de satisfação dos estudantes. Outro aspeto importante a retirar desta análise é que todos os alunos, quer nacionais quer internacionais, preenchem estes questionários de avaliação pois os mesmos encontram-se traduzidos para inglês, seja em papel ou online.

Fazendo, também, uma análise global às respostas dadas pelos estudantes, estes demonstram ter conhecimento generalizado sobre os objetivos dos seus cursos e consideram que os seus professores têm competência académica para o desempenho das suas funções no âmbito do curso. Para além disso também manifestam que os seus cursos oferecem unidades curriculares numa língua estrangeira e que tanto os estudantes nacionais como os internacionais estão envolvidos no processo de garantia da qualidade dos seus cursos, ainda que as respostas dadas a estas duas últimas questões sejam um pouco neutras, como se poderá constatar pelos gráficos nr. 2, 3 e 4 abaixo):

Gráfico 2 – Respostas obtidas à Questão nr. 12 - Os estudantes têm uma participação ativa nos processos de decisão no que diz respeito ao ensino e a sua qualidade

Gráfico 3 – Respostas obtidas à Questão nr. 13 - Os resultados dos inquéritos de satisfação aplicados aos estudantes são usados para melhorar o ensino

Gráfico 4 – Respostas obtidas à Questão nr. 17 - Os estudantes estrangeiros participam no processo de avaliação tal como os estudantes nacionais

Na prossecução dos resultados ao objetivo nr. 3 - *Perceber se as IES promovem, avaliam e melhoram a sua atividade científica, tecnológica e artística* - verificou-se que as três IES são Instituições muito ativas no que diz respeito à investigação internacional e à participação em projetos de mobilidade e cooperação sendo a sua promoção e monitorização feita nos seus planos de atividades, planos estratégicos, Manuais e Planos de Qualidade, documentos que se encontram publicitados nos respetivos sites das IES. Para além disso esta promoção é feita também através dos repositórios institucionais e dos próprios docentes e investigadores.

A participação em projetos de investigação nas três IES é extensa sendo que a grande maioria coordena projetos de investigação europeus e integra Centros de Investigação Internacionais de renome.

Os estudantes mantiveram uma posição neutra no que diz respeito aos períodos de investigação existentes nos seus planos curriculares ser ou não suficiente, à exceção da Universidade do Minho. Uma vez que o questionário foi passado a cursos nas áreas da educação estas respostas podem estar justificadas por si só dado que estes cursos não contemplam períodos de investigação como um curso mais científico.

Concluimos, ainda, que no âmbito do objetivo nr. 4 - *Perceber se as IES estão munidas de recursos humanos que consigam responder às solicitações dos seus estudantes* - as três IES responderam positivamente ainda que manifestando que estão mais capacitados os docentes na medida em que há aulas que são dadas em inglês, mas que também os funcionários estão devidamente identificados, ou seja, aqueles que conseguem dar resposta às solicitações em inglês. Para além disso as IES contam com o auxílio dos centros de línguas que estão sempre disponíveis e em colaboração com as IES para providenciar formação neste sentido. Há, contudo, noção de que é uma área em que devem continuar a apostar para fortalecer e providenciar cada vez mais um serviço de excelência ao seu público internacional.

Por sua vez, os estudantes são muito neutros nas suas respostas e, uma vez mais, a Universidade do Minho se destaca positivamente. As respostas dos estudantes levam-nos a questionar se efetivamente as IES têm os recursos humanos suficientes ou se as respostas provêm apenas do desconhecimento dos estudantes relativamente a esta questão.

Ainda na linha dos recursos, através do objetivo nr. 5 pretendia-se *perceber se as IES estão munidas de recursos materiais adequados ao desenvolvimento das aprendizagens dos seus estudantes*. Há, efetivamente, uma preocupação em proporcionar serviços de qualidade ao seu público internacional que é visível no que diz respeito às estruturas e recursos materiais que se encontram disponíveis para dar resposta às necessidades destes públicos (site, informação, serviços de apoio, materiais, relatórios de atividades) assim como os materiais que são produzidos para promover as IES em feiras e eventos internacionais e que promovem os cursos, a IES e a sua produção científica através dos Gabinetes de Comunicação, Relações Internacionais mas também através do próprio site e dos seus docentes e investigadores.

Numa análise global das respostas dadas pelos estudantes destas três IES às quatro questões que lhes foram colocadas no âmbito deste objetivo, podemos perceber que na generalidade as respostas foram positivas, o que demonstra uma preocupação das IES em fornecer recursos adequados aos seus estudantes.

No âmbito do objetivo nr. 6 - *Perceber se as IES dispõem de sistemas de recolha de informação e se publicitam os resultados dessa informação* - constatou-se que os sites das IES se encontram em inglês, onde os estudantes podem encontrar toda a informação que necessitam (menus, conteúdos, oferta formativa, etc). Há IES que estão mais desenvolvidas na questão da apresentação da sinalética, site e conteúdos em língua inglesa enquanto que as outras IES estão em processo de concretização desse objetivo.

Os estudantes responderam de forma positiva no que diz respeito à disponibilização no sites das suas IES dos conteúdos (informação, notícias, planos curriculares, programas, etc) numa língua estrangeira, sendo apenas de destacar as respostas mais neutras dos estudantes da Universidade do Algarve.

No que diz respeito à questão colocada sobre a taxa de empregabilidade dos seus cursos, os estudantes demonstraram não ter uma opinião muito positiva sobre esta matéria à exceção dos estudantes da Universidade do Minho.

Por fim, apresentam-se as conclusões ao objetivo nr 7 - *Perceber de que modo as IES estabeleceram as suas estratégias de internacionalização e quais os principais indicadores de internacionalização*, que era um dos objetivos chave deste estudo.

Assim, verificou-se que as três IES têm definida uma política e uma estratégia de internacionalização e que estas se encontram publicitadas mas não traduzidas numa língua estrangeira. Duas das IES são detentoras dos selos de qualidade ECTS e DS Label sendo que apenas a Universidade do Algarve não detém estes selos de qualidade. As IES fazem uma monitorização dos seus protocolos de cooperação mas não de forma sistemática.

Há uma grande aposta na mobilidade dos estudantes e pessoal *incoming* assim como *outgoing*, havendo medidas e estruturas de apoio definidas para auxiliar em ambas as situações.

As IES oferecem cursos em língua estrangeiras a nível de 2º e 3º ciclos ou seja, Mestrados e Doutoramentos e todas elas oferecem cursos em rede ou cursos conjuntos, principalmente no âmbito do Programa Erasmus Mundus. Para além disso, participam em projetos de investigação internacionais na qualidade de coordenadores, à exceção da Universidade do Algarve, e como parceiras e no que diz respeito à área da cooperação as três IES são muito ativas, participando em diversas redes e fóruns internacionais e em inúmeros projetos de mobilidade e cooperação, sejam eles nacionais, europeus ou internacionais, que estão em constante atualização e submissão de novos projetos. Há uma preocupação em manter os seus níveis de qualidade e atingir metas e objetivos para reforçar essa qualidade, alcançando posições de destaque em rankings internacionais tais como o U-Multirank.

As áreas em que as IES estão a apostar, no que diz respeito às novas candidaturas, divergem na medida em que a Universidade do Minho diz que uma vez que as suas unidades são muito ativas apresentam candidaturas em todas as áreas, a Universidade de Aveiro aposta na área do empreendedorismo e Desenvolvimento Curricular e por fim, a Universidade do Algarve aposta nas suas áreas de excelência – Mar, Turismo, Saúde e Bem-Estar e o Património Mediterrânico.

No que diz respeito aos indicadores que as IES consideram mais importantes quando se mede a internacionalização, as respostas foram:

- 1) número de pessoas/cidadãos estrangeiros, quer se trate de pessoal estudantil, quer de pessoal docente e não docente / número de estudantes internacionais em relação ao número total de estudantes e que a proveniência seja de diversos contextos e países;
- 2) número de estudantes e pessoal docente (e não docente) que beneficia da mobilidade de estudos no estrangeiro / o número de estudantes, docentes e não docentes in e out;
- 3) número de diplomados internacionais;
- 4) número de protocolos de cooperação e acordos bilaterais celebrados/ o número de parcerias com instituições estrangeiras;
- 5) a transferência de conhecimento para multinacionais;
- 6) número de projetos de mobilidade e de investigação internacional / colaboração científica entre os nossos docentes e os docentes de outras Instituições/ internacionalização da investigação.

Este estudo também nos demonstra que há IES com áreas mais desenvolvidas do que outras, que as apostas de internacionalização, investigação e cooperação são visíveis e crescentes, um pouco divergentes em termos de áreas mas, o facto é, que todas elas já dispõem de estratégias para a sua internacionalização, se estas são mais institucionalizadas ou se se ajustam no decorrer do tempo consoante os planos de atividades anuais, se são públicas ou do domínio privados das próprias IES, pouco interessa, desde que estas existam e deem resposta à política de qualidade e internacionalização da Instituição.

As IES devem, e esta é também uma preocupação da Comissão Europeia, saber aproveitar as suas potencialidades individuais na educação, na investigação e, também, na inovação ou estabelecimento de parcerias, dentro e fora da Europa, que reforcem e complementem os perfis das IES, tendo sempre presente a ideia de que estabelecer ou renovar a cooperação com IES dos países em desenvolvimento deve ser um elemento importante das estratégias de internacionalização nacionais e institucionais.

Seguindo, ainda, as considerações feitas pela Comissão Europeia, as IES Europeias devem definir estratégias globais de internacionalização e nelas deverão ser incluídas ações prioritárias, que não deverão ser consideradas isoladamente mas sim como elementos integrantes de uma estratégia global, e que passem por promover a internacionalização, a mobilidade internacional dos alunos e do pessoal, o desenvolvimento dos currículos e a aprendizagem digital e, ainda, incentivar a cooperação estratégica, as parcerias e o reforço das capacidades.

No amplo sentido, desenvolver uma estratégia global de internacionalização significa posicionar as IES, os seus estudantes, investigadores e pessoal, bem como os respetivos sistemas nacionais, num plano mundial, de acordo com o seu perfil individual, as necessidades do mercado de trabalho e a estratégia de desenvolvimento do próprio país.

Em suma, podemos constatar, que da análise feita aos diversos materiais Institucionais, pelas entrevistas realizadas e questionários aplicados, há uma forte aposta na Qualidade e na Internacionalização por parte destas três IES. Aposta na captação de estudantes, principalmente oriundos dos Países Oficiais de Língua Portuguesa e da América Latina, de crescimento do número de parcerias e projetos de investigação mas, também, da oferta de cursos conjuntos.

Muito trabalho tem sido feito nos últimos anos nestas matérias mas, muito há a fazer. Assim, estas IES deverão prosseguir a sua aposta na concretização dos seus objetivos de prossecução de uma política de qualidade e de aposta na sua Internacionalização definindo as suas próprias estratégias de internacionalização e seguindo as diretivas europeias que pretendem conseguir implementar um Ensino Superior Internacional de Qualidade e Globalizado, aberto ao mundo, e de fácil acesso.

4. LIMITAÇÕES E RECOMENDAÇÕES

4.1 Limitações do estudo

Como em qualquer estudo foram encontradas algumas limitações que, sem dúvida, influenciaram os resultados obtidos.

Em primeiro lugar a inexistência de estudos semelhantes feitos em IES nacionais. Em segundo lugar, o facto de o estudo estar grandemente dependente das entrevistas Institucionais, e nesse sentido, dependente da disponibilidade das agendas das pessoas a entrevistar e da investigadora também (o facto de que duas das Instituições estudadas estarem geograficamente afastadas do local de residência e trabalho da investigadora dificultou a articulação das disponibilidades das agendas).

Outra limitação esteve interligada à aplicação dos questionários aos estudantes e que, uma vez mais, teve a ver com a disponibilidade da investigadora em ir pessoalmente às salas de aula dos cursos onde foram aplicados os questionários. As dificuldades sentidas passaram por:

- a) a dificuldade em obter as necessárias autorizações dos diretores dos cursos;
- b) a dificuldade em obter as necessárias autorizações por parte dos docentes para poder aplicar os questionários na suas aulas;
- c) as mudanças de salas de aulas e de horários

Estas dificuldades limitaram também as amostras de estudantes respondentes, ainda que a percentagem de respondentes tenha sido muito positiva.

Também o número de respostas neutras (não concordo nem discordo) dadas pelos estudantes (oito questões em dezoito com esta opção de resposta) merecem aprofundar melhor o motivo destas respostas. As questões às quais se obtiveram respostas neutras foram relacionadas com a participação dos estudantes nacionais e estrangeiros nos processos de decisão no que diz respeito ao ensino e a sua qualidade e saber se os resultados dos inquéritos de satisfação aplicados aos estudantes são usados para melhorar o ensino. Ainda, no que diz respeito a haver unidades curriculares lecionadas numa língua estrangeira e se o curso tem professores visitantes estrangeiros a lecionar. Duas questões que também obtiveram respostas neutras foram a questão de o plano de estudos do curso contemplar suficientes períodos de investigação e o curso ter uma boa taxa de empregabilidade. Por último, os estudantes de duas IES manifestaram não concordar nem discordar com a questão de que as suas Universidades dispõem de recursos humanos suficientes (professores e funcionários) para apoiar os estudantes estrangeiros.

Outra limitação foi o facto de os temas escolhidos para este estudo serem temas em constante atualização pelo que as alterações afetam o estudo em curso para além de serem temas sensíveis e internos às próprias IES não tendo sido possível obter algumas informações relevantes para este estudo e que teriam a ver com as estratégias de internacionalização das IES.

4.2 Algumas recomendações para trabalho futuro...

Considerando as limitações com que nos deparámos no decurso deste estudo gostaríamos de poder alargar o estudo a outras IES de modo a poder obter mais elementos de comparação sobre as temáticas abordadas.

Gostaríamos, também, de aplicar os questionários a áreas não direccionadas à educação por forma a ver se os resultados divergem. Ainda na questão dos questionários, tentar aplicar o questionário com a escala invertida (1 – discordo totalmente e 5 – concordo totalmente) pois aquando da passagem dos questionários pelos estudantes e, muito embora se tenha feito uma explicação da escala e a mesma constasse no corpo do questionário, verificou-se na análise que haviam nitidamente respostas inversas.

Seria necessário adaptar os instrumentos de recolha de dados deste estudo aos recém aprovados (2015) *Standards and Guidelines for Quality Assurance in the Higher Education Area* que deram origem a uma reavaliação por parte da A3ES sobre os seus referenciais, tendo sido em outubro de 2016, aprovados os novos Referenciais para os Sistemas Internos de Garantia da Qualidade nas IES pela A3ES. Estes referenciais referem que as IES devem assegurar que existem estruturas e procedimentos de garantia da qualidade abrangentes e eficazes no âmbito de cada uma das vertentes nucleares da missão da instituição e das áreas transversais que as suportam, a saber: o ensino e aprendizagem; a investigação e desenvolvimento (ensino universitário) ou a investigação orientada e desenvolvimento profissional de alto nível (ensino politécnico); a colaboração interinstitucional e com a comunidade – incluindo a internacionalização; a gestão dos recursos humanos e dos recursos materiais e serviços de apoio; a gestão e publicitação da informação e a avaliação externa periódica (A3ES, 2016). Assim, seria importante fazer um reajuste dos instrumentos utilizados neste estudo de acordo com estes novos referenciais e ver se os dados sofriam alterações consideráveis.

Para terminar e a título de recomendação, seria importante que as IES nacionais se debruce sobre os últimos estudos, relatórios e recomendações da Comissão Europeia sobre as questões do Ensino Superior e as prioridades para Portugal no que diz respeito a esta questão. Mas, também, que analisem as suas forças internas e as suas melhores capacidades e que as reforcem de modo a irem de encontro à tão mencionada “estratégia global de internacionalização”, não esquecendo os mercados emergentes nesta área, apontados pelos últimos estudos realizados pela Comissão Europeia.

A maior força de qualquer Instituição de Ensino Superior são os seus colaboradores e os seus alunos...só neles está o poder para mudar e criar algo!

ABSTRACT

In this research was analysed the effect of ultrasounds in the content of phenols, hydroxymethylfurfural (HMF) and antioxidant activity (ABTS) present in a monofloral honey after 120 days of storage. The monofloral honey was obtained from the nectar of *Citrus sinensis* and was harvested in May from the municipality of San Felipe Orizatlan in the state of Hidalgo, Mexico. The ultrasound treatment was performed using a Branson 3510 ultrasonic bath with a frequency of 42 kHz and 5, 10 and 15 minutes at a controlled temperature of 20 ° C. After the ultrasound treatment, significant differences ($p < 0.05$) were found in the content of HMF and antioxidant activity (ABTS). In the 15-minute ultrasound treatment, the highest content HMF and antioxidant activity was found with increases of 4.3% and 24.6%, respectively. In phenols no significant differences ($p > 0.05$) were observed between the treatments. At 120 days of storage, significant difference ($p < 0.05$) were observed in the treatments with an increase in phenols, HMF and antioxidant activity. During storage it was found that the increase in HMF in the ultrasound treatments was 58% lower than those found for the control treatment (without ultrasound). The results suggest that the use of ultrasounds is an alternative method to increase the antioxidant properties of honey and decrease the production of HMF during storage.

Keywords: *Citrus Sinensis*, Ultrasounds Treatments, Bioactive Compounds, Antioxidant Activity, Hydroxymethylfurfural (HMF).

1. INTRODUCTION

Since ancient times, honey has been used in the treatment of multiple diseases, due to its natural characteristics with great potential for therapeutic use, which are related to its antimicrobial and antioxidant properties (Bueno-Costa *et al.*, 2016). These properties are related to the active compounds which depend on the floral source, from which it is obtained, as well as the climatic conditions and (Baltrusaityte *et al.*, 2007).

From the point of view of processing of honey, the phenomenon of crystallization is an undesirable property that causes complications in the handling process, affecting the quality due to the humidity change of this phenomenon, which can generate fermentation in the product (Yao *et al.*, 2003). While for the consumer, crystallized honey does not meet the quality standards demanded such as fluidity, scalability and appearance (Kabbani *et al.*, 2011).

In order to solve the phenomenon of crystallization and ensure safety in honey, the processing most used practice is to heat around 80 ° C to increase it is commercial life (Escriche *et al.*, 2008). In general, heat treatments increase the concentration of HMF which is a quality and freshness indicator compound, which is not present in fresh or unheated honeys (Tosi *et al.*, 2004). However a warming may increase phenolic compounds and their antioxidant activity (Pimentel *et al.*, 2015).

The use of emerging technologies also called clean technologies is an alternative for the treatment of honey as a crystallization retardant process. Specifically, ultrasound, with frequencies above 320 kHz, has been reported as an effective method to decrease crystallization, without compromising the functional properties that would be affected by a thermal treatment (Robles & Ochoa, 2012). As it has been observed that in crystallized honeys in addition to the lack of acceptance by the majority of the consumers due to the appearance, the phenolic compounds directly related to the antioxidant activity, are less available, being able to increase this availability by ultrasound (Quintero-Lira *et al.*, 2016).

The objective was to determine the effect of ultrasound on a monofloral honey in its bioactive compounds and its antioxidant properties in storage of 120 days.

2. METHODOLOGY

2.1 Honey

The fresh honey was collected in the month of June of the municipality of San Felipe Orizatlan located in the northern region of the state of Hidalgo with monofloral *Citrus sinensis* nectar and stored in amber bottles to protect it from light.

2.2 Ultrasound treatment

The freshly harvested honey was distributed in test tubes with 15 g of honey each and then exposed to ultrasound using a Branson 3510 ultrasonic bath with a frequency of 42 kHz in times of 5, 10 and 15 minutes at 20 ° C. Tubes were protected from light and stored for further analysis in the following months after treatment.

2.3 Total phenolic

The phenolic content was assessed using the Folin-Ciocalteu method described by Singleton *et al.* (1999). A total of 5 g of sample was diluted into 50 mL of distilled water and filtered through Whatman No. 1 filter paper. A volume of 0.3 mL of the solution as then mixed with 1.5 mL of 0.2 N Folin-Ciocalteu reagent (Sigma–Aldrich, Toluca, Mexico) for 5 minutes and further homogenized with 1.2 mL (0.7 M) of Na₂CO₃. The resulting mixture was measured at 765 nm against a blank solution using a spectrophotometer. The total phenolic content was determined from a standard curve prepared using gallic acid (Sigma–Aldrich, Toluca, Mexico) standard solutions and ranged from 0-200 mg/L. The amount of total phenols is expressed in mg of gallic acid equivalents in 100 g of honey (mg GAE/100 g of honey).

2.4 Antioxidant activity

The antioxidant activity was determined using the chromogenic compound 2, 2'-azino-bis (3-ethylbenzothiazoline-6-sulphonic acid) (ABTS) according Re *et al.* (1999) with some minor modifications. The ABTS was combined with potassium persulphate to generate the ABTS⁺ radical, which was used to determine the antioxidant activity with two readings per sample. The first measurement was performed at minute one and the second measurement was performed at minute six at a wavelength of 740 nm and the results were calculated as ascorbic acid equivalents in 100 g of honey (mg AAE/100 g honey).

2.5 Hydroxymethylfurfural

The 5-hydroxymethylfurfural (HMF) was determined by Carrez (AOAC980.23, 2005). First, 5 g of honey was weighed and dissolved in 25 mL of distilled water. The solution was mixed with potassium ferrocyanide, and then zinc acetate was added and the solution homogenized. The mixture was placed in a 50 mL volumetric flask and filtered, and the first 10 mL was eliminated. Then, 5 mL of the filtered solution was added to each of two test tubes, one with 5 mL distilled water and the other 5 mL of sodium bisulphite 2 %. The tube with water was measured at 284 nm and the tube with sodium bisulphite at 336 nm. Results were expressed as (mg HMF/kg of honey).

3. RESULTS

In the total phenol content, no significant differences ($p < 0.05$) were found between control and ultrasound treatments. (Table 1). For the control the total phenol content was 32.46 mg EAG / 100 g of honey these results was similar to report by Ferreira *et al.* (2009) in monofloral honey from Portugal with 22.6 mg / 100 g and Pimentel *et al.* (2017) in a monofloral honey from the state of Hidalgo obtained from complex flowers with values of 42.08 mgEAG / 100 g of honey.

Table 1. Effect of ultrasound on total phenol content, antioxidant activity and HMF

	Phenols mgEAG/100g of honey	ABTS mgEAA/100g of honey	HMF mg/Kg of honey
Control	32.028 ± 0.146 ^a	61.47 ± 2.852 ^a	4.57 ± 0.022 ^d
U5	31.62 ± 0.772 ^a	71.53 ± 3.254 ^b	4.49 ± 0.025 ^c
U10	31.92 ± 0.48 ^a	72.35 ± 0.819 ^b	4.38 ± 0.031 ^a
U15	32.46 ± 1.368 ^a	76.52 ± 2.112 ^c	4.41 ± 0.019 ^b

Different lowercase letters represent a significant difference ($p < 0.05$) within the column between ultrasound treatments as determined by Tukey comparison of average

U5 treatment of 5 minutes of ultrasound, U10 treatment of 10 minutes of ultrasound, U15 treatment of 15 minutes of ultrasound

Significant differences ($p < 0.05$) were observed between the treatments with ultrasound finding an increase in the antioxidant activity (Table 1). The highest antioxidant activity was found in the 15-minute ultrasound treatment with 76.52 mgEAA / 100 g. These results are similar to those reported by Rodríguez *et al.* (2012) with different samples of commercial honeys in Mexico and higher than those reported by Pimentel *et al.* (2015) in a monofloral citrus honey.

HMF concentration showed significant differences ($p < 0.05$) between treatments. Ultrasound treatment did not increase HMF content. Untreated honey contained 4.57 mg / kg of HMF, this value is similar to report by Pimentel *et al.* (2015) with a multifloral honey subjected to heat treatment, but lower than those reported by Thuran *et al.* (2008) in samples of pine honey from Turkey.

A significant increase ($p < 0.05$) in storage time was found (Figure 1), with an increase in total phenol content up to day 120. Results different from those of Saric *et al.* (2012) who found a decrease in total phenol content during a 360 day storage of a multifloral honey without receiving any treatment. Spanos *et al.* (1990) found an increase of phenolic compounds in the pasteurisation of apple juice.

Figure 1. Effect of storage on total phenol content

Figure 2. Effect of storage on antioxidant activity by ABTS

In Figure 2, it was observed that there were no significant differences ($p > 0.05$) between days 0 and 60 in all treatments in antioxidant activity. At 120 days if significant differences were observed ($P < 0.05$) found in all treatments with an increment. Kahoun *et al.* (2017) found no significant differences in the first 90 days of storage in a drink water of honey with Czech Republic in the antioxidant activity.

As regards the content of hydroxymethylfurfural in figure 3 it is shown that there are significant differences ($p < 0.05$) between storage time. All treatments increased the HMF, but values were still below the established standards (AOAC980.23, 2005). The 10-minute ultrasound treatment showed the smallest increase, results comparable to those found by Quintero *et al.* (2016), the behaviour of HMF concentration with respect to time agrees with that described by Wang *et al.* (2004) finding increases in HMF in raw clover honey during 6 months of storage at room temperature.

Figure 3. Effect of storage on the content of hydroxymethylfurfural

4. CONCLUSIONS

The use of ultrasound is an effective alternative to preserve the quality of honey by not showing an increase in HMF content due to its application, increase total phenols and improve antioxidant activity during the storage period.
