INTRODUCTION

Interdisciplinarity is the main topic and the main goal of this conference.

Since the sixteen century with the creation of the first Academy of Sciences, in Napoles (Italy) (1568), and before that with the creation of the Fine Arts Academies, the world of science and arts began to work independently, on the contrary of the Academy of Plato, in Classical Antiquity, where science, art and sport went interconnected. Over time, specific sciences began to be independent, and the specificity of sciences caused an increased difficulty in mutual understanding.

The same trend has affected the Human and Social Sciences. Each of the specific sciences gave rise to a wide range of particular fields. This has the advantage of allowing the deepening of specialised knowledge, but it means that there is often only a piecemeal approach of the research object, not taking into account its overall complexity. So, it is important to work for a better understanding of the scientific phenomena with the complementarity of the different sciences, in an interdisciplinary perspective.

With this growing specialisation of sciences, Interdisciplinarity acquired more relevance for scientists to find more encompassing and useful answers for their research questions.

CIEO (Research Centre for Spatial and Organizational Dynamics) organises this conference, being Interdisciplinarity an important issue.

It is focused on social sciences with an integrative focus in the questions of well-being in society, and it is funded by the Foundation for Science and Technology. FCT rated CIEO with a classification of “Very Good” and one of the main reasons for this good evaluation was surely our potential for Interdisciplinarity.

CIEO has researchers from various scientific fields, and one of its main features is to develop knowledge from the interactions between complementary scientific areas of interest.

This conference was an excellent opportunity for strengthening and enriching our interdisciplinary systematic approach, not only for the CIEO members, but also for all the delegates researching in different scientific fields.

It was also an opportunity to show innovative research in social and human sciences, and to improve networks between researchers from different scientific disciplines.

The conference themes included topics from the following scientific fields: Economics, Management, Sociology, Psychology, Education, Sport, Tourism, Landscape Architecture, Geography and Political Sciences, just to mention a few.

As the CIEO is structured along three research areas, we have tried to organize the communications in parallel sessions corresponding to these three areas: 1) Cities and Spatial Dynamics; 2) Organizations, Innovation and Learning Spaces; 3) Tourism, Communities and Behaviour. There was also a significant number of communications included in the category of “Other topics”.

In this conference we had more than 300 communications presented in symposiums, parallel sessions, conferences and posters.

The diversity of papers and communications submitted enabled us to compile a scientific program which builds a bridge between theory and application. With its multidisciplinary focus, the scientific program covered a large number of topics, which we hope will provide many opportunities for stimulating exchange between participants in an interdisciplinary perspective.

Participants came from several countries, namely from Spain, Brazil and Portugal, and so, although the official language of the congress was English, presentations in Portuguese and Spanish were permitted.

In this “Book of Proceedings” papers could be written in English, Portuguese and Spanish.

101 of the communications presented at the conference are published here. They are organized in six parallel sessions and posters, corresponding to the structure of the conference program.

We believe this book can be an important contribution to establish the state of the art in the field of Interdisciplinarity in Social and Human Sciences.

TABLE OF CONTENTS

Introduction	3
PARALLEL SESSION I.....	7
Utilización de internet en la promoción de estrategias de éxito en la universidad	8
Liderança para a melhoria dos resultados escolares: Estudo de caso	15
Evaluation of stakeholder engagement of Brazilian companies: A text mining approach	25
Influence of personal characteristics of nursing professors in Brazil and Portugal on their organizational commitment	35
Influence of sustainability and innovation on the entrepreneurial intention of brazilian and portuguese university students	47
Cartografias contemporâneas – Olhar a natureza, regressar à cidade	61
Why does language matter? Evidence from EU and MERCOSUR trade	68
Equidade e bem-estar no uso de paragens de autocarro	80
The social and spatial structures in management situations	91
Sociology of tourism education in Argentina: An analysis of the educational offer and research structures in tourism	101
PARALLEL SESSION II.....	114
Régimen de responsabilidad en la contratación de viajes vinculados	115
¿Quo Vadis Derecho turístico de la Unión Europea? A propósito de las competencias normativas de las regiones del estado español	122
Bienes comunales y bienes comunes: Viejas y nuevas estrategias para una gestión sostenible del territorio	134
Análisis de las políticas de inclusión y acogida de inmigrantes en Europa	144
Promotion of the economy and social development in Honduras. Integrated municipal markets (MERCOIM): Master plan and logical framework	156
Implementing continuous improvement. The case of Cantabria	162
Collective action and tourism	173
Food and nutritional education in schools	183
Analysis of the viability a non-invasive cardiologic method of diagnosis and its contribution for the patient's quality of life	187
Espacios de aprendizaje de nueva generación en la formación profesional	192
Interdisciplinarity and interprofessionality in professional master's: Concepts, practices and skills developed according to master's students	197
The implementation of a core of university extension of transdisciplinarity and entrepreneurship: A proposal for professional complementation for the market	205
The phases of serial killers	213
Espacios verbales del lenguaje visual: Arteterapia y secuencias narrativas en personas mayores	221
PARALLEL SESSION III.....	282
Los trabajadores fronterizos y su afectación turística	283
Construção de testes de escolha múltipla	291
WOLFRAM ALPHA: Uma ferramenta de aprendizagem ativa em Cálculo I	301
Innovation as a mediating variable on the cooperation and performance of agribusinesses	307
Comportamiento del consumidor de turismo gastronómico en sistemas conversacionales de mensajería móvil: Los chatbots	315
Study of female entrepreneurship. An empirical evidence in the municipality of León in Nicaragua	323
The quality of life as presupposed by the social management in public politics	335

<u>The azorean-madeiran (i)migration of middle of the eighteenth century and the process of occupation and spatial organization of the Santa Catarina Island, southern of Brazil.....</u>	340
<u>The different dimensions of urban public space and its influence on designing plans and projects of urban restructuring.....</u>	348
<u>A paisagem sonora de Évora no século XVII: Perspectivas a partir da actividade musical das instituições religiosas da cidade</u>	355
<u>Evaluation of customers satisfaction in hypermarkets: The impact of national culture and SERVQUAL dimensions.....</u>	360
<u>Cod-nations: Trade of an expanding commodity.....</u>	370
<u>Gender relations within the social stratification in female employment in rural India.....</u>	379
<u>Trabajar por proyectos en educación primaria: Una experiencia desde ciencias.....</u>	396
<u>Trabajar actividades económicas en el Grado de Educación Primaria: Una experiencia en la Ciudad del Arcoíris.....</u>	417
 PARALLEL SESSION IV	423
<u>Prediction of irregular socio-economic data</u>	424
<u>Modelo matemático + sistema físico = teoria dos sistemas.....</u>	433
<u>Aplicações de transformadas integrais em processamento de sinais</u>	442
<u>Bem-estar psicológico e rendimento académico: Um estudo com estudantes do ensino secundário.....</u>	445
<u>Dream makers Erasmus+ project: A creative approach to education.....</u>	452
<u>Determinantes da indisciplina escolar em alunos do 2.º e 3.º Ciclo do Ensino Básico</u>	459
<u>A utilização de aprendizagem ativa no ensino superior resulta num melhor desempenho do aluno?</u>	466
<u>A assimetria do coeficiente de correlação e propriedades na detecção de variáveis endógenas.....</u>	472
<u>Estratégias de aprendizagem ativa versus aprendizagem tradicional: Resultados de um pequeno estudo de caso</u>	479
<u>Educação financeira: Um projeto piloto para a educação e formação de adultos e para a formação contínua de professores e educadores.....</u>	486
<u>Atividades experimentais no ensino das ciências: Reações dos professores no âmbito de um curso de formação continuada.....</u>	497
<u>The use of a global management simulator to consolidate transversal knowledge.....</u>	505
<u>Attitudes towards social robots: The role of gender, belief in human nature uniqueness, religiousness and interest in science fiction</u>	509
<u>Who wants to work with social robots? Using the theory of reasoned action and the theory of planned behavior to predict intention to work with social robots.....</u>	515
<u>Pedestrian and cycling routes and paths: Tourist animation in the Algarve.....</u>	523
<u>The relevance of cross-border cooperation (CBC) processes to achieve territorial cohesion and sustainable development.....</u>	542
<u>Quality of life of students in an undergraduate nursing course from a portuguese public school.....</u>	552
<u>Innovation as an ally of strategic management in small and medium business enterprises: A case study of Brazil</u>	568
<u>Innovation management in micro and small commercial enterprises: An analysis of the level of innovation</u>	580
<u>Sociedade algorítmica, pluriactividade e rendimento básico universal (RBU): Uma utopia para o século XXI?</u>	587
<u>Como os alunos jovens vêem a escola do século XXI?.....</u>	595
<u>Relationship between education in pharmaceutical sciences and profession: An interdisciplinary perspective</u>	601
<u>Teaching in two cycles of professional life: A comparative brazilian case study.....</u>	609
<u>Achievement goals profiles in school physical education: Differences at the nature of athletic ability beliefs.....</u>	616
 PARALLEL SESSION V.....	623
<u>People, ageing communities and diversity.....</u>	624
<u>Community interventions to promote healthy aging.....</u>	631
<u>Retirement experiences, mental health and quality of life in seniors of the republican national guard transit detachment of Beja</u>	638

Sense of community and productive aging: Protective factors of wear of an elderly informal caregiver	648
Interactive introduction to first-order ordinary differential equations and its applications	656
Solving second-order linear ordinary differential equations by using interactive software	664
Bilingual teaching in Algarve and its advantages	674
Extending the social tradition on organisational learning - ethics, gender and citizenship	679
Sustentabilidade: Práticas na hotelaria	686
Diabetes literacy among higher education students	698
Mental health and sleep-vigil disturbances in high school students: Sleep hygiene consultation	707
Reaching for the moon: An observational study on the invisibility of women in city urbanization	713
The cinematographic cultural practice in the pedagogy students teaching training	719
Impact of service quality, brand image, perceived value, customers' satisfaction and behavioural intentions in the traditional retailing in the north of Portugal	726
Padrões de mobilidade do idoso em Faro	738
Incorporação da experiência de consumo no desenho do serviço de alojamento hoteleiro no Alentejo	747
Macho onde?! Mal onde?! Corpo, identidade e saúde em clínicas de fisioterapia	761
Structural empowerment and satisfaction in nursing work in primary health care	769
Escola: Cenário de violência simbólica	776
Initial motivation and pedagogical support to physical education academics of unipampa-rs as spaces to learn positively	779
 PARALLEL SESSION VI.....	785
Consumer behaviour of babies mothers. Repercussions in the psycophysical separation	786
Education today: $12 + 5 < 4$ – lessons of educational reforms in Portugal and beyond	798
Knowledge-based economy	806
Hotel rating procedure and wellbeing. Adapting criteria to promote energy efficiency	816
The olympic gaze	830
Service culture as a key determinant in services marketing	840
Transformações urbanas em Santos SP Brasil: Turismo como uma alternativa para promover o bem estar	849
Literacia estatística: A importância das competências básicas	867
Vulnerabilidades e solidariedades em contexto urbano	878
Determinantes psicossociais no trabalho e sua relação com variáveis de saúde psicológica em condutores profissionais rodoviários	882
The determinants of teachers' satisfaction and its influence in strategic management of human resources in the institute of education sciences in Kwanza South province	895
Educação afetivo-sexual e prevenção de abusos sexuais em lares de acolhimento de menores	904
Psicología del lenguaje diplomático y político	918
Assessing the impact of precision agriculture techniques in maize production under mediterranean conditions	929

Juan Tobal
Universidad Complutense de Madrid

RESUMEN

Muchos alumnos inician los estudios superiores sin las competencias necesarias para superar con éxito las dificultades de este nivel de estudios. Varios autores han identificado como causas del fracaso escolar factores personales, académicos y psicosociales. Basado en estos factores, se ha desarrollado un curso on-line de competencias de organización personal y métodos de estudio. Participaron en esta investigación-acción 42 alumnos universitarios, 21 de ellos del grupo control. Como instrumento de evaluación fue utilizada la Escala de Evaluación de Estilos de Vida y Métodos de Estudio para la Educación Superior (Martins & Jesus, 2007). Esta escala se aplicó tanto antes como al final del curso. Los resultados demostraron que los alumnos que han seguido el curso mejoraron significativamente su desempeño respecto a la organización personal y adquisición de estrategias de estudio eficaces. La eficacia del programa se acentúa porque en el grupo control no se verificaron alteraciones significativas en las variables estudiadas.

Palabras-clave: Programa de Intervención, Éxito Académico, Estilos de Vida, Métodos de Estudio, Alumnos Universitarios, Gestión del Tiempo, Ansiedad.

1. INTRODUCCIÓN

Los estudios superiores requieren competencias de estudio que muchas veces no fueron desarrolladas previamente, visto que los alumnos tienen que adaptarse a nuevos métodos de estudio, así como a ritmos de aprendizaje más exigentes. Además, los cambios psicosociales aumentan los niveles de estrés y la dificultad en organizar nuevos horarios, tareas académicas y personales que pueden comprometer el rendimiento escolar (Santos y Almeida, 2001).

Existen diversos modelos que debaten los factores que interfieren en el desempeño escolar de los alumnos. Walberg (1982) o Tinto (1987), por ejemplo, han estudiado el conjunto de factores que parecían influenciar a los alumnos del ensino universitario. Estos modelos, comprobados por diversas investigaciones posteriores, destacan factores individuales, factores académicos y factores psicosociales (Bruinsma y Jansen, 2007; Jansen, 2004; Ma y Wang, 2001; Wang y Staver, 2001).

En el primero grupo de factores destacan la auto-confianza (e.g. Eccles y Wigfield, 2002; Garger, Thomas, y Jacques, 2010), la autonomía personal (e.g.; Lamborn y Groh, 2009) motivación (e.g. Eccles & Wigfield, 2002; Martins, Pacheco y Jesus, 2008), la procrastinación y la gestión del tiempo (Bruinsma y Jansen, 2007, 2009).

Respecto de los factores académicos, se ha comprobado una relación entre los conocimientos previos del alumno, la utilización de métodos de estudio adecuados (Jansen, 2004; Van der Hulst y Jansen, 2002; Santos y Almeida, 2001), la percepción de la calidad evaluación/encino, el tiempo de estudio y el éxito escolar (Bruinsma y Jansen, 2007).

Por último, los alumnos con mejor apoyo social, es decir una buena relación con amigos, compañeros y familia, y con un buen ambiente en clase tienen más satisfacción personal (e.g. Yalçin, 2011), menor estrés y mejor rendimiento académico (Feldman, Gonçalves, Puignau, Zaragoza, Bagés, y Pablo, 2008; Jansen y Bruinsma, 2005).

A pesar de que algunos autores defienden que el ingreso en la universidad debe ser un proceso de independización del alumno y que estos deben, si es posible, intentar por sí mismos adquirir estrategias eficaces para lidiar con los nuevos problemas que surgen (Ferreira y Hood, 1990; Mather y Winston, 1998; Taub, 1995), otros autores consideran complejo este proceso. Para estos autores se debe ofrecer a los alumnos ayuda específica para una mejor adaptación y superación de las dificultades encontradas (Ferraz & Pereira, 2002; Jesus, 2002; Nelson *et al.*, 1993; Schunk y Zimmerman, 1998; Wolters, 1998).

Así, es importante definir programas de intervención que fomenten la adquisición de capacidades y promuevan el desarrollo y autonomía de los alumnos, contemplando no solamente la aprendizaje de métodos de estudio si no también las competencias personales que van permitir un mejor ajustamiento al contexto universitario.

Muchas universidades tienen centros de apoyo al alumno a un nivel psicológico. Por un lado, tienen intervención individual con alumnos con problemas y, por otro, desarrollan programas para mejorar el desempeño escolar de sus alumnos, focalizándose en los alumnos de primer año. No obstante, esos programas raramente son evaluados para detectar su eficacia y publicados para conocimiento científico. De esta manera, es muy difícil encontrar programas de intervención dirigidos a

la educación superior con eficacia comprobada. Todavía, los programas encontrados en la literatura muestran resultados positivos en la salud psicológica de los alumnos y hay una incrementación de los resultados.

Tavares *et al.* (2006) han realizado un programa de intervención en la Universidad de Aveiro (Portugal) con base en la creación de una asignatura de opción libre con el objetivo de dotar los alumnos de estrategias que permitan la obtención de un mejor rendimiento escolar. La asignatura fue considerada por los alumnos que la frecuentaran como muy importante para el desarrollo de estrategias de métodos de estudio. Sin embargo, las dificultades relativas a los horarios para frecuentar la asignatura llevaron a que muchos alumnos no participasen.

Iglesias *et al.* (2005) también han demostrado la eficacia de un programa de control del estrés, donde los alumnos bajaron los niveles de estrés, ansiedad, furia y neuroticismo.

En hecho, la adhesión a cualquier tipo de programa de prevención con estudiantes tiene sido un problema en la implementación del programas de intervención. Puede ser que los estudiantes crean que no tengan tiempo para participar, se queden desmotivados e poco interesados, por desconocieren los beneficios de este tipo de intervención. Algunos alumnos solamente piden ayuda cuando su nivel de mal estar no es más soportable, otros tan poco llegan a pedir ayuda y abandonan sus estudios.

En este sentido, Brown (2000) desarrolló un programa sustentado por un soporte informático, para alumnos del encino secundario, donde los participantes han aprendido diversos tipos de competencias, necesarias para un mejor desempeño escolar: competencias de estudio, escrita, presentación de trabajos, investigación y pensamiento. Chiauzzi, Brevard, Thurn, Decembrele, y Lord (2008) han desarrollado un programa a través de internet para el control del estrés con una grande adhesión de los alumnos. Los alumnos han disminuido los niveles de estrés, mejorado las relaciones familiares y cambiando algunos estilos de vida, como la práctica de ejercicio físico.

Actualmente, cada vez más estudiantes utilizan frecuentemente internet tanto para actividades lúdicas, como para buscas académicas. Muchos profesores disponen los resúmenes, apuntes u otro tipo de recursos a través de este medio. De esta manera, internet es un recurso en permanente ascenso y que cuenta cada vez con más usuarios, permitiendo la enseñanza a la distancia y facilitando la interacción y el feedback (Arenas & Hernández, 2002). Así, parece ser un medio muy importante para llegar más fácilmente a los alumnos, incrementando los niveles de motivación y adhesión.

La organización de un curso de aprendizaje de métodos de estudio y otro tipo de competencias para conseguir el éxito escolar debe, así, atender a algunos aspectos como la flexibilidad del horario y el atractivo de los contenidos y de la presentación del curso.

Para eso, se cree que la informática tiene muchas opciones que contemplan estas dos características.

Centrado en estos presupuestos, el objetivo de este artículo es desarrollar un curso de competencias de estudio que tenga en cuenta los intereses de los alumnos y que englobe los factores identificados como determinantes en el desempeño académico.

2. MÉTODO

2.1. Sujetos

Al inicio del estudio, 31 alumnos de diversos cursos de la Universidad del Algarve (Portugal) se han presentado voluntarios para participar en un programa sobre métodos de estudio. No obstante, solamente 21 de esos alumnos rellenaron el cuestionario al final del programa, representando la muestra analizada. Los participantes tenían edades comprendidas entre los 18 y 25 años ($M = 21,2381$), siendo 14 del sexo femenino y 7 del sexo masculino.

Para constituir el grupo control fueron seleccionados 21 cuestionarios al azar de un grupo de alumnos voluntarios que no participaron en el curso y que respondieron al cuestionario en los dos momentos de evaluación. En la selección de los cuestionarios se intentó la equivalencia del género, pero no ha sido posible la equivalencia de la edad.

Así, la distribución por género fue la misma (14 del sexo femenino y 7 del sexo masculino) y las edades variaran entre 18 y 28 años ($M = 22,38095$).

2.2. Material

Para la realización del curso de competencias de organización personal y métodos de estudio, fue construido un programa de dos módulos presentados en una animación del tipo Microsoft PowerPoint a la que podían tener acceso los alumnos inscritos a través del portal de la Universidad de Algarve.

El primero módulo englobaba contenidos relacionados con la calidad de vida y bienestar, como la gestión del tiempo, los hábitos personales y las condiciones de trabajo. El segundo módulo, a su vez, incidía en la motivación y en las metodologías de estudio, como las técnicas de estudio, de lectura, esquematización y resumen, las clases y los exámenes.

Para evaluar la eficacia del programa se ha recurrido al “Questionário de Avaliação de Estilos de Vida e Métodos de Estudo” (cuestionario de evaluación de estilos de vida y métodos de estudio), desarrollado para la población universitaria por Martins y Jesus (2007). El cuestionario presenta una buena fiabilidad, bien como escala global ($\alpha = 0,853$), bien en cada una de las sub-escalas: organización personal ($\alpha = 0,779$) y métodos de estudio ($\alpha = 0,749$). La primera sub-escala permite conocer los hábitos relativos a gestión del tiempo, procrastinación, sueño, ejercicio físico, ansiedad, condiciones ambientales, condiciones personales y motivación. La segunda sub-escala evalúa la interacción en las clases y exámenes, así como en los hábitos de estudio relativos a lectura, esquematización, resumen, ejercicios, comprensión y concentración. Para cada uno de los 36 ítems del cuestionario, el sujeto debe indicar la frecuencia con que ejecuta las acciones indicadas a través de una escala

tipo Lickert de 1 a 5 (siempre, casi siempre, algunas veces, casi nunca, nunca). Algunos ítems se encuentran formulados al revés, siendo la acotación invertida.

2.3. Procedimiento

El curso de métodos de estudio fue divulgado en los distintos campus de la Universidad del Algarve, con el objetivo de encontrar alumnos voluntarios para participar en el programa.

En un primer momento, los alumnos tenían 15 días para rellenar el cuestionario a través de su área personal en el portal de la Universidad del Algarve, para confirmar su inscripción en el curso de competencias personales y métodos de estudio. Después de ese periodo, los alumnos inscritos podrían acceder al primer módulo en los primeros diez días y al segundo módulo en los diez días finales. En la plataforma se ha dejado también actividades para practicar los contenidos y un chat para aclarar dudas y cambiar impresiones.

Para la visualización de cada uno de los módulos del curso, el alumno tenía que consultar una asignatura creada para permitir la visualización del material del curso y la interacción entre los alumnos y el tutor. Para que los participantes pudiesen consultar más fácilmente los contenidos se ha permitido el download de los mismos. Las actividades eran entregadas a través de la plataforma o por correo electrónico y el alumno recibía el feedback después de la corrección hecha. Dos semanas después del término del segundo módulo los sujetos respondían nuevamente al cuestionario inicial, enviado por correo electrónico.

Para el grupo control, se ha pedido a varios sujetos a través del correo electrónico personal de alumno que rellenasen un cuestionario quince días antes del inicio del curso. Quince días después del final del curso, se volvió a pedir, utilizando el mismo método, que rellenasen el cuestionario, basándose en su experiencia en la última semana.

3. RESULTADOS

Para evaluar la eficacia del curso implementado a lo largo de 20 días, el cuestionario ha sido aplicado al inicio y al final del curso. Los resultados de los dos cuestionarios fueron comparados a través del “Paired Sample T-Test” para las dos sub-escalas, en su global, y para cada conjunto de los ítems, teniendo en cuenta el grupo experimental y el grupo control.

Respecto a la primera sub-escala que corresponde a la Organización Personal, en el primer momento de evaluación los alumnos que acudieron al curso obtuvieron una media de 3,114, subiendo hasta un 3,410 en el segundo momento de la evaluación ($t = -6,412$). Para la segunda sub-escala, las medias obtenidas en el primer y segundo momento de evaluación fueron de 2,917 y de 3,307 respetivamente ($t = -6,983$). A pesar de que la diferencia media fue más acentuada en la segunda sub-escala (-0,390 versus -0,296), se constata una diferencia significativa en ambas ($p = 0,00$). El grupo control presentó en la sub-escala 1 una media de 3,239 en el primer momento de evaluación y de 3,178 en el segundo momento. La diferencia de 0,061 no se reveló significativa ($p = 0,106$). En la sub-escala dos, la media del primer cuestionario fue de 3,375, bajando hasta 0,103 en la segunda evaluación. La diferencia de 0,103 no se presenta significativa ($p = 0,084$).

Al analizar cada conjunto de los ítems de la sub-escala uno – Organización Personal (Tabla 1) se verifica la existencia de una diferencia significativa para la mayor parte de los conjuntos de ítems en el grupo experimental, excepto para los ítems de ejercicio físico y condiciones personales. Los ítems relativos a gestión del tiempo, sueño y ansiedad obtuvieron una diferencia media entre el primer y el segundo cuestionario más acentuada que los restantes ítems (0,507, 0,477 y 0,476 respectivamente).

Tabla 1. Resultados antes y después para los ítems de la sub-escala Organización Personal

	Grupo Experimental			Grupo Control		
	Antes	Después	<i>t</i>	Antes	Después	<i>t</i>
Gestión del Tiempo	2.429	2.936	-5.207**	2.873	2.841	0.641
Procrastinación	3.000	3.349	-3.736**	3.412	3.325	0.932
Sueño	2.571	3.048	-3.627**	2.786	2.691	0.722
Ejercicio Físico	3.191	3.238	-0.370	2.714	2.571	1.142
Ansiedad	2.905	3.381	-3.760**	3.548	3.595	-0.418
Cond. Ambientales	3.988	4.214	-2.321*	3.580	3.651	-0.679
Cond. Personales	3.405	3.571	-1.673	3.655	3.458	1.181
Motivación	3.112	3.429	3.298**	3.343	3.293	0.674

Nota. Los valores presentados se refieren a las medias obtenidas en el cuestionario presentado en el inicio y al final del curso.

* $p < .05$ ** $p < .01$

Los ítems sueño y ansiedad que presentaron inicialmente una media negativa (por debajo de 3) han subido hasta un resultado positivo en la evaluación realizada en el segundo momento.

Respecto del grupo control, no se reveló significativa ninguna de las diferencias, a pesar de que los valores encontrados para los ítems ejercicio físico y condiciones personales demostrasen diferencias más elevadas.

La Tabla 2 presenta los resultados referentes a los ítems evaluados en la sub-escala 2 – Métodos de Estudio. En el caso

del grupo experimental, todos los conjuntos de ítems revelan diferencias significativas entre los resultados presentados en el primer y en el segundo momento de evaluación. La diferencia media más grande se verifica en los ítems referentes a las técnicas de resumen y de lectura (0,572 y 0,556 respectivamente).

Tabla 2. Resultados antes y después para los ítems de la sub-escala Métodos de Estudio

	Grupo Experimental			Grupo Control		
	Antes	Después	<i>t</i>	Antes	Después	<i>t</i>
Lectura	3,246	3,802	-6,217**	3,334	3,165	1,183
Esquematación	3,500	3,905	-4,250**	3,377	3,286	0,799
Resumen	2,738	3,310	-5,435**	2,833	2,833	0,000
Ejercicios	3,476	3,929	-4,663**	3,643	3,619	0,295
Comprensión	3,238	3,476	-2,024*	3,929	3,786	1,000
Concentración	2,619	3,048	-3,544**	3,286	3,191	1,000
Clases	3,095	3,381	-3,294**	3,238	3,131	1,253
Exámenes	2,714	3,095	-4,985**	3,357	3,167	1,793

Nota. Los valores presentados se refieren a las medias obtenidas en el cuestionario presentado en el inicio y al final del curso.

* $p < .05$ ** $p < .01$

Los ítems que obtuvieron una media negativa antes de la realización del curso en el grupo experimental (resumen, concentración y exámenes) han subido hasta medias positivas en la evaluación siguiente, no registrándose ningún ítem con resultados inferiores a 3 en la evaluación hecha después del curso.

Tal y como ha sucedido con el grupo control en la sub-escala 1, ninguno de los ítems presenta diferencias significativas entre los dos momentos de evaluación.

4. DISCUSIÓN

El presente estudio demuestra la eficacia de un curso de aprendizaje de estrategias de calidad de vida y métodos de estudio. Los alumnos que siguieron el curso presentaron mejoras significativas en sus habilidades, tanto en la organización personal, como en la utilización de métodos de estudio adecuados.

A través del análisis de los resultados se verificó, por un lado, que los alumnos que siguieron el curso mejoraron significativamente en casi todos los ítems evaluados en las dos sub-escalas del cuestionario. Por otro lado, los alumnos que no siguieron el curso no mejoraron significativamente en ningún área. Los resultados obtenidos fueran los esperados, en la medida en que el curso fue construido con base en las áreas donde los alumnos presentan mayores dificultades, identificadas anteriormente en varios estudios (Bruinsma y Jansen, 2007; Jansen, 2004; Ma y Wang, 2001; Wang y Staver, 2001). Además, otros autores que implementaron cursos de métodos de estudio obtuvieron resultados positivos, aunque la evaluación del programa hubiera sido realizada mediante procedimientos cualitativos (Brown, 2000; Tavares *et al.*, 2006). Por otra parte, los cursos de control del estrés también han presentado resultados positivos (Chiauzzi *et al.*, 2008; Iglesias *et al.*, 2005). Estos resultados muestran la eficacia de estos cursos en la calidad de vida de los alumnos, mejorando sus competencias.

Extrañamente, los alumnos que no siguieron el curso bajaron sus medias en la segunda aplicación del cuestionario. Estos valores, a pesar de no ser significativos, pueden ser explicados por el momento en que el cuestionario fue rellenado. El primer momento, al inicio de Mayo, corresponde a una época de clases, mientras que el segundo momento, en Junio, es un periodo de exámenes. En esa época es normal un cambio de métodos de estudio y estilos de vida, en la medida en que muchos alumnos no realizan un estudio continuado, pero sí poco antes del momento de evaluación de la asignatura (König y Kleinman, 2005). Además, debido a la acumulación de contenidos para estudiar y la falta de estrategias eficaces para hacerlo, se produce una disminución de la práctica de ejercicio físico, de actividades sociales y de divertimento, evaluados por los ítems de las condiciones personales. Todo esto puede traducirse en un aumento de la ansiedad y disminución en la práctica de actividad física (Giacobbi, Tuccitto, y Frye, 2007). De este modo, es de destacar que los alumnos que siguieron el curso, no disminuyeron sus actividades lúdicas y sociales o la práctica de ejercicio físico. Así, a pesar de que los resultados no fueran significativos, el pequeño aumento de estas prácticas puede ser considerado como positivo, atendiendo a esta época específica.

Se destaca que los ítems que han revelado diferencias menos acentuadas son ítems relacionados con la personalidad y por eso tienen un carácter más estable, como por ejemplo la tendencia a procrastinar, el gusto por la práctica de ejercicio físico, las condiciones personales (hábitos de socialización y bienestar psicológico), la motivación, la comprensión de la materia, la participación activa en las clases o la preparación de los exámenes (Almeida, 2002; Ferraz y Pereira, 2002).

Los ítems relacionados con el aprendizaje de métodos de estudio prácticos fueron implementados más fácilmente en la rutina académica, como fue el caso de las técnicas de lectura, esquematización, resumen y concentración. Las técnicas relacionadas con la higiene del sueño y la gestión de tiempo, como la ejecución de un horario semanal, donde se prevén horas para el estudio, para el divertimento, para las actividades físicas y para los hábitos personales (alimentación, sueño y

higiene personal) también fueron fácilmente aprendidas por los alumnos, debido posiblemente a su carácter eminentemente práctico.

Posiblemente, la mejora del control de la ansiedad está relacionada con el aumento de las competencias a nivel de organización personal y de métodos de estudio. Costa y Boruchovich (2004), en un estudio donde relacionaron la ansiedad con las estrategias de aprendizaje, han constatado que los alumnos que no utilizan estrategias de estudio presentan niveles de ansiedad superiores a los alumnos que utilizan estrategias de estudio simplificadas. A su vez, los alumnos que utilizan estrategias de estudio complejas tienen menores niveles de ansiedad respecto a los otros dos grupos referidos (utilización de estrategias de estudio simplificadas y no utilización de estrategias de estudio).

A pesar de existir una mejoría significativa de las competencias de organización personal y métodos de estudio, la mayor parte de los resultados obtenidos en la segunda aplicación del cuestionario, no sobrepasa los 4 valores. Este resultado puede significar que los alumnos no llegaron un nivel de adquisición de competencias de organización personal y métodos de estudio muy elevado. Posiblemente sería necesario un curso con contenidos más detallado que permitiese a los alumnos más tiempo para entrenar los contenidos abordados.

Uno de los puntos discutidos en la introducción remitía a la utilización de internet como modo de aumentar la adhesión a los cursos de métodos de estudio. La adhesión a este curso no fue muy elevada (inicialmente 31 sujetos), a pesar de ser a través de internet y en un periodo de tiempo reducido (un mes). No obstante, no se utilizó ningún tipo de incentivo, como la equivalencia del curso con créditos ECTS (Tavares *et al.*, 2006), aspecto que se pretende concretar en futuras intervenciones.

Otra de las limitaciones pertinentes es la presentación del curso on-line. Puede ser que con esta modalidad, los alumnos tengan más dificultad en percibir la realización de algunas tareas como los ejercicios de relajación y no lo comuniquen al tutor. En futuras investigaciones pretendiese aplicar el curso también presencialmente para percibir se existen diferencias entre la modalidad presencial y on-line.

A pesar de los resultados positivos de esta investigación, se recomienda futuros trabajos que puedan comprobar los beneficios de este tipo de intervención. El hecho de utilizar una muestra reducida y de que el grupo control no presentara los mismos niveles medios para los ítems en cada una de las sub-escalas, son limitaciones que deben ser superadas en futuras investigaciones.

Por otra parte, se deben evaluar estrategias que motiven los alumnos a seguir este tipo de cursos, ya que se verifican bajas tasas de adhesión en los programas de este tipo (Brown, 2000; Tavares *et al.*, 2006). Se sugiere la creación de una asignatura orientada para la adquisición de competencias personales y de métodos, que permita a los alumnos obtener créditos ECTS con su participación.

La eficacia de los métodos de estudio utilizados depende muchas veces del tipo de materia enseñada en cada asignatura. Así, es importante correlacionar el éxito de las estrategias utilizadas con el tipo de curso que los alumnos frecuentan. Para eso, es necesario tener una muestra representativa de cada carrera, imposible de realizar en este estudio. Podría ser útil, para comprobar si un periodo de enseñanza más extenso posibilita la obtención de mejores resultados, un análisis con base en la extensión de curso.

Otra de las limitaciones presente en esta investigación es el hecho de no ser comprobado en la práctica, a través de los resultados curriculares, el éxito escolar de los alumnos que han participado en el curso. Se sugiere para futuras investigaciones, contemplar los resultados obtenidos en momentos anteriores de evaluación, comparándolos con los resultados obtenidos en momentos de evaluación posteriores a la realización del curso. Se recomienda también que sea aplicado el mismo cuestionario en un tercer momento, algunos meses después de la participación en el curso, para verificar la permanencia de los resultados.

En su aspecto global, y teniendo en cuenta los resultados obtenidos y el *feedback* de los participantes, el curso on-line si ha revelado mucho positivo para los alumnos, demostrando poder ser eficaz para mejorar las competencias de organización personal y métodos de estudio que pueden contribuir para su éxito académico.

Es que ya se hizo un estudio preliminar de la adaptación de la Escala de Evaluación de Estilos de Vida y Métodos de Estudio para España (Martins, Casado, Jesus & Tobal, 2011), y ahora estamos adaptando el programa de intervención para que pueda ser aplicado a los estudiantes en las universidades españolas.

LIDERANÇA PARA A MELHORIA DOS RESULTADOS ESCOLARES: ESTUDO DE CASO

Maria Helena Santos Gregório

Centro de Investigação sobre o Espaço e as Organizações

(mhgregorio@ualg.pt)

RESUMO

Desenvolvemos este trabalho com o propósito de analisar e compreender como o contrato de autonomia determina ou influencia a gestão das organizações escolares. Nestas organizações, a descentralização, a autonomia e a liderança para a melhoria dos resultados escolares dos alunos têm vindo a receber mais atenção na sua compreensão e análise.

Seguimos a metodologia de investigação qualitativa e optámos pelo estudo de caso, de escolas da região algarvia. Para a análise dos dados recolhidos junto de líderes escolares (de topo e lideranças intermédias), utilizámos a análise de conteúdo, realizada através de computador. Os resultados apurados são apresentados numa perspetiva análise global.

Encontramos, nos resultados apurados, indicadores referentes a descrições sobre como se vivenciam, no dia-a-dia, os processos de gestão e de liderança. Estes não se referem apenas ao contratualizado e ao modo como as escolas tiveram que criar condições para a sua aplicação, mas também em vários âmbitos e extensões do desenvolvimento organizacional e profissional. Destacam-se os papéis desempenhados pelas lideranças de topo e lideranças intermédias (distribuídas), que se tornaram mais assertivas e com uma ação mais robusta na obtenção dos melhores resultados dos alunos.

Palavras-chave: Políticas Educativas, Organizações Escolares, Contratos de Autonomia, Liderança para a Melhoria.

JEL Classification: I28

1. INTRODUÇÃO

A gestão educativa é uma atividade complexa que abrange todos os sistemas de uma organização escolar (Formosinho, Fernandes, Machado & Ferreira, 2009). O projeto piloto de contratos de autonomia e desenvolvimento das escolas veio acrescer a complexidade da sua gestão ao introduzir alguns aspetos com os quais estas organizações ainda pouco lidavam até àquele momento (Lima, 2010).

O desenvolvimento da contratualização no sistema público de educação implicou a realização de metas concretas acordadas entre as partes e assegurou a autonomia adequada para a gestão dos meios com vista a sua consecução. O contrato vem estimular a ação dos protagonistas no sentido de alcançar os objetivos pré-estabelecidos e apelou a uma gestão muito próxima da verificação das discrepâncias entre os objetivos negociados e os resultados obtidos.

Esta questão da contratualização emerge como uma modalidade de gestão escolar alternativa à normalizada e à descentralizada para as autarquias (Formosinho, Fernandes & Machado, 2010), fora de um modelo liberal ou de um modelo de escola privada ou, ainda, de características empresariais (Formosinho & Machado, 2010).

A noção da governação por contrato pressupõe negociação entre a escola e o Ministério da Educação acerca das metas e dos compromissos a realizar, do período da sua realização e dos esforços de ambas as partes à sua realização (Formosinho & Machado, 2010; Gaudin, 2007).

O reforço da autonomia da escola através da contratualização revela-se um desenvolvimento no processo da reconceptualização da intervenção do Estado na educação, apelando a um maior envolvimento e responsabilização dos atores educativo locais. (Formosinho & Machado, 2007).

O grande propósito destas medidas é a melhoria das aprendizagens dos alunos, as suas melhores classificações académicas e o aumento dos níveis de escolarização da toda a população em geral (Formosinho & Machado, 2010).

O grande propósito deste trabalho foi o de analisar e compreender como o Contrato de Autonomia determinou ou influenciou os processos de gestão e liderança das organizações escolares analisadas.

2. DESCENTRALIZAÇÃO E AUTOGESTÃO EM EDUCAÇÃO E LIDERANÇA ESCOLAR

A motivação para a descentralização reside no pressuposto segundo o qual os profissionais, e outros governantes dentro das escolas, se encontram em melhores condições do que os políticos e agentes de governação nacional, para realizar uma avaliação mais precisa das necessidades específicas dos alunos e lhes proporcionar programas de maior qualidade e ajustados às suas necessidades (Caldwell, 2012).

As organizações educativas trabalham ou operam num quadro legislativo estabelecido por um governo estadual e um dos aspetos deste quadro é o grau de descentralização dentro do sistema educativo. Os sistemas fortemente centralizados tendem a ser burocráticos e a permitir pouco autonomia às escolas e às comunidades locais. Por seu lado, os sistemas descentralizados

delegam, transferem ou transmitem grandes poderes ao nível subalterno, e estes poderes quando são devolvidos ao nível organizacional ou de escolas pode ser chamada de autogestão (Bush, 2008).

O processo de descentralização exige a redução do papel do governo central na planificação da educação e este pode assumir muitas formas pois a descentralização em educação significa uma mudança na distribuição da autoridade *top down*, do centro para a periferia.

Investigações realizadas em Inglaterra e País de Gales, por investigadores como Bush, Coleman e Glover. (1993), Levacic (1995) e Thomas e Martin (1996), sugerem que a mudança da escola no sentido da autonomia tem sido benéfica, resultados estes que são congruentes com os publicados pela OECD em 1994, que conclui que esta prática se torna eficaz pois leva a uma maior flexibilidade e a um melhor uso de todos os recursos humanos e materiais, ao desenvolvimento profissional, ao maior conhecimento dos pais pelos professores, a melhores decisões financeiras, e a um melhor planeamento e implementação baseados na prioridade dos resultados dos alunos e nas suas necessidades.

A importância da autogestão no desenvolvimento da liderança reside na esfera de ação para a liderança e a gestão ser maior e, enquanto os gestores dos sistemas centralizados se encontram confinados à implementação de políticas e decisões feitas pelos altos níveis da hierarquia, os líderes das escolas com autonomia têm maiores responsabilidades pelos orçamentos, pessoal e relações externas, bem como na interpretação e implementação do currículo. Este tem mais oportunidade para inovar do que os líderes limitados e constrictos a contextos centralizados (Bush, 2008).

Muitas escolas em autonomia têm estruturas de lideranças mais abrangentes que, por vezes, incluem líderes séniores e lideranças intermédias (*middle managers*), em vários cargos de liderança. Um estudo de Young (2006) com escolas do primeiro ciclo inglesas, mostra um padrão elaborado de liderança com um vasto número de pessoal a exercer papéis de liderança. Este crescimento do número de líderes e de âmbitos de ação das lideranças tem vindo a desenvolver o interesse pelo estudo da liderança distribuída, partilhada, participada ou intermedia, pois segundo Harris (2004), o envolvimento de um vasto número de pessoas na liderança aumenta a necessidade do desenvolvimento de líderes eficazes.

3. CONCEITO DE LIDERANÇA ESCOLAR

De acordo com a OECD (2001, 2008), é vasta a literatura que explora a conceção genérica de liderança, e o elemento central à maioria das definições de liderança é que esta envolve um processo de influenciar outros. Para Yukl (2002), grande parte das definições de liderança refletem a assunção de que esta envolve um processo de influência social, no qual prevalece a influência intencional que é exercida por uma pessoa ou grupo de pessoas sobre outra pessoa ou grupo de pessoas com o objetivo de estruturar as atividades e as relações num grupo ou numa organização (Bush & Glover, 2003). O termo “intencional” utilizado por este autor é muito importante, uma vez que a liderança se baseia em objetivos e resultados articulados, os quais são esperados alcançar com o processo de liderança (OECD, 2008). Ainda, Yukl (2002) usa as palavras “pessoa” e “grupo” para enfatizar que a liderança pode ser exercida tanto por equipas como por indivíduos (Bush & Glover, 2003). Esta visão da liderança como uma ação plural, repartida, é reforçado por autores como Harris (2002) e Leithwood (2001), que defendem que a liderança distribuída por distintos níveis (*distributed leadership*), é uma alternativa aos tradicionais modelos de liderança de cima para baixo (*top down*) (Bush & Glover, 2003). Ogawa e Bossert (1995), também referem que a liderança se traduz na influência que é exercida nos outros, concordando que esta pode ser desenvolvida por qualquer pessoa dentro de uma organização.

Cuban (1988) refere que a liderança assumida por “pessoas” que levam os outros a mudar as suas motivações, se pode traduzir em “ações” que, uma vez realizadas, permitem alcançar determinados objetivos. Este processo implica a tomada de decisões, bem como a assunção de certos riscos. Esta conceção de liderança evidencia que o processo de influenciar outros tem propósitos e procura obter resultados específicos, aspeto reforçado por Fidler (1997), que acrescenta que os seguidores ou colaboradores do(s) líder(es) são influenciados para a consecução de metas ou propósitos.

A ideia de partilha que está subjacente ao ato de liderar é defendida por Stoll e Fink (1996), quando se referem à forma como os líderes operam nas escolas. Para estes autores, e num contexto de uma organização educativa, a liderança tem a ver com comunicação ou transmissão de mensagens convidativas aos indivíduos e grupos com os quais os líderes interagem, para construir e agirem numa visão partilhada e envolvente, que aumente as experiências educativas dos alunos (Stoll & Fink, 1996).

3.1. Efeitos e impactos do conceito de liderança nas escolas

Um corpo crescente de investigações acentua os efeitos da liderança nos respetivos locais onde esta é estudada. Enquanto alguns investigadores argumentam que este foco nos efeitos da liderança apenas refletem um desejo humano de estar no controle da situação, outros afirmam que embora o impacto da boa liderança possa ser difícil de determinar, os efeitos de uma má liderança, de uma liderança fraca, ou da ausência de liderança, são fáceis de identificar.

Segundo Bush (2008), uma visão clara da organização desenvolve as escolas, embora a evidência empírica da sua eficácia permaneça ainda complexa, pois a questão dos líderes escolares conseguirem desenvolver uma visão específica das suas escolas, apesar da influência dos seus governos centrais, em vários dos aspetos da sua gestão, deverá ainda ser melhor abordada.

A liderança é, assim, um processo de influenciar outros para a realização de propósitos comuns, onde os líderes de sucesso desenvolvem uma visão das suas escolas, a partir dos seus valores pessoais e profissionais, através da articulação entre esta visão e cada oportunidade de a partilharem com os seus colaboradores e todos os interessados no processo da educação (stakeholders), onde a filosofia, a estrutura e as atividades da escola são orientadas para o alcançar esta visão partilhada (Bush & Glover, 2003).

Aceitando que existem elementos comuns e tendências nas práticas da liderança dentro os vários setores e lições a serem apreendidas em todos estes contextos, todos podem ser aplicados à liderança escolar (OECD, 2008).

Uma visão clara da organização é importante para o estabelecimento da natureza e do sentido da mudança organizacional, também é importante ter a certeza de que as inovações são implementadas de forma eficiente e que as tarefas funcionais da escola são realizadas eficazmente (Bush, 2008).

3.2. Liderança e gestão

O conceito de liderança sobrepõe-se ao conceito de gestão. Segundo a OCDE (2008) e Dimmock (1999) a distinção entre liderança, gestão e administração escolar reconhece a responsabilidade dos líderes escolares que, por vezes, têm que atuar nestas três áreas. Assim, a liderança consiste em dar prioridade às tarefas distribuídas para o desenvolvimento dos colaboradores, alunos e desempenhos dos alunos, e a gestão será a manutenção das rotinas com vista às operações e a administração dos deveres menores (ou cumprimento de atividades de caráter normativo ou burocrático).

Bush (2008) e Cuban (1988) relacionam a liderança com a mudança e a gestão com a manutenção de atividades de rotina. Estes autores providenciam uma clara distinção entre estes dois termos e referem a importância destas duas dimensões na atividade organizacional. Para os autores a liderança será “influenciar a ação dos outros para a obtenção dos propósitos desejáveis. Os líderes são pessoas que modelam os seus objetivos, motivações e ações dos outros. Com frequência estes iniciam mudanças para a obtenção de objetivos planeados ou novos objetivos.” (Bush, 2008, p. xx). De acordo com os mesmos autores, a gestão consiste em “manter o funcionamento corrente da organização de forma eficaz e eficiente, e mesmo que a gestão exija capacidade de liderança, a sua principal função tem mais a ver com a manutenção do que com a mudança.” (Bush, 2008, p. xx).

Dimmock (1999) distingue liderança, gestão e administração escolar, embora reconheça que o líder escolar tem responsabilidade sobre os três. Nas palavras do autor, “independentemente da forma como estes termos são definidos, os líderes escolares sentem dificuldade na tomada de decisão sobre a harmonia entre as tarefas mais importantes para o desenvolvimento do pessoal, dos alunos e o desempenho da escola (liderança), as rotinas de manutenção das operações presentes (gestão) e afazeres menos importantes (administração)” (Dimmock, 1999, p. 18). Os três elementos estão de tal maneira entrelaçados que não será muito fácil para um dos elementos ter sucesso sem a sua relação com os outros dois.

3.3. Abordagem teórica ao estudo da liderança

Durante o século XX foram desenvolvidas teorias de grande influência no domínio da liderança. As primeiras focaram-se nas qualidades dos líderes e dos seus colaboradores (Jesuino, 2005; Silva, 2010), as seguintes focaram-se em outros fatores, como a situação e a relação entre líderes e colaboradores. Uma abordagem à liderança que emerge na década de 80, pelos trabalhos de Burns (1978), é a abordagem transformacional. Esta defende que o líder conduz os colaboradores para além dos interesses pessoais imediatos, através de uma influência idealizada, inspiração, estímulo intelectual ou, ainda, de considerações individuais. Isto eleva o nível de maturidade do colaborador bem como as suas preocupações com as suas concretizações, o bem-estar dos outros, das organizações e da sociedade.

A liderança transformacional acontece quando o líder visiona um futuro ideal, operacionaliza a forma como este pode ser atingido, estabelece um exemplo para ser seguido, determina os padrões de desempenho e mostra determinação e confiança. Os colaboradores querem identificar-se com este tipo de liderança. O estímulo intelectual acontece quando o líder ajuda os colaboradores a se tornarem mais criativos e inovadores, e a consideração individual acontece quando os líderes prestam mais atenção às necessidades de desenvolvimento dos seus colaboradores e apoiam e desenvolvem atividades de *coaching* perante estas necessidades. Assim, os líderes delegam tarefas que se constituem como oportunidades de crescimento para quem as desenvolve. Os membros das equipas que se regem pelos princípios de uma liderança transformacional preocupam-se mais uns com os outros, estimulam-se intelectualmente, inspiram-se uns aos outros e identificam-se com os objetivos da equipa, o que torna o seu desempenho altamente funcional.

Existem evidências na literatura de que a liderança transformacional é bastante eficaz. Alguns estudos sugerem que existe uma relação positiva entre liderança transformacional e indicadores efetivos de desempenho (Bass, 1985). Os fatores transformacionais encontram-se regra geral altamente correlacionados com resultados de eficácia e de satisfação dos colegas, bem como com a sua contribuição para a inovação e a melhoria. No entanto, ainda falta muito para explicar na forma como a liderança transformacional funciona.

Um dos modelos mais atuais é o de Kouzes e Posner (1995; 2002). Este modelo baseia-se em várias investigações empíricas, e inclui uma série de qualidades que devem ser adquiridas e práticas que devem ser aplicadas, bem como sugestões acerca de como agir em situações difíceis.

As investigações de Kouzes e Posner, levadas a cabo durante mais de 20 anos, sugerem que a liderança não é uma posição, mas sim um colírio de práticas e comportamentos. Estas práticas são os componentes essenciais do conceito de liderança transformacional, traduzem-se nas seguintes etapas: i) desafiar o processo; ii) inspirar uma visão partilhada; iii) levar os outros a agir; iv) mostrar o caminho; e v) encorajar a vontade que de seguida passamos a enunciar.

Desafiar o processo traduz a capacidade dos líderes para, através de novas ideias, mostrarem a vontade de desafiar o sistema com vista a transformar essas ideias em ações e a conseguirem novos produtos, processos ou serviços. Ou seja, procuram “janelas de oportunidades” e buscam formas inovadoras de melhorar as organizações.

Quando inspiram uma visão partilhada, os líderes acreditam que conseguem fazer a diferença ao antecipar o futuro e idealizar imagens organizacionais. Inspiram uma visão nos seus colaboradores tão positiva que geram entusiasmo para uma visão comum através do uso adequado de metáforas e linguagem positiva.

Levar os outros a agir consiste em acalantar a colaboração e o *empowerment* (capacitação) dos colaboradores, envolvê-los na planificação e dar-lhes liberdade de escolha nos processos de tomada de decisão, o que lhes dará a possibilidade de fazerem o seu trabalho e concretizarem o seu potencial. Estes líderes criam um ambiente de confiança e dignidade e ajudam cada um a sentir-se capaz.

Mostrar o caminho, configura um cenário em que os líderes dão exemplos de práticas a serem seguidas e, desta forma, estabelecem compromissos que geram progresso.

Encorajar a vontade, visa o incentivo para a realização de propósitos da organização. Ao influenciarem a motivação dos colaboradores, os líderes articulam reconhecimento e recompensa no desempenho dos colaboradores, e ao celebrarem a obtenção das metas juntos levam todos a sentirem-se parte significativa da organização, o que gera o sentimento de pertença; quando os líderes encorajam os colaboradores através do reconhecimento e da celebração, inspiram os colaboradores a um melhor desempenho.

Esta abordagem da liderança transformacional remete-nos as qualidades dos líderes bem como para o seu trabalho a ser desenvolvido, diariamente, junto dos colaboradores.

4. LIDERANÇA PARA A MELHORIA DA ESCOLA

A liderança começa a encontrar-se, na literatura, relacionada com a melhoria das escolas e há já duas décadas atrás Beare, Caldwell e Millikan (1992) afirmavam a importância da liderança neste contexto. Harris (2004) reforça este ponto de vista afirmando que os líderes eficazes exercem uma influência indireta, embora de relevo, na eficácia da escola e nos resultados académicos dos alunos. A relação entre a qualidade da liderança e o sucesso dos alunos tem vindo a acolher um reconhecimento global.

Esta evidência largamente disseminada que a liderança e a gestão são fatores significativos na determinação dos resultados escolares não se encontra ainda suficientemente suportada empiricamente no que toca à extensão e natureza dos efeitos da liderança. Em relação a este aspeto, Hallinger e Heck (1996) creem que os efeitos da liderança escolar acrescem 3 a 5% na variação dos desempenhos dos alunos.

O *International Successful School Principalship Project (ISSPP)*, é um projeto internacional de investigação que tem o propósito de procurar quais as práticas para a escola de sucesso, a serem desenvolvidas pelos gestores escolares. A primeira fase do ISSPP incluiu um total de 63 estudos de caso com uma abordagem multi-perspetiva em 8 países (Austrália, Canada, China, Dinamarca, Inglaterra, Noruega, Suécia e EUA) com vista à identificação das práticas de liderança para o sucesso educativo. Destes estudos de caso Leithwood e Riehl (2003), identificaram um conjunto de práticas básicas de liderança. Estas práticas passam pelo estabelecimento objetivos, reorganizar a organização, gerir o currículo educativo e construir parcerias. De acordo com Leithwood (2001), estas práticas são passíveis de serem adaptadas pelos líderes e contingentes, ao momento específico em que estes ocorrem.

Em Portugal existem alguns trabalhos de caráter académico sobre este tema, no entanto, ainda é um tema pouco explorado. Desde o Decreto-lei nº 75/2008 de 22 de abril, que a liderança das escolas é assumida como unipessoal na figura do Diretor da escola, isto porque o programa do XVII Governo Constitucional identificou a necessidade da revisão do regime jurídico da autonomia, administração e gestão das escolas no sentido do “favorecimento da constituição de lideranças fortes”. (Decreto Lei nº 75/2008, de 22 de abril, p. 2341). Onde se procura o reforço das lideranças das escolas, impondo-se a criação de condições para que se afirmem boas lideranças e lideranças eficazes, para que em cada escola exista um primeiro responsável, dotado da autoridade necessária para desenvolver o projeto educativo da escola e executar localmente as medidas de política educativa. A este diretor é confiada a gestão administrativa, financeira e pedagógica, assumindo de igual modo a presidência do conselho pedagógico. (Decreto Lei nº 75/2008 de 22 de abril). E a responsabilidade de acompanhar este desenvolvimento ficou a cargo da Inspeção Geral do Ensino e Ciência (IGEC) que até esta data tem vindo a fazer o acompanhamento no sentido da sua implementação e melhoria.

5. METODOLOGIA

O desenvolvimento deste trabalho, seguiu a opção por um trabalho exploratório, descritivo, interpretativo e heurístico, assente na metodologia qualitativa. A escolha recaiu sobre o Estudo de Caso pois este encara o caso numa perspetiva holística, sistémica, ampla, integrada, e tem como propósito compreender o caso no seu todo e na sua unicidade. A escolha do Estudo de Caso de tipo coletivo ou multicase, que se verifica quando são estudados vários casos, foi opção para possibilitar um conhecimento aprofundado sobre o fenómeno em análise.

Quanto à seleção dos casos, esta foi intencional, seguindo o caso de conveniência, as duas escolas com Contrato de Autonomia assinado, em 2007, na região do Algarve, dada a proximidade do investigador aos casos permitir os melhores procedimentos de recolha dos dados favorecendo a melhor gestão de tempo e dos recursos humanos e materiais. A seguir designadas, por questões de confidencialidade, por Escola A e Escola B.

A seleção dos protagonistas da investigação aconteceu em função da literatura consultada e após a obtenção de todas as respetivas autorizações necessárias. Fizeram parte do estudo os elementos da gestão de topo e da gestão intermédia de ambas as escolas bem como os professores mais antigos dessas escolas (*sénior staff*), num total de 11 professores, distribuídos da seguinte forma: 6 professores no Caso A (Diretor, Subdiretor, 2 Adjuntos, Diretor de Turma, *Sénior Staff*) e 5 professores no Caso B (Diretor, Subdiretor, 2 Adjuntos, 2 Assessores). Na escola B, o diretor e o subdiretor assumiram-se, igualmente, como *Sénior staff* (dado o tempo de serviço e as diversas funções de lideranças já desenvolvidas).

Nos procedimentos metodológicos, como técnicas e instrumentos de recolha de dados, recorremos a uma entrevista semiestruturada cujo guião foi construído a partir dos itens que constam no modelo do quadro de referência para avaliação externa das escolas (IGEC, 2011; 2012), e no *International Successful School Principals' Project (ISSPP)* (Day, 2007). A análise documental foi realizada a partir dos documentos recolhidos junto das respetivas organizações produtoras que os disponibilizam para consulta, alguns na sua página virtual (v.g., IGEC, 2012). As notas de campo resultaram de observação naturalista realizada durante os contactos com as escolas.

Ainda, nos procedimentos metodológicos e para o tratamento e análise dos dados recolhidos, procedemos à análise de conteúdo, assistida por computador. Começamos pela construção de categorias, a partir das quais identificamos subcategorias emergentes e procedemos, de seguida, à distinção de indicadores a partir da análise dos segmentos de texto dos documentos recolhidos. A triangulação metodológica foi utilizada por forma a validar os resultados do nosso trabalho.

6. ANÁLISE E DISCUSSÃO DOS RESULTADOS

A análise de conteúdo, assistida por computador, realizada aos dados recolhidos pela entrevista semiestruturada, que construímos e validamos para o efeito desta investigação, e que foram, entretanto, complementados pelos dados recolhidos da análise documental e das notas de campo, revelou-nos várias categorias de análise, das quais emergiram um número variável de subcategorias, com um número, igualmente, variável de indicadores identificados por cada subcategoria.

Para a descrição e análise de resultados apurados que aqui nos propomos desenvolver vamos centrar-nos na categoria a que denominamos de “perfis de liderança”. Nesta categoria foram agregados todos os aspetos relacionados com a liderança e os processos que nela se encontram envolvidos ou ainda subjacentes.

Apresentamos e discutimos esta categoria segundo uma ordem que reflete os principais processos implicados na prática da liderança e que se expressa na seguinte sequência: aspetos individuais; conceitos de gestão; ouvir e orientar/acompanhar e supervisionar; delegar; lideranças intermédias; tomadas de decisão; gestão partilhada; responsabilidade partilhada das tarefas; contexto de gestão; planificação estratégica; horizontes temporais. O gráfico 1 ilustra esta distribuição dos segmentos de texto apurados em cada uma das subcategorias emergentes.

Figura 1. segmentos de texto apurados em cada uma das subcategorias emergentes

As subcategorias “lideranças intermédias” e “planificação estratégica” reúnem a maior quantidade de unidades de registo apuradas, 22,70% e 21,62%, respetivamente. A subcategoria “aspetos individuais” surge, de seguida, com 14,05% do total apurado, “tomadas de decisão”, com 12,97% e “conceitos de gestão” com 10,81%.

Estes aspetos aparecem abundantemente referidos na literatura, pois não só a planificação é importante, como o apoio das lideranças intermédias é crucial para a melhoria das escolas (Bolívar, 2012; Day *et al.*, 2011; Leithwood, 2001; Mourshed, 2007; OCDE, 2008). Os aspetos individuais da figura do diretor têm bastante influência na melhoria da escola (Wang & Howell, 2010) bem como as tomadas de decisão.

A subcategoria “lideranças intermédias” tem a ver com a emergência do papel das lideranças intermedias ou distribuídas (Bush & Glover, 2003) na escola pública, como dos diretores de departamento, de turma, e com o peso que lhe foi sendo atribuído, nas escolas públicas, com contrato de autonomia. Desta subcategoria emergiram os indicadores que passamos a apresentar na tabela 1.

Tabela 1 . Subcategoria “lideranças intermédias” e indicadores apurados

	Unidades de registo	
	N	%
1. Importância da liderança intermedia na gestão	16	38,09
2. Liderança partilhada	2	4,76
3. Da supervisão à delegação do líder nas lideranças intermédias	3	7,14
4. Lideranças intermedias como apoio aos líderes de topo	5	11,90
5. Transição para cultura de liderança	4	9,52
6. As lideranças intermédias no contrato de autonomia	4	9,52
7. Da liderança à transição para responsabilização para as lideranças intermédias	8	19,04
Total	42	100

O indicador “importância da liderança intermedia na gestão” apresenta uma percentagem de 38,09% de unidades de registo e o segundo indicador com mais unidades de registo foi “da liderança à transição para responsabilização para as lideranças intermédias”, com 19,04%. Estes resultados relevam a importância das lideranças intermédias na gestão da escola, onde segundo os autores, as lideranças intermédias ou distribuídas, bem organizadas, contribuem para a melhoria da prestação do serviço educativo das escolas (Bolívar, 2012; Bush, 2010; Leithwood, 2001; Vidoni & Grassetti, sd.).

A subcategoria “planificação estratégica” diz respeito à organização que segue um plano e objetivos, num espaço e num tempo. Desta subcategoria emergiram os indicadores que passamos a apresentar na tabela seguinte.

Tabela 2. Subcategoria “planificação estratégica” e indicadores apurados

	Unidades de registo	
	N	%
1. Planificar é projetar	5	12,5
2. Da preparação à valorização das pessoas	7	14
3. Planificar é flexibilizar	2	5
4. Contrato de autonomia levou à planificação por objetivos	3	7,5
5. Planificar é antecipar	10	25
6. Planificar é supervisionar	2	5
7. Planificar é ter visão real	1	2,5
8. Planificar é organizar	1	2,5
9. Planificar é construir um Conselho Pedagógico eficaz	1	2,5
10. Planificar é definir funções e competências	8	20
Total	40	100

O indicador com mais unidades de registo foi “planificar é antecipar” com 25% do total apurado; em segundo lugar surge o indicador “da preparação à valorização das pessoas”, com 14%; o terceiro indicador em número de referências foi “planificar é projetar” com 12,5%; e o indicador “contrato de autonomia levou à planificação por objetivos” junta 7,5% das unidades de registo apuradas. Estes indicadores remetem para as questões ligadas à metodologia de trabalho de projeto, nomeadamente para a parte da planificação que estrutura toda a sequência do trabalho a desenvolver para a boa prossecução dos objetivos do trabalho (Barbier, 1993; Guerra, 2006; Serrano, 2010), desenvolvida nas escolas desde o Decreto-Lei nº 43/89, de 3 de fevereiro, e que, no âmbito da autonomia das escolas, se assume como Projeto Educativo de Escola. Este consiste num modelo geral de organização da escola e num instrumento de gestão das organizações educativas (Costa, 1991; 2004; Grade, 2008) e de apoio à avaliação interna e externa da escola (Afonso, 2010).

A subcategoria “aspectos individuais”, integra todas as unidades de registo que se referem às características de personalidade ou aspectos particulares da personalidade da figura do diretor da escola, que assumem grande relevo quando este se relaciona com os outros nas suas atividades de liderança.

Nesta subcategoria foram identificados quatro indicadores, que passamos a apresentar por ordem de implicação nos aspectos das inter-relações pessoais e a que demos as denominações que se apresentam na tabela abaixo.

Tabela 3. Subcategoria “aspectos individuais” e indicadores apurados

	Unidades de registo	
	N	%
1. Contrato de autonomia parte de pessoas e construído por pessoas	8	30,76
2. Da complementaridade à colaboração	8	30,76
3. Da personalidade aos interesses de cada um	5	19,23
4. Personalidade da figura do diretor	5	19,23
Total	26	100

Os indicadores “contrato de autonomia parte de pessoas e construído por pessoas” e “da complementaridade à colaboração” reúnem, ambos, 30,76% dos resultados apurados. Os indicadores “da personalidade aos interesses de cada um” e “personalidade da figura do diretor” reúnem, igualmente, cada um 19,23% das unidades de registo apuradas. Isto leva-nos a inferir que este é um trabalho realizado com “pessoas”, e que coloca a tónica nas relações humanas ou nas relações interpessoais, aspeto muito importante para pôr em prática o contratualizado e trabalhar para a melhoria dos resultados dos alunos. Como a comunicação se pode converter em troca de ideias e partilha de opiniões, será desta interação que sairão as ideias mais adequadas para as práticas de gestão e liderança para a melhoria da escola (Kouzes & Posner, 1995). A dimensão pessoal dos envolvidos nos processos de liderança encontra-se aqui bastante bem expressa, assim como aspetos da personalidade do diretor (Glatter, Mulford & Shuttlesworth, 2003).

A subcategoria “tomadas de decisão” refere-se aos processos e procedimentos, e ainda lugares e momentos inerentes à tomada de decisão em relação aos aspetos da gestão da escola. Desta subcategoria emergiram os três indicadores que se apresentam em seguida, na tabela 4.

Tabela 4. Subcategoria “tomadas de decisão” e indicadores apurados

	Unidades de registo	
	N	%
1. Tomadas de decisão: desde o ouvir todos à decisão em conjunto ou em colaboração	11	45,83
2. Do tipo e tempo da tomada de decisão aos momentos próprios de tomada de decisão	10	41,66
3. Responsabilização das lideranças intermédias e concessão da sua autonomia	3	12,5
Total	24	100

O indicador “tomadas de decisão: desde o ouvir todos à decisão em conjunto ou em colaboração” apresenta uma prevalência de 45,83% de unidades de registo apuradas, logo seguido do indicador “do tipo e tempo da tomada de decisão aos momentos próprios de tomada de decisão”, com 41,83% de unidades de registo apuradas. As tomadas de decisão são momentos de grande importância nos processos de gestão e liderança escolar. Associados a estes processos, encontram-se o tipo de decisão, os momentos de tomada de decisão e a importância e a responsabilização crescente das lideranças intermédias nestes processos (Bush & Glover, 2003).

A subcategoria “conceitos de gestão” diz respeito a conceções ou ideias pessoais referentes ao conceito de gestão de escola. Nesta subcategoria foram identificados quatro indicadores, que passamos a enunciar por ordem de implicação nas conceções individuais de gestão, na tabela 5.

Tabela 5. Subcategoria “conceitos de gestão” e indicadores apurados

	Unidades de registo	
	N	%
1. Definição de gestão: da dificuldade de definir à liderança e programação	3	15
2. De liderar a delegar	6	30
3. Da gestão ao tempo de reflexão	1	5
4. Liderar: das relações interpessoais ao ensino de qualidade	10	50
Total	20	100

Os indicadores identificados com uma percentagem mais elevada de unidades de registo foram liderar: das relações interpessoais ao ensino de qualidade”, com 50%, ou seja, metade das unidades de registo apuradas, e “de liderar a delegar”, com 30%. Esta conceção de gestão em aspetos que se prendem com as relações interpessoais é um aspeto referido na literatura, que nos diz que liderar envolve processos de influência de uma pessoa ou grupo de pessoas sobre outra pessoa ou grupo de pessoas, com vista à estruturação das atividades numa organização (Bush & Glover, 2003). E constituem aspetos

importantes para compreender as conceções de gestão dos protagonistas que, neste caso, assumem a gestão como um aspeto fortemente ligado à liderança, embora a maioria dos autores não o faça. Distinguem liderar como o processo de influenciar outros no sentido da obtenção de objetivos comuns (Leithwood & Riehl, 2003), e gerir como a execução de atividades no sentido da manutenção da organização (OCDE, 2008). No entanto, estes indicadores apontam no sentido das relações interpessoais e das lideranças intermédias, circunstância que os gestores e líderes ainda se encontravam a consciencializar, pois a figura do Diretor escolar emergiu, como já vimos, com o Decreto-Lei nº 75/2008, de 22 de abril e os contratos de autonomia haviam sido celebrados em 2007 (estas entrevistas foram realizadas no final de 2012, início de 2013), o que nos remete para o desenvolvimento de práticas ainda pouco trabalhadas.

7. CONSIDERAÇÕES FINAIS

Numa perspetiva global os resultados obtidos sugerem a prática de muitos dos aspetos referidos na nossa revisão da literatura. A contratualização contribuiu, de modo geral, para o desenvolvimento organizacional das escolas (Bolívar, 2012), do desenvolvimento dos profissionais, e do seu desenvolvimento pessoal também.

A contratualização permitiu, igualmente, o aprofundamento da autonomia através do maior envolvimento das lideranças intermédias (Bolívar, 2012; Day *et al.*, 2011; Leithwood, 2001; Mourshed, 2007; OCDE, 2008) pois as lideranças distribuídas, organizadas, são um bom contributo para a melhoria da prestação do serviço educativo das escolas (Bush, 2010; Vidoni & Grasseti, *sd.*). Neste processo emerge a importância da personalidade do diretor, no desenvolvimento de práticas assentes nas interações com os seus colaboradores, mobilizadoras do propósito comum da prestação de um serviço educativo de sucesso a toda a comunidade escolar (Glatter, Mulford & Shuttleworth, 2003).

Da contratualização emergem, ainda aspetos como a planeamento estratégico que remete para as questões ligadas à construção de um Projeto Educativo de Escola ao abrigo do Decreto-Lei nº 43/89, de 3 de fevereiro, que se assuma como instrumento de gestão e liderança das organizações educativas e de apoio à prestação de contas junto da Tutela, no âmbito da autonomia das escolas (Afonso, 2010; Costa, 1991; 2004; Grade, 2008).

Nos resultados apurados, no contexto deste trabalho, encontramos os processos de tomadas de decisão como momentos de grande importância na gestão e liderança da escola, onde o tipo de decisão, os momentos da tomada de decisão, a importância e a responsabilização crescente das lideranças intermédias nestes processos vem aumentando, gradual e progressivamente (Bush & Glover, 2003).

Da análise dos dados apurados encontramos conceções de gestão como um aspeto fortemente ligado à liderança. Estes indicadores apontam no sentido das circunstâncias em que os gestores e líderes ainda se encontravam a masterizar estas práticas, uma vez que a figura do Diretor escolar surge no Decreto-Lei nº 75/2008, de 22 de abril, após a celebração dos contratos de autonomia em 2007. O que nos remete para práticas em experimentação e desenvolvimento.

Algumas práticas passíveis de fomentar a liderança para a melhoria dos resultados dos alunos foram apenas sugeridas pelos resultados obtidos neste trabalho, como a crescente responsabilização das lideranças distribuídas, as características individuais dos diretores e a sua capacidade para a interação com os seus colaboradores com vista o alcançar de objetivos comuns, a planificação estratégica traduzida num documento agregador dos esforços de todos e a tomada de decisão nos momentos adequados e em consonância com a respetiva ação. No entanto, todos os aspetos aqui analisados requerem maior exploração dado ainda se encontrarem em desenvolvimento.

ABSTRACT

Sustainability reports have been gaining importance through the years because, differently from the financial reports, they cover aspects of a company other than their financial and economic performance. They bring information about environmental and social policies, its corporate governance practices, stakeholder engagement, among others. The quantity of information in these reports also makes them more complex and harder to evaluate. Given this situation, this study aims to develop a tool to evaluate the organization's stakeholder engagement, disclosed in these reports, using a text mining approach. In order to achieve this goal, we use reports of Brazilian companies that were published under the G4 guidelines of the Global Reporting Initiative during 2016. The results showed that the most mentioned stakeholders were employees, clients, market and suppliers, and the major concern raised by them relates mainly to the environment. We also find that the firm-characteristics did not played any part in differentiating the companies with high and low stakeholder engagement.

Keywords: Sustainability Report, Text Mining, Stakeholders Engagement.

1. INTRODUCTION

Companies have to meet the needs of a diverse set of stakeholders (e.g. employees, clients, suppliers, government, NGOs) that pursue different economic, environmental and social interests. In this context, sustainability reports represent an important channel through which companies try to meet these demands (Hahn; Kühnen, 2013).

Kolk (2010) shows that sustainability-related reports went through changes in their focus along the years. During the 1970s, reports focused heavily in traditional financial statements, sometimes complemented by social information. In the 1980s, the focus changed from the social to environmental information, on account of natural disasters like the Bhopal gas tragedy in 1984. During the 1990s, both social and environmental information began to be heavily disclosed by the companies.

The increase in the number of sustainability reports along with the growing interest among the various stakeholder groups, have made those reports harder to evaluate and created a new challenge in obtain metrics from them (Modapothala; Issac, 2009).

These reports being highly qualitative often pose serious concerns to the users of information in terms of analysis, comparability and assessing (Modapothala; Issac, 2009). So, it is important to develop techniques of text mining to automate the analysis of these texts. According to Nisbet, Elder and Miner (2009), text mining consists in the discovery of new information or associations, from a collection of texts, also called corpus. Makhabel (2015) consider that a text is a collection of unstructured documents and the purpose of text mining is to process it and transform it into a numerical and structured representation.

In a context where sustainability reports have a growing importance, but are also more complex to evaluate, due to the number of stakeholders they have to address, and considering the proficiency of text mining tools to extract information from collections of texts, we aim evaluate stakeholder engagement disclosed in CSR reports using a text mining algorithm.

We also use the results from the text mining analysis to evaluate the companies regarding their stakeholder engagement and how they relate with other firm-level characteristics such as their size, level of governance, type of ownership and debt ratio.

The proposed method should facilitate pattern recognition in texts, minimizing or eliminating the need for time-consuming techniques, such as, content analysis, that are usually used in the analysis of CSR reports.

The results showed that Brazilian companies consider a set of nine stakeholders and reports a set of twelve stakeholders' concerns. The most mentioned stakeholders were employees, clients, market and suppliers, and the most mentioned concern

of them is related to the environment. We also find that the firm-characteristics did not play any part in differentiating the companies with high and low stakeholder engagement.

2. STAKEHOLDER ENGAGEMENT AND SUSTANABILITY REPORTS

The power growth experienced by companies since the beginning of the 20th century has developed concerns in many segments of society. Berle (1931) was among the first scholars to express his view about this issue. In an essay called *Corporate powers as powers in trust*, he argues that the rising power of companies would require an adaptation from society to a new reality. Bowen's book *Social responsibilities of the businessman*, published in 1953 is considered the initial mark in the Corporate Social Responsibility theory.

Frederick (1960) understands that the companies should aim to achieve an economic system capable of supplying public needs, so the resources should be employed in a way that could allow the general welfare state. McGuire (1963) also express this feeling, when he says that companies should have responsibilities beyond the economic and legal aspect, being also responsible for providing community welfare, education and employee happiness.

The view that a company should have other responsibilities other than those in the economic aspect was in conflict against the *shareholder theory* view, which stated that the main goal of the company was to maximize the shareholder's wealth. This economic view started to be questioned by a new, emerging *stakeholder theory*, according to which, the shareholders are a part of a broader group of stakeholders, whose needs and expectations should be considered in the corporate decision process (Jones, 1995).

Following Lee (2008), the first concepts of *stakeholders* emerged during 1960s, but only in 1984, Freeman was able to synthetize those concepts in a comprehensive framework and therefore made the foundations for the Stakeholder Theory. Freeman (2001) define a stakeholder as any group or individual who can affect, or can be affected, by a company's activity.

Prado-Lorenzo, Gallego-Alvarez and Garcia-Sanchez (2009) state that for a company to survive and grow, it must perform well and undertake socially desirable actions to benefit the groups from which they derive their power. The authors also emphasize the role that social reporting has as a mechanism through which a company can show their compliance with those desires.

González-Benito and González-Benito (2006) proposed a framework to study environmental proactivity. They argue that this proactivity has three key aspects: organizational, operational and communicational practices. The first one is related to the decision of implementing an environmental proactive conduct, then the second aspect is related to the actual implementation of the processes that would lead to this proactivity, and the last aspect is related to communicate the results of the implementation of this conduct. The authors go ahead and highlight the importance of the CSR reports to integrate the stakeholders in this process.

From the 1990s, companies around the world began to disclose non-financial information related to socio-environmental issues, such as preservation of the environment, protection of human rights, well-being of employees and contributions to society. In 2010, according to a survey conducted by KPMG (KPMG, 2011), the percentage of Global 250 companies that issued this type of report reached 95%.

As stated by Cho *et al.* (2012), the discussion between the informational potential of the disclosure of social-environmental information and the fact that it is just another public relations tool for companies, still does not present a consensus. Du and Vieira (2012) argue that there is anecdotal evidence that companies with unscrupulous business practices can resort to socio-environmental disclosure as a strategy to promote, minimizing the effects caused by environmental disasters, for example. For Arena, Bozzolan and Michelon (2014), one element that contributes negatively to this debate is that socio-environmental disclosure is still essentially voluntary and deregulated.

This scenario began to change with the creation of the Global Reporting Initiative (GRI). In 1997, the leaders of the Coalition for Environmentally Responsible Economies (CERES), after realizing that there was a lot of inconsistency in disclosing aspects related to the social and environmental performance of companies, which made it impossible to compare information between companies, defined as a goal, to work so that a global standard of disclosure of sustainability information is achieved. The organization received the support of the United Nations Environment Program (UNEP), which had already established its own standard of disclosure for sustainable corporate practices and was used primarily in Europe. This same standard came to be borne by CERES, still in 1997, culminating in the creation of the GRI (Willis, 2003).

The GRI guidelines for sustainability reporting offer principles, content and an implementation manual so that different organizations, despite their size, sector or location, can produce sustainability reports (GRI, 2017).

Based on the Disclosure Theory, many authors argue that companies that disclose a higher level of information can achieve competitive advantages over other companies. Most of these advantages are due to the reduction of the informational asymmetry between the management and the investors, reducing the risk perceived by the latter, and also encouraging them to negotiate their roles.

3. TEXT MINING AND THE RECOGNITION OF PATTERNS IN CSR REPORTS

In recent years, there has been an immense increase in the amount of text data available in internet, such as social media comments, blogs, news, emails, government and enterprise documents. This has led to a growing demand for tools to help people analyze and manage the amount of text data effectively and efficiently (Zhai & Massung, 2016).

Text mining encompasses a wide range of theoretical approaches and methods with one thing in common: text as input data (Feinerer *et al.*, 2008).

Feldman and Sanger (2007) describe text mining as a knowledge-intensive process that tries to solve the information overload problem by using techniques from data mining, natural language processing, information retrieval and knowledge management.

The first applications in text mining come from the data mining community, like document clustering and document classification. For both, the idea is to transform the text into a structured format and subsequently apply standard data mining techniques (Feinerer *et al.*, 2008).

Data mining is the analytical process of exploration of large databases, which aims, from the application of statistical and artificial intelligence techniques, to recognize patterns or systematic relationships between variables or objects and do their validation using new data (Tufféry, 2011).

Supervised and unsupervised classification, to discover interesting patterns, are the main goals of data mining studies. In a typical supervised classification scenario, we consider a dependent variable or response, of a qualitative nature (which defines groups), which we intend to predict from a set of independent variables. By providing data about these variables for a set of observations, we construct predictive models (classifiers) capable of predicting the value of the response variable for new observations. While in the supervised classification the group that generates each pattern is known, in the unsupervised one, also called cluster analysis, there is no variable response that identifies groups, trying to find a structure in the data that allows classification.

A text mining system takes an input (text documents) and generates various types of output, such as patterns, maps of connections and trends. This process involves the preprocessing of document collections, the storage of the intermediate representations, the analysis of these intermediate representations (such as distribution analysis, clustering, classification, trend analysis, and association rules), and the visualization of the results (Feldman & Sanger, 2007).

Modaphothala; Issac (2009) analyzed a large sample of 2415 reports, mostly from manufacturing sector, followed by tertiary and primary sectors, to measure the corporate environmental reports in terms of economic, environmental and social performance indicators using GRI guidelines. A Java program was wrote to do text mining. The article indicates that by adopting the GRI guidelines, the global corporate environmental reports are now undergoing fragmented reporting in its incremental approach. The results of one-way ANOVA indicated that economic performance is similar across industries, while environmental and social performances are different.

Modaphothala *et al.* (2010) used text mining to analyze a large sample of 2650 reports. One-way ANOVA indicate that the disclosures made by the companies differ across the industrial sectors. Organizational issues are widely reported followed by social, environmental and economic issues. Multivariate discriminant analysis was then applied to determine which variables discriminate between the naturally occurred groups and allowed to conclude that the environmental variable is a greater significant contributing factor towards explanation of sustainability report.

Rivera *et al.* (2014) focuses on demonstrating a method for identifying, tracking, and reporting of sustainability indicators specific to a region using digital news articles with text mining methods. A supervised classification algorithm with natural language processing techniques was applied to analyze sustainability content in news articles and compare the results with the sustainability indicators obtained by traditional methods performed by a regional entity. Results showed that the text mining approach could identify all of the indicators highlighted as important in the reports.

Tremblay *et al.* (2015) utilized text mining to analyze the contents of corporate sustainability reports produced by seven Dow Jones companies in three years. The goal of their study was to find evidence that environmental sustainability has become embedded in corporate policy. Supervised techniques of text mining were applied on the whole corpus of the core business discourse to verify whether deductive machine learning would perform in a similar way as humans at the task of classifying contents from CSR reports into one of the five Sustainability dimensions that are based on the Sustainability Accounting Standards Board (SASB) (2014): business, governance, environment, human capital and social capital. The authors presented metrics of accuracy of three supervised classification models: decision tree, neural network and memory-based reasoning model. The neural network model had the best performance, assessed by the lowest misclassification rate. Unsupervised classification techniques (cluster analysis) were then applied to the data of each year, to show clusters that exhibit a tendency for business components to increasingly group with environmental components through time.

4. METHODOLOGY

4.1 Population, sample and variables

In this paper, we studied Brazilian companies that report their economic, social and environmental practices using the Global Reporting Initiative as their framework. Currently, GRI have two generations of guidelines in use, the third generation (G3 and G3.1) and the fourth (G4, the most up to date). Even though most companies still use the G3 and G3.1 guidelines, we opted to use the G4 version in our study, as stakeholder engagement is better addressed in the fourth generation (Constantinescu & Kaptein, 2015).

We searched in the GRI database during March 2017, for reports of Brazilian companies that were issued using the G4 guidelines that were published in 2016, resulting in 25 reports whose companies composed our sample. We chose this year because it represented the most recent information available, as there were no reports published in 2017 when we made our research in the GRI database.

In order to study the stakeholder engagement, we chose two index from the GRI framework, G4-24, that asks the company to provide a list of their stakeholders, and G4-27, to which the company must disclose which are the key topics, issues and concerns that raises from stakeholder engagement, and how the company respond to them. The general standard disclosures related to the stakeholder engagement also comprehend two other indexes, G4-25 and G4-26, that are related to

the way the company identifies and how they approach these stakeholders. They were not considered in this analysis due to their textual complexity, once the objective was to implement a text mining tool, and because the companies were not able to clearly differ those two indexes.

Aside from information about the stakeholder engagement, we also collected other firm-level information about the company. This information and their source are presented in Table 1.

Table 1 – Other firm-level variables used in this study

Variable	Formula	Source
Size	Natural logarithm of Total Assets	Balance Sheet
Debt Ratio	Total Debt/Total Assets	Balance Sheet
Type of Ownership	State, Family, Foreign or Institutional	Formulário de Referência (Equivalent to Form 20F)
Governance	Participation in the Índice de Governança Corporativa (Corporate Governance Index – IGC)	Bovespa

4.2 Data analysis

We begin through descriptive statistics to present the companies that composed our sample. We show their frequency by economic sector, participation on IGC and by type of ownership.

The first step of the text mining process was the construction of a corpus, which is a collection of text documents that can be processed with text mining functions. In this study, the text documents include the sections of the reports of the 25 companies in which the stakeholder engagement, more specifically, G4-24 and G4-27, was disclosed. The processing of the corpus included the follow procedures: remove punctuation, remove numbers, transform letters to lower case, strip whitespaces, stem words (to retrieve their radicals), remove stop words (words that do not add informational content, such as articles, conjunctions, common verbs and qualifiers) and replace terms by synonyms.

The next step was the creation of a document term matrix (DTM), which is a matrix that represents the relationship between terms and documents, where each row represents a term and each column a document. The values are, typically, the number of occurrences of the terms in the documents, called term frequency. There are others possibilities, but the term frequency was the value adopted. To reduce the dimension of the DTM, only the terms that appear at least in 5 documents were included.

The DTM were then submitted to a descriptive analysis, aiming to show the range of stakeholders and issues/concerns mentioned and the frequency they were mentioned by the companies in their reports.

The DTM was also used as input variables in a hierarchical cluster analysis. Cluster analysis is a generic name given to techniques which objective is to combine objects in groups that present similar characteristics (Tufféry, 2011). In a hierarchical cluster analysis, the similarities among objects is computed for their variables using a measure of distance, generally the Euclidian distance, and the most similar objects are those with the smaller distances (Everitt & Hothorn, 2011).

We used the clustering to compare the companies regarding to their range of stakeholders, and range of issues addressed, to see if there are clusters of companies that have better engagement to stakeholders than others. We also compared the clusters using the other firm characteristics to see if companies with better stakeholder engagement had any characteristics that should be highlighted. To do these comparisons, we used T and Wilcoxon tests. We used both parametric and non-parametric tests as a robustness check to our results, once our sample is small and that can lead to bias. Both tests are used to test the null hypothesis that two groups have the same behavior regarding a numerical variable. T tests compare the groups' means, while Wilcoxon uses variable rankings.

For qualitative variables, such as participation on IGC and type of ownership, we used Chi-square test to compare them between the clusters. The null hypothesis in this test is that there is no association between the cluster and the firm characteristic.

All the analysis was made on the software R 3.3.3 (R Core Team, 2017). We used the package tm to implement the text mining, SnowballC to word stemming, stats to do the descriptive statistics and T, Wilcoxon and Chi-square tests, and stats and NbClust to implement the hierarchical cluster analysis.

5. RESULTS

We conduct our analysis, first describing the companies that compound our sample, considering their economic sector, adherence to IGC and their type of ownership. The results are shown in tables 2, 3 and 4.

Table 2 – Companies by sector

	Absolut frequency	Percentage
Banks	4	16.00%
Beverages	1	4.00%
Chemistry	2	8.00%
Computers	1	4.00%
Electricity	9	36.00%
Financial services	1	4.00%
Food	2	8.00%
Oil & gas	1	4.00%
Personal care	1	4.00%
Telecommunications	2	8.00%
Transport material	1	4.00%
Total	25	-

We can see that companies in the Electricity sector represent 36% of the companies using the GRI G4 to the 2015 report. This can be explained by the regulation the sector is submitted from the *Agência Nacional de Energia Elétrica* (National Agency of Electrical Energy – ANEEL), that imposes high environmental, among others, standards to the companies (Souza; Lima; Barbosa; Coutinho; Albuquerque, 2015). Banks also highlights from the other sectors. O'Sullivan (2015) emphasizes the importance that social accounting has to investment banks as a mean to achieve external assurance.

Table 3 – Companies by adherence to IGC

	Absolut frequency	Percentage
IGC	17	68.00%
Non-IGC	8	32.00%
Total	25	-

In Table 3, we can see that, in general, the companies issuing G4 GRI reports are also concerned with better governance, as 68% of them are a member of one of the upper governance segments of Bovespa.

Table 4 – Companies by type of ownership

	Absolut frequency	Percentage
Foreign	8	32.00%
Family	7	28.00%
State	6	24.00%
Institutional	4	16.00%
Total	25	-

As for the type of ownership, Table 4 shows that 32% of the companies are owned by foreign investors, 28% are controlled by a family, 24% are state-owned companies, and 16% are companies whose ownership belongs to a national institution.

Continuing the analysis, we submitted the GRI reports parts that were related to stakeholder engagement (G4-24) to a text mining algorithm. We could identify nine stakeholders mentioned by the companies. Table 5 presents those stakeholders, the number of companies that mentioned them and the total amount of times they appeared.

Table 5 – Stakeholders identified through text mining

Stakeholder	Reporting companies	Frequency of report	Percentage
Shareholders	18	52	4.09%
Clients	24	237	18.65%
Community	22	121	9.52%
Suppliers	25	199	15.66%
Employees	23	271	21.32%
Government	18	56	4.41%
Market	24	200	15.74%
Midia	14	30	2.36%
Society	19	105	8.26%
Total	-	1271	-

Results show that *employees* are the most mentioned stakeholder, even though 23 out of 25 companies added them in their report. All companies mentioned their *suppliers* as their stakeholders, while *market* and *clients* were listed by 24 companies. Interestingly, the *shareholders*, usually appointed as one of the most stakeholders due to the risk they assume (Jones, 1995), were not among the most mentioned group. This may be due to the ownership concentration in Brazil. As Iturriaga and Crisóstomo (2010) point out, the non-diversified ownership of Brazilian public companies turns the agency conflict among them, be, in most cases, between majority and minority shareholders. So, based on Mitchell, Agle and Wood (1997) and Magness (2006), minority shareholders in Brazil have less power to impose their demands than other stakeholders such as the *employees*, *suppliers*, *market* or *clients*.

We also analyzed the reports to find the issues or concerns that were appointed by the stakeholders (G4-27). Here, we aggregated more specific terms in more broad constructs to make the analysis easier. Table 6 shows the results.

Table 6 – Issues and concerns appointed by the stakeholders disclosed in the reports

Issues	Reporting companies	Frequency of report	Percentage
Climate	16	37	3.17%
Economy	20	55	4.72%
Education	13	50	4.29%
Finance	15	55	4.72%
Product	18	85	7.29%
Health	17	69	5.92%
Security	19	88	7.55%
Social issues	17	92	7.89%
Sustainability	25	174	14.92%
Work issues	13	18	1.54%
Environment	23	339	29.07%
Ethics	22	104	8.92%
Total	-	1166	-

We can see that the main issues appointed by the stakeholders that are disclosed by the companies are related to environment, present in 23 companies, and representing 29.07% of all the mentioned words. It is worth noting that, even though employees were the most mentioned stakeholder, issues related to work were the less mentioned, an unexpected behavior. This result suggests that, as Ferreira-Quilice and Caldana (2015) points out, sustainability reports are treated like a public relation tool rather than a transparency tool.

Our next step was a hierarchical cluster analysis using the text mining output as variables for the classification of the companies in groups. First, we used ten criteria from the package *NbClust* to determine how many clusters we should consider in our analysis. The results in figure 1 shows that two clusters fit better in our sample.

Figure 1 – Number of clusters that should be considered in the analysis

The dissimilarity matrix was generated using Euclidian distances, and the Wards minimum variance method was used to form the clusters. Figure 2 shows the dendrogram and the companies assigned to each cluster.

Figure 2 – Cluster dendrogram and companies' distribution

In order to better understand the clusters, we compared both considering their stakeholder approach and other characteristics. We called *Cluster A*, the smaller one, composed of 9 companies, and *Cluster B*, the bigger one, composed of 16 companies. The results are presented in tables 7, 8 and 9.

Table 7 – Comparison of clusters A and B regarding their stakeholders

Stakeholder	Mean Cluster A	Mean Cluster B	T-Test	Wilcoxon-Test
Shareholders	3.5555	1.2500	0.1523	0.3674
Clients	15.3333	6.1875	0.0286	0.0144
Community	8.3333	2.8750	0.0153	0.0088
Suppliers	17.1111	2.8125	0.0291	0.0001
Employees	25.2222	2.7500	0.0293	0.0007
Government	4.0000	1.2500	0.1721	0.0554
Market	13.7778	4.7500	0.0082	0.0063
Midia	2.1111	0.7500	0.0529	0.0317
Society	7.5556	2.3125	0.1282	0.0202

Results show that only the *market* was significant at 1% for both tests. *Clients*, *community* and *suppliers* showed 5% of significance for T test and 1% for Wilcoxon. *Shareholders*, *government* and *society* didn't present any level of statistical significance for the T test, rendering both groups similar regarding those stakeholders. *Employees* were the most mentioned stakeholder for the *cluster A* and *clients* for *cluster B*.

Table 8 – Comparison of clusters A and B regarding their stakeholder's issue

Issues	Mean Cluster A	Mean Cluster B	T-test	Wilcoxon-test
Climate	2.1111	1.1250	0.2559	0.4636
Economy	3.3333	1.5625	0.0786	0.0786
Education	4.6667	0.5000	0.0312	0.0013
Finance	2.8889	1.8125	0.3833	0.0483
Product	6.2222	1.8125	0.0314	0.0048
Health	4.6667	1.6875	0.1417	0.0729
Security	6.0000	2.1250	0.1619	0.1190
Social issues	7.4444	1.5625	0.0547	0.0055
Sustainability	11.4444	4.4375	0.0793	0.1444
Work issues	1.4444	0.3125	0.0001	0.0005
Environment	25.2222	7.0000	0.1513	0.0124
Ethics	7.8889	0.2063	0.0004	0.0002

Considering a significance level of 1%, only issues related to *work* and *ethics* can be considered different between *clusters A* and *B* (for both tests), with the first one having a better performance. Raising the significance to 5%, both *education* and *product* can also be considered concerns for the stakeholders that a different in *clusters A* and *B*.

Table 9 – Comparison of other characteristics in Clusters A and B

Variable		Cluster A	Cluster B	T-test	Wilcoxon-test	χ^2
Size (Mean)		17.0651	17.7316	0.4946	0.4867	-
Debt ratio (Mean)		0.4483	0.4905	0.6234	0.6771	-
IGC (Qty)	Yes	7	10	-	-	0.7343
	No	2	6			
Ownership (Qty)	State	1	5	-	-	0.6905
	Foreign	3	5			
	Family	3	4			
	Institutional	2	2			

Considering other characteristics of the companies in the clusters, such as their size, debt ratio, adherence to IGC and type of ownership, we can see that none of those variables present differences that could be considered significant. This suggests that other factors may affect the way companies disclose information about their stakeholder engagement. Based on these tests, we can state that we have a group of companies with a higher stakeholder engagement (*cluster A*) but they not differ from the group with lower stakeholder engagement (*cluster B*) regarding other characteristics usually appointed as determinants to this engagement.

6. CONCLUSION

This article aimed to apply a text mining algorithm to evaluate stakeholder engagement. In order to do this, we used a sample of 25 Brazilian companies, who used the G4 GRI guidelines to report their economic, social and environmental practices.

Following the work of Neu *et al.* (1998), we used the number of terms related to a theme as a measure of the engagement of the company with it. Based on two GRI indicators, G4-24, that accesses which stakeholders the company recognized, and G4-27, that disclosed which issues and concerns these stakeholders have, we composed a range of information to evaluate the companies. Then we used the number of terms each company reported in this range of themes to classify them in two groups using a cluster analysis.

We compared the resulting two groups regarding their stakeholder engagement and firm-level characteristics and found out that we had a cluster of high engagement, that was composed by 9 companies, and a cluster of low engagement, composed of 16 companies. They showed differences in the stakeholders *clients*, *community*, *employees* and *market* but when we compared them using other firm-level characteristics (size, debt ratio, governance and type of ownership) we didn't find any differences that were statistically significant.

The non-significance of these firm-level characteristics diverge from previous studies like Prado-Lorenzo *et al.* (2009) and Baumann-Pauly, Wickert, Spence and Scherer (2013). Despite that, we can attribute this result to the fact that we had a small sample, and we considered companies that were among early users in Brazil of G4 GRI guidelines, which implementation will only be compulsory after 1 July 2018. Because of that, we may have a rather homogeneous and small sample.

We also must highlight the fact that the tool we chose to perform the text mining analysis (package *tm* from R) was clearly optimized to work with English language, so its implementation to reports write in Portuguese showed some setbacks that can have some impact on the results.

Despite that, we conclude that text mining analysis to evaluate CSR reports can be a very useful tool. Future studies could implement this type of analysis in different contexts like, corporate governance or social and environmental performances. It is also possible to perform this type of analysis in different languages to compare the results and see if they present similar difficulties.

ABSTRACT

The constant social and economic changes in society have raised the need for adaptations in higher education organizations. The studies on people management have emphasized the importance of organizational commitment to the excellence of organizations. Organizational commitment has been one of the most studied constructs over the past decades in many areas of knowledge. However, there are few scientific studies on work commitment among professors, especially in higher education. This article has three goals: validate a scale of organizational commitment, in Portuguese language, applied to professors of public nursing schools; compare the level of organizational commitment of professors in public nursing schools in Portugal and Brazil; and evaluate the influence of personal characteristics of the professors on the affective, normative and continuance components of organizational commitment. A quantitative research was conducted, with an online questionnaire responded by 127 professors. The analysis of the data includes descriptive statistics, confirmatory factor analysis, independent samples Mann-Whitney tests and Spearman's correlations. The results show evidence of the influence of gender on normative commitment. The affective commitment is influenced by instruction level, being professor in a Post Graduate Program and distance from home to university. The personal characteristics of the professors have no influence on continuance commitment. The commitment doesn't show significant differences between countries.

Keywords: Organizational Commitment, Nursing Professors, Personal Characteristics, Confirmatory Factorial Analysis, Inferential Statistics.

1. INTRODUCTION

The current socio-economic changes in economic, financial and social instability have led to greater job insecurity for workers, requiring them to become more flexible. According to Meyer and Allen (1997) studies on organizational commitment do not lose relevance, despite conditioning in relation to changes in organizational structure and configuration. It is increasingly important to have a workforce committed to the organization, considering it as a preponderant factor of competitive advantage, and it is therefore fundamental that organizations understand the mechanism by which commitment develops and how it influences attitudes and behaviors.

Nursing professors are struggling with the effects of changes in higher education; evaluating the effectiveness and efficiency of education organizational systems, the demand for quality indicators of excellence, partnerships between schools/universities/work contexts and the adequacy of regulatory observatories of institutional dynamics (Santiago *et al.*, 2005).

The competitiveness between institutions is increasingly prominent worldwide, leading institutions that centralize the focus on processes to redirect them towards the results. In this context, many times, employees are challenged to perform tasks for which they were not trained, undergoing constant changes (Siqueira and Kurcgant, 2012). The paradigm shift in higher education requires a transformation in nursing education and the roles of professors in teaching.

Concerns of nursing professors include socio-professional changes that fall within nursing education in the field of policy, regulation education and educational decision-institutional decision, which justifies greater attention to people management policies and the commitment and satisfaction of social transformations in organizations. These changes, of influencing challenges in performing daily tasks and can produce satisfaction in some and dissatisfaction in others (Spector, 2004).

Authors such as Armenakis and Bedeian (1999) and Meyer, Srinivas, Lal and Topolnytsky (2007), have pointed out that commitment is one of the most important factor involved in employees' support for change initiatives.

On the other hand Mowday (1998) recognized that organizational commitment may have multiple forms and suggests alternative management strategies leading to desired behaviors in the workplace.

According to Abreu *et al.* (2013) is possible to identify behavioral differences for employees with different commitment profiles. Rhoades and Eisenberger (2002) in turn, demographic characteristics of employees say that are important factors often used as control variables to rule out alternative explanations of the organizational commitment.

In this context came the following research question: Will the personal characteristics of nursing professors influence organizational commitment?

For this, we have outlined the following goals of this research: validate a scale of organizational commitment, in Portuguese language, applied to professors of public nursing schools; compare the level of organizational commitment of professors in public nursing schools in Portugal and Brazil; and evaluate the influence of personal characteristics of the professors on the affective, normative and continuance components of organizational commitment.

The present study aims to contribute to the advancement of studies in the area of people management with an innovative way of measuring policies for managing people through the diagnosis of the studied institutions. This study will contribute to better decision-making by managers in order to improve individual commitment, leading to the achievement of more relevant organizational results. Rowe, Bastos and Pinho (2013) demonstrate the lack of scientific studies on work commitment among professors, especially in higher education.

2. LITERATURE REVIEW

2.1 Organizational Commitment

Mowday *et al.* (1979) and Mowday *et al.* (1982), in addition to being pioneers in the study of organizational commitment, also gave rise to most studies in this area. These authors emphasize the affective nature of the process of identification of the individual with the goals and values of the company; considering organizational commitment as the identification and involvement of the individual with particular company strength. They characterize commitment as a strong belief and acceptance by the individual's values and goals of the organization; a desire to exert considerable effort on behalf of the organization; and a strong desire to remain a member of the organization.

Organizational commitment has been one of the most studied constructs over the past decades in many areas of knowledge. According to Siqueira and Gomide (2004), its multidisciplinary character triggered the emergence of various conceptions about the subject. Yet because of this range of approaches related to the construct Bastos (1993) states that there is no consensus in the literature with regard to its conceptualization, as well as, the proposed measures are also varied.

According to Siqueira and Gomide Júnior, (2004), while affective commitment includes affective links with the organization and is within the scope of affectivity, both continuance commitment as the norm represent particular cognitive dimensions of the relationship between employee and organization. Siqueira (2000) suggests that continuance commitment can be seen by the act of the employee to remain in the organization from the motivation of individual perceptions of costs/losses resulting of the investment from the shutdown of the organization. That is, the organization will have the employee while she is attractive to him. The same author states that the employee's beliefs about the social debt to the organization, or need to return a favor integrate the normative organizational commitment.

Thus, Demo *et al.* (2013) employees who have a high level of normative commitment feel trapped in the organization that, in turn, has different ways to make its employees feel unable to leave it. In these organizations, there is considerable contact between organization and employees in a similar way to a family with rules of conduct and very strong mission to bring the employee to the conviction that the organization needs them to continue succeeding. In other words, employees who are normatively committed to continue working for the organization have a sense of debt or further obligation. Hence if the employee remains in the organization because he feels morally bound to it or to colleagues, the presence of normative commitment is present.

Allen and Meyer (1996) proposed a three-component commitment model because a one-dimensional model did not capture the diverse nature of organizational commitment among individual employees. The three components of the model reflect the emotional desire to work in the company (affective commitment), the perceived cost of job change (continuance commitment) and the moral obligation to remain (normative commitment). Meyer and Allen (1991) argued that one of the most important reasons for distinguishing between different forms of organizational commitment is that they have different implications for behavior.

In the present study, we used this three-component commitment model. The description of the three components according to Siqueira (2008) is shown in Table 1.

Table 1. Dimensions of Organizational Commitment

Dimension of Commitment	Description
Affective	Individual's identification with the goals and values of the organization. Scientific equivalent of "wear the organization".
Continuance	Product of rewards and costs perceived by the employee in the condition of the integral part of the organization.
Normative	Set of normative pressures of social norms that define the relationship of the employee with the company.

Source: adapted from Siqueira (2008)

2.2 Antecedents associated with affective, continuity and normative commitment

The researches demonstrate the relevance that has been given to the study of antecedents and results of commitment to the organization. According to Meyer, Vandenberghe and Becker (2004) this interest derives from the evidence that a

motivated and committed workforce provides benefits to the organization. Meyer and Allen (1991) pointed out that the essential nucleus of organizational commitment is the feeling of being linked to the goals of the company.

Allen and Meyer (1990) consider affective commitment as an emotional attachment to the organization in such a way that individual identities strongly committed to, are involved and enjoy membership to the organization. The affective commitment tries to have a sense of belonging, leading to feeling emotionally attached and feeling part of the company (Bloemer and Odekerken-Schroder, 2003).

The propensity for instrumental commitment stems from a general expectation about the quality of the exchange with the organization in terms of expected benefits and rewards in return for performance at work. The propensity for normative commitment is a general moral obligation to the organization. Thus, after entering the organization, the instrumental commitment is confirmed and the employee develops an affective commitment demonstrated by their identification, evidencing an emotional involvement and a sense of belonging to the organization.

Upon entry into the organization, the instrumental commitment is confirmed and the employee develops an affective commitment demonstrated by identification with him, emotional involvement, and a sense of belonging.

Meyer, Hecht, Gill and Toplonytsky (2010) pointed out that affective impairment was greatest when the perceived culture of the organization was similar to the individual's preferred culture.

Marsden, Kalleberg and Cook (1993) pointed out that gender can have an impact on affective commitment depending on the characteristics of the work and previous experience. McColl-Kennedy and Anderson (2005) argue that the feminine focus is on participating in "connection," mutuality, interdependence, and collectively, rather than the traditionally male focus on self-gratification, autonomy, competition, and independence.

Mathieu and Zajac (1990) suggest that there is a significant but weak relationship between age and affective commitment.

Meyer and Allen (1997) added that older employees are more likely to have a positive work experience than younger employees. Unlike age, educational level appears not to be significantly related to affective commitment.

Meyer and Maltin (2010) demonstrate some evidence that affective commitment to career or occupation may have positive implications for the health and well-being of employees. A strong relationship between performance and health benefits can be achieved by promoting employee commitment to company goals.

Meyer, Hecht, Gill and Toplonytsky (2010) pointed out that affective impairment was greatest when the perceived culture of the organization was similar to the individual's preferred culture.

Luchak, Pohler and Gellatly (2008) have shown that employees experiencing stronger levels of affective commitment are more likely to promote later retirement. We also think it is important to mention that Powell and Meyer (2004) argue that the satisfaction of working conditions is positively related to affective commitment. Allen and Meyer (1996) reported that affective impairment is positively correlated with work experiences and organizational characteristics.

Abreu *et al.* (2013) examined the long-term influence of five employee personal characteristics (type of employment, job level, gender, education level and service time) on the organizational commitment of the employees of a Brazilian energy company. The results pointed that the type of employment had the greatest impact on affective and normative commitment, while service time and education level are the most significant contributors to continuance commitment. Gender and job level didn't presented evidences of influence in commitment.

With the purpose of analyzing the workers perception regarding human resources management and organizational commitment in the Portuguese banking sector, Monteiro (2013) conducted a study which results pointed that the service time on institution is positively correlated with affective and normative commitment, age and instruction level are correlated with normative commitment and gender doesn't influenced the organizational commitment.

3. METHODOLOGY

This research is descriptive, exploratory and transversal, with quantitative nature. The population is all the professors in nursing career of Public Nursing Schools in Portugal or Brazil. The survey sample consists of 130 professors who responded to the online questionnaire sent to the entire population. 69 of the respondents live in Brazil and 61 live in Portugal.

The necessary elements for a characterization of the organizational commitment and the sociodemographic characteristics of the professors were collected. A diversified set of data related to the sociodemographic characterization of these professors was obtained, namely, age, gender, marital status, instruction level, having children, number of children, service time at university, exclusive dedication to the university and distance from house to university. On the other hand, data about their organizational commitment were also collected.

3.1 Instrument of data collection

To measure organizational commitment, the scale developed by Meyer, Allen and Smith (1993) for identification of affective organizational commitment (6 items), continuance organizational commitment (6 items) and normative organizational commitment (6 items) were used. The items are presented in Table 2.

Table 2. Organizational Commitment Scale

Affective commitment
I would be very happy to spend the rest of my career with this organization
I really feel as if this organization's problems are my own.
I do not feel a strong sense of "belonging" to my organization.
I do not feel "emotionally attached" to this organization.
I do not feel like "part of the family" at my organization.
This organization has a great deal of personal meaning for me.
Continuance commitment
Right now, staying with my organization is a matter of necessity as much as desire.
It would be very hard for me to leave my organization right now, even if I wanted to.
Too much of my life would be disrupted if I decided I wanted to leave my organization now.
I feel that I have too few options to consider leaving this organization
If I had not already put so much of myself into this organization, I might consider working elsewhere.
One of the few negative consequences of leaving this organization would be the scarcity of available alternatives.
Normative commitment
I do not feel any obligation to remain with my current employer
Even if it were to my advantage, I do not feel it would be right to leave my organization now.
I would feel guilty if I left my organization now.
This organization deserves my loyalty
I would not leave my organization right now because I have a sense of obligation to the people in it.
I owe a great deal to my organization.

Source: Adapted from Meyer, Allen and Smith (1993)

3.2 Data Analysis

Data analysis included descriptive statistics, confirmatory factor analysis (CFA) and inferential statistics. Descriptive statistic techniques, including frequencies tables, crosstabs and descriptive measures, such as minimum, maximum, mean, mode, median and standard deviation, allowed characterize the sample and describe the organizational commitment.

Then, confirmatory factorial analysis (CFA) was applied to the scale. This multivariate technique aims to reduce the number of variables in a smaller number of factors. Marôco (2010) states that CFA is used to assess the quality of adjustment to a theoretical model. In the AFC, it was verified the convergent validity, measured by the average variance extracted (VEM), which must be greater than 0.5; the factorial validity, verified when the factor loadings are greater than 0.5; discriminant validity, which is verified by comparing the VEM of the factors with the square of their correlations, VEM must be greater than the square of the correlation; and the composite reliability, which must be greater than 0.7. In this article, CFA were used to validate the scale in the population of professors in public nursing schools and obtain the factor loadings that were used as weights in the calculation of means that reflect the levels of each dimension of organizational commitment. These levels were compared between Portugal and Brazil and according to all the other personal characteristics of the professors considered in this research, using non parametric tests because the distributions of the scores differ from a normal distribution. To evaluate the relation between the levels of commitment and the quantitative personal variables, the correlation of Spearmann was used. For qualitative personal variables, Mann-Whitney test for independent samples was used.

Statistical data analysis was done using the softwares IBM SPSS (Statistical Package for Social Sciences) and IBM SPSS Amos (Analysis of MOment Structures), versions 22.0.

4. RESULTS

4.1 Descriptive statistics of the characteristics of professors

The first stage of the data analysis was the descriptive analysis of the sociodemographic characteristics of professors and of the variables that characterize professor's situation at the university. This stage allows to profile the sample under study. Regarding the sociodemographic characteristics of professors, was analyzed data about age, gender, marital status, instruction level, if the professor has children and the number of children that the professor has.

Table 3 present descriptive measures of the age of the respondents. The age ranged from 28 to 64 years, with a mean of 47.69, standard deviation of 9.61 and median and mode equal to 50 years.

Table 3. Descriptives measures of the age

Mean	Std. Deviation	Minimum	Median	Maximum	Mode
47.69	9.61	28	50	64	50

With respect to gender, 78% of the professors are women, as can be seen in Table 4. This predominance of women is a typical feature of nursing schools. 74.8% are married or lives in a stable union, which can be classified has “Living with someone”. 10.2% of the professors are divorced, 13.4% are singles and 1.6% are widowers. These three categories were grouped and classified has “Not living with someone”, representing 25.2% of the sample, to guarantee the representative of this group in other analysis. About the instruction level, 51.2% of professors have PhD and 9.4% are post-doctors, totalizing 60.6% of the sample. From the 39.4% that are not doctors, 9 professors are only graduate and 41 have a master degree.

Table 4. Frequencies table of the gender

		Frequency	Percent
Gender	Male	28	22.0
	Female	99	78.0
Marital status	Living with someone	95	74.8
	Not living with someone	32	25.2
Instruction level	Not doctor	50	39.4
	Doctor	77	60.6
Having children	Yes	106	83.5
	No	21	16.5

Most professors (83.5%) have children, as showed in Table 4. Table 5 shows that the maximum number of children is 5 and median and mode are both 2 children. The number of children has a mean of 1.54 with a standard deviation of 0.97.

Table 5. Descriptives measures of the number of children

Mean	Std. Deviation	Minimum	Median	Maximum	Mode
1.54	.97	0	2	5	2

In order to characterize the professor's situation at the university, the variables analyzed were: service time at university, having exclusive dedication to the university, having a management position, being professor in a post graduate program and distance from the house to the university.

The time of career ranged from 1 to 38 years, with a mean of 16.22 and a standard deviation of 10.32, as can be seen in Table 6. The median is 15 (near the mean), but it is interesting that the mode is much smaller (5 years).

Table 6. Descriptives measures of the service time at university

Mean	Std. Deviation	Minimum	Median	Maximum	Mode
16.22	10.32	1	15	38	5

Almost all professors (87,4%) have exclusive dedication to the university, 48.0% have a management position and 56.7% of professors teach in a Post Graduate Program, as shown in the Table 7.

Table 7. Frequencies table of the exclusive dedication, management position and Post Graduate Program

		Frequency	Percent
Exclusive dedication	Yes	111	87.4
	No	16	12.6
Management position	Yes	61	48.0
	No	66	52.0

Professor in a Post Graduate Program	Yes	72	56.7
	No	55	43.3

The mean of the distance from the house of the professors to the university is 11.16km, with a standard deviation of 15.59km. This distance varied from 0.5 to 110km, with a median of 5km and 3km, as presented in Table 8.

Table 8. Descriptives measures of the distance from house to university

Mean	Std. Deviation	Minimum	Median	Maximum	Mode
11.16	15.59	.5	5	110	3

4.2 Validation of the scale of organizational commitment

The analysis of organizational commitment starts with the descriptive analysis of the responses to the items of the respectively scale. Table 9 shows some descriptive measures, namely, minimum, maximum, mean and standard deviation, of the responses of the 127 professors to the items of the scale of organizational commitment. All items exhibit great variability in the responses, ranging from 1 to 5. The items of affective commitment present the highest means and the items of normative commitment present the lowest. The greatest mean (4.000) was obtained for the item CA6 “This organization has a great deal of personal meaning for me” and the lowest (2.373) for the item CN3 that represents “I would feel guilty if I left my organization now”.

Table 9. Descriptives measures of the responses to the items of the scale of organizational commitment

	Min.	Max.	Mean	St.dev.
Affective commitment				
I would be very happy to spend the rest of my career with this organization. (ca1)	1.0	5.0	3.811	1.213
I really feel as if this organization's problems are my own. (ca2)	1.0	5.0	3.504	1.090
I feel a strong sense of “belonging” to my organization. (ca3)	1.0	5.0	3.866	1.086
I feel “emotionally attached” to this organization. (ca4)	1.0	5.0	3.787	1.110
I feel like “part of the family” at my organization. (ca5)	1.0	5.0	3.417	1.231
This organization has a great deal of personal meaning for me. (ca6)	1.0	5.0	4.000	1.054
Continuance/instrumental commitment				
Right now, staying with my organization is a matter of necessity as much as desire. (ci1)	1,0	5,0	3.819	1.164
It would be very hard for me to leave my organization right now, even if I wanted to. (ci2)	1,0	5,0	3.528	1.284
Too much of my life would be disrupted if I decided I wanted to leave my organization now. (ci3)	1,0	5,0	3.252	1.391
I feel that I have too few options to consider leaving this organization. (ci4)	1,0	5,0	2,559	1,307
If I had not already put so much of myself into this organization, I might consider working elsewhere. (ci5)	1,0	5,0	2,622	1,208
One of the few negative consequences of leaving this organization would be the scarcity of available alternatives. (ci6)	1,0	5,0	2,441	1,349
Normative commitment (CN)				
I feel the obligation of remain with my current employer. (cn1)	1,0	5,0	2,568	1,266
Even if it were to my advantage, I do not feel it would be right to leave my organization now. (cn2)	1,0	5,0	2,866	1,287
I would feel guilty if I left my organization now. (cn3)	1,0	5,0	2,373	1,251
This organization deserves my loyalty. (cn4)	1,0	5,0	3,754	1,191
I would not leave my organization right now because I have a sense of obligation to the people in it. (cn5)	1,0	5,0	2,772	1,274
I owe a great deal to my organization. (cn6)	1,0	5,0	3,252	1,297

The validation of the scale of commitment was made by confirmatory factor analysis. 3 items of this scale (ci4, ci5 and ci6) were excluded because they were not significant at a 5% level of significance. The greatest modification index is obtained for the correlation between errors en4 and en6 (M.I. = 24.334; Par change = .372), which suggest that the part of behavior of items cn4 and cn6 not explained by the factor CN is correlated, in other words, the items cn4 and cn6 share some other cause not included in the model. Because of this, the correlation between en4 and en6 was included in the final model to improve its adjustment. The final model is presented in Figure 1.

Figure 1.

In the model presented in Figure 1, all the standardized factorial weights are greater than .5 and significant, with p values less than .001. The item ca3 is the most important of the affective commitment (with a standardized weight of .890), followed by ca5 (.876), ca4 (.837), ca6 (.786), ca1 (.778) and finally ca2 (.663). With respect to instrumental commitment, the most important item is ci1 (.915), followed by ci2 (.735) and ci3 (.581). About the normative commitment, highlight the item cn2 (.764), followed by the items cn3 (.751), cn5 (.735), cn6 (.644), cn1 (.627) and cn4 (.555). Almost indexes of fit showed in Figure 1 indicate an acceptable fit of the model.

It was also verified that the model obtained composite reliability, convergent validity and discriminant validity of all dimensions of commitment. The values of the index of composite reliability are: $CC_{CA} = .952$; $CC_{CI} = .866$; $CC_{CN} = .896$, all greater than .7. Convergent validity was verified, with all the values of the mean variance extracted (VEM) greater than .5: $VEM_{CA} = .770$; $VEM_{CI} = .690$; $VEM_{CN} = .593$. The VEM of each factor is greater than the square of its correlation with each of the other factors, as shown in Table 10, which indicates the discriminant validity.

Table 10. Verification of discriminant validity of organizational commitment

Relation			R ²	VEM _{CA}	VEM _{CI}	VEM _{CN}
CA	<-->	CI	.552	.770	.690	
CA	<-->	CN	.415	.770		.593
CI	<-->	CN	.381		.690	.593

From this analysis, the professors' scores in the three dimensions of organizational commitment were calculated, which are the weighted averages of the items.

4.3 Comparison of the level of organizational commitment according to the personal characteristics of the professors

Some descriptive statistics of the score of each dimension of organizational commitment was calculated to characterize its distributions. Table 11 presents the values of these statistics and the results of the Kolmogorov-Smirnov test applied to check the normality of the distributions.

Table 11. Descriptive statistics and normality test of the dimensions of commitment

	Affective commitment	Continuance commitment	Normative commitment
Mean	2.726	3.312	2.934
Median	2.855	3.472	2.860
Mode	2.8 ^a	4.2	4.4
Std. Deviation	.6973	.9067	.9190
Minimum	.8	1.0	1.1
Maximum	3.7	4.5	5.0

KS normality test	Statistic	.101	.128	.052
	df	127	127	127
	p-value	.003	.000	.200
a. Multiple modes exist. The smallest value is shown				

The highest means and medians were obtained for the continuance commitment. Affective commitment presents the lowest mean (2.726), the lowest absolute variability represented by the standard deviation (.6973) and also the lowest minimum (.8) the maximum (3.7). The distributions of the scores of affective and continuance commitment are significantly different from the normal distribution, as can be verified by the small p-values of the Kolmogorov-Smirnov normality test. This test was also applied to check the normality of the three scores of commitment across categories of country of residence, gender, marital status, instruction level and all the others variables analyzed. In most situations, there was evidence that the distributions differ from normal. Therefore, it was decided to use non-parametric hypothesis tests to evaluate the relation between the scores of commitment to the personal characteristics of the professors. Table 12 presents the p-values obtained for the independent-samples Mann-Whitney U test used for the qualitative personal characteristics.

Table 12. P-values of the Mann-Whitney tests

	Affective commitment	Continuance commitment	Normative commitment
Country	.551	.496	.562
Gender	.159	.884	.045*
Marital status	.464	.613	.410
Instruction level	.037*	.471	.546
Has children	.283	.702	.758
Exclusive dedication	.785	.706	.774
Management position	.073	.768	.362
Post Graduate Program	.021*	.243	.090
*. Significant (< .05)			

Evidence was found that the gender of professors influences their normative commitment score (Mann-Whitney U = 1042; Wilcoxon W = 5992; Standardized test statistic = -2.001; p-value = .045). Table 13 shows that men present higher mean (3.259) and higher median (3.164) for the score of normative commitment.

Table 13. Descriptive statistics for the normative commitment across categories of gender

Gender	Mean	N	Std. Deviation	Median
Male	3.259	28	.9582	3.164
Female	2.842	99	.8911	2.795
Total	2.934	127	.9190	2.860

The instruction level, more specifically, be or not to be a doctor (have a PhD or not) presented evidence of influence the affective commitment (Mann-Whitney U = 1503; Wilcoxon W = 2778; Standardized test statistic = -2.082; p-value = .037). Table 14 shows that the professors with PhD are more affectively committed, with higher values for mean (2.825) and median (2.938).

Table 14. Descriptive statistics for the affective commitment across categories of instruction level

Instruction level	Mean	N	Std. Deviation	Median
Doctor	2.825	77	.6691	2.938
Not doctor	2.572	50	.7184	2.759
Total	2.726	127	.6973	2.855

Being a postgraduate professor increases the level of affective commitment, as shown in Table 15. The difference of affective commitment between the professors who are in a Postgraduate Program and who aren't is significant (Mann-Whitney U = 1507; Wilcoxon W = 3047; Standardized test statistic = -2.301; p-value = .021).

Table 15. Descriptive statistics for the affective commitment across categories of professor in a Post Graduate Program

Professor in a Post Graduate Program	Mean	N	Std. Deviation	Median
Yes	2.868	72	.5916	2.944
No	2.539	55	.7823	2.733
Total	2.726	127	.6973	2.855

To evaluate the correlation between the scores of commitment and the personal characteristics of the professors represented by quantitative variables, the non-parametric coefficient of correlation of Spearman was applied. Table 16 presents the results obtained.

Table 16. Correlation Spearman's rho coefficients and significance tests

		Affective commitment	Continuance commitment	Normative commitment
Age	Coefficient	,075	-,135	-,037
	p-value	,420	,144	,686
	N	119	119	119
Number of children	Coefficient	,090	,006	-,051
	p-value	,318	,949	,573
	N	124	124	124
Service time at university	Coefficient	,166	-,031	,052
	p-value	,062	,730	,560
	N	127	127	127
Distance from home to university	Coefficient	-,186*	-,142	-,146
	p-value	,037	,114	,104
	N	126	126	126

The only significant correlation was found between affective commitment and distance from home to university (coefficient = -.186, p-value = .037). This correlation is negative, which means that the longer the distance, the lower the affective commitment.

5. CONCLUSION

The present study had as specific objectives: to validate a scale of organizational commitment, in Portuguese language, applied to the professors of public nursing schools; compare the level of organizational commitment of the professors in the public nursing schools in Portugal and Brazil and also to evaluate the influence of the personal characteristics of the professors on the affective, normative and continuity components of the organizational commitment.

As for the first specific objective, although it is necessary to remove some items from the instrumental component of the model, the model presented composite reliability, discriminant validity and convergent validity in addition to good adjustment indices; so it was possible to confirm the theoretical framework of three factors.

In relation to comparing the level of professors in public nursing schools in Portugal and Brazil, there are no statistically significant differences when analyzing the three components of the commitment. This result is in agreement with the study by Meyer *et al.* (2002) which, when comparing studies conducted inside and outside the North America, observed without exploring the impact of cultural differences in organizational commitment.

Regarding the third specific objective, it was verified that the affective and normative components presented statistically significant differences in relation to some personal characteristics of the professors. Statistically significant differences were found for the affective component in relation to schooling - professors with a PhD degree are more affectively compromised - and distance from the home to the University, shows that how the greater is the distance, lesser is the affective commitment.

The affective commitment refers to the emotional attachment, identification, and involvement of the employee with the organization. Professors with a PhD degree are well regarded by the academics, because the title is culturally associated with higher payment and greater knowledge in the area in which they teach. Therefore, the professors' own expectation of its importance within university is greater when they have this title. Thus, this characteristic, although personal, is closely linked to the professors' experience at work. If the professor has the title, it is more respected and valued within the university.

This result corroborates with Meyer *et al.* (2002), who observed that the affective commitment had stronger correlations with work experiences - such as job satisfaction, involvement in work and occupational commitment.

As far as the distance of the domicile, it negatively affects the affective commitment, Meyer *et al.* (2002) indicated that affective impairment correlated negatively with stress. Since the distance from the home to the workplace is a stress factor,

it's understandable the result found here. People who travel a long way to work tend to be more stressed and stress correlates negatively with affective commitment.

The policy component reflects a sense of obligation to continue in the organization. Employees with a high level of normative commitment feel they must remain in the organization. The results of previous studies by Mathieu and Zajac (1990) and Meyer *et al.* (2002) didn't show a relationship between gender and normative commitment. Therefore, to clarify this result, a new qualitative study is needed to explain why male professors feel more obliged to stay in the University, than female professors.

As a limitation of this research we have the representativity of the sample, since the respondents were chosen for convenience and accessibility, which limits the generalization capacity of the results. The recommended, for having a better representation of the population, would be a probabilistic sample, in which, the elements that compose the sample are randomly selected.

To better analyze the personal characteristics differences in the commitment, it is suggested that this study must be replicated in more countries and also in professors of other courses. It would also be interesting to add to the survey method a qualitative method, in a proposal of mixed approach. We believe that this area of research is a very broad field, relevant and useful for the development of other studies.

ABSTRACT

This study consists of analyzing the influence of sustainable and innovative behavior on the entrepreneurial intention of Brazilian and Portuguese university students. The proposed model is based on the theory of behavior planned for the entrepreneurial intention, in the theory of adaptation-innovation for the innovative behavior, and on behavioral scales focused on environmental issues. This research is developed through an exploratory survey, applied to students from the Federal University of Ceará (Brazil) and the University of Algarve (Portugal). Multivariate analysis techniques, such as factorial analysis, logistic regression and classification and regression trees, are used to analyze the data. The results confirm that (i) there is a positive relation between the entrepreneurial intention of the students and the existence of a parent business; (ii) portuguese students have a greater entrepreneurial intent; (iii) there is no significant relationship between the professional experience of students and their entrepreneurial intention; (iv) there is a positive relationship between the sustainable behavior of students and their entrepreneurial intent; (v) there is no significant relation between the sustainable behavior and the entrepreneurial intention; and (vi) there is a positive relationship between the innovative behavior of university students and their entrepreneurial intent.

Keywords: Sustainable Behavior, Innovative Behavior, Entrepreneurial Intent.

1. INTRODUCTION

In recent decades, entrepreneurship has been considered preponderant for the economic development of a country (Hisrich, Peters & Shepherd, 2014, Teixeira & Davey, 2010). Entrepreneurship focused on sustainable development is based on the triple bottom line (Elkington, 1997), which balances the economic, social and environmental spheres.

Entrepreneurial intent is directly linked to entrepreneurship, and can be considered an intrinsic individual process. It leads to the contextualization of Ajzen (1991), to whom an intention is prior to the actual behavior of entrepreneurship, that is, it anticipates a creation or expansion of a particular business. Bird (1988), Liñán and Chen (2009), Thompson (2009) and Teixeira and Davey (2010) point out innumerable models that are based on entrepreneurial intent, which rely on predicting potential entrepreneurs.

Another phenomenon that is widely recurrent in research concerning entrepreneurship is innovation, since the entrepreneur can be considered an innovator, capable of proposing critical solutions to problem solving (Kirton, 1976; Taylor, 1989). Therefore, in order to understand innovative behavior, the theoretical perspective of Kirton (1976) - Theory of Adaptation-Innovation is used, which has notoriety and relevance in research related to the behavior of the individual linked to innovation.

In addition, the environmental dimension also complements the entrepreneurship axis, based above all on aspects related to the protection of the environment, with the aim of incorporating sustainable practices in the creation of new businesses (Boszczowski & Teixeira, 2012). Therefore, in order for some business to have a position favorable to the environment, the founders must be aware of the impact of their behavior and actions regarding the environment (Gonçalves-Dias *et al.*, 2009, Kuckertz & Wagner, 2010).

Considering the discussions that contextualize the topics in question, the following question is raised: "What is the relation of sustainable and innovative behavior in the entrepreneurial intention of university students?"

The main objective of this research is to analyze the influence of sustainable and innovative behavior on the entrepreneurial intention in Brazilian and Portuguese university students. The specific objectives are: (i) to identify the relationships between the profile of university students and their entrepreneurial intention; (ii) to analyze sustainable behavior in the entrepreneurial

intention of university students; (iii) to investigate innovative behavior in the entrepreneurial intention of university students; and (iv) to develop a model that predicts entrepreneurial intent based on the profile of university students and their sustainable and innovative behavior.

In general, the theoretical contribution of this study is based on the following questions, as proposed by Whetten (1989): “what”; “how”; “why”; “Who, where and when”. With regard to “what”, this research seeks to analyze the influence of sustainable behavior - through ecological awareness - and innovative behavior - through the individual’s cognitive style (information processing) in the entrepreneurial intention of Brazilian and Portuguese university students.

As to “how”, the purpose is to identify if the university student has an entrepreneurial intention (Liñán & Chen, 2009; Thompson, 2009); In addition, we seek to analyze the influence of sustainable behavior - using the theoretical-methodological perspective of Straughan and Roberts (1999) and Gonçalves-Dias *et al.* (2009); as well as grounding the innovative behavior through the Theory of Adaptation-Innovation (Foxall & Hackett, 1992; Kirton, 1976) in the entrepreneurial intention of Brazilian and Portuguese university students.

With regard to “why”, we highlight researches in the large portals of scientific research such as Spell and Scielo, especially noting the scarcity of studies that align innovation-entrepreneurship-sustainability. These individual phenomena are largely grounded in the empirical and conceptual literature; however, when it comes to the alignment of these phenomena, literature is scarce or almost non-existent.

In what represents the set “who, where and when”, the limitations in the propositions of explanations in scientific research, where the contextual factors are limited and when they can be understood as the extension of a certain theory stand out. This research is carried out in a specific moment, in which the Brazilian and Portuguese university students of the courses related to the management, like the course of administration are analyzed.

2. THEORETICAL FOUNDATION

2.1 Entrepreneurial Intent

Studies and discussions on entrepreneurial intention have been gaining visibility and relevance since the last two decades of the 20th century, in works such as the ones of Shapero and Sokol (1982), Krueger (1993), Davidsson (1995), Carvalho and González (2006) and Teixeira and Davey (2010).

Shapero’s seminal works mark the crucial point of researches concerning entrepreneurial intent (Shapero & Sokol, 1982). After this, researchers in the field of entrepreneurship studies recognized the value of entrepreneurial intention as a key part of understanding the process of creating a company (BIRD, 1988). Thus, with the evolution of the literature on entrepreneurial intention, some theories were considered crucial to explain this phenomenon (Autio *et al.*, 2001).

In reference to the behavioral aspects of entrepreneurship, starting with Ajzen and Fishbein’s Theory of Action (1977), which stimulated the Theory of Entrepreneurial Intentions of Shapero and Sokol (1982) and the Theory of Planned Behavior (TPB) of Ajzen (1991). These theories are characterized as being dominant theoretical models that explain the entrepreneurial intention in the light of behavioral psychology.

The intention of the individual in favor of entrepreneurship is addressed in the literature because it is influenced by many factors, namely: time; cooperation with others; propensity to innovate; financial resources; skills; among others. It represents, in turn, the behavioral control made by the individual, directed to the entrepreneurial behavior (Ajzen, 1991; Davidsson, 1995; Teixeira & Davey, 2010).

In addition, Carvalho and González (2006) demonstrate external and individual factors that influence the behavioral attitude-intention, and which are denoted in studies concerning the entrepreneurial intention, since, they have as a focus to predict behavioral aspects that highlight the intentions through attitudes, based on behavioral psychology.

2.2 Theory of Adaptation-Innovation

The Theory of Adaptation-Innovation proposed by Kirton (1976) shows that individuals are able to propose creative solutions to solve problems. In such a case, it exposes the involvement of the individual’s behavior through, mainly, creativity and innovation.

The KAI theory seeks to reveal tools aimed at creativity as well as solving team problems in order to achieve positive results (Stum, 2009). In addition, a number of empirical studies have sought to highlight the influence of KAI on the identification of potential potential entrepreneurs, such as Goldsmith (1984), Robinson *et al.* (1991), Taylor (1989), Bagozzi and Foxall (1995), Marcati, Guido and Peluso (2008), Kuckertz and Wagner (2010) and Chudry, Foxall and Pallister (2011).

Kirton (1976) considers style (innovative and adaptive), which influence behavior, but prevails problem solving and decision making. Cognitive styles are stable individual differences in the preference to obtain, organize, and use information for decision making.

Stum (2009) demonstrates the KAI as a cognitive style (information processing) that promotes organizational, personal and social changes. This author highlights the influence of globalization on organizations as they foster the individual’s ability to cope quickly with the constant changes in society and the marketplace. In Kirton’s (1976) perspective, the KAI index seeks to measure two styles of problem solving: adapter (“doing things better”) and innovative (“doing things differently”).

In general, the research proposed by KAI is to promote the creative style of each individual, making it possible to identify the individual’s cognitive style on a continuous scale (innovative and adaptive), which was proposed by Kirton (1976).

2.3 Sustainable Behavior

In this paper, we present the results of a study of environmental behavior in environmental psychology (Corral-Verdugo & Pinheiro, 1999), since it refers to studies that focus on environmental research (Günther, Pinheiro & Guzzo, 2004). Studies related to relatively recent environmental aspects are also emphasized, enabling the multidisciplinary and transdisciplinary field, which are constantly challenging researchers through multiple and diverse approaches.

For sustainable behavior, it is worth mentioning, firstly, the problems related to the environment, since they are becoming research concerns in research related to environmental themes, trying, therefore, to explain causes that influence environmental degradation or environmental conservation (in addition to the impact of the sustainable behavior of individuals, through environmental awareness, for or against environmental practices (Gonçalves-Dias *et al.*, 2009).

Corral-Verdugo (2012) considers sustainable behavior as a more negative than positive effect on the environment. It is worth noting also the studies related to the environmental behavior of Corral-Verdugo and Pinheiro (1999) and Gonçalves-Dias *et al.* (2009).

In this research, we present the sustainable behavior in the perspective of the individual's concern with environmental issues, which, consequently, are aligned with social issues (Gonçalves-Dias *et al.*, 2009; Kuckertz & Wagner, 2011; Pato & Tamaio, 2006). Sustainable behavior refers to the development of alternatives that seek to reduce environmental degradation, with a focus on protecting the development through social and environmental solutions.

When aligning entrepreneurship with sustainable behavior, it is based on the fact that an individual, while engaging in entrepreneurial activities, can positively or negatively impact on the environment (Kuckertz & Wagner, 2011), since when this individual has an environmental conscience, a positioning in favor or not in relation to the environment, its actions can directly impact the aspects of the triple bottom line (Elkington, 1997).

Considering the theoretical-methodological perspective of Gonçalves-Dias *et al.* (2009), this research seeks to identify the sustainable behavior of the individual, based on aspects of his/her daily life, namely: water and energy consumption, energy reduction, use of resources in the residence, and questions about the treatment given to the trash.

2.4 Hypotheses Development

It is worthy to emphasize a set of items that intend to measure traits, such as: entrepreneurial intention (Thompson, 2009); (Environmental awareness issues: water and energy economy, waste treatment, mobilization and domestic environment) (Gonçalves-Dias *et al.*, 2009; Kaiser, 1998; Pato & Tamayo, 2006); Innovative behavior, through the individual's cognitive capacities - information processing (Foxall & Hackett, 1992; Kirton, 1976); and sociodemographic variables (if you have entrepreneurial parents, professional experience, gender, country of origin, among others) (Carvalho & González, 2006; Kuckertz & Wagner, 2010).

In the findings of the studies done by De Wit (1993), Van Praag (1997) and Noorderhaven *et al.* (2003) found sufficient evidence to support the positive relation of the entrepreneurial intention of the individual who has parents with their own businesses. **H_{1a}**: There is a positive relationship between the entrepreneurial intention of university students and the existence of the parents' own business.

In addition, in relation to the profile of Brazilian and Portuguese university students, it is sought to identify, in the context of culture, which country - Brazil or Portugal - presents a greater number of students with an entrepreneurial intention. This research corroborates Hofstede (2011), since this author emphasizes that the profile of Brazilian and Portuguese students is not similar, which is worth mentioning aspects such as aversion to uncertainty and distance from power. Thus, another hypothesis emerges: **H_{1b}**: There is a positive relationship between the country of origin of university students and their entrepreneurial intent.

Considering that professional experience may influence the entrepreneurial intention of the university student, Kuckertz and Wagner (2010) confirm that professional experience has an impact on entrepreneurial intention. Therefore, the following hypothesis arises: **H_{1c}**: There is a positive relation between the professional experience of university students and their entrepreneurial intention.

It focuses on Kuckertz and Wagner (2010), referring to the impact that a person, through the creation of a business, can generate in the environment. In this context, environmental protection occurs through the consciousness of the individual, since their actions can protect or degrade the environment (Corral-Verdugo, 2012).

In relation to the issues related to the field of sustainability action that concerns the daily life of the individual, it is mainly based on Gonçalves-Dias *et al.* (2009), since environmental awareness has a positive or negative effect on the individual's behavior, as shown in Table 1.

Table 1. Dimensions of sustainable behavior

Dimension	Description
Consumption	It groups variables related to respondents' attitudes to consumption. It expresses the level of awareness of individuals about the environmental issues that involve the posture of the manufacturers and also a more active character in the search for ecologically correct product options.
Concern about Trash	It brings together variables related to the attitude of the individuals regarding garbage and cleaning of domestic and public environments.
Boycott via Consumption	It entails behavioral variables related to consumption, yet the character of the individuals' posture indicates a greater propensity to penalize ecologically incorrect products and services.
Mobilization	Adds behavioral variables related to a proactive stance in the search of awareness of other individuals with regard to environmental issues.
Domestic Environment	It groups variables related to the individual's behavior in the home life. The variables are related to the daily use of natural resources, such as electricity and water.

Source: Adapted from Gonçalves-Dias *et al.* (2009)

From the perspective of the empirical literature on entrepreneurship and sustainable behavior, the following hypotheses emerge: **H_{2a}**: There is a positive relationship between the sustainable behavior of university students and their entrepreneurial intention; and **H_{2b}**: There is no significant relationship to sustainable behavior in entrepreneurial intent among Brazilian and Portuguese university students.

In reference to the innovative behavior, the theoretical-methodological basis of the Theory of Adaptation-Innovation is used, which emphasizes the capacity of the individual to be innovative and able to propose creative solutions to problem solving (Kirton, 1976).

Considering the entrepreneurial intent (Thompson, 2009; Kuckerz & Wagner, 2010) related to the innovative behavior - propensity to innovate - through the individual's cognitive styles (Kirton, 1976; Taylor, 1989; Foxall & Hackett, 1992). The following hypotheses to be investigated: **H_{3a}**: There is a positive relationship between the innovative behavior of university students and their entrepreneurial intent; and **H_{3b}**: There is no significant relationship regarding the innovative behavior in the entrepreneurial intention between Brazilian and Portuguese university students.

In view of these approaches, it is fundamental to adopt the hypothetical model for this research, focusing on the influence of sociodemographic variables and sustainable and innovative behavioral constructs on the entrepreneurship intentions of Brazilian and Portuguese university students.

+ Positive relationship with entrepreneurial intention

There is no significant relationship with entrepreneurial intention

3. METHODOLOGY

The classification proposed for this study by Collis and Hussey (2005) is considered, being a quantitative research, of descriptive nature. In addition, it is explanatory to establish relationships between variables. The method used to obtain the data is an intentional survey (Hair *et al.*, 2009).

Specifically, the population was composed of university students from the administration courses of the cities of Fortaleza (Brazil) and Faro (Portugal), both with courses related to management. The course of administration, in accordance with the

evidence of Paço *et al.* (2011), presents a wide incidence of studies and practices related to entrepreneurship, which supports the justification of the choice of this course for the chosen population.

It is possible to emphasize the choice of university students in Brazil and Portugal, confirming Thomas and Muller (2000), who list some reasons considered as fundamental for the choice of university students, in relation to research related to entrepreneurship, which also use Contribution to justify the population chosen in this research: (i) difficulty in accessibility of entrepreneurs, since they already have their own businesses; and (ii) relevance of analyzing the entrepreneurial intention of university students, as well as the homogeneity of the sample, allowing comparisons between different cultures.

The methodology applied by Kirton (1976) is taken into account; Taylor (1989); Foxall and Hackett (1992); Carvalho and González (2006); Thompson (2009); Gonçalves-Dias *et al.* (2009) and Kuckertz and Wagner (2010), adopting the measurement of some aspects, namely: Relatives Upcoming Entrepreneurs; Country of Origin; Professional Experience; Sustainable Behavior and Innovative Behavior.

The questionnaire, the research instrument, was structured through a set of preestablished items, constituted, in the majority, in a likert scale of 5 points. With regard to entrepreneurial intention, the dichotomous analysis is used “yes / no” or if it is already entrepreneurial; for sustainable behavior ranges from 1 “never” to 5 “always”; in relation to the innovative behavior of 1 “totally disagree” to 5 “totally agree”.

For these analyzes, the rationale is based, mainly, through two scales - with relevant methodological bases in the empirical and conceptual literature on these themes: (i) Sustainable Behavior - Gonçalves-Dias *et al.* (2009) and (ii) Innovative Behavior - Foxall and Hackett (1992).

Image 2 summarizes the statistical techniques used to achieve the objectives. For the analysis of the data the statistical software of statistical treatment of data is used: Statistical Package for the Social Sciences (SPSS) (version 21.0).

Image 2. Synthesis of techniques of statistical analysis of data

Source: Made by the author

The descriptive statistics seek to portray the profile of the sample in relation to gender, age, semester, professional experience of university students and parents and country of origin, highlighting, in turn, comparative aspects between Brazilian and Portuguese students.

Exploratory factorial analysis was used to reduce the factors of sustainable and innovative behavioral aspects, with the Varimax orthogonal rotation type, and rotation is more used when the number of variables is to be reduced (Pallant, 2013). In addition, the criterion of the substitute variable is used for each factor of the construct, raising the variable used with greater factorial load, because it presents greater explanatory power in the construct (Hair *et al.*, 2009).

LR and CART aim to develop a model that allows predicting entrepreneurial intent from the profile of university students and their sustainable and innovative behavior. These steps are fundamental for the development of the hypothetical model of the study, as well as to supplant the empirical literature of the entrepreneurial intention and the sustainable and innovative behavior, identifying a scientific model that makes possible to highlight these behavioral and sociodemographic aspects in the entrepreneurial intention.

4. ANALYSES AND RESULT DISCUSSION

4.1 Search sample

The sample is made up of 400 university students, of these, 285 students in the “Brazilian sample”, in which there is predominance of university students with EI, in a total of 53.3%. In general, women have a lower quantitative value than men, considering individuals with Entrepreneurial Intent (EI). Most individuals work in the private sector, and these were the ones who were shown to have more EI.

As for the “Portuguese sample”, there is a quantitative of 115 individuals, of which 75.7% show EI. The amount of women and men with EI was similar, men reported having a little more than women. It is also observed that individuals with professional experience have a little more EI than individuals without professional experience.

In order to understand EI on students with entrepreneurial parents, a variable named Entrepreneur Close Relatives, it

is worth emphasizing the influence of Ajzen's Theory of Planned Behavior (1991), as well as the studies by De Wit (1993), Van Praag (1997), Noorderhaven *et al.* (2003) Carvalho and González (2006); it is noted that for college students who have entrepreneurial parents, 71.1% have EI; However, for those who have parents who already are entrepreneurs, but no more, 53.3% have EI and for individuals who have parents who were never entrepreneurs, 51.9% have EI, and this is pertinent to infer the relationship between EI and the entrepreneur relatives.

This result is in agreement with the findings of several researchers in the area of entrepreneurship, such as Davidsson (1995), Reynolds *et al.* (2010), and Teixeira and Forte (2011), and Geldhof *et al.* (2002), Carvalho and González (2006), Teixeira and Davey (2010), Van Der Zwan, Thurik and Grilo (2014).

University students of the University of Algarve (UALg) were predominant in EI when compared to university students of the Federal University of Ceará (UFC), (75.7% versus 53.3%). In addition, university students without EI, exhibited (20% versus 40%) when comparing UALg with UFC.

In relation to professional experience and EI, it can be seen that in the case of individuals who have never worked, 66.1% have EI, while those working in the private sector show 60.7% EI.

4.2 Factor analysis for behavioral constructs

The factors of the Sustainable Behavior (SB), under the methodology of Gonçalves-Dias *et al.* (2009), are arranged in 16 items, grouped into 5 factors (conscient consumption, concern with garbage, mobilization, domestic environment and boycott via consumption).

The explanatory variance for this construct found from the division was 64.357%. The degree of explanation of the data was 0.826 - Kaiser-Meyer-Olkin (KMO = 0.826), a value higher than 0.5 indicates that the factorial analysis is satisfactory.

Table 2. Factor analysis of the sustainable behavior construct

Variables	Factor loadings					Communalities
	Conscious Consumption	Concern with garbage	Mobilization	Domestic environment	Boycott via consumption	
SB1	.745					.597
SB2	.743					.653
SB3	.540					.581
SB4	.740					.680
SB5	.696					.524
SB10	.521					.591
SB6		.850				.744
SB7		.893				.823
SB8		.787				.670
SB11			.673			.658
SB12			.801			.657
SB13			.634			.511
SB14				.527		.508
SB15				.815		.679
SB16				.765		.610
SB9					.897	.812

Source: Research data

With the criterion of the substitute variable for each factor, it is clear to observe: Engaged consumption - SB1: "I have paid more for environmentally correct products" (factor load of 0.745); Concern with garbage - SB7: "I avoid throwing paper on the floor" (factor load of 0.893); Mobilization - "I mobilize people for the conservation of public spaces" (factor load of 0.801); Domestic environment - "I keep the refrigerator open for a long time, looking at what's inside" (factor load of 0.815); and Boycott via consumption - SB9: "I buy products from a company even though it knows that it pollutes the environment" (factor load of 0.897).

On an incial analysis of the innovative behavior, there are some insignificant variables to the analysis, since they did not meet the minimum level suggested by the literature (commonalities greater than 0.500). Therefore, a new factor analysis is performed, verifying an explanatory arrangement of 64.057% of the data variance. The Kaiser-Meyer-Olkin value (KMO = 0.700) and the Bartlett sphericity test (chi-square = 386,071) were shown to be significant ($p = 0.000$), and this indicates that there is a correlation between the variables, which results in a large amount of explanatory variance.

Table 3. Factor analysis of the construct innovative behavior

Variables	Factor loadings				communalities
	Preference to dynamism and creativity	Appropriateness to originality	Efficiency in details	Compliance with rules	
IB5	.700				.568
IB6	.733				.596
IB7	.765				.614
IB8	.360				.588
IB1		.767			.636
IB3		.820			.688
IB9			.804		.662
IB11			.808		.669
IB13				.845	.743

Source: Research data

It is worth mentioning the variables with higher factor loads within each factor: Preference to dynamism and creativity - IB7: "I share my ideas" (factorial load of 0.614); Adequacy to originality - IB3: "I have new perspectives for old problems"; Efficiency in details - IB9: "I prefer gradual rather than radical change"; and Compliance with rules - IB13: "I need the stimulus of frequent change."

This construct points to three factors, taking into account the perspective of some researchers in the field, such as Taylor (1989) and Foxall and Hackett (1992), which they call: appropriateness to originality, detail efficiency and rules compliance. However, since the results of the analysis of the factorial loads for this construct, given the Brazilian and Portuguese samples, provided four factors, an additional factor will be defined, preferably in terms of dynamism and creativity.

In this sense, based on the factorial structures of the EFA - which provided nine behavioral variables, the most representative within each factor, it is possible to portray, from a reliable point of view, the dimensions adopted for this research.

4.3 Search model results

The theoretical model proposed for this work is verified using Logistic Regression (LR) to use behavioral and sociodemographic variables (independent variables), in order to predict the entrepreneurial intention (dependent variable).

Table 4. Analysis of the logistic regression of the model variables

Variables	B	Sig.	Exp(B)
Conscious Consumption	-.032	.828	.968
Concern with garbage	-.236	.373	.790
Mobilization	.293	.006	1.341
Domestic environment	.233	.102	1.262
Boycott via consumption	.062	.685	1.064
Preference to dynamism and criativity	.050	.745	1,051
Appropriateness to originality	.552	.001	1.736
Efficiency in details	-.033	.785	.968
Compliance with rules	.458	.001	1.581
Gender(female)	-.546	.037	.579
Age	-.032	.355	.969
Married	-.101	.844	.903
Single	-1.820	.151	.162
Year you first enrolled in university	.005	.888	1.005
Semester	-.116	.037	.891
University (UAlg)	.712	.035	2.038

Professional experience (owner/partner)	2.991	.007	19.897
Professional experience (private sector)	.332	.303	1.394
Professional experience (public sector)	.278	.509	1.321
Professional experience (another)	-.049	.917	.952
Parent experience (no, but one of them used to be)	-.868	.011	.420
Parent experience (no, neither have ever been)	-1.164	.000	.312
Constante	-10.814	.870	.000

Source: Research data

For sustainable behavior, it is evident the mobilization - variable that refers to the mobilization that the individual provides to other people for conservation of public spaces, as well as to the importance of the environment. This relationship between the mobilization and the EI presents is significant (p-value of 0.006). The value of B for this relation was positive (0.293), and this indicates that the mobilization has a positive influence on EI. The other variables of sustainable behavior did not have statistically significant relationships in the model.

Thus, it is worth confirming H_{2a} : There is a positive relationship between the sustainable behavior of university students and their entrepreneurial intention.

Regarding the innovative behavior, they are pointed out as representative variables, adequacy to originality and compliance with rules, being possible to relate them as predictors to explain the IE of the university student. It is identifiable that appropriateness to originality exhibits p-value of 0.001 with B of 0.552 and compliance with rules p-value of 0.001 with B of 0.552. It is evident that the variable appropriateness to originality, referring to the original ideas; and the variable compliance with rules (which is the inverse), that is, the greater the compliance with the rules, the less the individual wants rules and norms, thus the demand of the stimulus of frequent change; both are positively related to EI.

H_{3a} is therefore confirmed: There is a positive relationship between the innovative behavior of university students and their entrepreneurial intent. Therefore, the innovative behavior can be considered a predictor of the EI of the university students, it is emphasized that the greater the innovative behavior of the individual - turned towards originality and compliance with the rules, the greater the possibility of the individual to have EI.

The variables related to the sample profile in the adopted model were also observed. Thus, the semester has a negative influence on the sample investigated, that is, the lower the semester, the higher the university student's EI (p value of 0.37 and B of -0.116). Regarding the gender, a negative influence is perceived in women and their EI, and this allows to infer that the male gender has a positive relation with EI.

In addition, there is a positive relation for UAlg students, with $\text{Exp}(B) = 2.038$, which means that Portuguese students have the double of the chance to have entrepreneurial intent than the Brazilians. This results allows to confirm the hypothesis H_{1b} : There is a positive relationship between the country of origin of university students and their entrepreneurial intention.

Nevertheless, one can not infer the existence of the relation of professional experience with EI, and this is essential to reject H_{1c} : There is a positive relation between the professional experience of university students and their entrepreneurial intention.

In view of this model, it can be seen that the parent experience: at least one parent who was an entrepreneur, but no more (p value of 0.011 with B of -.868); and none of the parents was an entrepreneur (p value of 0.000 with B of -1,164), these negative values of B provide evidence that the IE of university students is lower when the parents are not entrepreneurs. The entrepreneurs close relatives strongly influence the EI of the university students. Therefore, it is understood that EI has a positive relation with close relatives of individuals, and this proves H1a: There is a positive relation between the entrepreneurship intention of the university students and the existence of own businesses of the parents.

The analysis of this logistic regression expresses Nagelkerke R^2 of 0.324. This value indicates that the adopted model is acceptable to explain the relation of the variables in the model. The likelihood ratio (p of 0.000) asserts the viability of the applied model. In order to further deepen the developed model, another method is adopted: Classification and Regression Tree (CART).

Image 3. Classification and Regression Tree - CART

Source: Research data

In addition, Table 5 identifies the CART method with the terminal node descriptions and their probability, considering university students who have entrepreneurial intention.

Table 5. Summary of the characteristics of terminal nodes

Terminal Node	Descriptions of nodes	Probability (Has EI)
1	1. SB12 (mobilization): never	0.367
5	1. SB1 (Conscious Consumption) ≤ Sometimes 2. Parent Experience: Yes, at least one is an entrepreneur. SB12 (mobilization) > never	0.865
6	3. SB1 (Conscious Consumption) > Sometimes 4. Parent Experience: Yes, at least one is an entrepreneur. 5. SB12 (mobilization) > never	0.619

9	6. Professional Experience: Owner of a business or has never worked 7. IB3 (Appropriateness to originality) <= I do not agree or disagree 8. Parent Experience: Yes, at least one is an entrepreneur. 9. SB12 (mobilization) > never	0.682
13	IB13 (Compliance with rules) <= I do not agree or disagree Professional Experience: Works in the public or private sector or other situation IB3 (Appropriateness to originality) <= I do not agree or disagree Parent Experience: Yes, at least one is an entrepreneur. SB12 (mobilization) > never	0.148
14	IB13 (Compliance with rules) > I do not agree or disagree Professional Experience: Works in the public or private sector or other situation IB3 (Appropriateness to originality) <= I do not agree or disagree Parent Experience: Yes, at least one is an entrepreneur. SB12 (mobilization) > never	0.588
11	UFC (University Federal of Ceará) IB3 (Appropriateness to originality) > I do not agree or disagree Parent Experience: Yes, at least one is an entrepreneur. SB12 (mobilization) > never	0.636
12	UAlg (University of Algarve) IB3 (Appropriateness to originality) > I do not agree or disagree Parent Experience: Yes, at least one is an entrepreneur. SB12 (mobilization) > never	0.860

Source: Research data

The CART find subgroups of student (nodes) with similar entrepreneurial intention. Based on the university students with EI, is highlighted the group that shows strong influence of the mobilization normalized importance 100%); entrepreneur close relatives (normalized importance 73.8%); with a neutral behavior for conscious consumption, which means that sometimes these individuals pay more for environmentally correct products. We can also see the influence of sustainable behavior, mainly by mobilization; and entrepreneur close relatives in EI of university students.

With this influence of the entrepreneur close relatives in EI of the university students, H_{1a} is confirmed: There is a positive relation between the entrepreneurial intention of the university students and the existence of parental entrepreneurial experience, and this is relevant to align this finding to the researches of De Wit (1993), Van Praag (1997), Reynolds *et al.* (2002), Noorderhaven *et al.* (2010), Van Der Zwan, Thurik and Grilo (2010), Teixeira and Davey (2010) and Teixeira and Forte (2011).

Concerning university students with EI, two more groups are considered with predominance for the following variables: mobilization; Appropriateness to originality (normalized importance 67.8%) and Portuguese sample - UAlg (standardized importance 60.8%); the other group is evidenced by all these nodes, however, in the last node, we have the Brazilian sample - UFC.

From this perspective, it can be seen that mobilization (sustainable behavior) and appropriateness to originality (innovative behavior) can also be considered variables that predict EI of the university student. In this sense, we hypothesize H_{2a} : There is a positive relationship between the sustainable behavior of university students and their entrepreneurial intention.

It is fundamental to explain that entrepreneurship related to the protection and conservation of the environment, facing the environmental conscience of the individual in relation to environmental issues, can impact the triple bottom line (economic, social and environmental spheres) (Dean & McMullen, 2007; Parrish, 2008), which explains the importance of sustainable behavior in the individual's EI (Kaiser, 1998; Liñán & Chen, 2009).

Therefore, it is assumed that university students with sustainable behaviors, in the face of practices, awareness and mobilization of the importance of environmental issues, may be the most likely to implement new business - focusing on sustainability and environmental protection (Kuckertz & Wagner, 2010).

In addition to this hypothesis, the results obtained by the CART make it possible to corroborate H_{3a} : There is a positive relationship between the innovative behavior of university students and their entrepreneurial intention.

Based on this question, it is emphasized that the innovative behavior of the individual, aimed at creating new businesses, is relevant to accentuate creative and original solutions for the market. Thus, an individual with an innovative spirit can impact the economy as a whole by creating new companies, since it provides jobs and income to society (Kuckertz & Wagner, 2010; Teixeira & Davey, 2010).

As these analyzes were recurrent and had influence in both samples (Brazilian and Portuguese), it is considered, therefore, that there is no significant relation with regard to the sustainable and innovative behavior in the entrepreneurial intention between Brazilian and Portuguese university students.

Thus, the hypothesis H_{2b} is also confirmed: There is no significant relation between sustainable behavior in entrepreneurial intention between Brazilian and Portuguese university students and H_{3b} : There is no significant relation with the innovative behavior in entrepreneurial intention among Brazilian university students and Portuguese university students.

Regarding another group formed from the group of individuals without EI, it is pertinent to refer to appropriateness to originality, which was not very recurrent; Professional experience, emphasizing, above all, those already in the labor market;

And little recurrent to the compliance to rules (which refers to preference for rules and norms), these have been shown, in general, not to have EI.

On the other hand, it is emphasized that when the individual has professional experience and is already inserted in the labor market, the latter, in turn, presents a lower EI level than individuals who have never worked. In this approach, it is worth rejecting H_{1c} : There is a positive relationship between the professional experience of university students and their entrepreneurial intent, which contrasts Kuckertz and Wagner (2010).

When verifying that both samples (Brazil and Portugal) presented significant relations to EI of the university student. The acceptance of H_{1b} is confirmed: There is a positive relationship between the country of origin of university students and their entrepreneurial intention.

In relation to sustainable and innovative behavior, there is a positive relationship for sustainable and innovative behavior in the entrepreneurial intention of Brazilian and Portuguese university students, and it should be noted that no significant relationship was found between the two samples, both of which presented a significant relation to the entrepreneurial intention.

The results of both LR and CART provided sufficient support for the confirmation of the hypotheses of this study, with the exception of H_{1c} , and this proposes a predictive model to predict the entrepreneurial intention from the profile of university students and their sustainable behavior and Innovative.

Image 4 summarizes the main results obtained from the perspective of the model proposed for this study. This summary is therefore intended to indicate the fundamental factors that culminate in the prediction of the entrepreneurial intention of university students.

Image 4. Summary of results in the proposed model

Source: Research data

5. CONCLUSION

This study had as main guideline to analyze the influence of sustainable and innovative behavior on the entrepreneurial intention of Brazilian and Portuguese university students. From the specific objectives and the hypotheses, it was confirmed that the methodology was pertinent to meet the objectives of the proposed research.

For the specific objective 1 - "to identify the relations between the profile of university students and their entrepreneurial intention"; identified a strong influence of Ajzen's Theory of Planned Behavior (1991), emphasizing, above all, the influence of external factors, such as social and family pressure - relevant to stimulate and encourage entrepreneurship. The influence of the entrepreneur close family in EI of the university students was verified.

When highlighting the professional experience in EI of the university students, this variable, in turn, did not have influence in the IE of the university student, and this was registered in the perspective that the university students without professional experience also revealed preponderance in having EI.

In view of these approaches, we conclude that the hypotheses were confirmed: H_{1a} e H_{1c} . Hypothesis H_{1b} did not obtain sufficient evidence for its acceptance, therefore, this hypothesis was rejected

For the specific objective 2 - "to analyze the sustainable behavior in the entrepreneurial intention of the university students", the influence of the sustainable behavior in the EI could be evidenced, emphasizing the mobilization dimension - that refers to the proactive position of the individual in the quest to incite other people with regard to environmental issues. Thus, H_{2a} was confirmed.

It should be noted that entrepreneurship, when aligned with the protection and conservation of the environment, based on environmental awareness, impacts the triple bottom line (economic, social and environmental spheres) (Dean & McMullen, 2007; Parrish, 2008), which is relevant to verify that the sustainable behavior is fundamental in the EI of the university students (Kaiser, 1998; Liñán & Chen, 2009).

As this analysis was predominant for both UFC and UAlg university students, it was possible to emphasize that there

were no significant relationships for sustainable behavior in EI between Brazilian and Portuguese university students, and this accepts H_{2b} .

In relation to the specific objective 3 - "to investigate innovative behavior in the entrepreneurial intention of university students", it was detected that the dimensions of originality and compliance with rules were substantial to predict the innovative behavior in EI of university students. In this context, it could be verified that individuals with behaviors more focused on originality, sharing ideas, being stimulating for other people and liking to vary already established routines; And those who consider themselves to need the stimulus of frequent change, these are, in turn, those that have manifested higher EI. It was also verified in the formation of the subgroups of the CART, that adequacy to the originality has normalized importance (67.8%) to explain EI.

In a central perspective, this question is alluding to the perspective that an entrepreneurial individual is an innovator, capable of proposing innovative and original creative solutions to the market, and this corroborates Kirton (1976) and Schumpeter (1984). Therefore, considering the findings of this research, that the appropriateness to originality and compliance with rules represent the innovative behavior, these dimensions were nevertheless considered predictors of EI. In this case, H_{3a} was ratified.

The results, appropriate to the innovative behavior, were predominant for both UFC and UAlg university students, and this pointed to the confirmation of H_{3b} . In a general context of innovative behavior in EI, the dimensions of compliance with originality and compliance with rules were considered.

The specific objective 4 - "to develop a model that allows the prediction of the entrepreneurial intention from the profile of university students and their sustainable and innovative behavior", highlighted the following variables that predict EI: mobilization; Appropriateness to originality; Compliance with rules; Close Family entrepreneurs; university; Gender (men) and the first semesters of the university.

From the point of view of the impact of this research in the short term, it is fundamentally perpetuated in the encouragement of policies and practices to university level institutions, with the purpose of boosting interest on environmental issues in university students, which, for the most part, are shown with EI (academic scope). Because EI is essential for entrepreneurship, in a long-term perspective, this research provides enough support to impact entrepreneurship as a whole.

Although the literature on entrepreneurial intent is broad, both in the national and international databases, no studies were found that would allow the alignment of innovation and sustainability in the entrepreneurial intention of university students, which is fundamental to bring an innovative character to this research.

In future research, these phenomena could be examined in a longitudinal perspective, with different courses, in other universities and comparing them among other countries. The main focus for future scenarios is to further understand innovation and sustainability in the context of entrepreneurship.

CARTOGRAFIAS CONTEMPORÂNEAS – OLHAR A NATUREZA, REGRESSAR À CIDADE

João Minhoto Marques
Universidade do Algarve / CIAC
(jmarques@ualg.pt)

RESUMO

No enquadramento proporcionado pela tradição ocidental do bucolismo, a representação do espaço tem-se configurado por certos elementos que, pelo facto de terem sido objecto de elevado grau de codificação, funcionaram como constantes quase invariáveis nos mais variados domínios do trabalho artístico e da cultura, pelo menos até aos alvares da época moderna e contemporânea (*e.g.*, o princípio do *locus amoenus*, a recorrência da oposição cidade/campo, etc.).

Neste estudo, procurar-se-á discutir a capacidade impositiva dos referidos elementos na contemporaneidade, tentando compreender eventuais reconfigurações na concepção do espaço, a partir do contributo da literatura e de outras artes.

Palavras-chave: Bucolismo, Contemporaneidade, Cidade, *Locus Amoenus*.

JEL Classification: Z11

As acepções mais recorrentes e consensuais do lexema «paisagem» remetem para a representação artística de um tipo de espaço particular, o espaço campestre. Este, de resto, convoca inevitavelmente um processo de contemplação que parece estar associado a uma experiência de prazer – o que poderá explicar a proliferação de elementos com que a lexicografia identifica o mencionado vocábulo: desde logo, o género, quer no domínio da literatura, quer no contexto da pintura; mas, igualmente, o quadro, o desenho, o trecho. O *Novo Dicionário Compacto da Língua Portuguesa*, de António de Moraes Silva, por exemplo, depois de definir «paisagem», de modo mais lato, como uma «extensão de território que se abrange de um só lance de vista, e que se considera pelo seu valor artístico, pelo seu pitoresco» (Silva, 1994), centra-se sobre o «género de pintura ou de literatura, cujo fim é a representação ou a descrição do campo ou lugares campestres», para considerar ainda o «quadro que representa esses lugares» e finalizar a lista de acepções com o sentido figurado de «aspecto, vista». Se olharmos para outros dicionários, podemos encontrar descritores como «desenho» («sobre um motivo rústico»), como é o caso do *Dicionário da Língua Portuguesa*, de J. Almeida Costa e A. Sampaio e Melo, ou «trecho» (figurando este no *Dicionário Priberam da Língua Portuguesa*). Se considerarmos ainda que estes elementos têm vindo a ser actualizados – num dado momento, num certo contexto, num determinado espaço – em múltiplas obras artísticas concretas e individuais no decurso do tempo, contribuindo para a construção de uma história cultural comum, podemos defender, pelo menos, que existe um alargado (ainda que, possivelmente, relativo) consenso quanto a uma das finalidades da representação da natureza. Mais: não será abusivo depreender que a variedade dos referidos elementos e a multiplicidade das suas concretizações deverá revelar uma aceitação dos textos paisagísticos (no domínio das diversas artes) mais ou menos generalizada, sobretudo no que se refere a aspectos de recepção.

Um bom exemplo que pode ser entendido como ilustração desta tendência do público apreciador do referido tipo de obras artísticas é a conhecida sondagem levada a cabo, no final do século passado, sob os auspícios dos artistas russos Vitaly Komar e Alexander Melamid, para apurar o que os americanos queriam no domínio da arte, e, especificamente, no caso da pintura. Os resultados foram expressos, em primeiro lugar, de forma quantitativa, estatística, e, posteriormente, foram como que traduzidos, embora de modo discutível, na famosa obra pictórica *America's Most Wanted*. Vieram, de qualquer modo, confirmar a preferência por um certo tipo de representação do espaço. Este foi, portanto, corporizado numa interpretação que veio a constituir-se como uma paisagem substancialmente familiar, na sua dominante cor azulada, sinalizando o céu e a água, e incluindo outros elementos porventura esperados, como a presença de vegetação rasteira, árvores, alguns animais e, por fim, pessoas fruindo momentos de lazer neste contexto de uma natureza amena.

Podemos interrogar-nos acerca do motivo pelo qual tal preferência existe e de um modo muito mais generalizado do que talvez pudéssemos imaginar, uma vez que os referidos artistas demonstraram que não eram apenas os habitantes dos Estados Unidos da América que gostavam de paisagens azuis; também pessoas de outros países (como a China, o Quênia, a Islândia, etc.) se exprimiram no mesmo sentido quando interrogadas no contexto da mesma sondagem. Talvez a razão dessa familiaridade ou dessa preferência se relacione com um processo de reconhecimento – o que explicaria também o prazer inerente ao mesmo processo (a lição aristotélica não andaria longe, neste sentido). De algum modo, preferiríamos um certo tipo de representação espacial pelo facto de já termos contactado com outra semelhante. Esta explicação parece assentar, é claro, na ideia segundo a qual o gosto é adquirido à medida que se desenvolve a nossa biblioteca cultural, segundo um percurso de experiência e de leituras.

É um pouco neste sentido, aliás, que a tese de Vitaly Komar aponta, ao propor a nostalgia de algo perdido como a razão, das pessoas entrevistadas na sondagem, para a predilecção manifestada. De facto, sendo-lhe perguntado o que pensava acerca da opção do público pela paisagem azul, o artista responde: «I believe it reflects people's nostalgia about freedom. It's a very simple metaphor, and very deep at the same time: closed space and open space. The concentration of idea of

closed space, I believe, it's prison. And concentration of idea of open space is a landscape – air, no barriers, in other words, vacation, freedom.» (Wypijewski, 1999).

Este juízo parece ter simultaneamente em conta uma visão simbólica da existência e um processo de aprendizagem cultural que parte dessa visão e a incorpora no que se tem verificado ser uma tendência cada vez mais clara na história, à medida que o homem se concentra em espaços urbanos. De facto, ao associar a representação do espaço campestre aos princípios da liberdade e do ócio, Vitaly Komar está, ao mesmo tempo, a contrapor esse ao espaço da aglomeração urbana, da cidade – entendido este como um domínio fechado, caracterizado como «prisão» e sendo-lhe associados as «barreiras» e o trabalho. De resto, desenvolvendo o seu raciocínio, refere ainda o artista: «You know, life reminds me of office. Employees scribble abstract patterns in legal pads during meetings and leave office during lunch. Within greater enslavement we discover small freedom – so we think. But if we examine closer, this freedom turns out to be a new slavery, with its own smaller freedom/slavery, and so on: our choice of lunch, for example (...)» (Wypijewski, 1999).

O espaço citadino é, portanto, de acordo com o ponto de vista de Komar, o da escravatura, opondo-se ao da liberdade que o homem anseia e associa ao campo. Ora, a nostalgia dessa liberdade implica a sua perda, ou, se quisermos recorrer à metáfora mencionada, pressupõe uma espécie de trânsito entre espaços, o qual estaria na origem da valorização da paisagem campestre. Abraçada a cidade, cresceria a nostalgia do campo abandonado e, consequentemente, a preferência por paisagens campestres.

No âmbito da arte, estes aspectos – a oposição entre o campo e a cidade; a passagem de um para o outro; a instauração da natureza segundo um certo número de características reconhecíveis – são, há muito, recorrentes nos textos de carácter bucólico. Poderemos mesmo, com razoável facilidade, identificar a persistência dos referidos elementos na tradição ocidental do bucolismo que diz respeito não apenas à literatura e à pintura, mas a outras artes. De facto, neste sentido, a representação da natureza decorre, em grande medida, da aprendizagem e domínio de um código particular que, através dos objectos artísticos, tem esculpido o gosto e sedimentado as nossas competências de leitura do espaço.

Esta explicação de carácter cultural (à qual será necessário voltar) não é, porém, a única que importa ter em conta. Denis Dutton, numa obra intitulada *Arte e instinto* (cujo subtítulo, na edição original, em língua inglesa, é bastante eloquente: *Beauty, pleasure and human evolution*), defende justamente que as «respostas humanas a paisagens também mostram atavismos» e, referindo-se em concreto às «experiências de Komar e Melamid», afirma: «O tipo de paisagem azul exuberante, que os artistas russos descobriram, encontra-se em todo o mundo porque é uma preferência inata» (Dutton, 2010: 35). Concretizando o seu pensamento, explica ainda que a «atração fundamental por certos tipos de paisagem não é construída socialmente, mas está presente na natureza humana como uma herança do Plistocénico, os cerca de um milhão e meio de anos durante os quais os seres humanos modernos evoluíram» (Dutton, 2010).

O contexto em que o autor veicula esta ideia relaciona-se com o pensamento estético actual, preocupado em estabilizar a compreensão da contemporaneidade depois das feridas abertas, no domínio artístico, pela não-figuratividade e pelas facetas transgressivas do modernismo – e não deixa de ser notória a necessidade de estabelecer um diálogo com Danto, no âmago da sua argumentação. No entanto, o seu pensamento vai muito além da especificidade do discurso filosófico, interessado como está em incorporar a integralidade da experiência humana na conceituação da beleza.

Dutton convoca ainda as investigações levadas a cabo pela psicologia (desde o conhecido trabalho de Jay Appleton, *The Experience of Landscape*, até contributos mais recentes) acerca da «explicação genérica do tipo de paisagem ideal que os seres humanos iriam achar intrinsecamente agradável», para destacar que «esta paisagem tem muito em comum com as savanas e bosques da África Oriental, onde os homínídeos se separaram da linhagem dos chimpanzés e grande parte da evolução humana ocorreu». Quais são, então, as características dessa paisagem, os seus elementos constitutivos? Esquemáticamente, os seguintes:

- espaços abertos de vegetação baixa (ou aparada), intercalados por matas de arbustos e conjuntos de árvores;
- a presença de água directamente à vista, ou a certeza de água por perto ou à distância;
- um caminho aberto, pelo menos numa direcção, para uma posição vantajosa e desimpedida no horizonte;
- evidência de vida animal, incluindo aves; e
- uma diversidade de verdura, incluindo plantas floridas e frutícolas.» (Dutton, 2010: 37).

Na verdade, de acordo com a argumentação de Dutton, as nossas preferências por paisagens como esta – ou seja, a representação de espaços semelhantes aos da savana africana – decorrem de razões muito mais fundas do que as relacionadas com argumentos de carácter cultural. O grau de especificidade que o elenco mencionado revela mostra que as savanas africanas foram «o *habitat* para o qual os homínídeos comedores de carne evoluíram» e isto por razões concretas: elas «possuem mais proteínas por quilómetro quadrado do que qualquer outro tipo de paisagem»; e, por outro lado, «oferecem alimento ao nível do chão», contrastando, assim, com outro tipo de espaços menos favoráveis à sobrevivência.

Poder-se-iam ainda aduzir outros motivos, sustentando mais argumentos, mas estes bastam para sermos obrigados, em último caso, a considerarmos a tese de Denis Dutton como explicação digna de crédito para a preferência pelo referido tipo de paisagem. Aliás, talvez se deva acentuar que ela não se distancia tanto quanto poderia à primeira vista parecer da explicação de carácter histórico-cultural. Mais do que, porventura, consideradas em oposição, ambas as explicações deverão ser tidas em conta e entendidas como propostas diferentes, equacionadas sob ângulos diversos, para perspectivar um mesmo problema.

Se nos ativermos, por exemplo, à questão da universalidade e da intertemporalidade da imagem correspondente à savana africana, ancorada, de acordo com a perspectiva de Dutton, na própria condição humana por via de um atavismo involuntário, por via da genética, não poderemos deixar de pensar na perspectiva oferecida pela mencionada tradição artística do bucolismo. Este, de facto, não tem apenas uma natureza genológica, permeável ao tempo e às condições culturais particulares; o bucolismo tem, igualmente, uma natureza modal (cf., por exemplo, Loughrey, 1984; Bernardes, 1988; Bernardes, 1995;

Alpers, 1996; Gifford, 1999), e, neste sentido, ele define-se por não estar limitado nem no tempo, nem no espaço, nem a um determinado domínio artístico.

Assim, se é certo que a matriz do bucolismo é literária e localizável na Antiguidade greco-latina – sendo os textos fundacionais *Idílios*, de Teócrito, no que respeita à herança grega; *Bucólicas*, de Virgílio, em relação à latina (embora, dos dois, este seja este o texto mais influente na cultura ocidental) –, não é menos verdade que a prática estética bucólica se estendeu a outras artes, até hoje. Podemos encontrar múltiplos e variados exemplos na pintura, na escultura, na música, no cinema, na fotografia, entre outros domínios artísticos. Ou seja, a natureza modal do bucolismo relaciona-se com o que José Augusto Cardoso Bernardes designa como «respostas a expectativas estéticas tidas por básicas» (Bernardes, 1995), ligadas à própria natureza do homem, nomeadamente, à necessidade de equacionar a sua relação com o espaço, com o tempo, consigo próprio, com os outros homens e com Deus.

No que diz respeito ao primeiro destes elementos (a relação do homem com o espaço), importa considerar o modo como, na tradição clássica da bucólica, a representação da paisagem, frequentemente desempenhando uma função de cenário, obedece a conjunto tipificado de características, cujo modelo é possível associar a um *topos* muito comum, genericamente designado por *locus amoenus*.

Ora, os elementos constitutivos dos lugares amenos aproximam-se notoriamente dos que vimos associados à savana africana e, sendo constantes, mantiveram-se mais ou menos inalterados ao longo do tempo. Nesse tipo de *loca* encontramos, frequentemente num clima temperado ou quente, céus luminosos, fontes e sombras frescas, frutos e flores, seixos rolantes, águas em movimento, perfumes, sons agradáveis e deleitosos...

Convoquemos, a título de exemplo, dois fragmentos de obras pertencentes e tempos e autores diferentes. Observemos, em primeiro lugar, um excerto dos *Idílios*, de Teócrito (de acordo com a lição de Maria Helena da Rocha Pereira, na sua *Hélade*):

(...) Com prazer
nos reclinámos nos leitos fofos de junco fresco
e de parras acabadas de cortar.
Por cima das nossas cabeças, agitavam-se
choupos e olmos inúmeros; perto, murmurava
a sagrada água, que corria da gruta das Ninfas.
Nos ramos umbrosos, as negras cigarras
estafavam-se a cantar. Nos densos espinhos
das silvas, ao longe, ouvia-se a rela.
Cantavam cotovias e pintassilgos; gemia a rola;
em redor das fontes voavam as fulvas abelhas.
Tudo tinha o aroma da abundância do verão, da abundância do outono.
Pêras aos nossos pés, maçãs, dos lados, rolavam
inúmeras, fazendo pender até ao chão
os seus ramos carregados de frutos.

Repare-se como, nestes versos do idílio VII, o espaço natural é caracterizado em função do modo como o homem interage com ele, concedendo-se particular destaque ao que deleita os sentidos. Justifica-se, desta forma, de modo quase analítico, o «prazer» experienciado pelos intervenientes, referido no início de trecho. Os sentidos são, de facto, submetidos a numerosos estímulos, através dos quais se vai compondo, à medida que progredimos na leitura, todo o lugar ameno: pelo tacto se estabelece a qualidade dos leitos; a vista deleita-se com a agitação de «choupos e olmos», com os «ramos umbrosos», com as «negras cigarras», com os «densos espinhos das silvas», com os esvoaçar das «fulvas abelhas», com as cores das frutas e com a imagem das árvores carregadas; o ouvido identifica, sequencialmente, a água murmurante, o canto dos insectos e dos pássaros (as cigarras, a rela, as abelhas; as cotovias, os pintassilgos, as rolas); o olfacto, por fim, convoca os aromas fortes dos frutos maduros do Verão e do Outono.

Este harmonioso conjunto de elementos compõe, em suma, um quadro de «abundância» semelhante ao que imagináramos situado num tempo perfeito como o da idade de ouro, quando a natureza oferecia ao homem os seus frutos de modo espontâneo, sem necessidade de esforço humano. Nesse tempo, os homens «(...) Todos os bens / tinham à disposição: para eles, a terra fértil produzia frutos / espontaneamente, muitos e copiosos (...)» (cf. *Trabalhos e Dias*, vv. 116-118; Hesíodo, 2005). Na versão de Ovídio do mito, recorde-se que «a terra, livre de impostos, não tocada pela enxada / nem rasgada pela relha, produzia tudo de modo espontâneo. / Satisfeitos com os alimentos criados sem esforço, / [os povos] colhiam medronhos e morangos silvestres, / pilritos e as amoras pendentes da espinhosa silva / e as bolotas que caíam da frondosa árvore de Júpiter» (cf. *Metamorfoses*, I, 100-105; Ovídio, 2006).

Em qualquer dos casos, é notória a constituição de um espaço mais adequado ao ócio que ao trabalho, no qual o homem se pode deleitar; um espaço simultaneamente ancestral e utópico, tal como a figuração da Ilha dos Amores camoniana (Camões, 2000, IX, 54-56), no segundo exemplo a que aludimos:

Três fermosos outeiros se mostravam,
Erguidos com soberba graciosa,
Que de gramíneo esmalte se adornavam,
Na fermosa Ilha, alegre e deleitosa.
Claras fontes e límpidas manavam
Do cume, que a verdura tem viçosa;
Por entre pedras alvas se deriva
A sonora linfa fugitiva.

Num vale ameno, que os outeiros fende,
Vinhão as claras águas ajuntar-se,
Onde ãa mesa fazem, que se estende
Tão bela quanto pode imaginar-se.
Arvoredo gentil sobre ela pende,
Como que pronto está pera afeitar-se,
Vendo-se no cristal resplandecente,
Que em si o está pintando propriamente.

Mil árvores estão ao céu subindo,
Com pomos odoríferos e belos;
A laranjeira tem no fruto lindo
A cor que tinha Dafne nos cabelos.
Encosta-se no chão, que está caindo,
A cidreira cos pesos amarelos;
(...)

Neste «vale ameno» da ilha «alegre e deleitosa» imaginada por Camões, encontramos, como se pode comprovar, um conjunto de elementos que compõem um espaço muito semelhante ao descrito por Teócrito ou ao representado por Hesíodo e Ovídio. Um espaço que coincide até com as «savanas de alta qualidade», na terminologia de Denis Dutton, no que diz respeito, por exemplo, às árvores. De facto, quer na paisagem camoniana, quer no quadro teocritiano são representadas árvores rasando o chão, como se pode comprovar no final de cada um dos excertos citados. Lê-se, assim, no texto de Teócrito: «Pêras aos nossos pés, maçãs, dos lados, rolavam / inúmeras, fazendo pender até ao chão / os seus ramos carregados de frutos»; em *Os Lusíadas*: «Encosta-se no chão, que está caindo, / A cidreira cos pesos amarelos». Este é um aspecto digno de nota, pois Dutton chama a atenção para a explícita predileção das pessoas por espécies como a «*Acacia tortilis*, uma árvore que se estende por grandes áreas e que ramifica até ao chão», relacionando essa predileção com um aspecto pragmático e fundacional: «Uma árvore à qual se podia subir era um instrumento usado para escapar aos predadores no Plistocénico e este caso de vida ou de morte é revelado, hoje em dia, pelo nosso sentido estético relativamente às árvores» (Dutton, 2010).

Na Antiguidade greco-latina, como no longo tempo posterior entendido como seu herdeiro, não terá sido a ameaça dos predadores a determinar a valorização do espaço campestre, mas a sua representação eufórica não deixou de fazer o seu caminho até aos nossos dias, opondo-se-lhe, como se referiu, o contexto citadino. O homem civilizado, cansado da vida urbana, busca a simplicidade e a autenticidade da vida rural – profundamente idealizada pelo ponto de vista sofisticado do citadino. No entanto, mesmo nesse contexto idealizado, há já sinais de uma complexidade que sugere, se não mesmo antecipa, as tensões de que se fará a contemporaneidade, rasgada a partir das fronteiras românticas.

Importa, assim, que abordemos, ainda que de forma breve, um aspecto já presente na tradição greco-latina do bucolismo – embora de forma não completamente desenvolvida – que nos ajudará a cartografar a contemporaneidade, no que respeita à relação do homem com o espaço: os trajectos de migração. É certo que já na primeira bucólica de Virgílio Melibeu se lamenta por ter de, juntamente com o seu rebanho, abandonar as suas terras. Por outro lado, também poetas como Bernardim Ribeiro se mostraram sensíveis à necessidade de equacionar o campo como lugar dotado de uma desconcertante ambivalência, espaço simultaneamente paradisíaco e disfórico. Porém, só com o dealbar da época moderna e contemporânea ficará patente, em todas as suas consequências, a funda agressividade de uma natureza que foi abandonando a *persona* maternal.

Do ponto de vista da arte, os autores referidos mostram bem como o *locus amoenus* coexiste, embora de forma mitigada, com uma outra versão do espaço, de carácter mais realista e menos idealizada. E se é certo que podemos encontrar outros casos que mostram como o lugar ameno nunca foi só isso – no domínio da pintura, por exemplo, são bem elucidativas algumas obras de Guercino e de Poussin – a verdade é que será a partir da segunda metade do século XIX que o sentido da migração humana se tornará irreversível e gerador de cada vez maiores tensões.

Na obra de Cesário Verde – para referir um dos mais importantes casos, configuradores da contemporaneidade –, a asfixia que marca o sujeito na cidade leva-o a aspirar por outro espaço (Verde, 1992); porém, a sua busca apenas o conduz ou à constatação da impossibilidade de o encontrar (v.g. «O Sentimento dum Ocidental») ou à descoberta de um campo particularmente duro, marcado pelo trabalho e pela morte (como fica patente no longo poema «Nós»).

Importará, por outro lado, recordar a agónica aventura pessoana, em particular o caminho trilhado pelo pendor

especulativo de Caeiro, para interrogar a estabilidade de conceitos como o de natureza. Como confessava o Mestre, «Num dia excessivamente nítido / (...) // Vi que não há Natureza, / Que Natureza não existe, / Que há montes, vales, planícies, / Que há árvores, flores, ervas, / Que há rios e pedras, / Mas que não há um todo a que isso pertença, / Que um conjunto real e verdadeiro / É uma doença das nossas ideias.» (Caeiro, 2001).

Conceituar uma natureza atomizada (ecoando, aliás, a lição de Lucrécio), ou vê-la como um lugar infernal, como acontece em alguma da prosa de Eça de Queirós ou de Fialho de Almeida, conduz-nos à necessidade de equacionar o sentido da busca. Textos como *A Selva*, de Ferreira de Castro, deslocam o mapa do paraíso, ou, dito de outra forma, invertem-no. É nesse sentido que se impõe o êxodo, naquela que parece ser uma nova queda simbólica, uma espécie de nova expulsão do espaço paradisíaco, configurando o homem contemporâneo como um civilizado *homo viator*, vítima das suas próprias contradições e sem destino possível.

Esta forma viva de cartografar o espaço não diz respeito apenas à arte e, em particular, à literatura. Importaria, neste contexto, determo-nos também no domínio ensaístico e reflectir acerca dos importantes contributos que a ecocrítica e, mais recentemente, a geocrítica têm dado, tal como as diversas artes, para compreender a necessidade de reequacionar a capacidade impositiva de constantes como a do *locus amoenus* ou como a oposição cidade/campo no nosso tempo. Não sendo possível, gostaríamos, para terminar, de apontar duas outras visões deste problema: a primeira, oriunda do documentário cinematográfico; a segunda, da domínio da fotografia.

No que respeita à primeira dessas propostas interpretativas do espaço – *Ainda há pastores?*, de Jorge Pelicano –, sublinhe-se o modo como a obra procura retratar o legado da pastorícia na Serra da Estrela. Nela, o paraíso que a câmara constitui perante o nosso olhar é, para Hermínio, provavelmente o último dos pastores, um lugar de trabalho muito duro, de solidão e sofrimento. Por isso, o seu desejo confessado é partir. Para onde? Para a cidade, onde, ao contrário do que sucede em lugares como Casais de Folgosinho, há electricidade, água canalizada, dias de descanso e outros seres humanos.

O espaço campestre é, portanto, nesta, como na proposta de parte substancial da extensa obra de Sebastião Salgado (a segunda das referidas visões do mundo natural), um lugar de desassossego. Trânsito do cidade para a campo? Ou do campo para a cidade? E daí para onde? A este propósito, convoquemos algumas imagens publicadas no volume *Migrations*, de 2000, um livro que «tells the story of humanity on the move» (Salgado, 2000).

Como é referido, «Most migrants leave their homes filled with hope; refugees usually do so out of fear, yet in their different ways all are victims of forces beyond their control: poverty and violence»; na imagem seguinte, é captada uma família, presumivelmente de agricultores, em trânsito, na Albânia («On the road between the border post of Morini and Kukes in Albania, a family waits the return of their tractor, which had left to pull another trailer whose tractor had broken down. Albania. 1999»):

Figura 1: Em trânsito. Albânia, 1999.

O abandono do campo tem consequências muito notórias nas vidas das pessoas, quer para os que partem, quer para os que ficam. Muitas vezes, o êxodo dos homens para as cidades em busca de melhores condições de vida deixa, abandonadas, as crianças e as mulheres a cultivar os campos e a cuidar dos animais.

Figura 2: Pastoreio. Equador, 1998.

A solidão em que mergulham os últimos habitantes do campo, «waiting for husbands and fathers to return once or twice a year with supplies and money» (Salgado, 2000), está, por outro lado, bem patente na última figura.

Figura 3: Actividades agrícolas. Equador, 1998.

Assim, o campo transfigura-se, sob o nosso olhar, num espaço de dor e de sofrimento, muito diferente daquele que a tradição clássica nos deu a ler, através de alguma arte. E se quem opta pela cidade é também submetido a provações – «peasants who leave for the cities do so reluctantly, fully aware of the difficulties awaiting them in the cities» (Salgado, 2000) –, resta a inquietação da busca, por um lado, e a desorientação, por outro. Perdidos numa espécie de labirinto, descobrimo-nos sem mapa, sem «carta de orientação» (Júdice, 2000). Afinal, talvez o sujeito contemporâneo se encontre num lugar semelhante àquele que, no poema com o mesmo título, de Nuno Júdice, desconhece a saída de lugar que já não é nem inferno, nem paraíso, mas onde se encontra fechado:

Estou, no outono, a meio de uma ponte
 cujo arco, incompleto, oculta um centro
 submerso pelas águas que correm sem
 que eu saiba para onde. Da ponte
 não se vê o horizonte; e, a meio da ponte,
 o ruído das águas impede que se ouça
 o vento, os pássaros, e as vozes que indicam
 em qual dos lados fica a saída.

ABSTRACT

International trade has been increasing not only due to globalization, but also due to the economic integration process of the past century. However, there are still some barriers that hinder international trade and one of those can be the different languages spoken by both trading partners. Therefore, language may influence the choice of an international trading partner, since it can increase or decrease transaction costs. On the other hand, the creation of trading blocs, such as the European Union (EU) and the Southern Common Market (Mercosur), has enabled national economies to profit from regional trade networks. In this paper we look at the relationship between Portuguese exports and the dominant language in the destination country, while also analysing the influence of belonging to these two trading blocs. Taking a closer look at Portuguese data, we conclude that language similarity plays a relevant role in the choice of international trading partners, as does belonging to the EU.

Keywords: International Trade, Language Barriers, Multilingualism, Economics of Language.

JEL Classification: F14

1. INTRODUCTION

International trade has been steadily growing not only due to globalization in general, but also due to the increasing economic integration of the past century. The creation of trading blocs, such as the European Union (EU) and the Southern Common Market (Mercosur), has enabled national economies to profit from regional trade networks. Communicating within a wider market, however, implies facing certain barriers that hinder trade between different countries, and one of these — certainly the biggest one — is language, or better still, the different languages spoken in foreign markets.

Formal relationships between the EU and the Latin American countries that comprise Mercosur date back to the early formation the European Economic Community (EEC) with the Treaty of Rome signed in 1957. As early as that, the Member States of the EEC started to establish and intensify trade and economic relations with Latin American countries, supporting regional Latin American integration processes and entering into cooperation agreements with the regional groups that had formed in the region (Pinto, 2008). In the 1970's some advances were made regarding the relations between the EEC and Latin America. According to Saraiva (2004), that group of European countries was interested in finding and securing new markets for their exports and investment, while simultaneously guaranteeing access to raw materials; Latin-Americans, in turn, were undergoing a process of diversification of foreign partners and wished to find other options besides the United States. However, and as Saraiva stresses, these relationships remained only intentions that were not materialized at the time.

Only three decades later, did the EU formally initiate freed trade negotiations with Mercosur. However, these negotiations that had started in 1995 with the EC-Mercosur Cooperation Agreement¹ with the purpose of promoting free trade, investment, economic cooperation, and political dialogue between the two organizations were suspended in 2004, to be resumed only in 2010.

Foreign trade between the EU and Mercosur countries represents almost as much as foreign trade between the EU and the remaining Latin American countries as a whole. The EU was the first trading partner of Mercosur and is still its main investor. According to data provided by the World Bank, the EU — Mercosur's main trading partner — was responsible for around 19.8% of Mercosur's foreign trade in 2013. However, Mercosur was only the eighth trading partner of the EU in terms of the global market.

Considering the important and undeniable trade relationship between the EU and Mercosur and taking into account language barriers that may hinder international trade, this paper seeks to explore the role of language in international trade, with particular emphasis on the two trading blocs presented above, since Portuguese is an official language in both of them given that Portugal belongs to the EU and Brazil belongs to Mercosur. Our aim is to analyse trade between Portugal and

¹ Full title: 'Inter-regional Framework Cooperation Agreement between the European Community and Its Member States, of the One Part, and the Southern Common Market (MERCOSUR) and Its Member States, of the Other Part'.

Mercosur, and Portugal and the EU, focusing on whether language similarity (the fact that two countries share the same or a very similar language) has a positive influence on the volume of Portuguese exports to those countries. Our study was based on the following three main hypotheses:

H1: Portuguese exports are higher to countries that belong to the EU.

H2: Portuguese exports are higher to countries that belong to Mercosur.

H3: Considering only EU Member States, Portuguese exports are higher to those where language similarity with Portuguese can be identified.

In order to test the above-mentioned hypotheses, we have analysed data regarding trade between Portuguese companies and the 98 main countries to which these companies export. This paper is divided into eight sections. After this introduction, the first section contains a brief overview of language policies in the EU and Mercosur. After that, we offer some comments on the trade relationships that Portugal has with the two trading blocs we are focusing on — the EU and Mercosur. The next section describes what we mean by language similarity and why that is important when it comes to international trade. Following this, we detail the study we have carried out, starting by describing the gravity model of trade, characterizing the variables we used, and ending with a discussion of the results we obtained. At the end of this paper, we offer some final remarks and new avenues of research.

2. LANGUAGE POLICIES IN THE EU AND MERCOSUR

2.1 Language policies in the EU

The EU currently has 24 official and working languages stemming from its language policy that relies on adding the necessary new language(s) whenever a new Member State is accepted. Starting from the first initial group of four official and working languages used in the European Coal and Steel Community and the subsequent European Economic Community (EEC) into which it evolved — Dutch, French, German, and Italian — by the time the Treaty on the European Union was signed in Maastricht in 1992, this group included twelve languages, with the addition of Danish, English, Finnish, Greek, Irish, Portuguese, Spanish, and Swedish. After these languages were added to the group of official and working languages of European institutions, as more countries were accepted into the EU, this number increased, although the EU has less official languages than Member States (28 at the moment) because some of these Member States share common languages — e.g. Austria and Germany share German as their respective sole official language, but German also has the status of official language in Belgium and Luxembourg; these latter two countries also share French as their official language, which is logically the official language of France; and Belgium has a third official language, Dutch, which it shares with the Netherlands. This goes to show that these six countries (Austria, Germany, Belgium, Luxembourg, France, and Netherlands) contribute with only three languages (German, French, and Dutch) for the number of official EU languages.

The EU is openly a multilingual organization and it has been so from the start. In fact, the first Council Regulation (Council Regulation No. 1 of the EEC) determines the languages to be used by the EEC. The preamble to this regulation is unambiguous when it states that ‘each of the four languages in which the Treaty is drafted is recognised as an official language in one or more of the Member States of the Community’. The remaining articles of this regulation grant the citizen’s right to address community institutions in the official language of their country, to receive a reply in that same language, and to have access to community legislation in that language via the *Official Journal of the Community*, which is to be drafted in the official languages of the community (four at the time, as we have seen).

Table 1 below presents an overview of the official EU languages of the current 28 members of the EU, and their respective year of entry.

Table 1. Member countries of the EU by alphabetical order

Country	Official EU language(s)	Year of entry	Country	Official EU language(s)	Year of entry
Austria	German	1995	Italy	Italian	1958
Belgium	Dutch, French, German	1958	Latvia	Latvian	2004
Bulgaria	Bulgarian	2007	Lithuania	Lithuanian	2004
Croatia	Croatian	2013	Luxembourg	French, German	1958
Cyprus	Greek	2008	Malta	Maltese, English	2004
Czech Republic	Czech	2004	Netherlands	Dutch	1958
Denmark	Danish	1973	Poland	Polish	2004
Estonia	Estonian	2004	Portugal	Portuguese	1986
Finland	Finnish, Swedish	1995	Romania	Romanian	2007
France	French	1958	Slovakia	Slovakia	2004

Germany	German	1958	Slovenia	Slovenian	2007
Greece	Greek	1981	Spain	Spanish	1986
Hungary	Hungarian	2004	Sweden	Swedish	1995
Ireland	Irish, English	1973	United Kingdom	English	1973

Source Based on data provided by the EU's official website (Europa.eu). Last update 01/05/2017

The number of official languages of the EU, however, could be much higher, since some of its Member States have more than one official language. Article 8 of Council Regulation No. 1 of the EEC states that 'If a Member State has more than one official language, the language to be used shall, at the request of such State, be governed by the general rules of its law'. This implies that for a language to become an official language of the EU, the Member State has to make such a request. This restriction has left out, for example, Luxembourgish, which has been official in Luxembourg since 1984. Nonetheless, some regional languages, such as Basque, Catalan, and Galician spoken in Spain, and Scottish Gaelic, and Welsh, spoken in the United Kingdom, have attained the status of co-official languages of the EU by request of Spain and the United Kingdom, respectively.

2.2 Language policies in Mercosur

In Latin America, the economic integration process dates back to 1948, when the Economic Commission for Latin America and the Caribbean (ECLAC) was created in order to promote customs union by introducing the concept of regional cooperation. Subsequently, the Latin American Free Trade Association (LAFTA) was created in 1960 with the aim of forming a free trade zone.

According to Floroiu (2014), 'Historically, the creation of the Southern Common Market (Mercosur) began in 1985. This was the moment that Brazil and Argentina began trade negotiations with the aim of forming a regional market'. However, Mercosur was only officially created in 1991, when Argentina, Brazil, Paraguay, and Uruguay — its founding members — signed the Treaty of Asuncion. Venezuela was admitted as an effective member in 2012, but it has since been suspended in 31 December 2016 for failing to meet membership requirements. The accession process of Bolivia started in December 2012. Chile, Colombia, Ecuador, and Peru are associate states. These differ from effective states due to their degree of integration into the bloc and the fact that they have not joined the Common External Tariff (CET), which is what makes Mercosur a customs union. The members of Mercosur have large asymmetries not only in terms of size, but also in economic terms, which necessarily has consequences on international trade. For example, Brazil has 8,515,770 sq km and 205,823,665 inhabitants (2016 est.), while Uruguay, the second smallest country in South America, has 176,215 sq km and 3,351,016 inhabitants (2016, est.). Mercosur is then 'a market of four unevenly matched countries [...], where Brazil represents 71% of the GDP, 71% of the territory and 78.7% of the population' (Hamel, 2004: 118). Although these data are from 2003, Campos (2016: 871) confirms GDP numbers, stating that Brazil holds 'a privileged position as the dominant economy, holding around 71% of the share of Mercosur GDP, while Argentina held 26%, Uruguay 2%, and Paraguay 1%'.

Joining countries whose official languages are Spanish and Portuguese, Mercosur 'is a unique attempt of cultural integration and geolinguistic dynamics in the whole region' (Hamel, 2004: 116). In line with Council Regulation No. 1 of the EEC, Article 17 of the Mercosur Free Trade Agreement, the founding document signed in 1991, establishes that 'The official languages of the common market shall be Spanish and Portuguese, and the official version of its working documents shall be that drafted in the language of the country in which each meeting takes place'. The respect for the member's official language and the promotion of multilingualism within the bloc are therefore at the core of this trade union, reflecting the importance of language not only for identity and cultural reasons, but also in the very specific case of trade dealings. Later on, in 2006, the Ministers of Culture of Mercosur suggested the incorporation of Guaraní as one of the official languages of the bloc, admitting that it is the official language of one of the members of Mercosur (Paraguay amended the status of Guaraní from national language to official language of the country in 1992) and recognizing that it is one of the historical languages of Mercosur. However, most services are only provided in Portuguese and Spanish and not in Guaraní, as is the case of Mercosur's website (<http://www.mercosur.int>) since Guaraní is not considered a working language. Table 2 below presents an overview of the official languages spoken in Mercosur's founding members plus Venezuela and Bolivia.

Table 2. Founding members of Mercosur plus Venezuela and Bolivia

Member	Official language(s)	Area (sq km)	Population (inhabitants)
Argentina	Spanish	2,780,400	43,886,748
Bolivia	Spanish plus 36 indigenous languages (including Guaraní)	1,098,581	10,969,649
Brazil	Portuguese	8,515,770	205,823,665
Paraguay	Spanish and Paraguayan Guaraní	406,752	6,862,812
Uruguay	Spanish	176,215	3,351,016
Venezuela	Spanish	912,050	30,912,302

Source Based on data provided by the CIA World Factbook. Population data estimated for July 2016

As we can gather from the information contained in Table 2 above, Bolivia has a very unique language policy, since Article 5(I) of the Plurinational State of Bolivia's Constitution establishes that:

The official languages of the State are Spanish and all the languages of the rural native indigenous nations and peoples, which are Aymara, Araona, Baure, Bésiro, Canichana, Cavineño, Cayubaba, Chácobo, Chimán, Ese Ejja, Guaraní, Guarasu'we, Guarayu, Itonama, Leco, Machajuyai-kallawaya, Machineri, Maropa, Mojeñotrinitario, Mojeño-ignaciano, Moré, Masetén, Movima, Pacawara, Puquina, Quechua, Sirionó, Tacana, Tapiete, Toromona, Uruchipaya, Weenhayek, Yaminawa, Yuki, Yuracaré and Zamuco.

Article 5(II) further declares that

The Pluri-National Government and the departmental governments must use at least two official languages. One of them must be Spanish, and the other shall be determined taking into account the use, convenience, circumstances, necessities and preferences of the population as a whole or of the territory in question. The other autonomous governments must use the languages characteristic of their territory, and one of them must be Spanish.

This commitment to the protection and promotion of national languages reflects the importance of the linguistic heritage of a country, but it may become ineffective within the scope of a larger organization. Therefore, both the EU and Mercosur, while upholding multilingualism, have decided to incorporate the national official languages of its member states. Nevertheless, the balance of power between the languages that are considered official in both these organizations is uneven — in the EU, English and French are the *de facto* working languages in many instances, while Portuguese has had some difficulties in ascertaining its role in Latin America. Historically, Spanish has enjoyed greater prestige than Portuguese as a cultural, economic, educational, and scientific language in Latin America, while 'Portuguese was considered to be a less important language for international communication in the view of the Hispanic countries' (Hamel, 2004: 118). However in recent years, and particularly through the action of the working group on language policies, a plurilingual education has increasingly been offered to citizens in Mercosur's member countries, promoting Spanish in Brazil and Portuguese in the remaining members of the organization.

3. SOME COMMENTS ON THE TRADE RELATIONSHIPS BETWEEN PORTUGAL AND THE EU AND PORTUGAL AND MERCOSUL

There are many barriers to international trade, and the wider the market where trading possibilities occur, the largest those barriers will be. In this study, we wanted to analyse the physical barriers imposed by the distance that separates two countries that are involved in a trading relationship, as well as the language barriers that result from communication difficulties that arise when the trading partners do not share the same language.

Communication plays a vital role in the establishment of trading relationships — after selecting the destination country and the adequate trading partner, the company will have to communicate effectively with that partner in order to establish and maintain the commercial relationship, while also being able to deal with that partner in case any problem arises and it has to engage in legal procedures if and when that need arises. In all these cases, and in the after-sales process, communication — and consequently language — is essential. Therefore, when both trading partners do not share the same language, a trade barrier will be imposed and it will imply an added cost to be added to the commercial transaction. Conversely, when both partners share the same language, or even a similar language, negotiations between the trading partners will be easier and consequently trade between these partners will increase. Therefore, language similarity contributes to decrease transaction costs, eliminating the need to hire some sort of intermediary. Several authors have stressed the importance of sharing a common language or a similar one to facilitate trade and even when it comes to the selection of foreign trading partners (see, for example Fidrmuc & Fidrmuc, 2016, and Adserà & Pytlíková, 2015).

Portugal's main trading partners have always been European countries (even before Portugal was accepted as a Member State of the EEC) mostly due to the physical proximity between European countries, although the language similarity that Portugal shares with the countries where a Romance language is spoken — such as Spanish, French, and Italian — may also play a part. However, we would like to highlight that when Portugal accessed the EEC in 1986, the market share of some Portuguese products significantly decreased in their traditional markets, such as the United Kingdom, Germany, and France, but European countries were still Portugal's main trading partners due to the increase in the overall volume of Portuguese exports for the set of countries that belonged to that trading bloc at the time. Additionally, it is also important to highlight that before this date, Portugal did not have significant trading relationships with Latin American countries nor was there any significant Portuguese investment in those countries. The exception was understandably Brazil, a country with which Portugal has always maintained close relations mostly due to the former colonial ties that exist between both countries.

In the 1990's Portuguese trade increased greatly, which worked as the main engine of economic growth of the country. Table 3 below shows the evolution of Portuguese trade in the past eleven years, contrasting exports and imports, and showing the balance of trade.

Table 3. Portuguese international trade of goods and services

	1996	2001	2006	2007	2008	2009	2011	2012	2013	2014	2015
Exports	25 063	37 502	49 854	54 896	56 223	47 588	61 595	64 372	68 587	70 747	74 064
Imports	31 729	51 119	63 419	67 796	72 993	59 427	68 048	64 204	65 455	68 781	70 950
Balance of trade	-6 666	-13 617	-13 564	-12 900	-16 770	-11 839	-6 452	169	3 132	1 965	3 114

Source Based on data provided by Statistics Portugal/Pordata.

The EU is the world leader in terms of international trade and it is the largest exporter of goods and services as well as the largest importer from over one hundred countries. As we have mentioned above, the EU Member States are Portugal's most important trading partners. As seen on Images 1 and 2 below, the EU represented around 70% of the total Portuguese exports and imports of goods in 2013 (the year of our study).

Image 2. Portuguese exports of goods (2013)

Source Based on data provided by Statistics Portugal/Pordata.

Image 1. Portuguese imports of goods (2013)

Source Based on data provided by Statistics Portugal/Pordata

Given the linguistic similarity, the cultural proximity, and the historical ties that exist between Portugal and Brazil and the other Latin American countries, there have always been important commercial relationships between them. However, the trading relationship between Portugal and Mercosur was enhanced when Portugal became a member of the former EEC, which furthered the exchanges between Portugal (and Spain) and Latin American countries (Pinto, 2008).

Considering the countries that form Mercosur, Brazil has always been the main trading partner of Portugal, not only because both countries share the same language, but also due to all the historical and cultural relationships that have tied them throughout the centuries. In fact, of the 30% of Portuguese exports whose country of destination was not in the EU, around 10% were directed at Mercosur.

4. LANGUAGE SIMILARITY AND BILATERAL TRADE

The importance of language to trade is studied within the field of the 'economics of language', a concept defined in the 1960's by Jacob Marschak (1965). Besides international trade, the economics of language also studies how the language(s) spoken by an individual may influence his/her income, particularly in the context of immigration. We have explored this concept elsewhere (see Ferro & Costa, 2016; Ferro & Ribeiro, 2016), but we would like to highlight the insights that the economics of language can bring to international trade.

Among other relevant concerns, the choice of a foreign trading partner has to take into account how partners are going to communicate with each other. Nowadays, technology has greatly facilitated communication across vast distances with the growing access to e-mail, instant messaging services, and even social media. However, language differences still pose a problem in many respects. Let us take the following example: a Portuguese company wishes to communicate with a foreign trading partner based on a country where Portuguese is not widely spoken. In this case, and having eliminated the possibility of communicating in Portuguese, four other strategies may be employed:

- 1) Each partner may speak his/her language and be understood by the other, who, in turn, will answer in his/her own language — this is called intercommunication and would be, up to a certain point, possible between Portuguese and Spanish speakers; however, it is not a widely used option due not only to cultural aspects tied with the attitude of Spanish speakers towards Portuguese, but also with the different phonological structure of both languages that clearly makes it harder for Spanish-speaking people to understand spoken Portuguese (particularly European Portuguese);
- 2) The trading partners may agree to communicate using one of their respective languages; although English has been gaining momentum as a foreign language in Portugal for the past fifty years, French still is one of the most widely spoken languages in the country (European Commission, 2012) besides belonging to the same language group (Romance language group), and is therefore a viable option for Portuguese companies to communicate with companies based in one of the 29 territories where French is an official language, specifically France, Belgium, and Luxembourg in the EU, but also outside the EU, in territories such as parts of Canada and Switzerland, and in many African nations;

- 3) In the absence of a common shared language the trading partners may use a third language, one that is foreign to both of them but in which they can make themselves understood, which may be a *lingua franca* in their activity sector or in the region where they operate; for a Portuguese company, that language will most probably be English, which is the most widely spoken and learned language in Portugal presently (European Commission, 2012; Eurostat, 2015);
- 4) If none of the above direct communication options is possible, a mediator will have to be engaged, and that may be a language professional (such as a translator or interpreter) or someone who acts in that specific market as an intermediary.

When used to explain international trade gravity models usually include some language variable that may correspond to the official language(s) of the country and/or other widely spoken languages in that country, such as national or regional languages or even widely spread foreign languages. Several studies have already established the relationship between a common language and the volume of trade between two countries (see, for example, Helliwell, 1998; Mélitz, 2008; Egger & Lassmann, 2012; Mélitz & Toubal, 2014).

However, in the absence of a shared common language, even speaking similar languages may act as a facilitator, i.e., when two languages share many common traits (such as Portuguese and Spanish, for example), the speakers of one language will need a lower investment to learn the other language and therefore language policies that promote that may have a positive impact on international trade. Several methods to assess language similarity may be found in the literature, from which we would like to highlight the results of foreign language tests analysed by Chiswick & Miller (2005) in order to create a language similarity table; the Language Barrier Index created by Lohman (2011); Levenshtein's distance proposed by Ispording & Otten (2013); or the division between open circuit languages and direct communication languages as put forward by Mélitz (2008). All these methods to assess language similarity have the same goal of quantifying language similarity so that it can be used in econometric models as a variable aiming at analysing international trade and therefore going beyond the variable that identifies the same official language shared by both countries, which was used initially.

We have created a method to classify language similarity based on language criteria, specifically etymological criteria, based on which we divided languages according to the language family to which they belong. Since our starting point were Portuguese exports to two trading blocs (EU and Mercosur), we only needed three groups based on the language similarity classification we propose and therefore we divided the countries' official languages into three groups: Romance languages, Germanic languages, and Other.

5. THE GRAVITY MODEL OF TRADE

For our analysis we have used the gravity model of trade, which is the most common econometric instrument used to study international trade. This model was created by Tinbergen (1962) and since then it has been employed to analyse bilateral trade. This model starts by considering that exports between two countries are positively related to the size of their economies and negatively related to the distance between them, which is considered one of the most important aspects that indicate the existence of trade barriers.

The basic gravity model correlates the volume of exports between two countries T_{ij} and the economic weight of those two countries as measured by the Gross Domestic Product (GDP) of exporter and importer (GDP_i and GDP_j) and the cost of trade between them, represented by the distance that separates them, D_{ij} (models (1) and (2)), in which i and j indicate the countries. Models (1) and (2) represent the initial model:

$$T_{ij} = f \left[\frac{(GDP_i \cdot GDP_j)}{D_{ij}} \right] \quad (1)$$

$$T_{ij} = \beta_0 (GDP_i)^{\beta_1} (GDP_j)^{\beta_1} D_{ij}^{\beta_2} \cdot e^{\epsilon} \quad (2)$$

The gravity model was first used to analyse international trade in depth, and its theoretical framework was explored by Anderson (1979), Helpman and Krugman (1985), and Kalirajan (1999). The ease of implementation of this model as well as the success it has had in the explanation of trade flows have increased its usage. Therefore, the initial model has been increasingly improved and expanded with several variables that intend to explain bilateral trade. To the initial basic variables considered in the model (GDP and distance) several other variables were added, such as population, GDP *per capita* (Bergstrand, 1990), and the area of the country.

Most of the models that deal with international trade based on gravity models have expanded the scope of the model and explained exports between two countries depending not only on the variables considered in the basic model, but also on a set of binary variables aiming at measuring 'qualitative factors'. These variables are called dummy variables and their aim is to introduce a qualitative factor in the study, assigning 1 when the factor/situation is verified and 0 otherwise.

So that these non-quantitative factors can be considered in the explanation of bilateral trade relations, binary variables were also used with the purpose of representing the characteristics of the county, such as cultural proximity, language (Endoh, 1999; Breuss, & Egger, 1999; Nitsch, 2000; Feenstra, 2002), cultural similarity, belonging to the same trading bloc (Breus & Egger, 1999), whether the countries share their borders, or whether there has been a former colonial relationship (Glick & Rose, 2002), among others.

We would like to highlight that the gravity model equation implies taking the logarithms of its variables, which originates, for example, in its expanded form, a log-log model, such as the following equation:

$$\ln(T_{ij}) = \beta_0 + \beta_1 \ln(GDP_i GDP_j) + \beta_2 \ln D_{ij} + \beta_3 \ln Lang_{ij} + \beta_4 \ln Cont_{ij} + \beta_5 \ln RTA_{ij} + \beta_6 \ln ComCol_{ij} + \varepsilon_{ij} \quad (3)$$

Where i and j represent the countries and the variables are defined as:

T – volume of trade (considering only exports, only imports, or both) between the two countries;

GDP – real GDP;

D – Distance;

$Lang$ – dummy variable that is 1 when i and j share a common language and 0 otherwise;

$Cont$ – dummy variable that is 1 when i and j share a common border and 0 otherwise;

RTA – dummy variable that is 1 when i and j belong to a free trade area and 0 otherwise;

$Comcol$ – dummy variable that is 1 when i and j have had a former colonial relationship and 0 otherwise.

We would also like to stress that the existence of trading blocs has been used in this model for decades, namely considering the effect of the existence of preferential trade agreements. In the 1970's, Aitken (1973) in particular assessed the impact of such preferential trade agreements. Polak (1996) also concluded that countries have a larger bilateral trade volume if they are geographically closer to one another. Nascimento and Júnior (2013) argued that dummy variables might be used to capture more than the simple effect of a trading bloc or a trade agreement and can actually be used to capture a number of factors related to the History of the countries or their policies.

6. METHODOLOGY OF THE PRESENT STUDY

Based on the gravity model and aiming at analysing the volume of Portuguese exports, we have used international trade data for 2014 provided by Statistics Portugal (INE) that correspond to real data for 2013. We have analysed data from the 98 main countries of destination where the trading partners of Portuguese companies are based, considering the countries with which the volume of exports was over 10,000 million euros in 2013.

Since the Ordinary Least Squares (OLS) method is the most widely used econometric technique to perform the estimation of specification coefficients in the gravity model in its log-log form, we chose to use it in the present study. The multiple linear regression of the gravity model has been widely used in the past forty years and has proven to be empirically robust since it has broad explanatory power (Kepaptsoglou, Karlaftis & Tsamboulas, 2010).

Therefore, the explained variable in our model is an economic variable that translates the logarithm of the volume of exports between Portugal and a foreign trading partner.

The impact of all the explanatory variables will be analysed with the global significance test (Test F) and the individual significance test (Test T) always considering a significance level of 5%. We have also obtained the value of the determination coefficient (R^2); however, and since we did not consider any other potentially relevant variable in our analysis to explain the volume of exports of a country (given that our main aim was to analyse the effect of language similarity), we counted on a reduced value for that.

6.1 Characterization of the variables

We used different types of variables in the regressions we performed:

- Economic: such as the volume of exports between Portugal and a foreign trading partner, real GDP, and whether the trading partner belongs to the same trading bloc;
- Linguistic: specifically the existence of 'language similarity' between Portugal and the country to which it exports and the language group to which the official language of the foreign trading partner belongs;
- Geographic: in this case, the distance that separates Portugal from a trading partner.

Data on the volume of exports were obtained through the statistics on international trade published by Statistics Portugal (INE); data regarding real GDP of the different countries were obtained at the official website of the World Bank (www.worldbank.org) characterizing real GDP PPP (purchasing power parity) to prices of 2011 of all the 98 countries included in the study.

We have considered the distance between Portugal and a trading partner in all the models, represented by the kilometres that separate Portugal's capital, Lisbon, from the capital of the trading partner obtained at a language calculator tool (<http://pt.distance.to/>), not only due to the explanatory capacity that such variable is expected to have, but also in order to add to the quality of the analysed relationship. Given that we have used the logarithmic variable, the value estimated for this parameter will represent the elasticity of the volume of exports in relation to an absolute geographical distance. We expect the coefficient of this variable to be negative, since it constitutes a barrier to trade given that the greater the distance between two countries, the larger the barrier to the trading relationship will be.

In order to conclude on the effect of the impact of language similarity between two countries on the volume of exports, we have defined the variable Proxlin, taking into consideration the official language of the destination country, which could be Portuguese, Spanish or English, taking into account only EU Member States. Our aim was to capture a three-pronged effect: with this variable, we can identify (i) the countries that share a common language with Portugal; but we can also

include (ii) those countries that have Spanish as an official language, which reflects the linguistic similarity between the two languages; and (iii) the countries whose official language is English, and thus we are able to capture the effect of the foreign language that is more widely studied and spoken in Portugal.

Thus, the variable $UEProxLing_j$ is a dummy variable that is 1 when country j , a EU Member State, has Portuguese, Spanish or English as an official language and 0 otherwise.

In line with Ferro and Ribeiro (2016), we have considered the dummy variables R_j , G_j and O_j to identify respectively, the Romance language family, the Germanic language family, and Other families. Since we were interested in isolating the two language families that are more relevant to Portuguese foreign trade, taking into consideration the classification of Portuguese but also the language policies of the country regarding the teaching and learning of foreign languages, we classified the remaining languages as belonging to the group Other, thus eliminating the need for a more detailed classification.

Our aim was to analyse whether there is a direct relation between Portuguese exports to a given country and the language group to which the official language of that country belongs. Therefore, variable R_j is 1 when the country has a Romance language as an official language (and 0 otherwise), and G_j when country j has an official Germanic language. In case any of these variables is 1, variable O_j is 0; conversely, the latter is 1 when the country's official language does not belong to any of these language families. However, econometrically, this group cannot be used together with the other two variables, since it would cause multicollinearity given the linear relationship that exists between the three independent variables.

7. RESULTS

Based on these data, we have studied the relationship between the volume of Portuguese exports to its 98 main trading partners worldwide in 2013, considering whether these countries belonged to the EU or Mercosur and the language similarity between the official language of these countries and Portuguese, in order to find evidence to test our initial hypotheses.

We started by analysing regression (4) in order to clarify whether the fact that the trading partner (taking into consideration the 98 countries analysed) belonged to the EU influences the volume of Portuguese exports:

$$\ln(T_{ij}) = \beta_0 + \beta_1 UE + \beta_2 \ln D_{ij} + \varepsilon_{ij} \quad (4)$$

Through the results of the estimation of model (4) (attached as Table 4), we may conclude that, as expected, the fact that the country belongs to the EU has a positive impact on the volume of Portuguese exports and the increased distance has a negative impact on the volume of Portuguese exports, making it decrease by 0.584% for each 1% increase to the number of kilometres. This enabled us to verify H1: Portuguese exports are higher to countries that belong to the EU.

We have amplified the previous model by adding the 'Mercosur' variable, which is 1 when the country belongs to Mercosur and 0 otherwise, and which originated regression (5):

$$\ln(T_{ij}) = \beta_0 + \beta_1 UE + \beta_2 \ln D_{ij} + \beta_3 \text{Mercosur} + \varepsilon_{ij} \quad (5)$$

The results obtained in the regression (attached as Table 5) have allowed us to consolidate the conclusions reached in the previous model, since we can state that when a country belongs to the EU it has a positive impact — even higher than in the previous model — on the volume of exports and therefore we have strengthened H1. We also concluded that the effect of distance has a negative impact on the volume of exports making them decrease even further, now by 0.621% for each 1% increase to the number of kilometres.

The fact that a given country belongs to Mercosur has no explanatory impact on the volume of Portuguese exports and therefore we have rejected H2. This conclusion may, in part, be explained by the fact that the projected free trade agreements between the EU and Mercosur have not been implemented yet. We would like to highlight that the distance between Portugal and the countries that comprise this bloc may function as a barrier to trade; however, the language similarity between these countries might be taken advantage of to promote the volume of trade.

We created a new model (model 6) that intends to conclude on the effect of the impact of language similarity between two countries on the volume of exports (using the Proxling variable) within countries that belong to the EU, and on the effect of real GDP PPP to prices of 2011 for all the 98 countries considered, which originated the following model:

$$\ln(T_{ij}) = \beta_0 + \beta_1 UEProxLing_j + \beta_2 \ln D_{ij} + \beta_3 \ln GDP + \varepsilon_{ij} \quad (6)$$

By analysing the results of this model (attached as Table 6), we conclude that the quality of the models increases with the introduction of the possibility of the country belonging to the EU, together with what we called language similarity. Thus, we strengthen the positive effect of language similarity to Portuguese exports, an effect that increases when the country belongs to the EU. Additionally, GDP also has a positive effect on the volume of exports, which is in accordance with the initial assumptions of the gravity model.

Taking into consideration only the countries that belong to the EU trading bloc, we have organized them according to the language family to which their official language corresponds, in order to study model (7) below. We would like to highlight that in the case of countries (whether EU Member States or not) that have more than one official language, we chose the official language that has a larger number of speakers to use in our model based on data provided by the *CLA World Factbook*.

As referred previously, in line with Ferro and Ribeiro (2016), we considered the dummy variables R_j , G_j and O_j to identify respectively the Romance language family, the Germanic language family, and Other families. Our aim was to analyse whether there is a direct relationship between Portuguese exports to a given country and the language group to which the official language of the country belongs.

$$\ln(T_{ij}) = \beta_0 + \beta_1 R_j + \beta_2 G_j + \beta_3 \ln D_{ij} + \varepsilon_{ij} \quad (7)$$

By analysing the results obtained with this model (attached as Table 7), we concluded that the model is overall explanatory and that all the variables have explanatory power. Additionally, these results allow us to stress some points that seem relevant to us:

- 1) There is a direct relationship between the volume of Portuguese exports and the fact that the destination country has a Romance official language. Since this is also the language group to which Portuguese belongs, this result was expected, given that when two countries share the same language or a very similar one, the language barrier is blurred or even deleted and consequently the transaction costs tend to be lower. Thus, we found evidence for H3 since taking into consideration all the EU Member States the volume of Portuguese exports is higher to countries whose official language is similar to Portuguese.
- 2) Although with a smaller impact than the Romance group, the Germanic language group also has explanatory capacity. This is tied with the fact that one of Portugal's main trading partners is the United Kingdom, whose official language, English, is a Germanic language.
- 3) Although with a smaller explanatory capacity in view of the previous models, distance causes a lower effect on the volume of exports. This situation may be justified by the fact that distance between countries that belong to the EU is not large and therefore its impact is not as significant.

8. FINAL REMARKS

The reasons behind the fact that most Portuguese exports are directed at a EU Member State go well beyond the European economic union and the common market. As we state above, physical proximity and language similarity are two relevant factors. Considering that Portuguese is an official language of both the EU and Mercosur, we posited the hypothesis that the Portuguese language might be an added value for Portuguese countries when selecting a trading partner in the southern hemisphere. On the other hand, Spanish, which is also one of the official languages in both trading blocs, is very similar to Portuguese, since both languages belong to the same language family (Romance languages), which makes communication between speakers of these languages easier. In this scenario, any given native speaker of Portuguese will be able to communicate with speakers from any Mercosur country. Although some work has already been done to foster the dissemination of Portuguese and Spanish throughout all the countries that belong to Mercosur, more should be done in order to promote trading relationships.

We believe that our study contributes to the literature on Portuguese foreign trade, drawing attention to the relationship between Portuguese exports and the language spoken in the country of destination. In order to test the hypotheses identified in the Introduction, we have analysed trade data regarding Portuguese exports to companies based on the 98 main countries to which those exports are targeted. We concluded, as expected, that language is not the only determinant to foreign trade and that although it plays a relevant part in the choice of commercial partners, its relevance is underestimated in the context of Portuguese foreign trade.

In the future, we intend to expand our analysis and include not only the exports of goods, but also imports and services. We believe that our work may be used to inform language policies aiming at promoting stronger relationships between countries that comprise Mercosur, the Community of Portuguese Language Speaking Countries (CPLP), and even African Union (AU) profiting from one of Portugal's greatest assets, the Portuguese language, which is one of the official languages of each of these three institutions.

EQUIDADE E BEM-ESTAR NO USO DE PARAGENS DE AUTOCARRO

Manuela Pires Rosa

Centre for Spatial and Organizational Dynamics, University of Algarve
(mmrosa@ualg.pt)

Fábio Cavaco Gil

Universal Accessibility Consultant
(engenheirofabiogil@gmail.com)

RESUMO

O turismo acessível está promovendo mudanças profundas nos sistemas de transporte, que requerem meios de transporte específicos e ambientes físicos urbanos que integram paragens de autocarros que garantam equidade social, segurança e bem-estar para todos os turistas.

As pessoas com mobilidade reduzida têm necessidades especiais. Em consequência, os espaços edificados, os veículos de transporte, a informação e os serviços devem ter em conta os princípios do *Design* Universal que garantem um “uso equitativo”, “flexível”, “intuitivo”, “perceptível”, “baixo esforço físico”, “tolerável” e espaços “bem dimensionados” para diversos usuários. Estes princípios também consideram outras pessoas com requisitos de acesso, como é o caso dos turistas com *trolleys* ou com carrinhos de bebé.

Uma paragem de autocarro, com atributos de qualidade, necessita de algumas características inovadoras nos abrigos de passageiros, nas áreas de espera, no revestimento dos pavimentos e na rede pedestre. Pretende-se apresentar os atributos de uma paragem de autocarros e listar indicadores de desempenho para avaliar a sua qualidade.

A metodologia de análise e diagnóstico das condições de acessibilidade é aplicada em três paragens de autocarro localizadas na cidade de Faro, Portugal. O diagnóstico permite concluir que a renovação destas interfaces modais deve ser considerada nos processos atuais de regeneração urbana.

Palavras-chave: Turismo Sustentável, Equidade, Ambiente Físico da Paragem de Autocarro.

1. INTRODUÇÃO

A integração das temáticas sobre as necessidades das pessoas com deficiência e o turismo tem vindo a receber crescente atenção institucional, governamental e académica nas duas últimas décadas, na Europa, nas Américas e na Ásia-Pacífico.

Em Portugal, o Instituto Nacional de Reabilitação foi um dos pioneiros na promoção do Turismo Acessível, tendo desenvolvido, a partir de 1997/1998, várias iniciativas que advogavam que a oferta turística se devia adequar às necessidades das pessoas com diferenças sensoriais, intelectuais ou físicas, contribuindo progressivamente para uma oferta de maior qualidade e conforto, que beneficia toda a sociedade (INR, 2010).

A Convenção sobre os Direitos das Pessoas com Deficiência (2008) adotou o modelo social/ecológico do funcionamento humano, assumindo que a incapacidade está intrinsecamente relacionada com a interação entre as características das pessoas e as barreiras comportamentais e/ou ambientais que existem na sociedade e que interferem na sua inclusão e participação.

Esta ênfase nos fatores ambientais determina que o meio edificado, os sistemas de transporte e de comunicação e os serviços têm de ser concebidos considerando o conceito de “equidade social” que está associado a valores de justiça e solidariedade, à igualdade de oportunidades no acesso a bens, serviços e informação e a formas alternativas de comunicação. Este conceito aplica-se à atividade turística.

O conceito de turismo acessível traduz “um processo para permitir que as pessoas com deficiência e os idosos usem de uma forma independente e com equidade e dignidade produtos, serviços e ambientes de turismo” (adaptado de OCA, 1999, p. 4, citado por Darcy, 2006). Mais tarde foi assumido um grupo mais amplo de pessoas que beneficiam das condições de acessibilidade universal, passando a considerar-se, também, as pessoas com carrinhos de bebé (Darcy & Dickson, 2009). Atualmente acrescentam-se os turistas com bagagens pesadas e os que utilizam *trolleys*.

Um conceito subjacente ao turismo acessível é o *design* universal. O *design* universal é definido como “o *design* de produtos e ambientes para serem usáveis por todas as pessoas, num maior número possível, sem a necessidade de *design* adaptado ou especializado (...). O conceito de *design* universal focaliza-se em todas as pessoas, de todas as idades, tamanhos e aptidões” (Center for Universal Design, 1997).

O Centro para Desenho Universal da Universidade do Estado da Carolina desenvolveu sete princípios associados ao “Design Universal” que devem ser atendidos na conceção de produtos e de meios físicos, de forma a criar-se uma sociedade justa:

- Princípio 1: uso equitativo - pode ser utilizado por pessoas com diversas aptidões: providencia o mesmo tipo de meios de uso para todos os usuários (idêntico sempre que possível e equivalente quando não o for);
- Princípio 2: Flexibilidade no uso - pode acomodar-se a um amplo leque de aptidões e preferências individuais;

- Princípio 3: simples e intuitivo - o uso é simples de entender, sem importar a experiência, o conhecimento, a linguagem, nem o nível de concentração do usuário;
- Princípio 4: informação perceptível - comunica a informação necessária ao usuário, não obstante as condições ambientais ou as aptidões sensoriais do usuário;
- Princípio 5: tolerância ao erro - minimiza os riscos e as consequências adversas dos acidentes ou ações não intencionadas;
- Princípio 6: baixo esforço físico - pode ser usado eficientemente, confortavelmente e com um mínimo de esforço físico.
- Princípio 7: dimensão e espaço de alcance e uso - permite um espaço e dimensão adequada para alcance, uso e manipulação sem importar o tamanho, postura ou mobilidade do usuário. (adaptado de Center for Universal Design, 1997).

Estes princípios devem, sistematicamente, ser incorporados na concepção de produtos e de meios físicos, de forma a que a sua utilização seja feita de forma independente e natural. São estes atributos que se pretendem implementar numa sociedade inclusiva.

Advoga-se que o *design* universal é imprescindível para as pessoas com deficiência ou incapacidade, é necessário para idosos e pessoas frágeis e contribui para a comodidade e bem-estar de todos.

De acordo com o Conceito Europeu de Acessibilidade “a acessibilidade é a característica de um meio físico ou de um objeto que permite a interação de todas as pessoas com esse meio físico ou objeto e a utilização destes de uma forma equilibrada, respeitadora e segura” (Aragall & EuCAN members, 2003).

A acessibilidade universal deve ser atendida em toda a cadeia de valor do turismo: gestão de destinos turísticos, informação turística e publicidade (preparação, informação e reserva), ambientes urbanos e arquitetónicos, modos de transporte e estações, alojamento, alimentação e convenções, atividades culturais (museus, teatros, cinemas e outros) e outras atividades e eventos turísticos (World Tourism Organization, 2013).

Neste âmbito, os veículos de transporte coletivo (aéreo, marítimo, fluvial, ferroviário e rodoviário) e as infraestruturas associadas (interfaces modais) devem ser projetados de forma a garantir um uso equitativo por parte das pessoas com deficiência ou incapacidade e das demais pessoas com mobilidade reduzida.

A presente comunicação focaliza-se nas interfaces modais pedestre/autocarro. Em termos de objetivos gerais, pretende-se apresentar as características técnicas urbanísticas de paragens de autocarro acessíveis para todos e listar indicadores de desempenho para avaliar a sua qualidade. Em termos de objetivos específicos pretende-se averiguar se os parâmetros técnicos encontrados foram considerados em três paragens de autocarro estruturantes, localizadas na cidade de Faro.

2. ZONAS DE INTERFACE MODAL

As interfaces modais devem assegurar a todos os pedestres o direito de usar o transporte coletivo de uma forma equitativa tendo em conta os princípios do *design* universal. Do ponto de vista urbanístico as interfaces modais fazem parte integrante da rede pedestre.

Os elementos constituintes de infraestruturas pedonais são: a) espaços reservados exclusivamente a pedestres (passeios e outras zonas pedonais); b) travessias pedonais (atravessamentos da rede viária); c) zonas de interface modal (Seco, Macedo & Costa, 2008).

As interfaces modais constituem, igualmente, um dos elementos fundamentais da rede de transportes e devem garantir acessibilidade dos passageiros aos meios de transporte, sendo então necessário integrar estas no espaço urbano e, consequentemente, na rede pedestre. Tratam-se de “infraestruturas que tem como função promover e facilitar a ligação de utentes entre diferentes modos de transporte, preferencialmente a pé e apoiada ou não por meios mecânicos, podendo integrar espaços destinados a uso terciário e equipamentos de utilização coletiva” (CML, 2012, p. 112).

O tipo de interface modal enquadrado nesta comunicação é o de pedestre-transporte coletivo (autocarro). A uma adequada transferência modal estão associados, normalmente, atributos relacionados com as características das paragens de autocarro, que incluem dimensões adequadas da zona de embarque dos pedestres, uma vez que são estas que permitem efetuar a transição entre a rede pedestre e o veículo e vice-versa.

A implantação de uma interface modal deverá respeitar um conjunto de critérios que garantam eficiência na articulação entre os vários modos de transporte, o fácil acesso pedestre ou a localização em locais de grande atração de utentes.

Presentemente considera-se que as interfaces modais pedestre-transporte coletivo detentoras de qualidade devem ter abrigo.

Um abrigo de transportes públicos deve deter um conjunto de características:

- Existir nas paragens de transporte público sobretudo nas que estão próximas de pontos de interesse da comunidade;
- Possuir um tamanho adequado para utentes de diferentes idades e capacidades;
- Garantir proteção das condições climáticas, do tráfego motorizado e do sol;
- Ser seguro e confortável;
- Poder ser visível na envolvente imediata e pela comunidade;
- Estar livre de obstáculos para pedestres e ciclistas;
- Deter informações atuais sobre o percurso;
- Deter espaço suficiente para alocar assentos para todos os tipos de usuários;
- Possuir o mínimo de mobiliário urbano necessário para permitir o acesso à paragem; e
- Ter estacionamento para permitir transferências multimodais (adaptado de Building Research Establishment, 2012).

Em termos de localização adequada da interface modal na rede de transportes coletivos, em situações em que há uma efetiva procura, considera-se que:

Em princípio a densidade das paragens devem corresponder a um valor de aproximadamente 2 a 3 paragens por quilómetro, sendo tipicamente a sua zona de influência, limitada por uma linha que representa o lugar geométrico dos pontos que distam à paragem de um tempo próximo dos 5 minutos (cerca de 300 metros) (Costa, 2008, p. 9).

Estas zonas devem ser dimensionadas de forma a evitar conflitos, devido essencialmente ao grande número de pedestres que se podem acumular, devendo conceder-se, então, um espaço apropriado para os passageiros aguardarem pelos meios de transporte e permitir a sua entrada e saída de forma fácil e fluida.

Contudo, a acessibilidade à paragem não está somente dependente do dimensionamento da própria paragem, é necessário contabilizar toda a sua envolvente, nomeadamente como se processa o seu acesso e de que forma é estabelecida a ligação desta com as restantes infraestruturas pedonais (passeios e travessias pedonais). O próprio abrigo não deve constituir uma barreira física aos pedestres utilizadores do espaço canal onde está inserido.

Apesar de “cada vez mais existirem mecanismos e sistemas de adaptação na interface entre paragens e transportes coletivos, ainda existem várias barreiras mentais ou psicológicas que atingem principalmente as pessoas com deficiências” (Pindado, 2006, p. 13), pois estas não se sentem seguras em realizar uma viagem em que podem existir quebras na sua continuidade quando estas chegam a um destino.

Assim, as zonas de interface modal devem ser acessíveis de forma a garantir condições de autonomia para todos os pedestres satisfazerem as suas necessidades de deslocação. Para tal ser possível é necessário dotar estes espaços de recursos adequados que permitam o movimento de todos.

Constata-se que esta acessibilidade é por vezes quebrada pelos seguintes obstáculos:

- Falta de espaços de manobra (no abrigo e envolvente) com dimensões apropriadas para as pessoas em cadeiras de rodas;
- Falta de dispositivos mecânicos apropriados para a entrada de uma pessoa em cadeira de rodas nos veículos (plataforma elevatória ou rampa com pequena inclinação);
- Incapacidade de as pessoas pequenas ou frágeis vencerem os desníveis entre a zona de espera e a entrada do veículo;
- Falta de piso tátil que forneça a orientação dos pedestres cegos ou amblíopes;
- Falta de informação dos percursos.

O motorista do meio de transporte só deve iniciar a marcha depois das pessoas com mobilidade reduzida estarem acomodadas, para não haver risco de derrube.

As pessoas em cadeiras de rodas que se encontrem na faixa de rodagem e que se dirigem ao passeio onde se encontra a paragem de autocarros, devem ter acesso a estas, através de um rebaixamento de lancil, com pavimento adjacente rampeado a 8% e pavimento tátil para perceção pelos cegos e amblíopes. As inclinações suaves de rampeamentos estão previstas no regime jurídico nacional sobre acessibilidade (Decreto-Lei n.º 163/2006 de 8 de Agosto).

De forma a evitar conflitos de congestionamento, decorrentes da paragem dos autocarros comprometer a fluidez do tráfego motorizado, os abrigos devem ser colocados a uma distância das esquinas superior a 15 metros (SEHAB, 2003).

3. CARACTERÍSTICAS GEOMÉTRICAS DAS PARAGENS DE AUTOCARROS

3.1 Zona de espera e abrigo das paragens

Os abrigos são uma parte importante do acesso aos transportes públicos e tem como principal função desempenhar um papel de segurança ou proteção aos passageiros. Podem fornecer outro tipo de serviços como informações relativas aos itinerários, publicidade, entre outros.

A forma de identificar as paragens é conseguida por meio de um poste constituído por uma placa no topo do abrigo ou um postalete. Estes elementos devem-se destacar do restante mobiliário urbano, de modo a haver perceção fácil da sua presença. As placas devem conferir uma legibilidade adequada devendo ser colocadas a uma altura livre de 2,40 metros (DL n.º 163/2006).

O abrigo deve localizar-se distanciado da linha de edificação em 1,20 a 1,50 metros, larguras livres de obstáculos que os passeios devem possuir (medidas assumidas no DL n.º 163/2006).

Como boa prática, a largura livre de obstáculos deve localizar-se sempre na retaguarda dos abrigos das paragens, de forma a não gerar conflitos entre os pedestres que circulam e os que se encontram na zona de espera. Neste caso, a largura livre de obstáculos disposta na dianteira do abrigo deve ser superior a 0,90 metros. Porém, nos casos em que o passeio é mais estreito pode a largura livre de obstáculos estar disposta na dianteira do abrigo sendo necessário garantir um mínimo de 1,40 metros de largura a esta (Arrête du 15 janvier, 2007).

Em ambas as situações os passeios deverão possuir largura suficiente para permitir a implantação adequada dos abrigos: para os casos em que o abrigo não se localiza junto às fachadas dos edifícios o passeio deve garantir uma largura mínima de 3,80 metros. Para as situações em que o abrigo se situa junto ao edifício, o passeio deve possuir no mínimo uma largura de 3 metros (Direction de la voirie Ville de Caen, 2013) (Figura 1).

Figura 1. Implantação de paragens com abrigos

Fonte: Direction de la voirie Ville de Caen (2013, p. 65)

A plataforma de espera ou zona de espera, espaço destinado aos passageiros quando estes aguardam pela chegada do autocarro, deve possuir uma dimensão adequada devido à elevada ocupação por utentes que se pode gerar neste local. Habitualmente estes espaços não se distinguem do restante passeio, no entanto, devem ser contabilizados na conceção das paragens. Recomenda-se para estas plataformas uma largura mínima de 0,90 metros (Arrête du 15 janvier, 2007).

As dimensões dos abrigos dependem da intensidade de fluxos de utentes que utiliza a paragem de autocarro. Em princípio considera-se 5 m² como área mínima do abrigo, com uma profundidade mínima de 1 metro e a altura deve ser de 2,50 metros (Costa, 2008).

No entanto, para se atender à diversidade humana, normas francesas exigem que os abrigos devem garantir, no seu interior, uma superfície livre que garanta no mínimo 1,50 metros de diâmetro de rotação para as pessoas de cadeiras de rodas e prever a instalação de bancos fixos de descanso para pessoas com mobilidade reduzida (Arrête du 15 janvier, 2007).

Toda a informação (linhas, paragens, horários) localizada no interior do abrigo deve ser colocada a uma altura inferior a 1,40 metros, para ser acessível a utentes com baixa capacidade visual e deve ser dotada de informação Braille, ou formas de comunicação áudio, permitindo uma maior abrangência de disseminação da informação (Teles & Silva, 2010).

Os revestimentos dos pavimentos devem ter superfícies estáveis, duráveis, firmes e contínuas, não devendo possuir juntas com uma profundidade superior a 0,005 m (DL n.º 163/2006).

Para orientação dos cegos, a paragem deve conter uma faixa de aproximação ao longo de toda a zona de paragem do autocarro, em pavimento tátil de alerta, com largura compreendida entre 0,25 metros a 0,60 metros, localizando-se a uma distância da extremidade do passeio num mínimo de 0,50 metros (ABNT NBR 9050, 2004).

Junto ao poste e ao pavimento tátil de alerta, deverá ser implementada sinalização tátil direcional para sinalizar aos cegos da localização do local de embarque, de dimensões entre 0,75 metros a 1 metro (ABNT NBR 9050, 2004) (Figuras 2 e 3).

Figura 2. Exemplo de pavimento tátil em paragem de autocarro

Fonte: SMPED (n. d., p. 116)

Figura 3. Pormenor de pavimento tátil numa paragem de autocarro

Fonte: adaptado de ABNT NBR 9050 (2004, p. 37)

3.2 Atributos da faixa de rodagem

Quanto à zona de paragem do autocarro na faixa de rodagem, a sua demarcação adequada pode permitir que os motoristas consigam gerir de forma mais eficiente o tempo de paragem, garantido maior segurança aos pedestres, utentes do meio de transporte.

Costa (2008) apresenta uma solução tipo relativamente à paragem de autocarros onde são especificadas as dimensões necessárias que os autocarros necessitam para estacionar, convenientemente, nos locais de embarque e desembarque de pedestres. O comprimento total destas zonas é igual a 37 metros permitindo assim o estacionamento de dois autocarros em simultâneo, a sua largura deve ter o valor de 3 metros, sendo que nesta área não é permitido qualquer estacionamento ().

Figura 4. Esquema da zona de paragem de autocarros na faixa de rodagem

Fonte: Costa (2008, p. 12)

Para locais em que a velocidade de projeto é de 50 km/h, para facilitar a fluidez de tráfego, Costa (2008) propõe que seja criada uma baía específica com 2,75 metros de largura e um comprimento total de 27 metros.

Quando não existe facilidade de acesso da plataforma ao veículo, pode-se proceder ao alargamento do passeio na direção da faixa de rodagem, de cerca de 1 a 2 metros, devendo manter-se um espaço para circulação dos pedestres, na retaguarda, no mínimo de 2 metros (Figura 5). O comprimento total da zona de paragem do autocarro deverá ter um mínimo de 9 metros.

Figura 5 - Paragem de autocarro com alargamento do passeio

Fonte: Costa (2008, p. 13)

A zona de paragem deverá ser assinalada através de marcação horizontal, sob a forma de linhas em ziguezague de marca M14 com larguras e comprimentos específicos (Roque, n. d.) (Figura 6). A marcação pode ser efetuada na própria faixa de rodagem ou nas baías e deve possuir uma extensão mínima de 15 metros (CERTU, 2006).

4. METODOLOGIA DE ANÁLISE E DIAGNÓSTICO DA QUALIDADE DAS PARAGENS DE AUTOCARRO

Tendo em consideração a metodologia de análise e diagnóstico da qualidade das paragens de autocarro desenvolvida anteriormente, no âmbito de uma dissertação de mestrado em Engenharia Civil (Gil, 2014) apresenta-se um conjunto de parâmetros/indicadores que permitem avaliar, adequadamente, as características urbanísticas de paragens de autocarro existentes, tendo-se acrescentado indicadores relativos a sinalização tátil. Assume-se que os veículos possuem uma plataforma elevatória para utilização por parte de uma pessoa em cadeira de rodas ou têm piso rebaixado o que permite a utilização de uma rampa suave para garantir autonomia e segurança por parte das pessoas com deficiência (Figura 7).

A análise destes indicadores visa entender as dificuldades que os utentes com mobilidade reduzida têm na utilização destas interfaces modais e as condições de comodidade para todo o cidadão.

Este método permite que se faça um diagnóstico dos problemas e norteia a apresentação de soluções para proceder à reabilitação das paragens de autocarro.

Figura 7 – Exemplos de autocarros acessíveis

<http://www.cmc.pr.gov.br>

<http://www.caterresdefrance.fr/fr/71/accessibilite-des-arrets-de-bus/>

Para o efeito foram elaboradas listas de parâmetros/indicadores referentes às características de uma paragem de autocarro detentora de padrões de qualidade, o que inclui aspetos de inclusão social. Os indicadores foram selecionados com base nas disposições técnicas, normalizadas ou recomendadas, descritas anteriormente. Estes indicadores também poderão ser utilizados no processo de monitorização e avaliação das paragens de autocarro, após a sua requalificação.

Foi desenvolvida uma tabela de análise técnica (Tabela 1), que permite a avaliação da conformidade dos vários indicadores a serem observados, sendo classificados com as opções “Conforme”, “Não conforme” e “Não aplicável” (N/a), em função da infraestrutura em análise. A tabela contém ainda a localização e a designação das interfaces modais.

Tabela 1. Lista de indicadores para avaliação da qualidade das interfaces modais

Rua Interface n.º								
Interfaces modais (pedestre/ autocarro)	Características nos abrigos e sua localização	Indicadores		Valores recomendados	Existe (S/N)	Valor medido	Conforme Não conforme Não aplicável	Obs.
		I1	Largura livre de obstáculos nos passeios - na retaguarda dos abrigos (DL n.º 163/2006 art.º 1.2.1)	$\geq 1,50$ m (recomenda-se passeio alargado para garantir segurança aos pedestres na retaguarda do abrigo - ≥ 2 m -)				
		I2	Pavimento estável, durável, firme e contínuo na zona de paragem (DL n.º 163/2006 art.º 4.7.1)					
		I3	Largura da plataforma de espera (Arrête du 15 janvier, 2007)	$\geq 0,90$ m				
		I4	Altura dos abrigos nas paragens (Costa, 2008)	2,50 m				
		I5	Profundidade do abrigo (Costa, 2008)	≥ 1 m				
		I6	Largura dos espaços destinados a pessoas de cadeira de rodas (Arrête du 15 janvier, 2007)	$\geq 1,50$ m				
		I7	Iluminação no interior do abrigo (ABNT NBR 9050, 2004)					
		I8	Altura da informação (linhas, paragens, horários) (Teles & Silva, 2010)	$\leq 1,40$ m				
	Marcação horizontal	I9	Marcação ziguezague M14 (Roque, n.d a)					
	Sinalização rodoviária	I10	Altura livre da sinalização vertical (postalete) (DL n.º 163/2006 art.º 4.5.1)	$\geq 2,40$ m

5. ESTUDO DE CASO: PARAGENS DE AUTOCARRO NA CIDADE DE FARO

A cidade de Faro localiza-se no litoral sul de Portugal Continental, é capital de distrito e sede do município de Faro. Em 2011, apresentava uma população de 44119 habitantes e um índice de envelhecimento de 120,8 % (INE, 2012). O centro histórico constitui uma importante centralidade com potencial comercial e turístico.

Esta cidade de serviços detém um aeroporto que desempenha um papel determinante no desenvolvimento económico da região ao servir os principais polos de turismo do Sul de Portugal e também de Espanha. Em 2016 passaram pelo Aeroporto de Faro 7,6 milhões de passageiros (dados da ANA/VINCI Airports).

O aeroporto de Faro é servido por transportes coletivos rodoviários (autocarros) que estabelecem a ligação com a cidade de Faro.

É objeto do presente estudo, a análise de três paragens de autocarros que constituem pontos estratégicos numa ótica de turismo acessível (Figura 7). As interfaces modais IM 1 e 2, da linha 16 (serve o percurso Aeroporto – Terminal Rodoviário de Faro), encontram-se próximas à Estação de Caminho de Ferro, respetivamente a 50 m (Rua Coelho Ventura) e a 120 m (Rua Francisco Barreto). A interface modal IM 3, limítrofe ao Terminal Rodoviário de Faro, está localizada na Avenida da República no sentido noroeste-sudeste, serve percursos para Olhão e Albufeira, cidades do interesse turístico.

Estas paragens permitem a transferência de passageiros para o comboio e para outras redes de transportes coletivos rodoviários e *vice-versa*. Por estarem localizadas no centro histórico de Faro também são importantes no atual contexto de Turismo Acessível.

A análise da interface modal n.º 1 permitiu verificar que não é dotada de abrigo, a sinalização vertical de informação dos números de linha é visível, mas encontra-se a 2,12 m do pavimento, constituindo uma barreira física em altura. Não há informação sobre horários. O pavimento em calçada não é adequado pois encontra-se degradado e polido. A largura do passeio é de 1,75 m, valor que é considerado adequado para zona de espera. No entanto, a viabilização do embarque através de uma rampa suave de um veículo de piso rebaixado ou de um que disponha plataforma elevatória está dependente da dimensão destes mecanismos. A zona de espera detém espaço suficiente para ser utilizado por uma pessoa em cadeiras de rodas. Não dispõe de sinalização tátil. Na faixa de rodagem existe marcação em ziguezague.

A análise da interface modal n.º 2 permitiu verificar que não é dotada de abrigo, a sinalização vertical de informação dos números de linha é visível, mas encontra-se a 2,12 m do pavimento, constituindo uma barreira física em altura. Não há informação sobre horários. O pavimento em calçada não é adequado pois encontra-se degradado e polido. A largura do passeio é de 1,50 m, valor que é considerado adequado para zona de espera. No entanto, a viabilização do embarque através de uma rampa suave de um veículo de piso rebaixado ou de um que disponha plataforma elevatória está dependente da dimensão destes mecanismos. A. Não dispõe de sinalização tátil. Na faixa de rodagem existe marcação em ziguezague.

A análise da interface modal n.º 3 permitiu concluir que é dotada de abrigo e que a sinalização vertical de informação de paragem de autocarro está bem visível, mas não garante uma altura livre de obstáculos mínima, pois encontra-se a 2,12 m de altura. O abrigo não constitui uma barreira urbanística ao garantir, na sua retaguarda um espaço amplo (superior a 2 m) e na sua dianteira 1,15 m e, portanto, a dimensão da zona de embarque é adequada. A altura do abrigo de 2,30 é considerada pequena, a profundidade de 1,30 é adequada, no entanto, não dispõe de espaço suficiente para usabilidade por parte de uma pessoa em cadeiras de rodas, pois detém somente um espaço de 1,12 m entre o banco e o painel lateral. Há informação sobre horários, localizada a uma altura adequada. Não existe iluminação no interior do abrigo, mas encontra-se bem iluminado devido à presença de luminárias públicas. O pavimento em calçada não se apresenta contínuo (apresenta juntas com largura superior a 0,005 m) e encontra-se polido. Não dispõe de sinalização tátil. Na faixa de rodagem existe marcação em ziguezague.

Efetuada a análise e diagnóstico, apresentam-se tabelas síntese (Tabela 2) que representam de forma abreviada, a avaliação dos diferentes indicadores aplicados na avaliação da qualidade das interfaces modais objeto de estudo.

As interfaces modais não se encontram com a qualidade desejável revelando a necessidade de intervir neste domínio.

Tabela 2. Síntese de avaliação da qualidade das interfaces modais objeto de estudo

6. CONSIDERAÇÕES FINAIS

Em todo o mundo, os sistemas tradicionais de transportes públicos urbanos são, geralmente, concebidos para uma população saudável e raramente têm em conta as necessidades das pessoas com deficiência (Zhou *et al.*, 2012).

No presente estudo, a análise das características urbanísticas de um dos elementos do sistema de transportes coletivos rodoviários – as paragens de autocarro – permite concluir que não se garante, na sua utilização, equidade para as pessoas com mobilidade reduzida e bem-estar para os restantes cidadãos. Este diagnóstico permite aos decisores políticos e técnicos priorizar intervenções nos processos de reabilitação urbana.

Na União Europeia, a Directiva 2001/85/CE determina que os veículos dos transportes rodoviários tenham rampas de acesso ou piso rebaixado para viabilizar o acesso das pessoas com mobilidade reduzida. No entanto, para além destes requisitos relacionados com o veículo, as paragens de autocarro devem deter características urbanísticas para garantir o acesso ao veículo.

Nesse sentido é exigível um maior rigor no dimensionamento destas zonas de transferência modal, assumindo-se características geométricas adequadas nas zonas de embarque, que garantam maior comodidade, segurança e acesso aos meios de transportes.

O presente estudo considerou veículos coletivos detentores de plataformas elevatórias ou de rampas. Tem-se constatado que a extensão destas rampas não é apropriada pois não asseguram inclinações suaves para garantir autonomia e segurança para uma pessoa em cadeira de rodas. Para a sua usabilidade, é fundamental considerar paragens de autocarro sobre-elevadas em relação ao passeio onde se integram, conforme recomenda o projeto COST 322 (COST, 1995).

Por outro lado, na última década tem-se aumentado a perceção de que a acessibilidade nas paragens de autocarros vai para além de aspetos urbanísticos (Transport for London, 2006), relaciona-se com outras dimensões, nomeadamente, serviços de informação fornecida aos passageiros (informação escrita e sonora), sistemas inteligentes de orientação para cegos, bilheteiras e outros equipamentos instalados no local (ex. pisos táteis), design de bancos e de abrigos.

A consideração de interfaces modais de grande qualidade pode potenciar uma maior utilização dos transportes coletivos, contribuindo para uma sociedade mais inclusiva e para uma mobilidade mais sustentável, aspetos essenciais num contexto de Turismo Acessível e Sustentável.

THE SOCIAL AND SPATIAL STRUCTURES IN MANAGEMENT SITUATIONS

Thiago Duarte Pimentel
Universidade Federal de Juiz de Fora
(thiago.pimentel@ich.ufjf.br)

ABSTRACT

Starting from the assumption that ontic structures of reality, space and time, have implications over epistemological, theoretical, methodological and practical domains, in this paper I make a discussion about the concepts of social space and management situation, trying to outline their consequences over the framework of strategic and social management. A theoretical review on the space theme in social theory, as well in these of strategic and social management was made seeking to highlight the emergence of space emerges as relevant dimension in management situations, Then I analyze the forms of relationship, and modulation of space utilization by different social, organizational and institutional actors in a given context. Specifically, we present a “catalogue” of spatial categories in social theory and how they link – or can be linked – with the strategic and/or social management. We hope that the identification of the forms of strategic use of space allows enhance productive relations, while the social ones can contribute to collective and democratic insertion of actors in the sphere of public action.

Keywords: Ontology, Space, Management Situations, Social Management, Strategic Management.

1. INTRODUCTION

Space is an important factor of production that must be taken into account when formulating and implementing strategies, since it can potentiate or restrict the possibilities of action, according to how it is used, organized and managed, by a single actor or a set of social, organizational and institutional actors. Nevertheless, it is rarely considered as a variable of action pertaining to a management problem (Raulet-Croset, 2008) or as a useful analytical framework category to the understanding of the management phenomena to the point of deserving a due prominence. It is only recently that space and territory have become objects of interest to the social sciences, in general, and in the management sciences, in particular (Lauriol, Perret & Tannery, 2008), - and, let us say, still more recently yet in the case of not developed countries.

If, on the one hand, space can be used strategically, as has already been well noticed by space economy studies (cf. Capello & Nijkamp, 2004), on the other hand, its implications for a social perspective still need to be further elaborated (Zieleniec, 2007). This is because more than one production factor, space can be considered as a platform that allows the inclusion (or exclusion) of a set of actors, whether in the sphere of individual or collective action since it selectively imposes synchronic or diachronic conditioning, of co-presence or alternation, to the other entities of the reality that maintain contact with him.

Thus, in the same way as it performs selective constraints on entities, human or material ones, which imposes consequences in terms of possibilities of use - strategic or not - the spatial structure may tend to promote a more democratic participation; is delegated by the representative of the public power, is appropriated by the users themselves when they perform their symbolic bricolages in their daily actions, depending on the framework resulting from the space-time structure on collective action.

In this sense, having as a background the proposal of a research agenda alluding to space in social theory defended by (Pimentel, 2008; 2009; 2012; 2014), this work aims to explore the relationship between the ontic dimension of reality through the space-time structure and the different forms of management, strategic and social, starting from the axiomatic understanding of management in terms of management situations (Girin, 1990; Fabbri, Gallais & Schmitt, 2010) and the analysis of the concept of space in social theory.

Specifically, it is intended to carry out a discussion about the concepts of space and management situation, and its consequences in the field of strategic management and social management, presenting a “catalog” of spatial categories in social theory and how they are linked - or can be linked - with strategic or social management. By “management situation”, we mean those that revolve around spatially situated problems and which, by their nature, affect a large number of actors belonging to different social / institutional groups, who are inscribed and positioned on the (and the) space where the problem unfolds (Girin, 1990c).

This study is based on premises of critical realism, which considers reality as structured, stratified and external to the individuals and to the knowledge that they may have of it. In this conception things - what exists in reality - have their own structures that give them causal powers (or capacities), that is, of exerting tendencies on other things of reality. Among so many other things in reality, space and time structures are crucial in the sense that their causal powers affect all other structures known to man. Yet - or precisely because of this - they become trivialized and disregarded as sources of systematic studies (Bhaskar, 2008; Pimentel 2012).

Thus, we assume the premise that the ontic structures of reality, space and time, have repercussions on the epistemological, theoretical, methodological and practical domains of this reality. We start from the assumption that the effects of constraints of the spatial structure on the other entities act selectively on such entities, depending on how they are in contact and

interact. Specifically, it is assumed that the way in which space is used (or not used), organized and managed by different social, organizational and institutional actors, constitutes an important element for management, which can either enhance productive relations or contribute to better and more democratic insertion of these actors in the collective sphere of public action. However, there are spatial and temporal constraints that are beyond the capabilities or possibilities of human intervention, whether absolutely or relatively in a given context or time. [In these cases, there is the possibility of temporary and selective suspension of the effects of the spatial structure on one or another structure of the reality, what is called in physics the space deformation].

The central argument defended here is that such structures present constraints to human (individual or collective or social) action, and that in each of these modalities, for example, different forms of spatiality and temporality are presented / expressed in relation to the structural characteristics of agents and forms of their relationship with those structures of reality. From the practical point of view, in the sphere of management sciences, human action (that occurs in the context of collective action) occurs in management situations, characterized by the imperious flow of successive transformations in space. In these situations, there is the tendency framework resulting from the prior structuring of reality and its spatial linkage (or fixation) on the other things (entities) of reality, thus becoming the spatial structure, a factor of constraint of these other entities and their casual powers.

This essay is organized as follows: it initially makes a quick introduction or presentation of the discussion about the ontic dimension of reality, as a focus on the space-time structure. Next, I approach the question of space from the point of view of the literature existing in social theory, making a thematic, although not exhaustive, rigorous cut according to the main exponents that approached the question, from different levels of social analysis. In a third moment, I present the traditional thinking of strategic management and its interface with space from the discussion of the space economy (vision as a resource). Subsequently, the literature on social management and its interface with space are reviewed, evidencing its discussion as a means and possibility of action.

2. SPACE AND TIME IN SOCIAL THEORY

2.1 Simmel's Interactive Analysis and the Idea of Intermediate Space

According to Simmel (2009 [1908]) people can not be near or far from each other without the space lending their form for this, and more than those processes that one wants to attribute to the time can occur out of time. So, whatever the type of experience and its form of manifestation, it must make reference of some type and explain in some way how causal structures and mechanisms occur space-temporally. In this sense, it is important to emphasize that space itself and time act as generative structures with causal, passive or active effects on the other structures.

Espaço e tempo são conceitos (camadas) muito estratificados que podem ser usados formalmente, como Lefebvre faz, para definir diferentes modalidades de espaço (físico, social, psicológico) ou empregado metaforicamente para modelar a relatividade epistêmica no espaço-tempo na realidade física. Neste caso, o caráter irreversível dos processos causais pode prover um realismo ontológico análogo, que é em parte homeomórfico [homeomorph], considerando que a causalidade (ou sua ausência) é o critério mais geral para atribuição da realidade das coisas (Bhaskar, 2008, p. 239).

Among the most frequent degenerations of the causal human impulse is the cessation of formal conditions, without which certain events can not occur to maintain their positive and productive motives. The typical example is the power of time - a language that always defrauds the action of researching the real motives for the mitigation or cooling of feeling, reason for mental healing processes or habits firmly established (Simmel, 2009[1908], p. 544). The significance of space is no different.

When an aesthetic theory declares it the essential task of the plastic arts to make space perceptible for us, it misunderstands that our interest holds only for the particular shapes of things, but not space in general or spatiality, which constitutes only their *conditio sine qua non*, and neither its special essence nor its generating factor (Simmel, 2009[1908], p. 543 – italics in the original).

Simmel (2009[1908], p. 544) considers that “That space is in general only an activity of the psyche, only the human way of binding unbounded sensory affections into integrated outlooks, is specifically reflected in the need of psychological functions for the individual historical forms of space.”. In spite of this, the emphasis on spatial importance is not unwarranted. This is because, according to the author, the social interaction between human beings is - whatever else it is - also experienced (experienced) as a spatial perception.

Detailing his analysis of spatial interaction, individuals and social interaction, he adds:

If a number of persons inside certain spatial boundaries live isolated from one another, then each of them simply fills their own immediate space with their substance and their activity, and between this space and the space right next to them is unfilled space; practically stated: nothing. In the moment in which two of these enter into social interaction, the space between them appears filled and enlivened. Of course this only rests on the double meaning of betweenness: that a relationship *between* two elements, which though only one, is in the one and in the other immanently an occurring movement or modification *between* them, in the sense of spatial intervention. Whatever

errors this ambiguity might otherwise lead to, it is nevertheless of deep significance in this sociological matter. The betweenness as a merely functional reciprocity, whose content continues in each of its personal bearers, is also actually realized here as a claim of the space existing between these two; it always takes place actually *between* both points of space, with regard to which one and the other has a place of theirs designated for it, filled by each alone. (Simmel, 2009[1908], p. 545 – italics in the original).

Thus, the analysis of space-mediated social interaction must take into account not only the space itself, with its material referents that constrain human action, but the intermediate space, the intersection, of human interaction, that space that belongs to none of individuals exclusively, but also does not exist (is nothing) without the animation of the parties involved. It is a space that emerges as a symbolic or affective space that will originate the imagined community of Benedict Anderson (cf. Vandenberghe, 2010g), but also that presents a root (it is rooted) in the physical space (cf. Simmel, 2009[1908]). In this regard, Simmel (2009[1908]) will speak of the differentiation between the emergence of social groups intrinsically linked to space, such as the State (whose physical space necessary for its conception is the territory) and those that do not require a specific connection to physical space (but only abstractly refer to it), as is the case of the church and its dispersion to various similar spaces.

Simmel seems to link this differentiation to a polarity between spaces dominated by scientific or economic logic (that is, rationalization) and those dominated by religion or affectivity (i.e. symbolic), polarization that occurs by virtue of properties relative to form and function of space. Thus, if the form seems to be more relevant in the first case, in which the connection to the physical space is more pressing, the function seems to stand out in the second, in which the dispersion occurs by similar spaces.

Suggestively, a following passage summarizes the influence of space on the sociological dimension of human association, which seems to emerge stimulated by the situation of spatial proximity, given since antiquity by the common reference elements that put individuals in a situation of co-presence, of ‘intermediation’.

the ‘natural commons,’ i.e. the union of habitations under the common protection of rampart and ditch; the city magistracy, by which the community became a legal person; the church association of inhabitants in parishes. These are three wholly different themes that proceed to a combination of one and the same collection of persons within one and the same piece of terrain. (Simmel, 2009[1908], p. 544).

Whatever the ambiguity error that the spatial analysis related to sociological analysis may lead us to, yet the spatial dimension is a matter full of sociological significance. According Simmel (2009[1908]), Kant defines space as the possibility of being together, which makes it something for individuals to fill. Therefore, the association in the various types of interaction between individuals brings different possibilities of being together, some of which are perceived in such a way that the form of the space in which they typically occur justifies their emphasis on the spatial dimension.

In order to penetrate the forms of association in general and the spatial circumstances of the association process, in particular, Simmel (2009[1908], p. 545-587) presents five central features of space: (1) the exclusiveness of space; (2) the irreducibility of space; (3) the shape of space and its influence on its contents; (4) the outer relation of space, as a material structure, over other phenomena manifested through an ideal or social reality; and (5) the configuration of space and its influence on the social structures (social reality) of humanity. The exclusivity of space derives from the conception of existence of only a single universal space, of which all individual spaces are portions; then each portion of space has a kind of oneness for which it is difficult to have an analogy.

The quality or property of detachment refers to the fixation of an object at a single point in the space that can not be reduced to another single point. Such points can only be approximated, so there is a separation or distance between them. This quality of space vitally affects the patterns of social interaction and is manifested by the way space is divided (and also divides, that is, it impels us to make that separation), for our practical use, in portions that operate as units (as cause and effect) and are surrounded by boundaries.

[...]It is rarely made clear how wondrously now the extensity of space accommodates the intensity of the sociological relationships, how the continuity of space, precisely because it contains subjectively no absolute boundary of any kind, simply allows then such a subjectivity to prevail throughout. As far as nature is concerned, every boundary placement is arbitrary, even in the case of an insular situation, because indeed in principle even the sea can be ‘taken possession of.’ Precisely on account of this lack of spatial prejudice in nature, the sharpness, in spite of its prevailing unconditionality, of the physical boundary once it is fixed makes the power of social association and its necessity, originating internally, especially vivid. For that reason the consciousness of being inside borders is also perhaps not the strongest with regard to the so-called natural boundaries (mountains, rivers, seas, deserts), but rather precisely solely with political borders, which lie simply on a geometrical line between neighbors. And in fact precisely because here dislocations, expansions, migrations, mergers are more obvious, because the structure at its edge hits upon vital, psychologically functional borders from which not only passive oppositions but very active repulsions come. [...]The boundary is not a spatial fact with sociological effects, but a sociological reality that is formed spatially. (Simmel, 2009[1908], p. 449; 551).

The proper configuration assumed by space influences the specific patterns of interaction and the social formations derived from them. This relationship between form and content, in which both influence each other, is made possible or

restricted certain options of space use or making some more convenient and others more difficult or even impossible in a given context.

The outer relation of space, as a material structure, over degrees of contiguity or distance, is transformed into the vitality of sociological patterns of interaction. This psychosocial influence (of the vitality of patterns of interaction) is offered by space simply through the occupied position of proximity or perceived distance between people who are in some kind of relationship with one another.

The capacity for managing spatial tension in an association under common conditions of feeling and interests is dependent on the amount of available potential for abstraction. The more primitive the consciousness is, the less it is able to imagine the solidarity of the spatially separated or the lack of solidarity of the spatially near. (Simmel, 2009[1908], p. 566).

The spatial configuration within the structure of humanity, which is distributed in space, of which the elements described above (limits and distance, permanence and neighborhood) are like extensions. The basic sociological formations, derived from the essential characteristics of relationship with space, and its constraints, are evidenced, according to Simmel, by nomadism and sedentarism. While the first focuses on mobility (via migration) and uses the strategy of pilgrimage and the feeling of 'prehistoric' communism as the main strategy for maintaining group cohesion, the second focuses on the 'shelter' (by fixation) and uses as main strategy of standardization of the culture the objective symbols, in order to provide an awareness that everything would be the same in each point of the same group, even being in different places (Simmel, 2009[1908], p. 593).

2.2 Henri Lefebvre's (sócio)spatial dialectical theory

Lefebvre's vision, marked by an influence of Marxist criticism, especially emphasizes the question of the production of space. In his analysis, Lefebvre (1999) distinguishes between nature as a naively given context and what can be termed the "second nature," the transformed and socially realized spatiality that emerges from the application of deliberate work. It is this second nature that becomes the subject and geographic object of materialist historical analysis, of a materialist interpretation of spatiality.

O espaço não é um objeto científico afastado da ideologia e da política, sempre foi político e estratégico. Se o espaço tem uma aparência de neutralidade e indiferença em relação a seus conteúdos e, desse modo, parece ser "puramente" formal, a epítome da abstração racional, é precisamente por ter sido ocupado e usado, e por já ter sido foco de processos passados cujos vestígios nem sempre são evidentes na paisagem. O espaço foi formado e moldado a partir de elementos históricos e naturais, mas esse foi um processo político. O espaço é político e ideológico. É um produto literalmente repleto de ideologias (Lefebvre, 1999, p. 101).

Assuming, then, that space - and its organization, ordering and reorganization - is a social product, that is, that emerges from a set of social practices and with which it maintains close relations of continuity and discontinuity, the central issue that is outlined is not that it is a segregated and autonomous structure, but rather the relation of interdependence of this category to a wider social context. In this sense, what becomes relevant is the interaction of social space (i.e., constructed space) and organized and other structures, according to a particular mode of production. Space and its political organization express social relations, although they also react against them (Lefebvre, 1999).

In this way, it is observed that there is a possibility of understanding space from a socio-spatial dialectic, functioning in a structure of the economic base, in contrast with the current materialist formulation, which regards the organization of spatial relations only as a cultural expression restricted to scope of the superstructure. Because Lefebvre provides a critique of earlier currents, Soja insists that the 'materialist interpretation of spatiality' can not be assimilated by any of these traditions, and must be resumed from the Lefebvrian point of reference.

Gomes-da-Silva and Wetzel (2006), based on the three different dimensions of space production analysis proposed by Lefebvre (1991) - spatial practices, which refer to the perception of individuals about the dynamics of space production, as regards flows, transfers and physical interactions; the representations of space, which correspond to the representations and significations of space, elaborated through signs and the representational space, which involves the relation as the individual ascribes meaning to his experience - elaborate an analytical picture about social relations in the space potentially useful for The socio-spatial analysis in organizations.

2.3 The ideas of field and position in the analysis of Pierre Bourdieu

In spite of their intellectual rigor in the composition and accurate selection and cross-referencing of a wide variety of concepts and references of different philosophical traditions and social thought, several commentators hold in common that the Bourdieusian framework is relatively "simple", constituting a structuring nucleus of three, or perhaps four, concepts: field, capital, habitus and symbolic violence, around which secondary categories gravitate, whose function is to specify and give greater acuity, increasing the explanatory potential of its theoretical system (Jenkins 2006[1992]; Thiry-Cherques, 2006; Vandenberghe, 1999; 2009; 2010b).

The social universe - or the theory of social fields, as it is termed by many who recognize the field as the determining aspect of their work - is constructed by fields, microcosms, or spaces of objective relations, each with its own logic, which can not be reduced to that of other fields. The social field can be seen in a simplified way as a system of relations between

positions (which is the objective face of the field, the place in the social hierarchy that each agent occupies in the field), dispositions (which are the subjective face of the field, given by the habitus and the agents' propensity to act according to what has been internalized) and positions (which refer to a position in which those positions are expressed and whose principle lies in the structure and functioning of the field) (Vandenberghe, 2010b).

According to Vandenberghe (2010b), the field theory is the concrete realization of relational thinking in a particular sphere of action. It arises from the attempt to overcome the opposition between subjectivism and objectivism by means of a supplementary vertical relation that mediates the system of subjective dispositions - of individuals and collectivities - and objective positions in the social space (Thiry-Cherques, 2006).

From the outset, the field conception was linked to a highly conflictual view of the world, as a permanent battle for power, prestige and all kinds of capital (Vandenberghe, 2010b), being a space of objective relations between individuals and institutions that compete for the domination of a specific framework (Thiry-Cherques, 2006). The metaphor of the field is invoked in the sense of a social arena within which struggles and maneuvers occur to gain access to specific resources (Jenkins, 2006[1992]). It refers to a field of forces - as well as in physics - given by a preexisting, constraining structure - due to the limited existence of resources and the physical (and social) space where the agents involved are located, to engage them in social struggles, according to their relative positions in the field. With a view to have or increasing access to resources (or capital) in the field, which will culminate in the conservation or transformation of its initial structure (Bourdieu, 1996, p. 50).

From the perspective of Bourdieu's genetic structuralism, one must recognize that the central *focus* of research lies in the analysis of objective structures, but not in a fixed and stagnant way, as in Strauss's classical structuralism, but rather by linking the analysis of structures to the system of relations, which is space-temporally located. His analysis studies the field as the product of a genesis, that is, the incorporation of preexisting structures. Thus the structure of the field designates an exteriority (which is not the field) and an interiority (the institutions and agents that exist and subsist by difference). It is given by the relations of force between agents and institutions that fight for hegemony within the field, that is, the monopoly of authority that bestows the power to dictate rules (Thiry-Cherques, 2006).

Because of their objective analysis of established structural relations, Bourdieu assumes that, fields can be analyzed independently of the characteristic of their occupants, that is, as a system of objective relations. However, social fields are not fixed structures, structured spaces of positions at a given moment (Jenkins, 2006[1992]). On the contrary, they are products of the history of their positions and dispositions that reproduce them. "Our position in a field designates how we consume not only things, but also education, politics, the arts. It also determines how we produce and accumulate them." (Bourdieu, 1984, p. 210).

According to Bourdieu and Wacquant (2005), the fields result from the processes of social differentiation, the way of being and (re)knowing the world, embedded in a process of constant evolution of society that causes new fields to emerge in a process of continuous differentiation. In this way, every field is a historical product and therefore has a distinct *nomos* (set of laws governing it). What determines the existence of a field and demarcates its limits are the specific interests, the economic and psychological investments made by the different agents, endowed with a specific habitus convergent with that field, and the institutions therein inserted and that aim for a return, in the different forms of *capital*, related to the dominant capital in that field.

It goes without saying that every game presupposes rules and, in this sense, the agents of the field, tacitly or explicitly, share a *doxa* of the field (Bourdieu; Wacquant, 2005). Although each field creates - or rather institutionalizes - its own object and its principle of understanding, social fields are not self-evident and need to be defined as such, which requires observation and analytical delimitation of the researcher on a specific segment of the social world.

The social fields have universal properties and their own characteristics, which does not prevent Bourdieu from advocating structural homology between fields. All fields have: a) *habitus*, of the class and subclass in which the agent is positioned, which is at the same time a predisposition to act according to what he assimilated throughout his learning process; b) a structure, which refers to the "objective" system of relationships between agents, identified in the social space; c) *doxa*, or consensual opinion (substitutes the Marxist concept of ideology), and refers to what all the agents are in agreement, and is therefore opposed to the scientific, and contemplates everything that is admitted as "being anyway"; and d) the *nomos*, which refers to the specific laws (and rationalities?) that govern it (Thiry-Cherques, 2006).

3. THE SPACE DIMENSION

3.1 The Space Implications for Strategies

In *Space and territory on the strategy research agenda*, Lauriol, Perret and Tannery (2008) elaborate a historical retrospective on the development and incorporation of studies on the spatial dimension in the field of economics and administration, during the last century, emphasizing for this three great moments: (1) the location of activities or space as a variable of the organizational design, (2) strategic management of space and distances, and (3) territory as a space organization model.

The fact that a special issue of the journal *Advances in Strategic Management* (2003) being devoted to "Geography and Strategy" is a sign of the importance given to the spatial question in strategy. In this issue, Sorenson and Baum (2003) propose a division of the work into two categories: those that approach the location strategy from a "place", considering for this the superior performances obtained due to the location of the business activity in a given region, that would concentrate a set of characteristics and attributes peculiar to the territory. Because these attributes are fixed on the place - and therefore not mobile - they would provide that location with an advantage and favor a dynamic of agglomeration in their surroundings. Thus, companies would seek to incorporate the externalities of this space as a competitive advantage.

The other set of works would be those that approach the question of location from a question of “space”, considering the spatial distribution of firms within an industry, as well as the distribution of assets and resources within the firms themselves. These two issues have implications for the organization of relations between industries. This superior performance is supposedly attributed to its location, either by (1) location of activities or space as a variable of organizational design; (2) strategic management of space and distances; or (3) by the territory as a modality of space organization. Each of these (or specific moments) represents a way of seeing and dealing with the spatial dimension within the administration, and also proposes a set of specific elements and practices for the management of the same - based on certain valued elements / attributes in space).

3.2 The Situated Action and the Space as a Central Reference to Social Management

What is considered today as social management goes back to practices of workers’ association for the organization of production and consumption and also self-help, begun in the middle of the nineteenth century, approximately between the 1830s and 1850s (Lechat, 2002). However, these initiatives did not cease to exist, they simply had their role reduced or overshadowed by the robbery of the scene by the role of capitalist enterprises at first, then by the state afterwards. For Lechat (2002), after the Second World War, the non-monetary (domestic and reciprocity) economy had been marginalized by the expansion of the market and the nationalization of the most dynamic associative initiatives. But this scenario changed from the second half of the 70’s of the twentieth century. A new crisis of the capitalist system brought with it consequences, unemployment and the closure of companies and created a dramatic picture for the working class. In the 1970s and 1980s a wave of initiatives emerged, for example through worker cooperatives, to save or create jobs through self-managed enterprises.

It is important to emphasize that in social management, in addition to being applied to self-managed productive and consumer systems such as cooperatives, associations and mutual societies, it has also gained space when applied in larger systems. Not just of local character, such as cooperative networks, popular banks and whole communities. The logic of social management has increasingly applied to broader social systems, linking not specifically to the type of enterprise, but rather to the way in which it is managed (with a logic of development). And so, it has come very close to what could be considered as public policies, but carried out in a self-organized and self-managed manner.

From the theoretical point of view, and because it is a concept under construction, the notion of social management is still not consensual among the authors. Despite the different approaches, some principles can be identified as characteristic and defining social management. For França Filho (2008), social management is considered at two levels: (1) as a problematic of society and (2) as a specific modality of management. As for the problematic of society, the term refers to the management of the demands and needs of the social. The social, in this sense, suggests the idea of social policy, referring to the very idea of public management. In this sense, the purpose must be collective and must overlap with the individual.

As a specific modality of management, social management would be a way of subordinating the instrumental logics of economic calculation to other logics: social, political, cultural or ecological (França Filho, 2003). In this way, the use of the term social management is aligned with an attempt to counterbalance the excesses of individualistic logic based on instrumental rationality. Social management, it should be noted, would not seek to erase or replace the economic aspect, but rather to rebalance the system by incorporating and valuing other aspects, such as cultural, ecological and social.

França Filho (2003) considers social management as the mode of management of civil society organizations, of the non-state public sphere, distinct from both the private and state-run modes of management, since both are based on the instrumental rationality that guides utilitarian calculation of the consequences. In social management there is, in a different way, the development of forms of management that are based on substantive rationality, that is, in which social values, forms of solidarity and spontaneity and social ties are placed above the instrumental procedures of calculation. Thus, the objectives are, above all, non-economic, and these seem to be means to achieve social ends (political, cultural, ecological).

Another prominent contemporary author in the Brazilian context on the subject is Tenório (2008), whose central concern is the construction of an own thinking about social management, that is based essentially on the notion of public sphere and that can be applied to any type of organization and in any context. The author added to the discussion of the term social management the concept of deliberative citizenship and the notion of participation. This need for increased participation in the concept refers to the emphasis that is made primordial when it is meant that social management should be practiced as an intersubjective, dialogic process, where everyone has the right to speech without coercion. And this process must occur in a given social space, in the public sphere.

Tenório (2008a, p. 54) understands social management as the “deliberative decision-making process that seeks to meet the needs of a specific society, region, territory or specific social system.” According to Tenório (2008a), the concept of social management has been the object of study and practice much more associated to the management of social policies, nongovernmental organizations (NGOs), the fight against poverty and even environmental, than to the discussion and possibility of a democratic, participatory management, both in the formulation of public policies and in those relations of a productive character.

Trying to further detail the concept, Tenório (2008a, p. 40) argues that social management is:

[a] dialogical managerial process where the decision-making authority is shared among the participants in the action (action that can occur in any kind of social system - public, private or nongovernmental organizations). The adjective social qualifying the noun management will be understood as the privileged space of social relations where everyone has the right to speak, without any type of coercion.

Fischer (2002) discusses the concept of social management as a management of social development, since for the author it is about the transition between past models and new forms committed to local development utopias. Gondim, Fischer and Melo (2006) emphasize the importance of articulation of leadership, effectiveness and social efficiency in discussing how this development should be carried out. Social management would then be about social mediations carried out by individuals (managers) and their organizations. For the authors, multiple forms of power are exercised at different scales, in the complex construction of development programs and actions that occur in territorial and virtual spaces. Thus, the challenge that demands the competence of the social manager is to reconcile the diverse interests (Gondim, Fischer & Melo, 2006). In summary, these authors understand as social management: “a relational act capable of directing and regulating processes through the wide mobilization of actors in decision making, resulting in intra and interorganizational partnerships, valuing decentralized and participatory structures, the balance between instrumental rationality and substantive rationality, in order to at last achieve a collectively planned, viable and sustainable good in the medium and long term” (Gondim, Fischer & Melo, 2006, p. 4).

Faced with so many approaches to the concept of social management Pimentel and Pimentel (2010) selected nine categories of analysis, namely: (1). objective; (2) value; (3) rationality; (4) protagonist; (5) communication; (6) decision-making process; (7) operation; (8) sphere of action; and (9) autonomy / power. The aim of the authors was to identify points of conceptual encounter and disagreement among theorists. From the analysis undertaken, the authors synthesize the discussion listing seven principles or theoretical foundations of social management:

P1: Social management has as objective the collective interest of public character;

P2: The value orientation of social management is the well-understood public interest;

P3: Social management must subordinate instrumental logic to a deliberative decision-making process, based on substantive rationality;

P4: Social management has as its protagonist the organized civil society, but it involves all the social, organizational and institutional actors of a given public space;

P5: Social management is a participatory, dialogical, consensual process;

P6: Social management is materialized by the collective deliberation reached by the possible consensus generated by the free argumentation;

P7: Intersectoral partnerships and networks, both practical and knowledge, in forming a public sphere, are ways of thinking and operationalizing social management.

Quadro 1. Tipos de gestão e suas características

Categorias de Análise	Gestão Estratégica	Gestão Pública	Gestão Social
Objetivo	Lucro	Interesse Público	Interesse Coletivo de Conflito Público
Valor	Competição	Normativo	Cooperação Intra e Interorganizacional
Racionalidade	Instrumental	Burocrática	Substantiva/comunicativa
Protagonistas	Mercado	Estado	Sociedade Civil Organizada
Comunicação	Monológica, vertical, com restrição ao direito de fala	Monológica/Dialogica, vertical com algumas horizontalidades, em tese sem restrição à fala	Dialogica, com pouca ou nenhuma restrição ao direito de fala
Processo decisório	Centralizado/ top down	Centralizado com possibilidade de participação (bottom up)	Descentralizado, emergente e participativo/surge como construção coletiva
Operacionalização	Estratégica, com foco em indicadores financeiros	Estratégica, com foco em indicadores sociais	Social, com foco em indicadores qualitativos e quantitativos
Esfera de atuação	Privada	Pública Estatal	Pública Social (França Filho) x qualquer esfera (Tenório; Dowbor)
Autonomia e poder	Há diferentes graus de coerção e submissão entre os atores envolvidos	Há coerção normativa entre os atores envolvidos	Não há coerção, todos têm iguais condições de participação (Tenório) x As relações de poder restringem a capacidade de cada um se posicionar no debate (Fischer et al; Gondim, Fischer e Melo)

Fonte: Pimentel e Pimentel (2010, p. 9-10).

The categories of sphere and *autonomy / power* analysis presented conceptual differences and were therefore considered as limitations of the field. With regard to the sphere of action of social management, França Filho (2008) it would be the non-state public sphere, more precisely, social management would belong to civil society organizations. For the other authors analyzed, however, it can occur in any type of social system, depending on the degree of participation, dialogue and deliberation involved.

Another point of divergence concerns rational consensus. Tenório considers that the space of social management is

the space of social relations where everyone has the right to speak without coercion. On the other hand, authors like Godim, Fischer and Melo (2006) recognize and include the dimension of power in their analyzes of social management, considering this space in a more plural, complex and difficult way of working, since one must try to take into account the often antagonistic interests of the various stakeholders.

4. WHAT CATEGORIES OF SPATIAL ANALYSIS? WHAT KIND OF MANAGEMENT?

The table 2 summarizes a set of spatial categories from 3 questions: (1) the levels of social reality analysis: micro, even and macro; (2) the polarities of a triesthetic relationship marked by shape, content and intersection; and (3) the general properties or tendencies emanating from its ontic structure, fixation, embodiment (incorporation for the constitution of corporeal objects), and twisting.

Table 2: Catalog of spatial categories

Scales / Levels Polarities	Micro	Meso	Macro
Shape	1) The exclusivity of space	Space practices	Position
	(2) The irreducibility of space		
	(3) Constraints of the form of space on its contents		
Content	(4) The outer relation of space, as a material structure, on the other phenomena manifested through an ideal or social reality	The representations of space	Capitals
In between	(5) The configuration of space and its influence on social structures (social reality) of humanity, via overflowing	Representational space	Field / System
Propeties	(1) Its property of fixation (“frame”) of other things (objects or substances) of / in reality and its consequent effect of framing; (2) <i>embodiment</i> , derived from the space-time dimension (absolute in human life) (3) The deformation of the space-time structure (alteration of the behavior of space according to the properties of artefactual reality objects): torsion and tensioning (stretching or compression) and, consequently, altering the effects of its properties on other entities;		

Note: color – implications of spatial structure predominantly for strategic management. color – implications of spatial structure predominantly for social management.

Both – sobreposition.

Source: proper elaboration

While the forms of strategic management seem to privilege the elements of spatial analysis related mainly to the form of the spatial structure, the forms of social management tend to privilege the elements related to its content. The topics of spatial analysis from the point of view of strategic management focus, for example, (1) the location of activities or space as a variable of organizational design, (2) the strategic management of space and distances, and (3) the territory as a form of space organization. In all these cases the key variable relates to the exclusivity of space in the case of organizational design; with the irreducibility (and contiguity) of space, in the case of the management of space and distances; and with the form of space and its influence on its contents, in the case of the territory as a modality of space organization.

On the other hand, what can be perceived in the case of social management is a double insertion of the spatial dimension, or a sphere (understood as locus) of social management practices or a metonymy of the social group to which it covers. In the first sense, the type of space varies and what is at stake is the form of (types of practices) occurring anywhere (space), including apparently non-deliberative, in terms of citizenship, as is the case of private companies. In the second sense, a kind of communitarianism is demanded, where the attachment to a specific territory is necessary. In both cases the question of space as a reference in terms of content seems to overlap the logic of the functioning aspects of its form.

Recovering the analysis of social interaction mediated by space made by Simmel (2009[1908]), this author presents an important argument for our analysis here concerning the differentiation between the emergence of social groups intrinsically linked to space, such as the State (whose physical element necessary to its conception is the territory) and those that do not require a link specific to the physical space (but only abstractly refer to it), as is the case of the church, in the same way, when analyzing social management, initially tends to analyze it to a position of attachment to space, such as the state, being this space dominated by the logic of affectivity. However, this analysis is not so simple, since the conceptions about the concept of social management vary, thus modifying the possibilities of its relationship with space. If, for example, for França Filho, social management is a form of public management and therefore encompasses or can encompass all the individuals belonging to that sphere, for Tenório what is at stake is the possibility of exercising deliberative citizenship. Thus, if on the one hand we have a linkage to the form, on the other, this does not become important insofar as any form that possesses the content of the deliberative exercise (including in a private enterprise).

But perhaps from the point of view of interactional sociology the question of intermedium, and its overflowing effect, is the main element for thinking about social management and its relation to space, since it is from the constitution of this space of transition between two contiguities that generates the sphere of free public domain.

When we move our analysis to the mesosociological level, we can basically identify a distinction between spatial practices, which operate at the level of how space is used. On the other hand, the representations of space, elaborated by social groups, bring us information about the symbolic elements of space and the content that it allows to link and communicate functioning as a means of culture and communication. Already the representational space informs us specifically with the individual or the social groups perceive their subjective experience in relation to the space in which they are inserted. Thus, while space practices can be associated with a more strategic view of space, because in any circumstance depends on the exclusivist form of appropriation and use of space, in terms of flows and fixed; representations of space and representational space concern symbolic-affective elements and issues - reinforcing the emergence logic of groups bound to space, as pointed out by Simmel - where elements of social management gain strength since there is no exclusivity in terms of sharing such representations, not even in individual trials, since they are culturally shaped.

Finally, on the macro level, while the position that an actor occupies in space is something unique and exclusive (from there to strategies to gain market share, for example), in terms of content, the spatial structure harbors resources that are found unequally dispersed and can be seen as resources or capital. Although they may be individually and exclusively appropriated, their value is external and dialogically defined by the relationship with other agents, which therefore gives us a substantive feature in terms of content. In turn, the very notion of field (or system) can be seen as a space of social relations filled by agents and marked by the distances of the relations that maintain between them.

5. FINAL CONSIDERATIONS

In summary, the objective of this paper is to present a discussion about the concepts of social space and management situation, trying to outline its consequences in the strategic management and social management area. It is believed that we succeeded in this process by identifying, summarizing and to point out how some of the main features and properties of space, as an ontic structure of reality, have refutations about management, as a form of collective action, and particularly about specific forms of management.

In presenting an initial mapping of the ways in which the space category appears in the form of specific concepts in social theory, it was attempted to broaden theoretical knowledge and its implications, with which the space category is managed - albeit sparingly - in management. In addition, by understanding better how the use - conscious or not, tacit or explicit - of this category can have theoretical and practical developments, scholars and managers can from there use more consciously and skillfully the use not only of the theoretical term but also glimpse its practical applications, thus allowing a deepening of theorization about management, both strategic and social.

Particularly in the context of social management, consideration of the space category is still an unresolved issue, as pointed out by Pimentel *et al.* (2010), which helps us to move towards a better delimitation of the notion of "sphere" (or space) of application of social management.

If, on the one hand, this paper brings a potentially original proposition, since the studies on space in the scope of management are still little developed, on the other hand, it is affirmed here the propaedeutic and seminal character of this study, whose virtue may be very, but rather, to stimulate and open a broader debate than to determine the exact contours of the subject. Thus, it is suggested that more studies are necessary, both theoretically and empirically, in order to drop and deepen the debate proposed here.

ABSTRACT

This article analyses the educational offer in tourism (EOT) in Argentina, as well as the formal structures of research in tourism (FSRT), that are associated to the country's higher education institutions (HEI). The aim is to correlate the teaching and production of knowledge in tourism. A review was carried out on the sociology of education applied to tourism. The research was based on a survey of all the tourism programs in the country among the higher education institutions. It was identified 177 observations composing the educational offer, divided into categories like initial education (technical and undergraduate) and post-graduation education (specialization, MBA, master, doctorate). The EOT is linked to 61 HEI in the country (46.92% of the total of HEIs), that are linked to departments in 155 cases. Additionally, we have identified that 38 OET have a specific focus or emphasis, e.g. MBA in hospitality. The EOT core is formed by the thematic areas like "General tourism" and "Economy and management". Connected to the HEI's were found 9 FSRT, and 8 Regular Academic Journals specialized in tourism. As conclusion, there is a strong asymmetry between EOT and FSRT, apart from the internal discrepancies in the EOT, as the preponderance of Initial Education programs (82.38% of the total). The absence of a more pluralistic EOT, especially in the cross-sectional areas (as in social sciences), explain the difficulty to constitute FSRT, which tend to (or should give) feedback the system, generating more qualification and specificity the academic field of tourism.

Keywords: Sociology of Education, Tourism, Education Offer, Argentina.

1. INTRODUCTION

This article analyses the educational offer in tourism (EOT) in Argentina, as well as the formal structures of research in tourism (FSRT), that are linked to the country's higher education institutions (HEI). The aim is to correlate the teaching and production of knowledge in tourism from the standpoint of the sociology of education applied to tourism.

A panoramic retrospective of the sociology of education allows to identify three perspectives of analysis of the educational field (Young, 2000). The first, the functionalist version, highlights the search for establishing regularities, providing cognitive training and taking care of educational planning, as a technical tool. The second, the empiricist perspective, is concerned with assessments, measurements, comparisons, indexes, examinations, and skills development, so fashionable in the conduct of public policy today. And a third perspective, the critical one, accompanied the development of social tensions and demands, as well as the arising social relations.

This new sociology understands the school (in its different types of educational establishments) in a different way, criticizes the objectives, the curriculum, the teaching methods, and the barriers between the ways of knowing. In view of these approaches, it is questioned how tourism education has been discussed, what are the current issues, and what new issues are needed, taking the Argentine case for analysis. In particular, we will seek, from a paradigm distinct from the three approaches mentioned: the critical realism.

This philosophy for science specifically develops a deeper account, rooted in an intransitive (ontic) and transitive (epistemic) dimension of reality, simultaneously and inseparably, but necessarily in this way, that is, the ontological dimension is, ultimately, the basis upon which our cognitive capacity derives from the world. It follows that the task of science is to seek to identify and discover the *modus operandi* of the causal powers (or tendencies) inherent in the intrinsic structure of each object (material, ideal, social or artificial) of reality. So reality is not understood in a *monoplanar sense*, but rather this in a stratified one, from which each class of objects emerges, which, in turn, circumscribes general properties (of that level) specific to it, as well as a specific conjuncture and the mechanisms necessary for its activation.

As we start from this paradigmatic perspective, we want to emphasize that our focus is not specifically on any of the aforementioned approaches, but instead we will observe elements of the different approaches (such as "functions" derived from the intrinsic properties of each object, "empirical elements" as the morphological manifestation of that object and

“critics” such as the teleological discussion about the social role and the possibilities of change and emancipation provided by this type of social structure (“school”, educational system or more specifically the educational subsystem of tourism circumscribed in a given space-time reality - national, regional and local).

Thus, with regard to the question that guides this study: *what is the current state of the national subsystem of higher education in tourism and the constraints derived from its current structure?* – we are led to make a morphological analysis of the national subsystem of higher education in tourism (general objective) and the constraints generated by this structure. Specifically, this paper aims to: 1. To track the historical evolution of the broader educational system, in which the subsystem in question is inserted; 2. To identify the main structuring elements (components) of the subsystem on screen - a) educational offer, in its different levels, types and thematic areas, b) geographical and institutional location of this offer, c) existence of own scientific production and diffusion structures; 3. To analyse the characteristics of the structure of this system, its inherent constraints and the trends derived from this particular configuration (and the causal and contextual mechanisms that trigger the reproduction or transformation of this structure).

2. LITERATURE REVIEW

2.1 Sociology of Education

Throughout the twentieth century many theorists focused on the field of education and broadened the field of studies and research in the sociology of education. Hence, there are several approaches, including the positivist, Marxist, structuralism, critical, and postmodern currents (Gohn, 2012).

The Sociology of Education began in France, around 1870, to study the role of official educational institutions, the role of the teaching group, the strength of tradition, and educational changes (Gohn, 2012). Émile Durkheim, one of the founders of sociology and sociology of education, constructs his reflection showing the socializing nature of the school, as a privileged institution for the insertion of the modern individual in the public space. In proposing sociology in the field of education, Durkheim (2002) argued that education meant the same as socialization and aimed to form the social being.

According to this perspective, later, Norbert Elias (1993) will contribute to the debate when addressing the formation of the human being and elaborate several arguments for a theory of the process of civilization. This process takes place through social relations of interdependence between people, is neither homogeneous nor rectilinear, but is a long, slow process that may have advances, but also setbacks. From this perspective, one can ask what advances have been made in tourism education, and what obstacles or setbacks have plagued this educational area.

Weber, who attributes to the State a role of agent of rationalization of society and mediation of conflicts between social groups, understands education as a provider of symbolic codes through school-socialization processes. On behalf of Weber, education is a way of preparing for social life, but it contributes to maintaining a situation of domination of one group over others. Thus, education contributes to privileged social classes and to social stratification (Silva, 2008).

Going back to Weber's aspects of cultural goods, Pierre Bourdieu (1998) relates them to the theory of power and forms of domination, as well as to the formation of cultural capital in individuals' lives, and also articulates them with Durkheim within a vision of reproduction of the social order. In the field of sociology of education, Bourdieu will be from 1970 onwards one of the most influential theorists in the analysis of the educational system, in several parts of the world.

Also the Marxist current influenced the sociology of education. Karl Marx placed education in the field of social relations, within a society divided into social classes, acting in the maintenance of class domination. In the Marxist approach, after 1950, Louis Althusser had a great influence on studies of school systems, relating ideology and education to a structural view. The school is analysed as one of the main ideological apparatuses of the state, spreading ideologies of acceptance of existing forms of domination, mere reproducer of a social order given by the place that the individuals occupy in the system of production (Althusser, 1985). It would be derived from this, for example, the question of what are the objectives of the States in relation to education in tourism, how they structure the supply and, thus, what can be expected from the training in tourism available in the countries.

Habermas, in the tradition of the Frankfurtian school, takes up the question of the role of education in contemporary society from two themes: the formation of individuals' identities and their capacity to act. Affirms that identities are formed in social relations. They depend on the interactions of individuals as having physical, affective, sexual, cultural, ethnic, etc. characteristics. The construction of these identities depends on learning processes of norms and values and the capacity of reflection of the individuals in the life in society. Hence, reflective processes are fundamental, and Habermas advocates that the school curriculum must attend to this point, failing to prioritize the knowledge legitimized by custom and tradition, stimulating the knowledge generated through reflexive processes, where there is dialogue based on free argumentation (Habermas, 1987).

In short, the sociology of education as established by the cited works and others revolves around the role of Education in the production and reproduction of society. This great theme, in turn, unfolds in the themes of the role of ideology in this process, the nature of the capitalist state and its central participation in the institutionalization and continuation of an educational system that maintains a close relationship with the demands of capitalist production, of the decisive contribution of the organization of the distribution of scholarly knowledge in the process of constructing educational inequalities, of the close relationship between the processes of cultural reproduction and social reproduction, of the school's contribution to the reproduction of the social division of labour. Historically, sociology of education gains new subjects, such as the participation of the educational community, school culture, democratic management, violence and inclusion (school, social, racial, gender, digital).

2.2 Sociology of Tourism Education

The evolution of tourism led to the development of a matrix of research topics to understand and explain the various aspects related to this phenomenon (Airey and Tribe, 2005; Tribe, 2010; Jimenez, 2012; Campodónico & Chalar, 2014).

In order to develop the basic competences necessary for work in the hospitality, hotel management and other tourist business areas, tourism higher education began in technical / vocational schools (Butler, 1999; Morgan, 2004; Inui, Wheeler & Lankford, 2006). On the other hand, the creation of the chair of tourism in the University of Rome, in 1925, is a framework of the theoretical studies of the tourism (Barretto, 1995). Also, according to Barretto (1995) the first institute dedicated to the study of tourism was established in the School of Economics of Berlin in 1929. In Latin America the high educational offer in tourism began in Brazil in 1971, at Anhembi Morumbi University (Dencker, 2006).

According to Busby (2001) and also Inui, Wheeler and Lankford (2006), two approaches are highlighted in the debate on the academic offer in tourism: the vocational, business oriented, and academic oriented towards investigation. Still, Belhassen and Caton (2011) point out that in tourism studies the vocational curriculum has been highlighted in relation to educational orientation based on the social sciences with characteristics in the critical production of tourism knowledge.

In this context, Tribe (1997) argued that tourism knowledge is organized between extradisciplinary disciplines, interdisciplinary disciplines and established disciplines. According to him, the extradisciplinary disciplines would be those that refer, for example, to customer service; the aspect of interdisciplinarity that corresponds to environmental studies, marketing, etc.; while the established disciplines would be those traditional and basic, such as economics, anthropology, among others.

These elements, in different combinations, are basis for the formation of the educational offer in tourism. On this subject, Airey (2008: 44) argues that:

The offer of tourism programs continues to be strongly oriented from the professional to the business [...] However, if it is to become a truly independent area of study, its knowledge base must go beyond extradisciplinary. The risks to tourism education go in two directions: the first is that it is closely connected with professional practice and, therefore, offer little more than a reflection on the world of work. The second is to turn his back on his connections with industry, putting at risk one of his main *raison d'être*.

By observing overseas tourism careers, it is evident that the development of research takes place in developed countries such as North America, since according to Hudson (2005), these receive great support in tourism education, which Promotes the development of research on this topic. However, comparing North America with Latin America, Leal and Padilha (2008) show that the latter is in the early stages of tourism studies. Still, this first stage is not limited to the lack of research on the subject, which, little by little, manages to obtain its space, through journals such as *Studies and Perspectives in Tourism* (Argentina); *Tourism: Vision and Action* (Brazil), among others; but also applies to the skills of the workforce.

Another factor of institutionalization and maturity of the degree of production of knowledge in tourism is the existence of formal structures dedicated to research on the subject (Pimentel, 2016a, b), which converts maturity of the field as an area of study in its own 40 years (Airey, 2015). In general, knowledge is produced in universities, research centers or other organizations responsible for perpetuating the discovery of new techniques, innovative strategies and making comparisons of theory with practice. Research fosters epistemological and methodological curiosity, which leads to a critical stance on its research object, and hence the motivation to interfere with reality (Freire, 1996). In order to increase knowledge in the field of tourism, joint work between research structures, universities and the government sphere is essential.

Tribe (2002) proposes that industry and society should be included in tourism programs. On the other hand, “tourism education should provide a learning experience for students that will enable them to work dynamically, sustainably and effectively, in line with the rapid evolution of the sector” (Liburd and Hjalager, 2010: 13). In the knowledge society, epistemological and sociocultural discrimination generates meaning, in a way that affects the nature of knowledge in education (Petrova, Smokotin, Kornienko, Ershova & Kachalov, 2015). Therefore, there is a clear need for new ways of providing and expanding the capacity to build knowledge, through education related to the tourism industry (Airey, 2008).

The integration of research structures can be a way of generating data, relevant information and new technologies for the tourism industry, which contributes to the development of the sector in several countries, not only in the economic sense, but also in terms of integrated strategies for human development and democratic participation on interventions in tourist destinations. In this sense, the academic sub-field of tourism (that destined to deal with the production of tourist knowledge) becomes a key axis in the process of institutionalization and legitimation of the tourism field as a whole.

3. METHODOLOGY

This research is based on a quantitative-qualitative methodology. Firstly, was carried out a survey of all the tourism programs in the country among the higher education institutions of Argentina. The universe was constituted by all 130 Higher Education Institutions (HEIs) registered in the Ministry of Education of Argentina website¹. The data was collected between June and July 2015, and revised in October 2015.

To demarcate the sample, the website of the 130 existing IES previously identified was accessed, with the objective of verifying if those institutions had an Educational Offer in Tourism (EOT). The sample, which was the basis for the collection

¹ Argentina (2015). Buscador de títulos oficiales por el Ministerio de Educación de la Nación. Accessed in 13th of April 2015, in the website <http://titulosoficiales.siu.edu.ar/>. The complete list of the universities found, according to data from the Ministry of Education of this country, can be accessed on Pimentel (2016a).

of empirical research, was based on the procedure developed by Pimentel and De Paula (2014)² which was constituted by two parts: the first refers to a matrix based on the central categories of research for the positioning of HEIs in the tourism field; the second was a classification matrix to codify the textual information (qualitative), compiled from the websites, in quantitative variables.

In the first part of the protocol, the categories used were:

- 1) The identification of EOT in its different levels of undergraduate and postgraduate³;
- 2) The classification of EOT in thematic areas and study emphases⁴;
- 3) The identification of the institutional position of the EOT;
- 4) The identification of Formal Structures of Research in Tourism (FSRT) connected to HEIs with EOT and its thematic areas;
- 5) The identification of existence of scientific publications related to HEIs and their thematic areas.

In the second part of the protocol, attention has been devoted to the thematic classification of the work axes in tourism, which was based on a broad review of the international literature, which generated Table 1.

Table 1 - Thematic areas for ad hoc grouping and classification of research data

Area	Area Description
1) Human and Social Sciences	Anthropology, sociology, applied sciences, education and studies on the impact of tourism relations on humanity.
2) Economics & Management	Administration, business management, production, strategic management, organizational development, marketing.
3) Entertainment & Leisure	Leisure and entertainment activities, free time, therapeutic recreation, recreation in parks.
4) Health Sciences	Quality of life, aging issues and sports activities related to tourism.
5) Events	Production of small, medium and large events that take place in any area.
6) Gastronomy	Management and organization of restaurants, A & B (food and beverage), gastronomic space, hotels and gastronomy, enotourism.
7) Hospitality	Hospitality in vacation and business. Hotel branch, hotel market strategies.
8) Patrimony	Assessment of culture, protection of cultural property – tangible and intangible. Any relationship between tourism and culture that generates recognition and appreciation of cultural elements.
9) Tourism Planning	Process of tourism planning, development of plans and projects, their execution, elaboration of sectoral plans (for the segments, companies and tourist attractions) and public policy of tourism.
10) Alternative tourism and environment	Environmental protection, environmental impacts, sustainability, tourism management with emphasis on the environment and environment; protected areas (parks, reserves, etc.) and their management, local development and local community, community-based tourism, adventure tourism, rural tourism.
11) Tourist Service	General services and tour guides.
12) Travel and tourism	Tourism agencies, sales and tourism
13) Transports	Touristic transport in general – trains, ferries, etc.
14) International tourism	International tourism, global tourism
15) General Tourism	Courses or programs that do not clearly state a thematic area.
16) Other	What could not fit into the previous categories (Innovation, casinos, e-tourism, TICs and tourism, etc.)

Source: adapted from Pimentel (2016a)

In this phase for the quantitative analysis procedure the data collected were classified, ordered and coded according to the technique of Content Analysis (Bardin, 1977), according to the protocol developed by Pimentel and De Paula (2014).

In addition, the focus was to identify the existence of the Formal Structures of Research in Tourism (FSRT)⁵ – that is, formal, collective, permanent and institutionalized structures – connected to HEIs, and therefore that represent continuous structures. Temporary, informal and generally individual projects or actions, carried out spontaneously or voluntarily by a researcher, and which does not necessarily find support, as a programmed and formal IES initiative were disregarded in this study.

As restriction of the study, it should be mentioned that, because all the data have been collected through secondary

² This research presents part of the data of a comparative research - between the countries: Argentina, Australia, Brazil, Canada, Chile, China, Colombia, Cuba, Egypt, Ecuador, Spain, the United States, France, Greece, Italy, Japan, Mexico, New Zealand, Paraguay, Portugal, United Kingdom, Uruguay, Venezuela -, carried out in the period from 2013 to 2015, on the effects of the characteristics of the Educational Offer in Tourism in the vocational training of touristologists, linked to the impact of Existence of Formal Structures of Research in Tourism and of Scientific Journal and linked to HEIs (cf. Pimentel, 2016a). For further information, see Pimentel, T. D. y De Paula, S. C. (2014). Desenvolvimento de um protocolo de avaliação do desempenho de recursos humanos em instituições de ensino superior/IES: notas para a gestão acadêmica a partir do caso do Curso de Turismo/UFJF - Brasil. Revista Gestão Universitária na América Latina - GUAL, 7, 243-265.

³ In the EOT we have included all sort of programs, for example: undergraduate, bachelor, graduate, MBAs, master and PhD (for further information, see Pimentel y De Paula, 2014; Pimentel, 2016a).

⁴ Thematic areas are designed by Pimentel and De Paula, 2014: Social Sciences, Economics and Management, Education, Entertainment/Leisure, Sports, Events, Gastronomy, Geography, Hospitality, Cultural Heritage, Tourism Planning, Natural Resources (Environment), Tourism Service, General Tourism and Others.

⁵ For the purposes of this research, which is to identify perennial and institutionalized structures, we take as synonyms the expressions - nuclei, groups, observatories or research centers - designated by the name, in general, of Formal Structures of Tourism Research (FSRT) (Pimentel, 2016a).

sources, that is, the websites of HEIs, it has been assumed that the existing incomplete or outdated information, which is the responsibility of the IES, does not invalidate the research.

4. RESULTS

The data were systematized and presented in the sections: mapping of HEIs; educational offer in Tourism; institutional position of the educational offer; formal research structures and scientific journals.

4.1 Mapping of Higher Education Institutions in Argentina and the educational offer in tourism

The objective of this category was to identify and relate the existing higher education institutions of Argentina with the institutions that offer some type of training in tourism, in order to delimit the sample used in the empirical research, which was stratified in the other categories, evidencing, at the end the profile of the educational offer in tourism in the country.

In Argentina, 130 Higher Education Institutions (HEIs) were identified – 105 universities and 25 non-universities⁶. Regarding to the nature of these institutions 66 (50.77%) were public and 64 (49.23%) were private institutions. It was identified a sample of 61 (46.92%) HEIs that offer some kind of education training in tourism⁷, that represents an overall offer of 177 cases. Particularly, 59 (96.72%) of these HEIs are Universities while 2 (3.27%) are Non-Universities (Table 1).

In the sample of 61 IES (46.92% of HEIs in this country), 59 (96.72%) compose the University category and 2 (3.27%) are Non-Universities (institutions named as a centre and a school). Moreover, the sample of institutions with educational offer in tourism is composed of 31 (50.81%) HEIs of public nature, while 46 (75.40%) are institutions of private nature. Considering the total educational offer, the sample is distributed in 77 (43.50%) observations related to HEI of a public nature and 100 (56.49%) cases related to HEIs of a private nature (figure 1).

Table 1 - Type of Institution of Higher Education with Educational Offer in Tourism * Indicator of each first case paired as Principal – Cross tabulation

Count		Indicator of each first case paired as Main		Total
		Duplicate case	Main case	
Type of Institution of Higher Education with Educational Offer in Tourism	Centre	10	1	11

	University	101	59	160
Total		116	61	177

N=177

Source: own elaboration based on the data of the investigation

Figure 1 - Nature of the institution of higher education with education offer in tourism

Source: own elaboration based on the data of the investigation.

⁶ Due to the assumption that universities concentrate the majority of research and knowledge production, in general, and in tourism, in particular, this analytical category was prioritized, where universities have assumed centrality in research, in relation to other types of higher education institutions (HEI). However, it is not excluded that other types of HEI, which were also considered (see Table 01), since in a future context of the research the residues of this category can be exploited, including the contribution to deepen the results of this study.

⁷ Due to the extensive nature of the survey, we also identify and discriminate in this research, as exhaustively and meticulously as possible, the courses offered according to the level (strictu et latu sensu) and the modality (eg, technical, bachelors, specialization, masters and PhD).

4.1.1 Spatial Distribution of the Educational Offer in Tourism

It is noteworthy that the HEIs are unequally distributed throughout the Argentinian territory, most of them concentrated in the central region of the country, extending through an extensive strip that cuts from the east west, from the province of Buenos Aires - where it is most concentrated, with about half of all universities - to the east, through the provinces of Entre Rios, Santa Fe, Cordoba, La Rioja, San Luis, Mendoza and San Juan, in the west of the country, on the border with Chile. It is important to emphasize that as the distance from the 30° parallel, that is, outside the aforementioned range, both to the north and the south of the country there is a diffusion of the HEIs, which seems to follow the population distribution of the country.

Specifically, it is possible to identify three areas of concentration, respectively according to the density of its concentration: 1) one in the capital, Buenos Aires, and its metropolitan region; 2) in the central region of the country, between Córdoba, Santa Fe and San Luis; and 3) in the Cordillera de los Andes region (mid-west to north), from Mendoza to Jujuy.

4.2 Characteristics of the Educational Offer in Tourism in Argentina

4.2.1 The institutional position of the tourism educational offer

In this category, it was identified what type of organizational structure of the HEI - an institute, faculty, school or department - is connected the educational offer in tourism. The objective is to verify if there is a relationship, direct or indirect, of this association to a thematic area and the type/emphasis of the educational training offered.

Thus, according to the distribution in thematic areas, it was observed that of the 177 observations, the connection to a specific unit of their organizational structure is evidenced in 155 cases (87.57%) – 9.6% no-university type of IES and 90.4% in university type of IES. The areas of Economics and Management (31.07%), Human & Social Sciences (18.08%), General Tourism (12.99%) concentrates the thematic areas of the organization structure. On the other hand, 14.12% of the observations do not have a thematic area of the organization structure (table 2).

Table 2 - Type of IES_aggregated * Thematic area of the organizational link aggregate – Cross tabulation

Count				
		Type of IES_aggregate *		Total
		Non-university	University	
Thematic area of the organizational link aggregate	No theme	0,00%	14,12%	14,12%

N=177

* Data converted to percentages from the original data.

Source: own elaboration based on the data of the investigation

Considering the nature of the Institution of Higher Education the cases that compose the sample are characterized by balanced distribution among the Organizational Structure that is linked to the Educational Offer in Tourism (Figure 2).

Figure 2 - Nature of the Institution of Higher Education with Educational Offer in Tourism * Type of Organizational Structure that is linked to the Educational Offer in Tourism Cross tabulation

Source: own elaboration based on the data of the investigation

Next to the characterization of HEIs are presented the data referring to the characteristics of the *Educational Offer in Tourism – EOT*, that was classified by its levels and modalities.

In the level of the EOT (technical (vocational) + undergraduate) has been identified the existence of 155 cases, which represents 87.57% of the total offer, 146 (82.48%) in face-to-face modality and 9 (5.08%) in online modality, 72 (40.67%) in the IES-type university, 6 (3.38%) in non-university institution.

In the category master courses, 6 (3.38% of the total offer in the country) cases were identified, 5 of them are of presencial attendance and 1 online, all offered in university-type HEI.

Regarding the level of specialization, 8 (4.51%) cases were identified, 6 (3.38%) in presencial mode and 2 (1.12%) in online mode, 7 (3.95%) in university-type HEIs, 1 (0.56%) in non-university institution. At the MBA level, 1 (0.56%) case was observed, in face-to-face mode and in university-type HEI.

In addition, in the category of complementary training, 7 (3.95%) cases were registered - representing 3.95% of the sample cases - all in face-to-face; 2 (1.12%) in IES of the university type and 5 (2.82%) non-university.

In table 3 is presented the data according the type of IES in relation to the level of training, both considering aggregated variables.

Table 3 - Type of IES_aggregate * Level of trainingaggregate: technical (vocational) + undergraduate, specialization + MBA, master's, doctorate and extension activities – Cross tabulation

Count		Level of training_aggregate: technical (vocational) + undergraduate, specialization + MBA, master's, doctorate and extension activities				Total
		specialization + MBA	extension activities	technical (vocational) + undergraduate	master

	University	8	2	144	6	160
Total		9	7	155	6	177

N=177

Source: own elaboration based on the data of the investigation

Finally, the characterization of the EOT of Argentina is presented in relation to the thematic areas of the study programs identified in the set of 177 cases (table 4).

Table 4 – Level of training aggregate: technical (vocational) + undergraduate, specialization + MBA, master's, doctorate and extension activities * Main subject area of the educational offer in tourism Cross tabulation

Count		Level of training_aggregate: technical (vocational) + undergraduate, specialization + MBA, master's, doctorate and extension activities				Total
		specialization + MBA	extension activities	technical (vocational) + undergraduate	master	
The main thematic area of the educational offer in tourism	Events	0,00%	0,00%	2,82%	0,00%	2,82%
	Health Sciences	0,00%	0,00%	0,56%	0,00%	0,56%
	Others	0,00%	0,56%	0,00%	0,00%	0,56%
	Economy & management	1,69%	0,56%	19,77%	1,69%	23,73%
	Gastronomy	0,00%	0,00%	2,26%	0,00%	2,26%
	Tourist services	0,00%	2,26%	6,78%	0,00%	9,04%
	Hospitality	0,56%	0,00%	11,30%	0,00%	11,86%
	Patrimony	0,00%	0,56%	0,00%	0,00%	0,56%
	Tourist planning	0,56%	0,00%	2,82%	1,13%	4,52%
	General tourism	0,00%	0,00%	37,85%	0,00%	37,85%
	Alternative tourism	2,26%	0,00%	2,26%	0,56%	5,08%
	Travel and tourism	0,00%	0,00%	1,13%	0,00%	1,13%
Total		5,08%	3,95%	87,57%	3,39%	100,00%

N=177

* Data converted to percentages from the original data.

Source: own elaboration based on the data of the investigation

In the 155 cases identified at technical (vocational) + undergraduate level (that represents 87,57% of the sample), 37.85% cases were notorious in the General Tourism area, 19.77% in Economics & Management, 11.3% in Hospitality, 6.78% in Tourism Services, 2.82% in Events, 2.82% in Tourism Planning, 2.26% in Gastronomy, 2.26% in Alternative Tourism, 1.13% in Travel and Tourism and 0.56% in Health Sciences.

Amongst the 9 cases of EOT of specialization + MBA level, 2.26% are in Alternative Tourism, 1.69% were identified in Economics & Management, 0.56% in Hospitality and 0.56% in Tourism Planning. In the 7 cases of EOT in extension activities 2.26% were in Tourism Services, 0.56% in Economy & Management, 0.56% in Patrimony and 0.56% in other subjects.

In the 6 EOT cases of master courses level, 1.69% were in Economics & Management, 1.13% in tourism planning and 0.56% in Alternative Tourism.

4.2.2 Thematic Areas of the emphasis of the EOT

After identifying the number of institutions of higher education that have educational offer in tourism in Argentina, the total supply - in the different levels and modalities - and the institutional position relation that they have in their HEIs, was then verified if the education offer has specific characteristics or emphasis. For example, if a bachelor's degree in tourism management has a general approach or if it has some specific orientation, as in the case of a bachelor's degree in management of natural spaces. This characterization is based on the possibility of correlating the offer to the thematic fields and their specialties, that have an impact on tourism training.

The predominant emphasis of the EOT is Hospitality (11.3%), followed by Economy & management (2.3%) and Gastronomy (1.1%). On the other hand, in 78.5% of the observations do not have any emphasis; while in 5.8% emphasis are combined into at least two areas (table 5).

Table 5 - Aggregated emphases

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Economy & management	4	2,3	2,3	2,3
	Hospitality	20	11,3	11,3	13,6
	Gastronomy	2	1,1	1,1	14,7
	Tourism services	1	,6	,6	15,3
	Health Sciences	1	,6	,6	15,8
	Tourist transport*	1	,6	,6	16,4

N=177

*Combinations with just one case were not aggregated so as to be possible comparison with other countries.

Source: own elaboration based on the data of the investigation

4.3 Existence of a Formal Structure Dedicated to Research in Tourism

Starting from questions about: 1) HEIs offering tourism courses are only dedicated to teaching; or 2) if they produce some kind of knowledge (research) in tourism and, in this case, if they produce research, this is institutionalized / formalized in the university; it was sought to raise the existence of research structures, in an institutional way in the institutions (HEI), assuming as premise the fact that this would denote a more advanced stage in terms of collaboration (networks among researchers internal to the HEI itself or between national HEIs and even foreign) and the production of scientific research, as the role of the institution on the national scene and its own recognition by the other actors in the field.

Thus, within this category, we sought to identify: a) which are the thematic areas of the research structures and which thematic areas of the courses offered; and b) if there is any relation between the production of knowledge in tourism and its dissemination through teaching, in the institution itself.

It was possible to identify the existence of 9 Formal Structures of Research in Tourism, with varied themes, which were concentrated in only 6 universities of the group of the 61 institutions analysed with some educational offer in tourism. According to our classification - described in the methodology - from these research structures 5 of them have as central theme the focus in the area of "Economy and Management", 2 has as its central axis the theme of "Tourism Planning" and 2 with the theme of General Tourism (table 6).

Table 6 - Distribution of Research Structures, by associated universities and thematic area

Thematic area	Institution	Name of the FSRT	Type (research center, group, committee ...)	Quantity / Thematic area
Economics and Management	Universidad Nacional de General San Martín	Centro de Investigación y Desarrollo del Turismo (CIDE-Tur-EEyN)	Research Center	5 (55.55%)
	Universidad Nacional de la Patagonia San Juan Bosco	Observatorio de Economía y Administración del Turismo (OBSECATUR – GETACE)	Observatory	
	Universidad de la Cuenca del Plata	Observatorio Económico y Social	Observatory	
	Universidad Nacional de Lanús	Observatorio Turístico de Argentina (Observatur)	Observatory	
	Universidade de Comahue	Centro de Estudio del Conocimiento e Innovación Empresarial Turístico (CECIET)	Research Center	
Tourism Plannig	Universidad Nacional de Lanús	Centro Internacional de Estudios sobre Turismo y Desarrollo (CIETyD)	Research Center	2 (22.22%)
	Universidad Nacional del Comahue	Centro de Estudios para la Planificación y el Desarrollo Turístico Sustentable – CEPLADES	Research Center	
General Tourism	Universidad Nacional de Mar del Plata	Centro de Investigaciones Turísticas	Research Center	2 (22.22%)
	Universidad Nacional de la Plata	Instituto de Investigaciones en Turismo	Research Institute	
TOTAL	9 RESEARCH STRUCTURES			

N=9

Source: own elaboration based on the data of the investigation

It was also identified el *Consejo de Decanos y Directores de Unidades Académicas relacionadas con la Enseñanza del Turismo (CONDET)* as a non-profit association of 14 Nacional Universities (Public management Institutions)⁸. In addition, it was identified the Center for Research and Tourist Studies (Centro de Investigaciones y Estudios Turísticos - CIET), which publishes the Journal *Estudios y Perspectivas en Turismo* and makes agreements with some HEIs, as the *Universidad Nacional de General San Martín*. Finally, mention is made of the Tourism Documentation Center of the Government of the City of Buenos Aires (Centro de Documentación Turística del Gobierno de la Ciudad de Buenos Aires), which present statistical surveys on tourism in Argentina.

In the scope of the private sector, it was found the OEA.TUR (Observatorio Económico de Agencias de Viajes de República Argentina), linked to the Argentine Federation of Associations of Travel and Tourism Companies (Federación Argentina de Asociaciones de Empresas de Viajes y Turismo – FAEVIT), which presents data on the economy of national tourism.

Therefore, the total research structures in the country counts 13 entities, the latter four are not listed in table 6 because they are not set in a HEI (methodological scope adopted as a research procedure).

4.4 Existence of Scientific Journal Publication in Tourism by IES

In the sample of the 61 Institutions of Higher Education that offer tourism courses and other entities were identified 8 periodicals (table 7). According to the methodology adopted in the research, the reports on the tourism economy published by OEA.TUR, as well as the reports of the Tourism Statistics published by the Federal Government of Argentina, and publications of CONDET, have not been counted.

Likewise, the Scientific Publication *Estudios y Perspectivas en Turismo*, published by the Center for Research and Tourist Studies (Centro de Investigaciones y Estudios Turísticos - CIET), that is not directly linked to an HEI, has not been accounted as tourism journals.

Linked to 2 (two) institutions of higher education investigated were identified interdisciplinary journals, with the acceptance of topics related to tourism. These journals were again not counted, because tourism is not the central theme of their scope. The publications are:

- 1) Revista Tiempo de Gestión (Multidisciplinary Journal of the *Facultad de Ciencia y la Gestión* of the Universidad Autónoma de Entre Ríos);
- 2) Revista FACES (Multidisciplinary Journal of the *Facultad de Ciencias Económicas y Sociales* of the *Universidad Nacional de Mar del Plata*).

⁸ Namely: 1) Universidad Nacional de la Patagonia San Juan Bosco; 2) Universidad Nacional de La Plata; 3) Universidad Nacional de Lanús; 4) Universidad Nacional de Mar del Plata; 5) Universidad Nacional de Misiones; 6) Universidad Nacional de Quilmes; 7) Universidad Nacional de Río Negro; 8) Universidad Nacional de San Juan; 9) Universidad Nacional de San Luis; 10) Universidad Nacional de San Martín; 11) Universidad Nacional del Centro de la Provincia de Buenos Aires; 12) Universidad Nacional del Comahue; 14) Universidad Nacional del Sur.

Table 7 - Distribution of the scientific journals of tourism of HEIs with Educational Offer in Tourism by the university, type and thematic area

Thematic area	Institution	Name of the journal	Type (journal ...)	Quantity / Subject Area	ISSN
Economics and Management	Universidad Nacional del Comahue	Anuario de Estudios en Turismo	Statistical Report	2 (40%)	1850-1206

5. DISCUSSION AND CONCLUSION

In synthesis, it was identified 177 observations composing the educational offer, divided into categories like initial education (technical and undergraduate) and post-graduation education (specialization, MBA, master, doctorate). The EOT is linked to 61 HEI in the country (46.92% of the total of HEIs), that are linked to departments in 155 cases. Additionally, we have identified that 38 cases of EOT have a specific focus or emphasis, e.g. MBA in hospitality. The EOT core is formed by the thematic areas like “General tourism” and “Economy and management”. Connected to the HEI's were found 9 FSRT, and 8 Regular Academic Journals specialized in tourism.

In Argentina 61 IES delimit the academic sub-field of tourism. This structure predominates in the provision of HEIs of a private nature (75.4%) in terms of the total EOT. Education offer is massively concentrated at the undergraduate level (81.35%) which confirms the work of the area of education and training in tourism (Airey & Tribe, 2005). Moreover, it is concentrated in the thematic area of general tourism (37.85%). On the other hand, 78.5% of all observations concerning the EOT do not have an emphasis. Bound to the Institutions of Higher Education were found 9 Research Structures, and to these Structures 8 Regular Academic Journals with publications on the subjects related to the tourism. The distribution on predominant thematic areas is reproduced in the main theme of the research structures and the existing journals.

In general, the private institutions, that offer of higher education in tourism turns to the formation of the operational and managerial levels of the tourism industry, while in the public institutions, there is a greater thematic heterogeneity and emphases in the courses, referring to the areas of Economy and management, Social Sciences, General Tourism and Hospitality. In this way, the hypothesis is confirmed that the diversity of approaches of the tourism allows the growth of a heterogeneous educational offer, that can not be linked to the general objectives of the policies of education in tourism, and to be guided by other formative profiles, with scientific objectives, practical or functional.

In summary, it was observed that higher education in tourism, in general, has specific objectives, intends to train workforce at the operational and managerial levels, guarantee a certain qualification aiming at the employability of professionals, and the quality of this sector of the economy to ensure international competitiveness, as well as fewer incidents, such as the training of teachers and public servants. Thus, the analysis of the installed educational offer allows to verify that its intention is to contribute to the objectives of tourism policies, linked to the development of tourism as a sector of the economy.

However, their contribution seems less determinant for the production of new knowledge, skills and techniques in tourism, reproducing the skills required by the tourist market, and thus compromises the feedback of the educational process, that is, it compromises the quality of the tourism research and teaching, and thus the very development of tourism in this country.

As conclusion, there is a strong asymmetry between EOT and FSRT, apart from the internal discrepancies in the EOT, as the preponderance of Initial Education programs (82.38% of the total). The absence of a more pluralistic EOT, especially in the cross-sectional areas (as in social sciences), explain the difficulty to constitute FSRT, which tend to (or should give) feedback the system, generating more qualification and specificity the academic field of tourism.

In general, the agents that make up the academic sub-field of tourism are placed in a dynamic process of interaction in the IES space. However, the agents involved in HEIs have the possibility to develop different activities - teaching (in teaching activities), extension (in projects that have the objective of directly impacting society, such as the provision of services

information or leisure activities) and research. Thus, future studies could be placed in the interaction between the production of knowledge made by the formal structures of research in tourism and how it impacts the society.

PARALLEL SESSION II

RÉGIMEN DE RESPONSABILIDAD EN LA CONTRATACIÓN DE VIAJES VINCULADOS

Alfredo Batuecas Caletrío
 Universidad de Salamanca
 (batu@usal.es)

RESUMEN

Finalmente, después de un largo tiempo de espera, se ha aprobado la nueva directiva relativa a los viajes combinados y a los servicios de viaje vinculados.

Una de las principales novedades que introduce la Directiva es la relativa a la regulación de los llamados “viajes vinculados”, hasta hace poco tiempo denominados “paquetes dinámicos de turismo”. Este trabajo se centra en analizar una cuestión muy concreta de la contratación de este tipo de viajes, cual es el régimen de responsabilidad aplicable a su contratación. Antes de abordar la cuestión del régimen de responsabilidad se presenta como necesario estudiar los sujetos que participan en la contratación de este tipo de viajes.

Palabras Clave: Directiva de Viajes Combinados, Viajes Vinculados, Sujetos, Régimen Jurídico de Responsabilidad.

1. INTRODUCCIÓN

El Diario Oficial de la Unión Europea publicó el 11 de noviembre de 2015 la Directiva (UE) 2015/2302 del Parlamento Europeo y del Consejo de 25 de noviembre de 2015 relativa a los viajes combinados y a los servicios de viaje vinculados (en adelante, DVC)¹.

La necesidad de esta nueva DVC se justificaba en la propia realidad existente en torno a la contratación de servicios turísticos y en las respuestas que demandaba este mercado en particular. Así, por ejemplo, resultado de la incorporación de las nuevas tecnologías a los canales de venta de servicios turísticos, de unos años a esta parte se han extendido a gran velocidad nuevas formas de contratar este tipo de servicios². Estas nuevas formas de contratación constituían antes de la aprobación de la Directiva constituían una laguna legal en el Derecho comunitario y en los ordenamientos jurídicos de los diferentes Estados miembros. En este sentido, frente a la contratación de servicios turísticos sueltos y viajes combinados, modalidades éstas de contratación de servicios turísticos extendidas y generalizadas en los últimos décadas, de unos años a esta parte se han implantado nuevas modalidades de contratación, como la consistente en que el propio viajero contrataba dos o más servicios de viaje para el mismo viaje o vacación (p. ej. vuelo + hotel), de tal modo que cada servicio de viaje encontraba justificación en el resto de los contratados. El surgimiento de estos nuevos canales de contratación de servicios turísticos son muestra de un mercado turístico que ha convergido hacia un mayor dinamismo, consecuencia directa de que cada vez sean más los viajeros que contratan personalmente los servicios turísticos a través de la página web del empresario que los presta (a diferencia de lo que ocurría hasta hace poco tiempo donde la mayoría de los viajeros se servía de agencias de viajes para realizar la contratación)³. Es por ello que uno de los objetos que se propone alcanzar la Directiva sea adaptar el alcance de la protección para tener en cuenta esta evolución, junto con aumentar la transparencia y la seguridad jurídica de los viajeros y empresarios⁴.

Dicho lo anterior, la incorporación de las nuevas tecnologías a los procesos de contratación de servicios turísticos no ha sido la única causa que ha motivado la aprobación de esta Directiva, sino que han confluído otras de distinta naturaleza a la tecnológica, como la de lograr una mayor protección financiera para los viajeros frente a las declaraciones de insolvencia de algunas compañías aéreas (y que suponía para aquellos que no pudieran llevar a cabo su viaje), situación ésta que se ha conocido en diversos países miembros de la Unión Europea en los últimos años.

¹ Directiva (UE) 2015/2302 del Parlamento Europeo y del Consejo, de 25 de noviembre de 2015, relativa a los viajes combinados y a los servicios de viaje vinculados, por la que se modifican el Reglamento (CE) n° 2006/2004 y la Directiva 2011/83/UE del Parlamento Europeo y del Consejo y por la que se deroga la Directiva 90/314/CEE del Consejo. El plazo máximo de transposición es el 1 de enero de 2018.

² Las nuevas tecnologías ofrecen indudables ventajas, tanto a los empresarios que ofertan servicios turísticos, como a los viajeros que los contratan. Entre las ventajas que ofrecen para los empresarios pueden citarse la reducción de costes que supone la operativa a través de las mismas, el acceso a un mayor número de destinatarios de forma rápida, la flexibilización de precios y poder comercializar productos en forma de “ofertas de última hora”, como vuelos o reservas de habitación de hotel. Por su parte, entre las ventajas que ofrece para el viajero destacan poder acceder a una mayor cantidad de información en tiempo real y comparar precios, personalizar los productos a la medida de sus necesidades, obtener precios más ventajosos y hacer la contratación más cómoda. Frente a lo anterior urge apuntar que la implantación de las nuevas tecnologías no ha estado exenta de obstáculos, como el que representa salvar la desconfianza que (aún hoy, aunque en menor medida) todavía despierta en un buen número de personas y su coste para los empresarios (advirtiéndose que exige la adquisición de equipos informáticos y la formación del personal en su uso). Aún con estos inconvenientes, los resultados finales muestran que la figura del info-shopper (persona que utiliza Internet únicamente para informarse, pero no para contratar) se está viendo sustituido por el viajero que, además de utilizar Internet para informarse, contrata los servicios turísticos a través de Internet.

³ Los dos factores que, en nuestra opinión, han contribuido en mayor medida a que el mercado turístico se haya vuelto más dinámico han sido la comercialización de estos servicios a través de Internet y la aparición de compañías aéreas de bajo coste que han ofrecido productos a precios más asequibles. Sobre la incidencia que ha ejercido Internet en la comercialización de servicios turísticos véase Paniza Fullana, A. “Nuevas tecnologías aplicadas al turismo y sus consecuencias jurídicas: los paquetes dinámicos”, en Paquetes dinámicos de turismo: problemas y soluciones jurídicas desde una perspectiva internacional (Dir. Paniza Fullana). Madrid: Ed. Dykinson, 2014, pp. 13 y ss. y RIBEIRO CAFÉ, A. “Paquetes dinámicos y la transposición de la Directiva de servicios en Portugal (desde el punto de vista de los empresarios de turismo)”, en Paquetes dinámicos de turismo: problemas y soluciones jurídicas desde una perspectiva internacional (Dir. Paniza Fullana). Madrid: Ed. Dykinson, 2014, p. 93. De este último trabajo destaca la visión que ofrece el autor sobre el estado de la cuestión en Portugal.

⁴ Vid. Considerando n° 1 de la DVC.

Existiendo necesidad, como se indica, de esta nueva Directiva, y habiendo cumplido el legislador comunitario con la labor de elaborarla y aprobarla, algunas cuestiones finalmente contenidas en el nuevo régimen jurídico aplicable a la contratación de servicios turísticos están siendo contestadas desde un principio por parte de la doctrina, como la de que se haya dejado libertad a los Estados miembros para decidir si el régimen de responsabilidad en la contratación de viajes combinados debe ser solidario entre el organizador del viaje y la agencia de viajes que finalmente lo vende o debe recaer exclusivamente en el organizador del viaje⁵; la de la regulación jurídica otorgada a los viajes vinculados o la de que el régimen jurídico que en ella se contiene no haya eliminado algunas ambigüedades, ni haya superado lagunas existentes en la normativa anterior.

En la nueva DVC se parte de la idea de que en los últimos tiempos se ha consolidado una nueva forma de contratar servicios turísticos, conocida como “viajes vinculados”, consistente en la contratación de al menos dos o más tipos diferentes de servicios de viaje para el mismo viaje o vacación, celebrando contratos distintos con cada uno de los prestadores de servicios de viaje, si un empresario facilita: a) con ocasión de una única visita o contacto con su punto de venta, la selección y pago por separado de cada servicio de viaje por parte de los viajeros, o b) de manera específica, la contratación con otro empresario de como mínimo un servicio de viaje adicional siempre que se celebre un contrato con ese otro empresario a más tardar 24 horas después de la confirmación de la reserva del primer servicio (art. 3.5 DVC). De este modo, se estará ante un viaje vinculado cada que el viajero contrate en una agencia de viajes un billete de tren y una habitación de hotel o cuando habiendo reservado una habitación de hotel, y sin que hayan transcurrido 24 horas desde que se hizo la reserva, el viajero contrata por mediación del hotel un vehículo con alguna de las compañías que presta este servicio.

La combinación de servicios turísticos que se realiza en el viaje vinculado y el modo de combinarlos es distinto del que acontece en el viaje combinado, ya que en el viaje combinado la labor del empresario se limita a “*facilitar la contratación* de servicios turísticos”, lo que justifica que el régimen jurídico de aquél sea distinto del de este último⁶. Es por esta razón que en el Considerando noveno de la DVC se indica que “en aras de la transparencia, los viajes combinados deben distinguirse de los servicios de viaje vinculados, en los que los empresarios facilitan de manera presencial o en línea a los viajeros la contratación de servicios de viaje, llevándoles a celebrar contratos con distintos prestadores de servicios de viaje, inclusive mediante procesos de reserva conectados, que no presentan las características de los viajes combinados y a los que no sería apropiado imponer todas las obligaciones exigibles a estos últimos”.

Aunque, conforme al estado actual de la regulación, nada impide que un viaje vinculado pueda contratarse de modo tradicional, esto es, personándose el viajero en una agencia de viajes y contratando los diferentes servicios de viaje a través de la misma (o, como se acaba de exponer en el ejemplo anterior, que a través de un hotel —u otro empresario— se adquiera un servicio diferente al que presta), sin embargo la realidad dicta que la mayoría de los viajes vinculados se contratan electrónicamente, siendo su ejemplo tipo el de la contratación a través de una compañía aérea de un billete de avión y una reserva hotelera o el alquiler de un vehículo. La incorporación de las nuevas tecnologías en la contratación de servicios turísticos está propiciando lo que algunos expertos denominan “desintermediación” del sector o, lo que es lo mismo, la desaparición de las agencias de viaje intermediarias entre el turista y el proveedor del servicio⁷.

Siendo conscientes de la existencia (justificada) de críticas a la Directiva de viajes combinados, en este trabajo abordaremos la que consideramos una de las novedades más significativas que ofrece esta nueva norma, que es la relativa al régimen jurídico de responsabilidad en la contratación de viajes vinculados que en ella se contiene. A nuestro modo de ver, este régimen jurídico constituye una importante novedad por un doble motivo: por una parte, por su aprobación en sí misma considerada, ya que nada había antes que él sobre este materia; por otra parte, por las soluciones concretas que ofrece, aunque no carentes de dudas, eso sí, como se verá inmediatamente después.

2. SUJETOS QUE PARTICIPAN EN LA CONTRATACIÓN DEL VIAJE VINCULADO

2.1 El viajero

A diferencia de la Directiva 90/314/CEE, en la que se utilizó el término “consumidor”, en la nueva Directiva a la persona que contrata el viaje vinculado se le denomina “viajero”, lo que, ya de inicio, viene a constituir una notable diferencia entre uno y otro texto legal⁸.

Atendiendo a ello, estará protegido por la Directiva, en primer lugar, todo particular que contrate un servicio de viaje, entendiendo por tal cualquier persona que, ajena a una actividad profesional o empresarial, realice la contratación. De este modo, queda amparado por la Directiva el supuesto más común de contratación de servicios turísticos que acontece en la práctica, que es el del viajero que une a su consideración la de consumidor y que contrata los servicios turísticos para un viaje

⁵ Reproduciéndose con ello en esta nueva Directiva los mismos errores que ya se advirtieron en la antigua Directiva 90/314/CEE del Consejo, de 13 de junio de 1990, relativa a los viajes combinados, las vacaciones combinadas y los circuitos combinados (DO L 158, de 23 de junio de 1990, p. 59). Esta Directiva dejó un amplio margen de apreciación a los Estados miembros para su transposición, razón por la cual han subsistido divergencias significativas entre las distintas legislaciones. La fragmentación jurídica se ha traducido en mayores costes para las empresas y obstáculos para los empresarios que desarrollado actividades transfronterizas, limitando de este modo las opciones de los consumidores. Según se expone en el Considerando sexto de la DVC, “Las disparidades entre las normas de protección de los viajeros en los distintos Estados miembros son un factor disuasorio para que los viajeros de un Estado miembro contraten viajes combinados y servicios de viaje vinculados en otro Estado miembro y, del mismo modo, un factor disuasorio para que los organizadores y los minoristas de un Estado miembro vendan tales servicios en otro Estado miembro”.

⁶ Los viajes vinculados deben distinguirse de los viajes que los viajeros reservan de manera autónoma, a menudo en diferentes momentos, aunque se destinen a un mismo viaje o vacación. Deben distinguirse, asimismo, de sitios web a los que se accede mediante un enlace cuya finalidad no es la celebración de un contrato con el viajero, y de los enlaces a través de los cuales simplemente se informa a los viajeros sobre otros servicios de viaje de modo general, por ejemplo cuando un hotel o el organizador de un acontecimiento incluye en su sitio web una lista de todos los empresarios que ofrecen servicios de transporte a su establecimiento con independencia de cualquier reserva, o si se utilizan “cookies” o metadatos para insertar publicidad en sitios web. En los viajes vinculados el empresario “facilitador” del mismo ayuda a contratar servicios de viaje distintos con prestadores de servicios individuales, lo que exige cierta labor de organización en la contratación. Esta labor de facilitación suele basarse en una relación comercial remunerada entre el empresario que facilita la contratación y el empresario prestador del servicio.

⁷ Vid. PÉREZ PÉREZ, M.; MARTÍNEZ SÁNCHEZ, A.; ABELLA GARCÉS, S. “El sector turístico y el comercio electrónico”, en Boletín Económico de ICE, n° 2733, pp. 34 y ss.

⁸ Directiva 90/314/CE del Consejo, de 13 de junio de 1990, relativa a los viajes combinados, las vacaciones combinadas y los circuitos combinados (DO L 158 DE 23.6.1990, p. 59). Con respecto a los sujetos que participan en la contratación de un “paquete dinámico de turismo” vid. (Ferrer Tapia, 2014).

de ocio. Es natural que esto sea así, al ser la contratación de servicios turísticos realizada por consumidores las más frecuente en la práctica.

Junto a lo anterior, el uso intencionado del término “viajero” extiende la protección de la Directiva a otros supuestos distintos del consumidor, permitiendo que reciban protección igualmente los representantes de pequeñas empresas o profesionales que, por motivos relacionados con su negocio o profesión, realicen la contratación de servicios turísticos a través de los mismos canales de reserva que los consumidores. Hemos de entender esto en el sentido de que para el legislador comunitario este tipo de profesionales merecen un nivel de protección similar al de los consumidores, si la reserva del viaje la han realizado a través de los mismos canales que los consumidores. El profesional al que protege la Directiva es el de la pequeña empresa, no así a los de las empresas u organizaciones que contratan los servicios de viaje en el marco de un convenio general celebrado entre su empresa u organización y un empresario para múltiples fórmulas de viaje y para un tiempo específico. Ello es así porque quienes contratan bajo este tipo de fórmulas de viaje no requieren el mismo nivel de protección que los consumidores, si se atiende al alto poder negociador que tienen las empresas u organizaciones que acuerdan este tipo de convenios generales. En orden a ello, la Directiva resultará de aplicación a los viajeros de negocios, incluidos los que ejercen profesiones liberales o trabajadores autónomos, en la medida en que no organicen sus viajes sobre la base de un convenio general suscrito por su empresa.

2.2 El empresario “facilitador”

La segunda persona que interviene en la contratación del viaje vinculado es el empresario que facilita al viajero poder contratar dos o más servicios turísticos para el mismo viaje o vacación, el que permite (o da a conocer) al viajero la posibilidad de poder hacerlo. La Directiva se refiere repetidamente a él como empresario “facilitador” del viaje vinculado, para distinguirlo del prestador final del servicio, y su intervención se limita a facilitar esa contratación con los prestadores de los servicios turísticos, que será, como se verá más adelante, con quienes finalmente contrate el viajero⁹. En la práctica, en la mayoría de las ocasiones, estos empresarios serán compañías aéreas y agencias de viaje y, en menor medida, hoteles, compañías dedicadas al alquiler de vehículos u otros empresarios de distinta naturaleza (como los que ofrecen espectáculos).

Como ya se ha apuntado, su labor consiste en facilitar con ocasión de una única visita o contacto con su punto de venta la selección y pago por separado de dos o más servicios de viaje por parte de los viajeros; o, de manera específica, la contratación con otro empresario de como mínimo un servicio de viaje adicional, siempre que se celebre un contrato con ese otro empresario a más tardar 24 horas después de la confirmación de la reserva del primer servicio de viaje.

Lo que diferencia a esta clase de empresarios de otros que también pueden aparecer cuando se contratan servicios turísticos (por ejemplo, portales web que simplemente ofrecen información o metabuscadores) es que ellos han desplegado una labor organizativa que permite la contratación. Esta labor se ve, en el caso de las agencias de viajes, en que contratan en nombre del viajero y le entrega los contratos y, en los casos en los que la contratación se realiza a través de la página web de algún empresario, en que no se limita a ofrecer información, sino que permite contratar (no es lo mismo que la página web de un hotel ofrezca información sobre compañías de alquiler de vehículos a que permita su contratación). En este sentido, cuando la contratación del servicio turístico se realice por medios electrónicos, el viajero deberá poner especial atención en diferenciar al empresario que efectivamente presta servicios turísticos de esos otros operadores como son los mencionados portales web o metabuscadores que, actuando también en el ámbito del sector turístico, sin embargo, su función es diferente a la prestación de servicios turísticos y a los que, por lo tanto, no les resulta de aplicación el régimen jurídico de la Directiva¹⁰.

La labor que desempeña el empresario facilitador de la contratación de los servicios turísticos obedece a una relación comercial remunerada (basada, por ejemplo, en el volumen de ventas o en el número de “clics”) con los prestadores finales de los servicios de viaje.

Nada impide que este empresario sea, además, prestador de alguno de los servicios turísticos contratados (que es lo que ocurre, por ejemplo, cada vez que se adquiere un billete de avión y se reserva de una habitación de hotel a través de la página web de la compañía aérea). La concurrencia en el empresario del desempeño de estas dos funciones (facilitador del viaje vinculado y prestador de alguno de los servicios turísticos) impone que deba observar una especial diligencia de información hacia el viajero, a fin de evitar que éste pueda incurrir en errores en la contratación. Esta diligencia de información todavía será mayor cuando la contratación se realice electrónicamente, ya que, en estos casos, el empresario no desempeña dos funciones, sino tres (facilitador del viaje vinculado, prestador de servicio turístico y prestador de servicios de la sociedad de la información). Una contratación transparente que permita al viajero tener claro en todo momento con quién está contratando exigirá que el empresario proporcione correctamente la información requerida por el artículo 10 LSSI, que evite técnicas como el enmarcado de contenidos ajenos dentro de páginas web propias y que tenga accesibles las condiciones de uso de sus páginas web (y que son distintas en sí mismas de las condiciones generales de contratación aplicables a los servicios que

⁹ Vid. art. 3.5., 3.7, 19.1, 19.2, 19.3 o 23.1 DVC.

¹⁰ La denominación de “portal de viajes” está muy extendida en la actualidad, casi desnaturalizada, aplicándose por defecto a cualquier página en la que se ofrecen servicios relacionados con el turismo, desde su contratación directa a la mera búsqueda de ofertas.

Sobre este tipo de operadores vid. BENITO ROSER, M. T. “La agencia de viajes virtual”, en Turismo y comercio electrónico. La promoción y contratación on line de servicios turísticos. Granada: Ed. Comares, 2001, pp. 125-151; FERRER TAPIA, ob. cit., pp. 40 y ss.; y TUR FAÚNDEZ, M. N. “Portales y guías on line”, en Turismo y comercio electrónico. La promoción y contratación on line de servicios turísticos. Granada: Ed. Comares, 2001, pp. 165-170.

Por su parte, los metabuscadores son comparadores de precios y representan una evolución en el concepto del habitual “buscador” incluido en portales o en las páginas de las agencias de viaje, para constituirse en un modelo de negocio diferenciado. Suponen la aplicación al ámbito turístico de una herramienta de búsqueda de información en otros motores de búsqueda y en las propias bases de datos de agencias de viaje y proveedores, de manera que, conforme a los criterios establecidos por el usuario, le presentan un listado de resultados que puede ser objeto de diferentes ordenaciones, siendo la más popular la que tiene por criterio el precio (de ahí que en muchas ocasiones se presenten como “comparadores de precios”). Lo relevante es que el objeto principal de su actividad es dicha labor de búsqueda y presentación, remitiendo luego al usuario a las páginas de los proveedores de cada servicio para su concreta contratación.

Los metabuscadores o comparadores, por lo tanto, no prestan propiamente servicios turísticos; de hecho, y si funcionan únicamente como tales, ni siquiera son auténticos intermediarios desde el punto de vista jurídico (como pueden serlo las agencias o las centrales de reservas), aunque sí puedan serlo desde el punto de vista tecnológico (en cuanto proveedores de enlaces, cuya actividad quedaría sujeta a la LSSI —incluida la responsabilidad por los posibles ilícitos realizados por terceros a cuyas páginas remitan sus resultados—, art. 17 LSSI).

se adquirieran en cada caso)¹¹.

2.3 El prestador del servicio

El último de los sujetos que interviene en la contratación de viajes vinculados es el empresario prestador del servicio turístico. El prestador del servicio es la contraparte del viajero en la contratación y es deseo claro del legislador que el viajero sea informado sobre este extremo, al imponer expresamente en el artículo 19.2.a DVC al empresario facilitador del viaje vinculado una obligación de informar al viajero acerca de que cada prestador de servicios es el único responsable de la correcta prestación contractual de su servicio. Si la contratación de viajes vinculados se realiza por medio de una agencia de viajes, son empresarios que prestan servicios de viaje, por ejemplo, las compañías aéreas cuyo billete de avión se ha adquirido, los hoteles cuya habitación se ha reservado o las compañías de alquiler de vehículos cuyo automóvil se ha alquilado.

A semejanza de lo que se ha expuesto anteriormente para empresario facilitador del viaje vinculado, cuando la contratación con el prestador del servicio turístico se realice electrónicamente, además de prestador de servicios turísticos este empresario será prestador de servicios de la sociedad de la información, por lo que le resultará de aplicación lo allí mantenido referido al cumplimiento de los deberes de información que impone la LSSI y conductas propias de buenas prácticas comerciales.

Con la opción elegida por el legislador europeo de hacer responsable del incumplimiento del servicio turístico únicamente al prestador del mismo se despejan todas las dudas que pudieran existir relativas a si la responsabilidad por esta causa debía ser solidaria entre el empresario que presta el servicio y el que facilitó la contratación, descartando tal posibilidad.

3. RÉGIMEN DE RESPONSABILIDAD

Como ya se dijo al inicio del trabajo, el régimen de responsabilidad aplicable a la contratación de viajes vinculados es una de las cuestiones que ha motivado la elaboración de esta nueva Directiva, especialmente la responsabilidad que deriva de la insolvencia de las compañías aéreas cuando han sido ellas las que han facilitado la contratación del viaje vinculado.

El debate más importante que han generado los viajes vinculados en los últimos años ha girado en torno a si el régimen de responsabilidad que le resultara de aplicación debía ser igual al que el TRLGDCU contempla para los viajes combinados o si, en orden a la diferente naturaleza de esta clase de viajes con respecto a los combinados, los viajes vinculados debían quedar sujetos un régimen de responsabilidad diferente. Como podrá comprobarse inmediatamente, la nueva Directiva pone fin al debate, al mismo tiempo que llena el vacío normativo existente hasta ahora, al facilitar un nuevo régimen jurídico que evita ambigüedades.

El régimen de responsabilidad de los viajes vinculados se concentra en los artículo 19 y 21 DVC, distinguiéndose entre la responsabilidad que deriva del incumplimiento de alguna de las prestaciones que componen el viaje vinculado, la que se origina por la insolvencia del empresario que facilitó la contratación del viaje vinculado (ambas recogidas en el art. 19) y la proveniente de un error en la reserva (art. 21).

Con respecto a la responsabilidad que deriva del incumplimiento de alguna de las prestaciones que conforman el viaje vinculado, ésta se recoge en el artículo 19.2.a DVC, haciendo único responsable de los incumplimientos al prestador encargado de prestar el servicio (“...el empresario que facilita viajes vinculados...facilitará de forma clara, comprensible y destacada... que cada prestador de servicios será el único responsable de la correcta prestación contractual de su servicio”). Así, por ejemplo, si el viajero contrata un viaje vinculado a través de una agencia de viajes o de la página web de una compañía aérea consistente en la adquisición de un billete de avión y el alquiler de un vehículo y, llegado el día, la compañía de alquiler de vehículos no le facilita ninguno, el viajero deberá ejercitar la acción de responsabilidad nacida del incumplimiento contractual contra la compañía de alquiler de vehículos (y no frente a la agencia de viajes o la compañía aérea que le hayan facilitado vincular los servicios). Y, viceversa, ante un incumplimiento del viajero, el prestador del servicio turístico no podrá dirigirse frente al empresario que facilitó la contratación exigiéndole responsabilidad, sino que dicha responsabilidad únicamente podrá ser exigida al viajero.

Con una norma como ésta, la Directiva evita que se reproduzcan para los viajes vinculados los mismos debates (y se generen las mismas inseguridades jurídicas) que con la antigua Directiva se propiciaron para los viajes combinados ante el incumplimiento de algún servicio de viaje, a raíz de que en el marco de la anterior Directiva se dejara libertad a los estados miembros para que establecieran el régimen de responsabilidad que mejor se adaptaba a su Ordenamiento jurídico, y que terminó ocasionando que, mientras que para unos países la responsabilidad fuera solidaria entre el organizador del viaje y el minorista, para otros fuera exclusiva del organizador. Además de ello, al hacer responsable del incumplimiento al prestador del servicio, la Directiva se está posicionando indirectamente con respecto al tema de la naturaleza jurídica de los viajes vinculados y la relación que guardan con los viajes combinados, concediéndole un trato diferente a uno y otro.

Aunque en la Directiva no se contemplan causas de exoneración de responsabilidad para el prestador, éste no deberá responder cuando la causa del incumplimiento sea imputable al viajero, ni cuando el incumplimiento, como en cualquier otro ámbito del Derecho, sea debido a caso fortuito (art. 1105 CC).

La solución que impone la Directiva exonera de responsabilidad a los empresarios que facilitan la contratación de los viajes vinculados, salvo en aquellos supuestos en los que, además de facilitar la contratación del viaje vinculado, presten alguno servicio de viaje de los contratados y sea ése el servicio que se ha incumplido, ya que si ello acontece responderán como prestadores del servicio.

El segundo gran ámbito de responsabilidad que aborda la Directiva es la que deriva del incumplimiento de la prestación de

¹¹ Las buenas prácticas imponen igualmente que el empresario desarrolle políticas de privacidad, de tratamiento de datos personales y de envíos de comunicaciones comerciales correctas, cuestiones éstas exceden el ámbito del presente estudio.

alguno de los servicios de viaje contratados pero a consecuencia de la insolvencia del empresario que facilita la contratación del viaje vinculado (art. 19.2.b).

En el párrafo 1 del artículo 19 se señala que el empresario que facilite servicios de viaje vinculados deberá constituir una garantía para el reembolso de todos los pagos que reciban de los viajeros, en la medida en que un servicio de viaje que forme parte de un viaje vinculado no se ejecute como consecuencia de su insolvencia (la del empresario). Si dicho empresario es, además, responsable del transporte del viajero, la garantía cubrirá también la repatriación de estos.

Aunque, en principio, pueda pensarse que el supuesto aquí recogido está dirigido al caso de la compañía aérea que, a consecuencia de incurrir en insolvencia, impide que se preste alguno de los servicios turísticos contratados para el viaje vinculado (supuesto éste que, como venimos diciendo, ha ejercido una gran influencia en la elaboración de la nueva Directiva de viajes combinados), el alcance de la Directiva es mucho mayor y llega a cualquier empresario que oferta viajes vinculados (sea o no una compañía aérea). El artículo regula el supuesto en que un servicio de los contratados en el viaje vinculado (transporte aéreo, reserva hotelera o alquiler de vehículo) no puede prestarse a consecuencia de la insolvencia del empresario que facilitó la contratación del viaje vinculado, habiendo sido ya pagado al empresario que deviene insolvente. La causa que origina la no prestación del servicio deberá ser la insolvencia del empresario que facilita la contratación del viaje vinculado y en la práctica la negativa a ejecutar el servicio vendrá dada porque el prestador del servicio alegará no haber recibido el pago del servicio de parte del empresario a través del cual se contrató el viaje vinculado. Cuando ello ocurra, el viajero podrá recuperar las cantidades entregadas al empresario mediante la ejecución de una garantía que se le obliga a constituir a éste último como requisito previo al inicio de la actividad de comercialización de viajes vinculados.

Si bien la redacción del artículo no es clara y el término “empresario” con el que finaliza la primera frase del párrafo pudiera hacer dudar si alude a aquél que facilita la contratación del viaje vinculado o al prestador final del servicio, en nuestra opinión debe entenderse referida al primero de ellos. En este sentido, una redacción menos dudosa que la vigente “Los Estados miembros velarán por que los empresarios que faciliten servicios de viaje vinculados constituyan una garantía para el reembolso de todos los pagos que reciban de los viajeros, en la medida en que un servicio de viaje que forme parte de unos servicios de viaje vinculados no se ejecute como consecuencia de la insolvencia del empresario” hubiera sido “Los Estados miembros velarán por que los empresarios que faciliten servicios de viaje vinculados constituyan una garantía para el reembolso de todos los pagos que reciban de los viajeros, en la medida en que un servicio de viaje que forme parte de unos servicios de viaje vinculados no se ejecute como consecuencia de su insolvencia”.

Varios son las razones que nos llevan a pensar de esta manera: en primer lugar, el Considerando 43 DVC, en el que se establece que los empresarios que faciliten servicios de viaje vinculados están obligados a prestar protección frente a la insolvencia para la devolución de los pagos que perciban de los viajeros y, en la medida en que sean responsables del transporte de pasajeros, para la repatriación de estos. En segundo lugar, la versión inglesa de la Directiva, en la que se dice literalmente “of their insolvency”. Y, en tercer lugar, los trabajos preparatorios y debates surgidos durante la tramitación de la norma en los que se especifica que “...el objetivo es garantizar que, al comprar un servicio de viajes conexo, el viajero esté protegido en caso de insolvencia del operador que lo facilita”. Una interpretación distinta a ésta, además, sería contraria al texto de la norma, ya que en el articulado de la Directiva el legislador utiliza comúnmente el término “empresario” para referirse a aquél que facilita la contratación y “prestador del servicio” a quien efectivamente presta los servicios. Esta interpretación, por último, guarda coherencia con lo estipulado para el viaje combinado, en el que la insolvencia está referida al organizador del viaje, y no a los prestadores de los servicios. Debe tenerse en cuenta al interpretar este artículo que el supuesto que principalmente quiere cubrir el legislador comunitario con el precepto, recordemos una vez más, es el del viajero que, a causa de la insolvencia de la compañía aérea de la que ha adquirido un billete de avión, no puede disfrutar de los servicios de viaje contratados (por ejemplo, una reserva hotelera). Lógicamente, tal y como está redactado, no se limitará únicamente a aquellos casos en los que el facilitador del viaje vinculado sea una compañía aérea, sino que resultará de aplicación a todos los facilitadores de los viajes vinculados, sean compañías aéreas, hoteles, compañías de alquiler de vehículos u otros.

Debe entenderse que la garantía cubre al viajero exclusivamente frente a la insolvencia del empresario facilitador de la contratación y no de la insolvencia de los prestadores finales de los servicios de viaje, al haber cambiado la redacción en este punto con respecto a documentos preparatorios y haberse eliminado la mención a los proveedores de los servicios.

La Directiva exige la constitución de una garantía a todo empresario que ofrezca viajes vinculados, con independencia de la clase de empresario de que se trate (agencia de viaje, compañía aérea, hotel, etc.) y, por lo tanto, con independencia también de que el empresario opere en el mercado con el título de agencia o no, atendiendo de este modo a una vieja reivindicación que venían haciendo pública las agencias de viaje. En tal sentido, las agencias de viaje han venido denunciando durante los últimos años un ejercicio de competencia desleal por parte de las compañías aéreas que comercializaban lo que estos años pasados se han venido denominando “paquetes dinámicos de turismo”, fundamentando su protesta en que las compañías aéreas estaban comercializando este tipo de productos sin tener licencia de agencia de viajes (las agencias de viaje son las únicas que pueden comercializar viajes combinados) y sin haber constituido previamente la garantía a la que sí están obligados ellas.

Aunque la Directiva no especifica qué clase de garantía es la que deben prestar los empresarios, lo más razonable es que ésta se constituya por medio de un seguro obligatorio o de un aval bancario, en correspondencia con lo que ocurre para los viajes combinados. Estimamos que, cuando la garantía deba cubrir también la repatriación de los viajeros, no será necesario el otorgamiento de dos garantías diferentes por parte del empresario, una que cubra de la insolvencia y otra de la repatriación de los viajeros, sino que bastará con una única que cubra los dos riesgos.

Por aplicación del artículo 17.2 DVC, al que se remite el artículo 19, la garantía deberá cubrir los costes que sean previsibles de manera razonable, alcanzando los importes de los pagos realizados por los viajeros o en su nombre en relación con viajes vinculados, teniendo en cuenta la duración del período comprendido entre los pagos y la terminación de los viajes vinculados, así como el coste estimado de las repatriaciones en caso de insolvencia del organizador.

Además, el modo en que se hará efectiva esta garantía (se “activará”, dice la Directiva) varía según que se recurra a ella para cubrir la repatriación de los viajeros o el reembolso de pagos efectuados. Atendiendo al tenor literal del párrafo cuarto del artículo 17 (y por contraposición a lo que se indica en el párrafo quinto, en el que se exige expresamente a la previa solicitud del viajero), en caso de repatriación la garantía se hará efectiva de modo automático, esto es, sin necesidad de un previo requerimiento o solicitud por parte del viajero. En este caso, además, la repatriación será gratuita para el viajero y, si fuera necesario, el alojamiento previo a la repatriación también (hasta tres días). A diferencia de lo anterior, y como se señala en el párrafo quinto del mismo artículo 17, la garantía cubrirá el reembolso de los pagos sólo si previamente así lo solicita el viajero, sin demora indebida.

Conviene recordar nuevamente que resultado de que el artículo 148.18 CE atribuya a las Comunidades Autónomas la competencia de “promoción y ordenación del turismo en su ámbito territorial”, los Estatutos de Autonomía de un buen número de Comunidades Autónomas han asumido tal competencia, regulando distintos aspectos de la actividad turística y tomando igualmente tareas de control, inspección y sanción. Es por ello que en lo relativo a la comercialización de los viajes vinculados serán las Comunidades Autónomas las competentes para perseguir, desde el punto de vista administrativo, las conductas contrarias a la normativa turística, dentro de las cuales debe incluirse el no otorgamiento de la garantía que exige la comercialización de viajes vinculados o cualquier otra que atente contra los derechos de los consumidores, sean éstos reconocidos en su propia normativa o en la estatal de referencia (p. ej., el TRLGDCU).

De esta manera, cuando la comercialización de los viajes vinculados se produzca a través de Internet, esté dirigida a consumidores situados en su territorio, y dado que los contratos electrónicos, ex artículo 29 LSSI, se presumen celebrados en el lugar de residencia habitual del consumidor, cualquier Comunidad Autónoma podrá imponer sanciones, si bien la identificación y calificación de las infracciones en los oportunos expedientes deberán referirse exclusivamente a las tipificadas en su propia normativa, así como cuantificar las sanciones sólo en función de los criterios que afecten a los consumidores de su territorio.

El último ámbito de responsabilidad es el proveniente de un error en la reserva, regulado en el artículo 21 DVC. Según dicho artículo, el empresario será responsable de los daños y perjuicios que se ocasionen al viajero y que sean debidos errores en el sistema de reservas acaecidos por defectos técnicos que le sean atribuibles al empresario. El ejemplo típico será aquél en el que el viajero se presenta en la recepción del hotel y le comunican que no existe ninguna habitación reservada a su nombre, o en el mostrador de la compañía aérea y su billete no es válido.

Bajo nuestro punto de vista, aunque el legislador comunitario no hubiera dedicado un artículo a regular esta cuestión, el empresario respondería igualmente de los daños y perjuicios que su ejecución defectuosa le ocasionara al viajero, en virtud de la relación de mandato que, como ya se ha apuntado, le vincula al viajero (art. 1718.1 CC). Por aplicación del artículo 1726 CC, el empresario responderá no solamente del dolo sino también de la culpa, sabiendo que el mero retraso en el cumplimiento del mandato por parte del empresario no origina por sí mismo responsabilidad, sino por los daños que el retraso efectivamente le produzca al viajero y siempre que el empresario haya actuado con culpa transgrediendo sus deberes de conducta.

Eso sí, el empresario no será responsable de los errores en la reserva cuando dichos errores sean atribuibles al viajero, que es lo que ocurriría, por ejemplo, si el viajero introduce datos erróneos en la reserva de hotel que está realizando a través de la página web de una aerolínea y dan como resultado la reserva de una habitación distinta a la deseada. De igual modo, tampoco lo sería cuando los errores se deban a circunstancias inevitables y extraordinarias.

¿QUO VADIS DERECHO TURÍSTICO DE LA UNIÓN EUROPEA? A PROPÓSITO DE LAS COMPETENCIAS NORMATIVAS DE LAS REGIONES DEL ESTADO ESPAÑOL

Humberto Gosálbez Pequeño
Universidad de Córdoba
(ad1gopeh@uco.es)

M^a Teresa Acosta Penco

ABSTRACT

The law of the European Union refers to tourism as a Community matter, but there is no Community Tourism Law; only some rules governing certain parts, matters or sectors close to Tourism: protection of the environment, protection of consumers and users, liberalization of business activity ... In Spain the State legislates these matters, but also the Regions legislate; in fact the Regions, and not the State, are the competent organisms to approve Tourism Laws.

1. INTRODUCCIÓN

El Turismo se ha consolidado como una actividad económica de gran importancia en la Unión Europea (en adelante UE), con repercusiones muy positivas en factores trascendentales para los Estados miembros como el crecimiento económico y el empleo¹. Por otra parte, como bien apunta FERNÁNDEZ DE GATTA SÁNCHEZ (2012, p. 1), también debe destacarse la consideración del turismo como actividad indispensable para la vida personal de los ciudadanos europeos, su cultura y el refuerzo de la imagen de la Unión Europea y sus valores.

Reconocida por las distintas Instituciones de la Unión Europea, por los Estados miembros y por la doctrina en la materia la importancia del turismo en la UE, cabe esperar una consolidada política turística con la correspondiente asunción de competencias por parte de la organización internacional. Sin embargo, a continuación, se expondrá el particular entendimiento de este sector en la Unión Europea y su regulación desde un punto de vista horizontal o transversal frente a la esperada “Política Europea en materia de Turismo”, la cual brilla por su ausencia.

2. LA AUSENCIA DE UNA POLÍTICA EUROPEA EN MATERIA DE TURISMO

2.1 Falta de reconocimiento en del Derecho originario

Tal y como se refleja en el art.1 párr. primero del TUE, el fundamento de las competencias de la Unión Europea reside en la atribución que hacen los Estados miembros a favor de la UE por medio de los Tratados constitutivos con vistas a lograr los objetivos establecidos por aquéllos en dichos Tratados². Por lo tanto, y como explica Mangas Martín (2014, p. 69), “la Unión no tiene competencias propias u originarias”³ sino que derivan de “quienes son titulares [por razón de su soberanía] y las conservan: los Estados miembros”.

Constatada la importancia que tiene el turismo como actividad económica en la Unión Europea llama la atención el hecho de que, desde los Tratados Fundacionales de la UE, no ha habido ninguna referencia explícita a este sector hasta el Tratado de Lisboa, excepto una aislada disposición en el Tratado de Maastricht que analizaremos con posterioridad. Por lo tanto, como señala Villanueva Cuevas (2012, p. 59), en los orígenes de las Comunidades Europeas, las escasas argumentaciones a favor de la existencia de una política europea en el sector turístico las encontramos únicamente en actos de las instituciones como la Resolución del Consejo de 10 de abril de 1984, relativa a la política comunitaria de turismo, o los documentos de la Comisión “Primeras orientaciones para una política comunitaria del Turismo”⁴ y su documento anejo “La Comunidad Europea del Turismo”. Dichos actos tienen como denominador común que utilizaban el art.2 del Tratado de Roma para dotar de un fundamento jurídico a la incipiente “política europea del sector turístico”⁵.

Como se ha señalado, el primer paso para la adopción de una política comunitaria en materia de turismo se intentó dar en la Conferencia Intergubernamental previa al Tratado de Maastricht, sin embargo los resultados defraudaron las expectativas ya que solo en la letra t) del art.3 del Tratado Constitutivo de la Unión Europea (TUE) se reconoció la posibilidad de adoptar

¹ Según Soave (2016) “El turismo contribuye al producto interior bruto (PIB) y al empleo a razón de un 5% y un 5,2%, respectivamente, de la población activa. Si se tienen en cuenta los estrechos vínculos con otros sectores económicos, esta contribución es aún más elevada”.

² Como nos recuerda Salinas de Frías (2015, p.60) fue la Corte Internacional de Justicia la que en 1949, en el dictamen relativo a la reparación de daños sufridos al servicio de las Naciones Unidas, afirmó que está establecido en Derecho Internacional que “el principio base sobre el que actúa una Organización Internacional a la hora de ejercer los poderes o competencias de los que dispone es el llamado principio de atribución de competencias”.

³ De hecho, en los Tratados queda reflejado en tres momentos distintos que toda competencia no atribuida a la Unión en los Tratados constitutivos corresponderá a los Estados miembros: arts. 4.1 y 5.2 TUE y Declaración n°8 aneja a la CIG que adoptó el Tratado de Lisboa.

⁴ DOCE 115/1984, de 30.4.1984, serie C.

⁵ En virtud del Art.2 del Tratado de Roma la Comunidad Europea tenía como misión promover un desarrollo armonioso de las actividades económicas en el conjunto de la Comunidad y una expansión continua y equilibrada de la misma, así como lograr relaciones más estrechas entre los Estados que la integran.

medidas a favor del turismo⁶. El problema fue que se aplazó la transformación de esa “acción comunitaria” a una “política” *strictu sensu* a la siguiente Conferencia Intergubernamental que debía desarrollarse en 1996. Sin embargo ninguna referencia al turismo hubo en el Tratado de Ámsterdam, firmado en octubre de 1997.

Esta falta de mención al turismo en el mencionado Tratado fue premonitory de la no aprobación, por parte del Consejo, en noviembre de 1997 del Primer Programa plurianual a favor del turismo europeo “Philoxenia” (1997-2000) propuesto por la Comisión Europea⁷. Por todo ello deducimos que el Libro Verde de la Comisión sobre “El papel de la Unión Europea en materia de Turismo”⁸, en la que se destacaba la aportación positiva y el valor añadido que podía suponer una política comunitaria en materia turística, no caló en el Consejo, de ahí su postura en el Tratado de Maastricht y el rechazo al Programa Philoxenia.

2.2 Las razones que han motivado la ausencia: el principio de subsidiariedad

Llegados a este punto cabe preguntarse el por qué de la actitud reticente del Consejo, y por ende de los Estados miembros, para reconocer la existencia de una política europea en materia de turismo en el siglo XX. Al respecto debemos mencionar que ya en 1984 la Comisión reconoció que no se debía “ir demasiado lejos en la coordinación de las políticas nacionales [en materia de turismo], puesto que cada una de ellas se adaptaba a las situaciones particulares muy distintas de los Estados miembros, ni intentar resolver los problemas que se resuelven mejor a nivel nacional o incluso regional”⁹. Coincidimos con Villanueva Cuevas (2012, p. 74) en que esta noción primigenia en la actuación comunitaria en el sector turístico “no es más que el reflejo de la aplicación del principio de subsidiariedad a dicho sector, en cuanto que este indica que las decisiones que afecten al ciudadano se deben tomar en el nivel más cercano al mismo”¹⁰.

Como bien señala Fernández de Gatta Sánchez (2012, p. 11), tras el “no” del Consejo al programa Philoxenia y a la inclusión en el Tratado de Ámsterdam, “el Turismo se encontraba a nivel comunitario en una encrucijada que no se despejaría hasta el Tratado de Lisboa”. No obstante, se mantuvieron las esperanzas para su inclusión en los Tratados como política con actuaciones institucionales como el Dictamen del Comité Económico y Social sobre “La política Europea del Turismo”¹¹, la creación por parte de la Comisión en 1998 del Grupo de Alto Nivel sobre el Turismo y el Empleo (Grupo Corsten) y, especialmente, la Comunicación “Incrementar el potencial del Turismo como generador de empleo. Seguimiento de las conclusiones y recomendaciones del Grupo de Alto Nivel sobre Turismo y Empleo”^{12, 13}.

2.3 El intento de cambio llevado a cabo mediante el Tratado de Lisboa

La falta de fundamento jurídico en los Tratados Constitutivos para articular una política común en materia de turismo hasta el Tratado de Lisboa ha generado la necesidad de buscar otros mecanismos para intervenir en dicha materia, lo que ha sido propiciado por el carácter transversal y horizontal del turismo, concepto sobre el cual profundizaremos con posterioridad.

De cualquier modo, a finales del s. XX y principios del s. XXI diversos factores como la ralentización del crecimiento de la UE como destino turístico, el crecimiento demográfico, la introducción del euro o la liberalización de los transportes dieron lugar a un cambio de estrategia respecto al turismo en la Unión Europea. En su Comunicación “Una nueva política turística europea: hacia una mayor colaboración en el turismo europeo”¹⁴, la Comisión articula una política turística nueva, coherente y coordinada gracias a la integración de diferentes medidas relacionadas con el turismo que, de forma aislada, ya tenían precedentes. Nos referimos a medidas legislativas, coordinación de políticas económicas, medidas financieras y determinados aspectos concretos de gestión y fomento.

Todos estos cambios van a verse reflejados en el Tratado de Lisboa, el cual crea la base jurídica para una política europea en materia de turismo en el Título I, artículo 6, letra d) del TFUE y en el Título XXII, artículo 195, del mismo tratado. Antes de entrar en la regulación conviene destacar que fue en el Tratado de Lisboa donde se establece, por vez primera, la clasificación que clarifica los tipos de competencias que podemos encontrar entre los Estados miembros y la Unión Europea: competencias exclusivas¹⁵, competencias compartidas¹⁶ y competencias de apoyo, coordinación y complemento. Fue precisamente en estas últimas, ámbitos donde la acción de la Unión es complementaria de la de los Estados miembros

⁶ El TUE establecía sus objetivos, los cuales debían alcanzarse mediante el establecimiento de un mercado común y de una unión económica y monetaria y mediante la realización de políticas o acciones comunes, entre ellas se incluyeron “medidas en los ámbitos de la energía, de la protección civil y el turismo”.

⁷ Propuesta de Decisión del Consejo sobre primer programa plurianual a favor del turismo europeo “Philoxenia” (1997-2000). COM (96) 168 final 30.4.1996 Bruselas DO C 222 31.7.96, p.9.

⁸ COM (95) final, Bruselas, 4.4.1995.

⁹ “Primeras orientaciones para una política comunitaria del Turismo”. DOCE 115/1984, de 30.4.1984, serie C.

¹⁰ No fue la Comisión la única institución que justificó la ausencia de una política comunitaria del turismo en el principio de subsidiariedad. En 1990, el Comité Económico y Social indicaba en su “Dictamen sobre turismo y desarrollo regional” [DOCE 332/1990, de 31.10.90, serie C, apartado 4º] que “El turismo concierne a las autoridades locales y a las empresas [...] por lo que debe aplicarse el principio de subsidiariedad”. En 1992, el Consejo entendió en su “Decisión de 13 de julio por la que aprobaba un Plan de acciones comunitarias a favor del turismo” [DOCE 421-71992, de 13.08.1992, Serie L] que las medidas que se aplicaran en desarrollo del plan de actuación aprobado debían ajustarse a determinados criterios, “en particular deberán respetar el principio de subsidiariedad”. Por último, en 1995, el Parlamento Europeo solicitó en su “Resolución sobre el Informe de la Comisión concerniente a las acciones comunitarias 2 que afectan al turismo” la inclusión en el Tratado de un título específico referido al turismo “en el respeto al principio de subsidiariedad”.

¹¹ DOCE C 138, 18.05.1999.

¹² COM (2001) 665 final, Bruselas, 13.11.2001.

¹³ Además, el ejecutivo comunitario llevó a cabo medidas como la celebración de un Foro Europeo del Turismo en 2002, la constitución de un Grupo de turismo sostenible en 2004, la creación de “Destinos Europeos de Excelencia” (EDEN) desde 2006, la adopción de una Agenda para la sostenibilidad y la competitividad del turismo europeo en 2007, la constitución de una Cuenta Satélite de Turismo (marco estadístico contable en el sector turístico que mide bienes y servicios). Para más información Vid. Augusto González Alonso (2009).

¹⁴ COM (2006) 134 final, 17 de marzo de 2006.

¹⁵ En las competencias exclusivas solo la Unión podrá legislar y adoptar actos jurídicamente vinculantes, mientras que los Estados miembros solo podrán hacerlo si la Unión los habilita para ello (Art. 2.1 TFUE).

¹⁶ En las competencias compartidas, la UE y los Estados miembros son titulares de las competencias y concurren ambos a regularlas. Sin embargo, los Estados solo ejercen su competencia su la Unión no ha ejercido la suya o ha decidido dejar de ejercerla y solo en la medida en que no lo haya hecho (conocido principio de “campo quemado”). (Art. 2.2 TFUE)

y donde queda excluida la armonización de las disposiciones legislativas y reglamentarias de los Estados miembros, donde encontró encaje el turismo (Art. 6 d) TFUE). Por su parte, el art.195 del TFUE habilita al Parlamento Europeo y al Consejo para que establezcan con arreglo al procedimiento legislativo ordinario, medidas específicas que completen la actuación de los Estados miembros en el sector turístico.

Habiéndose consolidado la base jurídica, de conformidad con la nueva regulación de los Tratados y en línea con lo acordado en la Conferencia de alto nivel y la reunión ministerial informal celebradas en Madrid los días 14 y 15 de abril de 2010, se propuso actuar sobre cuatro ejes de la nueva Política Europea de Turismo: fomentar la competitividad del sector turístico en Europa; promover el desarrollo de un turismo sostenible, responsable y de calidad; consolidar la imagen y la visibilidad de Europa como conjunto de destinos sostenibles y de calidad; y maximizar el potencial de las políticas y los instrumentos financieros de la Unión Europea para el desarrollo del turismo.

3. EL TURISMO COMO POLÍTICA TRANSVERSAL U HORIZONTAL

Pese a todos estos avances hacia la consolidación de una política europea en materia de turismo, no podemos olvidar la concepción primigenia que la UE ha mantenido y continua manteniendo en materia de turismo respecto al principio de subsidiariedad y a las competencias de los Estados miembros sobre la misma. Muestra de ello es que, salvando ciertas actuaciones institucionales, como muestran diversas Comunicaciones de la Comisión¹⁷, no se ha materializado ni se ha llevado a la práctica el art. 195 del TFUE que habilitaba al Parlamento y al Consejo para tomar medidas concretas en materia de turismo. De hecho el Consejo no ha accedido a la petición del Parlamento para crear un programa específico para el turismo en el marco de las perspectivas financieras 2014-2020.

Por todo ello, el turismo es un sector cuyo éxito depende de hacer converger diversas políticas necesarias para superar las dificultades que se plantean en una actividad que se fundamenta en la prestación privada de servicios pero que necesita de recursos, bienes e infraestructuras públicas¹⁸. En definitiva, como afirma Villanueva Cuevas (2012, p. 96) “es necesaria la coordinación del turismo con muy diversas políticas públicas que no son turísticas en su naturaleza pero que afectan y se ven afectadas por la práctica del turismo [...]. Ello pone de relieve, por un lado, la horizontalidad como característica que debe regir la relación del turismo con tales políticas públicas, y por otro lado, la transversalidad que debe identificar el tratamiento conjunto de turismo y de tales políticas públicas [...] sea cual sea el ente público con competencias en esa materia”. Es lo que ha sido definido por el Libro Verde de la Comisión en materia de turismo como “medidas indirectas”¹⁹. Con un carácter ciertamente premonitorio, la Comisión ya destacó en 1984 en la mencionada Comunicación “Política comunitaria de turismo, primeras orientaciones” “el gran número de actividades comunitarias que influyen directa o indirectamente sobre el turismo. De la libre circulación de personas a la libre prestación de servicios turísticos, hasta el desarrollo regional y la protección del medio ambiente, pasando por el transporte de viajeros [...]” y destaca la necesidad de otorgar “una dimensión turística” a las anteriores políticas comunitarias²⁰.

Como conclusión podemos decir que el carácter transversal u horizontal del turismo han caracterizado la intervención de la Unión Europea en esta materia “influyendo de manera determinante en que la misma se ha producido (...) porque ha permitido una intervención sectorial o indirecta en el turismo a través de otras políticas comunitarias con las que este tiene relación que ha sido y es la única manera de articular un marco común a nivel supranacional de aspectos esenciales para la práctica del mismo (...)” (Villanueva Cuevas, 2012, p. 100).

4. LA INFLUENCIA DE LAS COMPETENCIAS DE LA UNIÓN EN MATERIA DE LIBRE CIRCULACIÓN Y MEDIO AMBIENTE EN EL TURISMO

Como hemos podido observar existen numerosas materias, en las que la Unión tiene competencias exclusivas o compartidas, que afectan y se ven afectadas por el turismo. A continuación profundizaremos en dos de ellas que prefiguran

¹⁷ Comunicación de 19 de octubre de 2007 “Agenda para un turismo europeo sostenible y competitivo” [COM (2007) 621]; Comunicación de 30 de junio de 2010 “Europa, primer destino turístico del mundo: un nuevo marco para el turismo europeo” [COM (2010) 352]; Comunicación de 7 de noviembre de 2010 “Aplicación y desarrollo de la política común de visados como estímulo del crecimiento en la UE” [COM (2012) 649] y Comunicación de 20 de febrero de 2014 “Una estrategia europea para un mayor crecimiento y empleo en el turismo costero y marítimo” [COM (2014) 86].

¹⁸ Libro Verde de la Comisión sobre el papel de la Unión en materia de turismo, op.cit., p.15.

¹⁹ Libro Verde de la Comisión, op.cit., p.10.

²⁰ Como muestra de ello a continuación se van a enumerar (sin ánimo exhaustivo) una serie de normas y actuaciones que, siendo aprobadas con fundamento en otras competencias, tienen influencia sobre el turismo:

A) Protección de los consumidores: Directiva 2005/29/CE del Parlamento Europeo y del Consejo de 11 de mayo de 2005 relativa a las prácticas comerciales desleales de las empresas en sus relaciones con los consumidores en el mercado interior; Reglamento (CE) 2006/2004 del Parlamento Europeo y del Consejo de 27 de octubre de 2004 sobre la cooperación entre las autoridades encargadas de la aplicación de la legislación de protección de los consumidores; Directiva 2008/122/CE del Parlamento Europeo y del Consejo de 14 de enero de 2009, relativa a la protección de los consumidores con respecto a determinados aspectos de los contratos de aprovechamiento por turno de los bienes de uso turístico, de adquisición de productos vacacionales de larga duración, de reventa y de intercambio; Reglamento (UE) 1177/2010 del Parlamento Europeo y del Consejo de 24 de noviembre de 2010 sobre los derechos de los pasajeros que viajan por mar y por vías navegables y por el que se modifica el Reglamento (CE) 2006/2004; Reglamento 181/2011 del Parlamento Europeo y del Consejo de 16 de febrero de 2011 sobre los derechos de los viajeros de autobús y autocar y por el que se modifica el Reglamento CE 2006/2004; Directiva 2015/2302/UE del Parlamento Europeo y del Consejo, de 25 de noviembre, relativa a los viajes combinados y a los servicios vinculados.

B) Servicios: Directiva 2006/123/CE del Parlamento Europeo y del Consejo de 12 de diciembre de 2006, relativa a los servicios en el mercado interno, en el marco de la UE. Esta Directiva tiene una gran importancia en lo relativo al ejercicio de la actividad turística ya que la actividad reguladora de la Administración mediante la técnica de la autorización pasa a ser sustituida por la declaración responsable y comunicación previa, según establezca la ordenación turística de cada Comunidad Autónoma. Ello, junto con otras medidas contempladas relativas a la simplificación administrativa, ha contribuido a facilitar los trámites para los empresarios del sector turístico.

C) Medio ambiente: Decisión 2003/287/CE de la Comisión de 14 de abril de 2003, por la que se establecen los criterios ecológicos para la concesión de la etiqueta ecológica comunitaria a los servicios de alojamiento turístico; Directiva 2006/77/CE, de 15 de febrero de 2006 relativa a la gestión de la calidad de las aguas de baño.

D) Desarrollo regional y empleo: En lo que respecta a la contribución que hacen las políticas de desarrollo regional y empleo al turismo en la UE debemos destacar las siguientes fuentes de fondos: Fondo Europeo de Desarrollo Regional (FEDER) para la financiación de proyectos sostenibles vinculados al turismo; Fondo Social Europeo (FSE) para el empleo; Fondo Europeo Agrícola de Desarrollo Rural (FEADER) para la diversificación de la economía rural y Fondo Europeo de Pesca (FEP) para la reconversión hacia el ecoturismo.

una línea de investigación²¹ que se completa con este trabajo.

4.1 La influencia histórica y actual de la libre circulación en el turismo

4.1.1 La progresiva consagración del derecho a la libre circulación en el Derecho de la Unión y su repercusión en el turismo

El principio de libre circulación y residencia se reconoció en 1951 en el Tratado de la CECA y desde 1957 en los Tratados de Roma. Dicho principio se concretó en tres libertades parciales de circulación de naturaleza esencialmente económica: trabajadores, establecimiento y servicios. Por lo tanto, al principio de la construcción europea, solo los agentes económicos se beneficiaban de la libertad de circulación de las personas. Sin embargo, gracias a la jurisprudencia del Tribunal de Justicia de la Unión Europea (TJUE), prácticamente desde los orígenes de la Unión los turistas pudieron disfrutar del principio de libre circulación. En la reveladora STJUE de 31 de enero de 1984 *Luisi y Carbone*, tras algunas consideraciones, el TJUE concluyó (apartado 16) que “la libertad de prestación de servicios comprende la libertad de los destinatarios de servicios a desplazarse a otro Estado miembro con el fin de hacer uso del servicio sin ser obstaculizados por restricciones (...)”²².

Ya en los años 90, a iniciativa española, el Tratado de Maastricht introdujo la nueva categoría de la ciudadanía de la Unión como instrumento para “reforzar la protección de los derechos e intereses nacionales de los estados miembros”²³. En virtud de la ciudadanía de la Unión se reconoció a los particulares, entre otros, el derecho a la libertad de circulación y residencia. Por consiguiente, desde ese momento, el principio de libre circulación se convierte en un derecho de carácter general, eliminándose su naturaleza meramente económica. Este cambio tuvo una importante repercusión respecto a los turistas nacionales de los Estados miembros, ya que su derecho a desplazarse libremente ya no solo se justificaba por una construcción pretoriana del TJUE sino que estaba y está reconocido positivamente. Desde este momento, por lo tanto, los turistas nacionales de algún Estado miembro disfrutaban del principio de libre circulación no como “agentes económicos” sino como “ciudadanos de la Unión”.

Pese al reconocimiento del derecho a la libre circulación en Derecho originario lo cierto es que este no se materializaba en la práctica debido al mantenimiento de las fronteras físicas entre los Estados miembros de la Unión. Por ello, el 14 de junio de 1985 la República Federal de Alemania, Francia, Bélgica, Holanda y Luxemburgo firmaron el Acuerdo de Schengen. Su objetivo inmediato era aligerar los controles en las fronteras comunes con la finalidad de hacer desaparecer las fronteras interiores en el futuro. Tras varias reuniones ministeriales, el Convenio de aplicación del Acuerdo Schengen de 1985 (CAAS) fue suscrito definitivamente, también en Schengen, el 19 de junio de 1990. Todo ello dio lugar a un denso entramado de normas, reglamentaciones, prácticas administrativas y mecanismos operativos denominado “acervo Schengen”.

Debemos puntualizar que el CAAS (Art. 2) dispone que “Las fronteras interiores podrán cruzarse en cualquier lugar sin que se realice control alguno de las personas”. La alusión al concepto “personas” no es baladí ya que, al contrario que el Tratado de Maastricht, está reconociendo el principio de libre circulación a toda persona que se encuentre en los Estados parte del Acuerdo Schengen, independientemente de su nacionalidad, y no únicamente a los “ciudadanos de la Unión”²⁴.

Podemos deducir de todo lo anterior que, en la década de los 90 existían dos regulaciones paralelas en materia de libre circulación que afectaban a los Estados miembros de la Unión Europea, la comunitaria (escasamente desarrollada y materializada) y la derivada de los Acuerdos Schengen (la cual suponía una verdadera puesta en marcha de la eliminación de las fronteras interiores con la consiguiente unión de las exteriores). Con el Tratado de Ámsterdam, en vigor desde mayo de 1999, se pone fin a esta situación mediante una inteligente operación jurídica que incorpora el acervo Schengen a la Unión Europea a través de un Protocolo anejo al Tratado.

Desde el Tratado de Lisboa el derecho a la libre circulación se constituye como competencia compartida entre la Unión y los Estados miembros dentro del Espacio de Libertad, Seguridad y Justicia. Su regulación actual la encontramos, fundamentalmente, en dos normas de derecho derivado: la Directiva 2004/38/CE de 29 de abril de 2004 relativa al derecho de los ciudadanos de la Unión y de los miembros de sus familias a circular y residir libremente por el territorio de los Estados miembros y el Reglamento (UE) 2016/399 de 9 de marzo de 2016 por el que se establece un Código de normas de la Unión para el cruce de las personas por las fronteras (Código de Fronteras Schengen o CFS).

4.1.2 Los límites a la libre circulación en la Unión Europea y su repercusión en el turismo

A) Los límites impuestos por la Directiva 2004/38/CE

El objeto de esta directiva es triple: regula las condiciones de ejercicio del derecho de libre circulación y residencia de los ciudadanos de la UE y de los miembros de sus familias; el derecho de residencia permanente y la restricción de dichos derechos por razones de orden público, seguridad y salud pública. En lo que aquí interesa haremos mención al primer y tercer objeto.

Dado que los desplazamientos con finalidad turística no se producen por un largo periodo de tiempo, la directiva establece explícitamente (art.6) que si la estancia fuese inferior a tres meses el único requisito exigible a los ciudadanos de la Unión es la

²¹ Vid. M^a Teresa Acosta Penco (2016 y 2017)

²² STJUE de 31 de enero de 1984, *G. Luisi y HG. Carbone c. Ministerio del Tesoro*, asuntos acumulados 286/82 y 26/83. La sentencia responde a dos cuestiones prejudiciales que se suscitaron en el marco de procedimientos de impugnación promovidos por dos residentes italianos contra resoluciones del Ministerio del Tesoro por las que les fueron impuestas sanciones pecuniarias por haber adquirido diversas divisas extranjeras, con vistas a su utilización en el extranjero, por un contravalor en liras italianas de importe superior al máximo permitido por la legislación italiana, que en esa época era de 500.000 LIT por año para la exportación de divisas efectuadas por residentes con fines de turismo, de negocios, de estudios y de cuidados médicos.

²³ Artículo B del Tratado de Maastricht, firmado el 7 de febrero de 1992.

²⁴ La consecuencia más importante es que, por ejemplo, un ciudadano estadounidense que se encontrara haciendo turismo en Francia en 1996 podía cruzar la frontera a Alemania sin ningún tipo de control de acuerdo con el acervo Schengen pero no de acuerdo con la normativa comunitaria. Sin embargo, un turista italiano que se encontrara haciendo turismo en Francia en la misma fecha, podía cruzar la frontera a Alemania sin ningún tipo de control amparándose en la normativa derivada de Schengen pero también en la normativa comunitaria, como “ciudadano de la Unión”.

posesión de un documento de identidad o pasaporte válidos²⁵. Los familiares no nacionales comunitarios se beneficiarán del mismo derecho que el ciudadano del que vengan acompañados, pero se les podrá exigir un visado para residencias de breve duración. Por otra parte, la directiva establece una relación de supuestos en los que se puede restringir el derecho de entrada por razones de orden público, seguridad o salud pública. Así pues, en virtud del art. 27, cualquier medida que afecte a la libertad de circulación y de residencia debe respetar el principio de proporcionalidad y basarse exclusivamente en la conducta personal del individuo al que se aplique, de manera que solo estará justificada la expulsión o denegación de entrada cuando dicha conducta represente una amenaza real y suficientemente grave para los intereses fundamentales del Estado²⁶. Por su parte el art. 29, en relación con la salud pública, establece que “Las únicas enfermedades que podrán justificar una medida que limite la libertad de circulación serán las enfermedades con potencial epidémico como se definen en los instrumentos correspondientes de la OMS, así como otras enfermedades infecciosas o parasitarias contagiosas siempre que sean, en el país de acogida, objeto de disposiciones de protección para los nacionales”.

B) Los límites impuestos por el Código de Fronteras Schengen

Como hemos señalado anteriormente, el Espacio Schengen se caracteriza por la ausencia de fronteras interiores entre los Estados firmantes del Acuerdo y el establecimiento de unas fronteras exteriores comunes. Sin embargo, en determinadas ocasiones y bajo unas condiciones específicas, el propio Código de Fronteras Schengen permite el restablecimiento de controles fronterizos entre Estados miembros. Existen dos regímenes: el régimen general de restablecimiento de controles fronterizos por amenaza grave para el orden público o la seguridad interior de un Estado miembro y el régimen específico de restablecimiento de controles fronterizos por circunstancias excepcionales que pongan en peligro el espacio sin fronteras interiores.

El primero de ellos existe desde el Convenio de Aplicación del Acervo Schengen de 1990 y prevé el restablecimiento de controles fronterizos por motivos de seguridad y orden público para casos de acontecimientos previsibles (como la Eurocopa de Fútbol o la Cumbre Europeas e Internacionales celebradas en los Estados miembros) y para casos que requieran una actuación inmediata (como el atentado terrorista de París, que provocó el restablecimiento de controles por parte de Bélgica).

Este régimen comenzó a demostrar sus carencias para hacer frente a las oleadas de inmigrantes provenientes del norte de África desde la primavera de 2011 por lo que, a través del Reglamento (UE) 1051/2013²⁷, se configuró el régimen de restablecimiento de controles en circunstancias excepcionales en virtud del cual “Cuando el informe de evaluación elaborado según las disposiciones del Reglamento (UE) 1053/2013²⁸ muestre graves deficiencias en el control de las fronteras del Estado miembro, la Comisión podrá recomendar mediante actos de ejecución la adaptación por parte del Estado miembro de ciertas medidas específicas (...)”. Cuando las circunstancias persistan, el CFS en su art.29 establece la posibilidad, para los demás Estados miembros, de restablecer sus controles fronterizos internos por un periodo no superior a seis meses, prorrogable hasta en tres ocasiones, siempre que dichas circunstancias representen una amenaza grave (como ha ocurrido en Grecia en 2015)²⁹.

Asimismo, la nueva redacción dada al art.29.1 del CFS por parte del Reglamento (UE) 2016/1324 sobre la Guardia Europea de Fronteras y Costas³⁰, permite también el restablecimiento de controles fronterizos internos como consecuencia del incumplimiento, por parte de un Estado miembro, de la decisión del Consejo a que se refiere el art. 19.1 de este último reglamento³¹.

C) Consecuencias para el turismo de los límites impuestos al principio de libre circulación

El restablecimiento temporal de controles fronterizos supone aumentar la intensidad de los mismos en parte o la totalidad

²⁵ Además, tal y como recalco el TJUE en la Sentencia *Onlane* de 17 de febrero de 2005 “si, pese a no presentar documento de identidad o pasaporte válido, el interesado puede, no obstante acreditar inequívocamente su nacionalidad por otros medios, el Estado miembro de acogida no puede cuestionar su derecho de residencia debido únicamente a que no presentó uno u otro de los medios mencionados”.

²⁶ En este ámbito es de especial importancia la STJUE *Calfa* de 19 de enero de 1999, asunto C- 348/96. En la misma, un tribunal griego planteaba al TJUE (mediante cuestión prejudicial) si la normativa comunitaria en materia de libre circulación (Tratado y Directivas) y el principio de igualdad se oponían a una legislación, como la griega, que obligaba al juez nacional a ordenar la expulsión de por vida de un nacional de otro Estado miembro por razones de orden público y seguridad pública por el mero hecho de que dicho nacional hubiera cometido en el Estado de acogida, en el que se hallaba legalmente como turista, los delitos de adquisición de estupefacientes exclusivamente para su consumo personal, cuando la referida expulsión implicaba la imposibilidad legal de que el interesado volviera al país para ejercer las actividades previstas por el Derecho comunitario. El TJUE determinó que “únicamente puede adoptarse una medida de expulsión contra una nacional comunitaria como la Sra. Calfa si, además de infringir la Ley de estupefacientes, su comportamiento personal crea una amenaza real y suficientemente grave que afecte al interés fundamental de la sociedad” (apartado 25).

²⁷ Reglamento (UE) 1051/2013 del Parlamento Europeo y del Consejo de 22 de octubre de 2013 por el que se modifica el Reglamento (CE) no 562/2006 con el fin de establecer normas comunes relativas al restablecimiento temporal de controles fronterizos en las fronteras interiores en circunstancias excepcionales.

²⁸ Reglamento (UE) No 1053/2013 del Consejo de 7 de octubre de 2013 por el que se establece un mecanismo de evaluación y seguimiento para verificar la aplicación del acervo de Schengen, y se deroga la Decisión del Comité Ejecutivo de 16 de septiembre de 1998 relativa a la creación de una Comisión permanente de evaluación y aplicación de Schengen.

²⁹ Vid. M^a Teresa ACOSTA PENCO (2017)

³⁰ La nueva redacción del art. 29.1 del nuevo CFS queda así: “1. En circunstancias excepcionales que pongan en riesgo el funcionamiento general del espacio sin controles en las fronteras interiores como consecuencia de las deficiencias graves persistentes en los controles de las fronteras exteriores según el artículo 21 del presente Reglamento, o como consecuencia del incumplimiento por parte de un Estado miembro de la Decisión del Consejo a que se refiere el artículo 19, apartado 1, del Reglamento (UE) 2016/1624 del Parlamento Europeo y del Consejo, y en la medida en que dichas circunstancias representen una amenaza grave para el orden público o para la seguridad en el espacio sin controles en las fronteras interiores o en partes del mismo, los Estados miembros podrán restablecer los controles fronterizos interiores con arreglo al apartado 2 del presente artículo por un periodo que no supere los seis meses. Ese periodo podrá prolongarse en tres ocasiones, como máximo, por un periodo de hasta seis meses, en caso de que persistan las circunstancias excepcionales”.

³¹ Art 19 Reglamento (UE) 2016/1624: “1. Cuando el control de las fronteras exteriores se vuelva tan ineficaz que pueda poner en peligro el funcionamiento del espacio Schengen, porque:

a) un Estado miembro no tome las medidas necesarias fijadas en una decisión del consejo de administración, según lo dispuesto en el artículo 13, apartado 8, o
b) un Estado miembro que se enfrente a un reto concreto y desproporcionado en las fronteras exteriores no haya solicitado ayuda suficiente a la Agencia en virtud de los artículos 15, 17 o 18 o bien no está dando los pasos necesarios para adoptar las medidas establecidas en dichos artículos
el Consejo, a propuesta de la Comisión, podrá adoptar sin demora, mediante un acto de ejecución, una decisión en la que se fijen las medidas que deberá adoptar la Agencia al objeto de aminorar dichos riesgos y en la que se exija al Estado miembro implicado que coopere con la Agencia en su aplicación. La Comisión consultará a la Agencia antes de formular su propuesta (...).
10. Si el Estado miembro en cuestión no ejecuta la decisión del Consejo a que se refiere el apartado 1 en el plazo de 30 días y no coopera con la Agencia con arreglo a lo dispuesto en el apartado 8 del presente artículo, la Comisión podrá activar el procedimiento previsto en el art. 29 del Reglamento (UE) 2016/399.

de las fronteras interiores. La intensidad y tipo de controles dependen de la razón que provoque el restablecimiento de los controles fronterizos y el país en el que se produzcan.

Los controles (sistemáticos o aleatorios) pueden efectuarse en automóviles, trenes, ferris, barcos autobuses, puertos y aeropuertos. Los documentos requeridos pueden ir desde el documento nacional de identidad o pasaporte (para ciudadanos de la UE) y el permiso de residencia o el visado (para extracomunitarios). Igualmente se podrán consultar bases de datos para la identificación de personas, inspeccionar los equipajes, comprobar la justificación de la estancia o la suficiencia de medios de subsistencia³².

En conclusión, se pasa de la mera necesidad de portar un documento identificativo a la posibilidad de ser expuesto a un número indeterminado de controles para poder atravesar las fronteras internas de la Unión Europea. Ello sin duda tiene consecuencias importantes en los desplazamientos turísticos y su intensidad durante estos periodos en los que se restablecen los controles fronterizos.

4.2 La influencia de la Política de medio ambiente de la Unión Europea en el turismo. Un estudio jurisprudencial

Como apuntó el *Informe sobre el estado y las tendencias de los tipos de hábitats y las especies regulados por las Directivas de Aves y de Hábitats durante el período 2007-2012*³³ “el desarrollo [en Europa] en particular durante el siglo XX, ha provocado una destrucción a gran escala de la naturaleza. Entre 1900 y mediados de los ochenta, Europa ya había perdido dos terceras partes de sus humedales y casi tres cuartas partes de sus dunas y brezales, debido a una combinación de factores como el cambio de uso de la tierra, la construcción de infraestructuras, la contaminación o la expansión urbanística”. En no pocas ocasiones todos estos factores que provocan un reconocido impacto medioambiental están íntimamente relacionados con el turismo, al menos con el turismo no sostenible.³⁴

4.2.1 Rasgos fundamentales de la Política Medioambiental de la Unión Europea

La política de medio ambiente de la Unión se remonta a la cumbre de Jefes de Estado y de Gobierno celebrada en París en 1972³⁵, en el que los Jefes de Estado y de Gobierno de los Estados miembros de las Comunidades Europeas “reconocieron la necesidad de establecer una política comunitaria en materia de medio ambiente que acompañara la expansión económica [...]” (Ohliger, 2016). Con posterioridad y periódicamente, en cada una de las revisiones de los Tratados se ha ido reforzando el compromiso de la Comunidad con la protección del medio ambiente.

En la actualidad, la regulación del medio ambiente plasmada en el Derecho originario la encontramos en los artículos 11 y 191-193 del TFUE. Un análisis somero de los objetivos y principios en materia de medio ambiente recogidos en el art. 191 TFUE nos da una visión general de la política medioambiental en la UE. Este precepto establece que “La política de la Unión en el ámbito del medio ambiente contribuirá a alcanzar los siguientes objetivos: la conservación, la protección y la mejora de la calidad del medio ambiente; la protección de la salud de las personas; la utilización prudente y racional de los recursos naturales; el fomento de medidas a escala internacional destinadas a hacer frente a los problemas regionales o mundiales del medio ambiente, y en particular la lucha contra el cambio climático”. Por su parte, el apartado segundo de este mismo artículo dispone que “[la política medioambiental de la Unión] se basará en los principios de cautela y de acción preventiva, en el principio de corrección de los atentados al medio ambiente, preferentemente en la fuente misma, y en el principio de quien contamina paga”.

En cuanto al Derecho derivado, debido al objeto del estudio jurisprudencial que se planteará a continuación, debemos hacer especial hincapié en la Directiva 92/43/CEE del Consejo de 21 de mayo de 1992 relativa a la conservación de los hábitats naturales y la flora y la fauna silvestres o Directiva Hábitats. Esta tiene como objetivo global “contribuir a garantizar la biodiversidad mediante la conservación de los hábitats naturales y la fauna y flora silvestres en el territorio europeo de los Estados miembros” (art. 2.1).³⁶

Muñoz Flores (2007, p. 158) apunta que, para cumplir este objetivo global al que hacíamos referencia, la Directiva Hábitats se estructura en dos grandes objetivos más concretos: la creación de la Red Natura 2000 para la conservación de los hábitats naturales (arts. 3 a 11, sobre los que haremos especial hincapié de ahora en adelante) y el establecimiento de un sistema de protección global de especies (arts. 12 a 16 y 22).

La Red Natura 2000, que representa hoy día un 18% aproximadamente del territorio de la UE, está integrada por dos tipos de espacios: las Zonas Especiales de Conservación (ZECs) y las anteriormente creadas por la Directiva Aves³⁷ Zonas de Especial Protección para las Aves (ZEPAs). Centrándonos, por motivos de contenido de este trabajo, en las zonas especiales de conservación (ZECs), su designación se hace en tres etapas. En primer lugar, cada Estado miembro prepara una lista de

³² Consejo de la Unión Europea, Informes sobre la reintroducción de los controles en las fronteras interiores: 16973/11 de 16 de noviembre de 2011; 10491/12 de 31 de mayo de 2012; 6346/13 de 18 de febrero de 2013; 17183/13 de 9 de diciembre de 2013; 10268/1/14 de 28 de mayo de 2014; 10268/14 de 28 de mayo de 2014 y 13818/14 de 24 de octubre de 2014.

³³ Informe de 20 de Mayo de 2015 de la Comisión al Consejo y al Parlamento Europeo: Informe sobre el estado y las tendencias de los tipos de hábitats y las especies regulados por las Directivas de Aves y de Hábitats durante el período 2007-2012 exigido en virtud del artículo 17 de la Directiva de Hábitats y del artículo 12 de la Directiva de Aves. COM [2015] 219 final

³⁴ STJUE de 31 de enero de 1984, *G. Lauij y HG. Carbone c. Ministerio del Tesoro*, asuntos acumulados 286/82 y 26/83. La sentencia responde a dos cuestiones prejudiciales que se suscitaron en el marco de procedimientos de impugnación promovidos por dos residentes italianos contra resoluciones del Ministerio del Tesoro por las que les fueron impuestas sanciones pecuniarias por haber adquirido diversas divisas extranjeras, con vistas a su utilización en el extranjero, por un contravalor en liras italianas de importe superior al máximo permitido por la legislación italiana, que en esa época era de 500.000 LIT por año para la exportación de divisas efectuadas por residentes con fines de turismo, de negocios, de estudios y de cuidados médicos.

³⁵ Celebrado tras la conferencia de las Naciones Unidas sobre el Medio Humano en 1972, conocida como Conferencia de Estocolmo, en la que se abordaron por primera vez temas relacionados con el medio ambiente.

³⁶ Fue traspuesta al ordenamiento español mediante el Real Decreto 1997/1995 de 7 de diciembre, por el cual se establecen medidas para contribuir a garantizar la biodiversidad mediante la protección de los hábitats naturales y de la fauna y flora (BOE núm.310, de 28 de diciembre de 1995).

³⁷ Directiva 2009/147/CE del Parlamento Europeo y del Consejo, de 30 de noviembre de 2009, relativa a la conservación de las aves silvestres que sustituyó a la Directiva 79/409/CEE del Consejo, de 2 de abril de 1979, relativa a la conservación de las aves silvestres. La directiva trata de conservar todas las aves silvestres de la UE estableciendo normas para su protección, gestión y control.

lugares con hábitats naturales y especies de fauna y flora silvestres. En segundo lugar, a partir de esas listas nacionales y de acuerdo con los Estados miembros, la Comisión elabora una lista de Lugares de Importancia Comunitaria (LICs) para cada una de las nueve regiones biogeográficas de la UE³⁸. Por último, en un plazo máximo de seis años tras la selección de un emplazamiento como LIC, el Estado miembro interesado designa el lugar como ZEC.

Coincidimos con Krämer (2012, p. 119 y ss.) en que “el nuevo sistema de la Directiva Hábitat fijó un criterio uniforme [de protección] para todos los Estados miembros”. En relación con este objetivo armonizador conviene destacar la regulación plasmada en el art. 6 de la Directiva. En virtud de su apartado tercero una vez catalogada un área como LIC, las posibilidades de los Estados miembros de autorizar planes, programas o proyectos que pudieran afectar al área seleccionada estaban limitados.

4.2.2 Estudio jurisprudencial: Los recursos contra Irlanda, Italia y Bulgaria

La base del estudio jurisprudencial la constituirán tres sentencias del Tribunal de Justicia de la Unión Europea (en adelante TJUE) en las que se declara el incumplimiento por parte de Italia, Bulgaria e Irlanda de la Directiva Hábitats. En todos estos casos la expansión turística en detrimento del medio ambiente es el origen de las sentencias:

A) El incumplimiento declarado contra Irlanda

En la STJUE de 11 de enero de 2007, *Comisión c. Irlanda*, asunto C-183/05 el Tribunal de Justicia valoró si la República de Irlanda estaba vulnerando el art. 12 de la Directiva Hábitats, el cual obliga a implantar un “sistema de protección rigurosa de las especies animales que figuran en la letra a) del Anexo IV”. En concreto, se refería a las poblaciones de murciélagos que, según la Comisión, estaban siendo afectadas por haber autorizado el proyecto de restauración y renovación del *Lough Rynn Castle Hotel* sin tener en cuenta previamente un Estudio de Impacto Ambiental.

En su fallo el Tribunal de Justicia declaró que la República de Irlanda estaba vulnerando el art.12 de la Directiva Hábitats. En concreto, argumentó el Tribunal (apartado 36 de la sentencia) que “la autorización de un proyecto [Proyecto de renovación y restauración del *Hotel Lough Rynn*] antes de la realización del estudio de impacto ambiental que determina las consecuencias negativas del proyecto para el medio ambiente demuestra que las especies incluidas en el anexo IV, letra a), de la Directiva 92/43 [los murciélagos], así como sus zonas de reproducción y de descanso, están sometidas a perturbaciones y amenazas que la normativa irlandesa no permite evitar. Por lo tanto [...] no puede considerarse que se hayan adoptado todas las medidas para instaurar efectivamente el sistema de protección rigurosa” (apartado 37).

B) El incumplimiento declarado contra Italia

En la STJUE de 10 de junio de 2010, *Comisión c. Italia*, as. C-491/08, el Tribunal de Justicia valoró si la República de Italia había incumplido el art. 6.2 de la Directiva Hábitats en virtud del cual “Los Estados miembros adoptarán las medidas apropiadas para evitar, en las zonas especiales de conservación, el deterioro de los hábitats naturales y de los hábitats de especies, así como las alteraciones que repercutan en las especies que hayan motivado la designación de las zonas, en la medida en que dichas alteraciones puedan tener un efecto apreciable en lo que respecta a los objetivos de la presente Directiva”. Concretamente, por permitir que se construyera un complejo turístico e inmobiliario (*SCI Arena*) en un lugar calificado como LIC (Lugar de Importancia Comunitaria).

En su fallo, el Tribunal declaró el incumplimiento del mencionado art. 6.2 de la Directiva Hábitats “al no haber adoptado (...) medidas apropiadas para evitar el deterioro de los hábitats naturales que han motivado la designación del mencionado lugar de importancia comunitaria”³⁹.

C) El incumplimiento declarado contra Bulgaria

En la STJUE de 14 de enero de 2016, *Comisión c. Bulgaria*, as. C-141/14, el Tribunal de Justicia valoró si la República de Bulgaria había incumplido el mencionado art. 6.2 de la Directiva Hábitats por permitir que se ejecutaran proyectos turísticos (*Thracian Cliffs Golf & Spa Resort*) en una ZEC (Zona Especial de Conservación), autorizados antes de la adhesión de Bulgaria a la Unión Europea.

En su fallo, el Tribunal de Justicia declaró el incumplimiento, por parte de la República de Bulgaria y al igual que Italia, de las obligaciones que se desprenden del art. 6.2 de la Directiva sobre los hábitats, al no haberse opuesto a la ejecución del proyecto *Thracian Cliffs Golf & Spa* en el LIC de Kaliakra. Es importante destacar que el TJUE no declaró el incumplimiento de Bulgaria por la autorización de este proyecto en 2005 (antes de su adhesión a la Unión Europea), ya que no le era aplicable la Directiva Hábitats, sino por no haberse opuesto a su ejecución tras la adhesión y por el consiguiente deterioro del LIC.⁴⁰

³⁸ La región alpina, la región atlántica, la región del Mar Negro, la región boreal, la región continental, la región macaronésica, la región mediterránea, la región panónica y la región estépica.

³⁹ Con tales medidas se refería al tardíamente aprobado “Plan de Gestión de Arenas SCI”, preparado por las autoridades italianas pero no aprobado hasta después de haber finalizado el plazo dado por la Comisión en el dictamen motivado. En dicho Plan se hacía una revisión del proyecto turístico y el complejo inmobiliario, en concreto en relación con el volumen de los edificios previstos. De hecho, las obras serían rediseñadas para que no tuvieran un impacto excesivo en el sistema de hábitats afectados.

⁴⁰ De hecho, el mencionado proyecto turístico incluía la construcción de un campo de golf y de una estación termal, para lo cual Bulgaria expidió licencia de construcción el 22 de diciembre de 2005 (antes de su adhesión a la UE), mientras que la licencia de explotación fue concedida el 6 de abril de 2010 (después de su adhesión a la UE, el 1 de enero de 2007, junto con la República de Rumanía).

5. EL DERECHO ESPAÑOL DEL TURISMO: ¿ORDENAMIENTO ESTATAL Y ORDENAMIENTOS REGIONALES?

5.1 A título introductorio: el sistema constitucional de distribución de las competencias normativas

La Constitución española de 1978 reconoce un Estado descentralizado: el llamado Estado de las Autonomías, un modelo de Estado híbrido entre el modelo del Estado federal y el modelo del Estado regional. Ya en su mismo artículo 2, tras proclamar la Unidad de la Nación española, “reconoce y garantiza el derecho a la autonomía de las regiones y nacionalidades que la integran”. Pero ¿en qué consiste esa autonomía regional o “de las nacionalidades”? La respuesta está en el Título VIII de la Constitución, titulado “De la organización territorial del Estado”.

El punto de partida es el artículo 137⁴¹, porque contiene el reconocimiento constitucional de la autonomía de las organizaciones o entidades territoriales que integran el Estado español: los municipios, las provincias y las regiones o nacionalidades; es decir, la Constitución reconoce que hay intereses locales (municipales y provinciales), intereses regionales e intereses nacionales o generales de España, y también reconoce la autonomía de cada una de esas entidades territoriales para gestionar sus respectivos intereses públicos. Y la autonomía se traduce en la atribución de competencias propias que consistirán en disponer de ciertas funciones públicas sobre algunas materias o asuntos públicos.

Ahora bien, la autonomía local no es la autonomía regional; por eso, el artículo 2 sólo se refiere a la autonomía de las regiones o las nacionalidades, no a la autonomía de municipios y provincias. Ciertamente, la autonomía local es una autonomía menor que la que tienen las regiones y nacionalidades; es una autonomía de gobierno y administrativa, disponiendo así el municipio/provincia de gobierno local autónomo y Administración pública local autónoma con competencias administrativas propias en materias o asuntos de interés municipal/provincial, conforme a lo dispuesto en los artículos 140 y 141 del texto constitucional⁴². En cambio, la autonomía regional es una autonomía, no sólo gubernativa-administrativa, sino también legislativa, por cuanto incluye, no sólo un Gobierno regional autónomo y una Administración pública regional autónoma con competencias administrativas propias en materias o asuntos de interés regional, sino que, además, conforme reconoce el artículo 152.1 de la Constitución, dispone del Poder Legislativo⁴³ en ciertas materias o asuntos de interés regional.

Se comprende que ya la propia Constitución, congruentemente con el cualificado valor constitucional de la autonomía regional (*ex* artículo 2), establezca las materias de competencia exclusiva del Estado y las de competencia exclusiva de las Comunidades Autónomas (CC AA), así como las materias de competencia compartida, encomendando en estas materias ciertas funciones públicas al Estado (la legislativa, por ejemplo) y a las CC AA otras funciones (las ejecutivas o administrativas). Y lo hace en los artículos 148 y 149 de la Constitución. Pero esta distribución de competencias no es tan simple o sencilla como pudiera deducirse de una mera lectura de ambas normas constitucionales⁴⁴; es cierto que en la Constitución española hay dos listas de atribución de competencias: la lista del artículo 148.1, con 22 apartados, se refiere a las materias de competencia autonómica exclusiva (“Las Comunidades Autónomas podrán asumir competencias en las siguientes materias:...”) y la lista del artículo 149.1, que tiene 32 apartados, se refiere a las materias de competencia estatal y de competencia compartida, pese a su desafortunado inicio (“El Estado tiene competencias exclusivas sobre las siguientes materias:...”); pero el artículo 148.1 de la Constitución no enumera las competencias de las Comunidades Autónomas que, de conformidad con lo establecido en el artículo 147.2.d) del texto constitucional, pueden asumir mediante su expresa previsión en sus respectivos Estatutos de Autonomía, sino que únicamente enuncia las competencias que podían asumir las CC AA durante los primeros cinco años. El propio artículo 148.2 dispone que “Transcurridos cinco años, y mediante la reforma de sus Estatutos, las Comunidades Autónomas podrán ampliar sucesivamente sus competencias dentro del marco establecido en el artículo 149”. Por tanto, la lista del artículo 149.1 de la Constitución es la realmente relevante, porque opera como límite para los Estatutos de Autonomía, que son las normas que realizan la efectiva distribución de las competencias para cada CC AA que no estén reservadas al Estado en el artículo 149.1 (principio dispositivo o de voluntariedad).

La complejidad del sistema constitucional de reparto de competencias autonómicas y estatales es aún mayor, porque las “materias” enunciadas en los artículos 148.1 y 149 no siempre están claramente delimitadas⁴⁵ y, en ocasiones, se superponen parcialmente o inciden unas en otras⁴⁶. Además, las dos listas no constituyen listas tasadas de materias, sino que, en parte en virtud de lo dispuesto en el art. 149.3⁴⁷, los Estatutos de Autonomía han establecidos nuevas materias o submaterias,

⁴¹ “El Estado se organiza territorialmente en municipios, en provincias y en las Comunidades Autónomas que se constituyan. Todas estas entidades gozan de autonomía para la gestión de sus respectivos intereses”.

⁴² Art. 140: “La Constitución garantiza la autonomía de los municipios. Estos gozarán de personalidad jurídica plena. Su gobierno y administración corresponde a sus respectivos Ayuntamientos, integrados por los Alcaldes y los Concejales...”. Art. 141: 1. La provincia es una entidad local con personalidad jurídica propia,... 2. El gobierno y la administración autónoma de las provincias estarán encomendados a Diputaciones u otras Corporaciones de carácter representativo...”

⁴³ Art. 152: “1... la organización institucional autonómica se basará en una Asamblea Legislativa elegida por sufragio universal con arreglo a un sistema de representación proporcional que asegure, además, la representación de las diversas zonas del territorio; un Consejo de Gobierno con funciones ejecutivas y administrativas, y un Presidente, elegido por la Asamblea, de entre sus miembros, y nombrado por el Rey, al que corresponde la dirección del Consejo de Gobierno la suprema representación de la respectiva Comunidad y la ordinaria del Estado en aquélla, El Presidente y los miembros del Consejo de Gobierno serán políticamente responsables ante la Asamblea.”

⁴⁴ No se parece al sistema utilizado por las Constituciones de los Estados federales, que realizan el reparto de competencias conforme a tres listas: las competencias del Estado federal o Federación, las competencias de los Estados miembros o federados, las competencias compartidas o mixtas; o, en otros términos, en las Constituciones de los Estados descentralizados, “o bien se enumeran en una sólo lista las competencias propias de la entidad superior (Estado Federal o simplemente Estado), correspondiendo todas las demás a los Estados Federados o Regiones o entidades miembros de la Federación; o bien se enumeran sólo, también en una única lista, las competencias de los Estados federados o entidades miembros de la unidad política superior, correspondiendo todas las demás a ésta o Estado Federal.

⁴⁵ Por ejemplo, la materia de competencia exclusiva estatal llamada “condiciones básicas que garanticen la igualdad de todos los españoles en el ejercicio de los derechos y en el cumplimiento de los deberes constitucionales” (art. 149.1.1a) de la Constitución).

⁴⁶ Por ejemplo, la regulación de las condiciones de los autobuses públicos para garantizar su seguridad: podría ser materia de transportes terrestres (arts. 148.1.5) y 149.1.21) de la Constitución), de industria (materia a la que se refieren los Estatutos de Autonomía), de protección del consumidor y usuario (materia a la que se refieren sólo los Estatutos de Autonomía), de seguridad pública (art. 149.1.29) de la Constitución).

⁴⁷ “Las materias no atribuidas expresamente al Estado por esta Constitución podrán corresponder a las Comunidades Autónomas en virtud de sus respectivos Estatutos” (es la denominada cláusula residual de primer grado). “La competencia sobre las materias que no se hayan asumido por los Estatutos de Autonomía corresponderá al Estado” (es la llamada cláusula residual de segundo grado).

atribuyéndose competencias⁴⁸ que inciden en las competencias atribuidas sobre otras materias. No es de extrañar, por ello, ciertos conflictos competenciales y que sea el Tribunal Constitucional quien esté delimitando las materias y las competencias sobre ellas⁴⁹.

5.2 Las competencias normativas en la materia de turismo

La Constitución ha reconocido el “turismo” como materia de competencia exclusiva de la CC AA, porque, por un lado, la incluye expresamente en el listado del artículo 148.1 (“Las Comunidades Autónomas podrán asumir competencias en las siguientes materias...18º) Promoción y ordenación del turismo en su ámbito territorial”), y, por otro, no dispone competencia alguna del Estado sobre dicha materia al no mencionarse en el artículo 149.1⁵⁰ que, como sabemos, es el precepto atributivo de las competencias estatales, exclusivas o compartidas con la CC AA.

Sin embargo, es significativo que, pese a esa explícita atribución competencial en exclusiva a favor de las CC AA, desde los primeros años del nuevo Estado de las Autonomías, el Tribunal Constitucional ha tenido que intervenir resolviendo conflictos de competencias y, por tanto, emitiendo jurisprudencia constitucional sobre las competencias en turismo y las incidentes o conexas con turismo, desde la pionera STC 125/1984, de 20 de diciembre de 1984⁵¹. Y esto confirma que la delimitación de la materia “turismo” no está suficientemente precisa y garantizada en el texto constitucional, así como tampoco lo están las funciones públicas de “promoción y ordenación”⁵² del turismo, funciones que, por cierto, ya Gallardo Castillo (2001, p. 73) intentaba identificar, respectivamente, con las actividades administrativas de policía (o disciplina) turística y fomento del turismo, aunque la misma legislación autonómica turística de finales de los 90 no se limitaba a esas dos clásicas modalidades de actividad administrativa, como la misma autora reconocía.

Así, pues, ¿qué alcance tiene esta competencia exclusiva autonómica dispuesta en el artículo 149.1.18º de la Constitución? ¿toda la regulación del turismo compete a la CC AA? Es decir, ¿“promoción y ordenación” del turismo incluye toda competencia en turismo?, ¿qué contenido y alcance constitucional tiene la “promoción” y la “ordenación”⁵³? Además, no se olvide el límite de la territorialidad que expresamente se dispone en la norma constitucional⁵⁴.

En todo caso, al amparo del artículo 148.1.18º de la Constitución, los Estatutos de Autonomía han atribuido a las Comunidades Autónomas la competencia exclusiva sobre turismo, especificando lo dispuesto en el citado título competencial constitucionalmente atribuido a las CC AA. Así, por ejemplo, la Ley Orgánica 2/2007, de 19 de marzo, de reforma del Estatuto de Autonomía para Andalucía, “desarrolla” la norma constitucional disponiendo su artículo 71 lo siguiente: “Corresponde a la Comunidad Autónoma la competencia exclusiva en materia de turismo, *que incluye, en todo caso*: la ordenación y la planificación del sector turístico; la regulación y la clasificación de las empresas y establecimientos turísticos y la gestión de la red de establecimientos turísticos de titularidad de la Junta, así como la coordinación con los órganos de administración de Paradores de Turismo de España en los términos que establezca la legislación estatal; la promoción interna y externa que incluye la suscripción de acuerdos con entes extranjeros y la creación de oficinas en el extranjero; la regulación de los derechos y deberes específicos de los usuarios y prestadores de servicios turísticos; la formación sobre turismo y la fijación de los criterios, la regulación de las condiciones y la ejecución y el control de las líneas públicas de ayuda y promoción del turismo”. Amplia concepción, pues, de esa previsión genérica constitucional sobre la “promoción” y la “ordenación” del turismo, porque la ordenación comprende la regulación de la planificación pública, pero también el estatuto jurídico de los usuarios y de las empresas y los establecimiento turísticos, incluyendo sus clases y categorías; y la promoción no se limita al ámbito territorial autonómico, sino que también incluye cierta promoción exterior con “acuerdos con entes extranjeros” y

⁴⁸ Por ejemplo, los Estatutos inventan la materia “protección del consumidor y usuario”, que no está en ninguna de las dos listas de los arts. 148.1 y 149.1 de la Constitución, atribuyéndose todas las competencias sobre esa materia ya que la Constitución, aparentemente, no reservó ninguna al Estado sobre esa “materia” (REBOLLO PUIG, 2011, p. 40 y ss.).

⁴⁹ Por otra parte, es preciso recordar los límites territoriales de las competencias de las CC AA: las competencias autonómicas no sólo están delimitadas por razón de la materia y de la función, sino también por el mismo territorio de la CC AA, como establecen los Estatutos de Autonomía.

⁵⁰ No sólo no se menciona en el art. 149.1, sino que en la Constitución no hay un artículo o precepto que se refiera a la legislación turística. Ahora bien, sí se contienen dos preceptos genéricos, no referidos a la actividad turística, pero que sí la afectan notablemente, condicionando -dado el valor normativo superior del texto constitucional (aunque no tienen los dos preceptos el mismo valor normativo)- tanto a la legislación turística que se apruebe como a la actuación de la Administración pública turística: 1.- El artículo 38 consagra el derecho fundamental a la libertad de empresa; el contenido esencial de este derecho constitucional es: Derecho a la libre iniciativa económica (derecho a la fundación/creación de empresas en esta economía de mercado), tanto a favor de los particulares como de las propias Administraciones Públicas que pueden, por tanto, “convertirse” en empresarios, crear “empresas públicas” (no se instaura una subsidiariedad de la actividad empresarial de la Administración en el art. 128); Derecho al libre ejercicio de las actividades empresariales: poder autoorganizatorio y de funcionamiento de la empresa; Derecho al cese de la actividad empresarial... Pero todos estos derechos inherentes al derecho constitucional de libertad de empresa no son absolutos, tienen límites o matizaciones en atención a la presencia de otros intereses privados y públicos que son afectados y que, en general, no son exclusivo o específicos del sector turístico. Pese a todo ello, no se olvide que la libertad de empresa es un derecho fundamental que goza de la protección constitucional establecida en el art. 53.1; 2.- El artículo 51, referente a la protección general de los derechos de los consumidores y usuarios frente a las empresas: “1. Los poderes públicos garantizarán la defensa de los consumidores y usuarios, protegiendo, mediante procedimientos eficaces, la seguridad, la salud y los legítimos intereses económicos de los mismos...”. Ciertos valores, intereses y derechos de los consumidores (por ejemplo, relevantemente, el derecho a la protección de la salud y seguridad frente a la actividad empresarial) han justificado que sean consagrados, aunque no como un derecho fundamental, sino como un “principio rector” que tiene una protección y un valor jurídico menor; 3.- También está el artículo 43.3, que consagra el derecho al ocio.

⁵¹ Una descripción del objeto del conflicto y del fallo del Tribunal en cada sentencia ha realizado MELGOSA ARCOS (2003, p. 1164-1167).

⁵² BLANQUER CRIADO (2001, p. 287-292) afirma incluso que se trata de un “concepto jurídico indeterminado”.

⁵³ Especialmente crítico con esta atribución competencial autonómica se ha manifestado BLANQUER CRIADO (1999, p. 32-33), por la afectación con las competencias exclusivas del Estado sobre las materias denominadas en el art. 149.1 de la Constitución “legislación civil” (apartado 8º) y “legislación mercantil” (apartado 6º), en la medida en que mediante la legislación autonómica del turismo se publique parcialmente el estatuto jurídico-privado del empresario y el contratante-consumidor del sector turístico: “...La regulación de las relaciones mercantiles sigue siendo competencia estatal; en lo esencial también son competencia estatal las relaciones civiles patrimoniales que no inciden en la familia (por ejemplo las contractuales). No es lo mismo la publicación del Derecho Privado que el desapoderamiento estatal del Derecho Civil y Mercantil. Una cosa es que sea la Comunidad Autónoma quien otorga o deniega las autorizaciones turísticas o quien gestiona el Registro administrativo en el que deben inscribirse quienes desarrollan esta actividad, y otra distinta es regular el estatuto del empresario que de forma habitual y organizada desarrolla esta actividad profesional. So pretexto de la ordenación del turismo, las Comunidades Autónomas han materializado una importante publicación del Derecho Privado mediante simples normas reglamentarias; esa publicación alcanza a dos extremos que con mucho desbordan el limitado alcance del artículo 148.1.18 de la Constitución: la regulación del estatuto del empresario y de las relaciones contractuales con los turistas... El problema no se limita a la regulación del estatuto del empresario (que es el actor o protagonista de la iniciativa privada), sino que se extiende al régimen de los contratos (el principal medio o instrumento jurídico de que se sirven los operadores turísticos). Las Comunidades Autónomas han expandido ilimitadamente las que les corresponden en la ordenación del turismo hasta asumir como propia la competencia de establecer y regular la forma y el contenido de algunos contratos. Algunos y no todos...”

⁵⁴ Como ha recordado MELGOSA ARCOS (2003, p. 1170), “es evidente que todas las Comunidades Autónomas aspiran a promocionar su turismo fuera de su ámbito territorial” y, quizás por ello, el Tribunal Constitucional ha propiciado “una importante relativización del principio de territorialidad en materia de promoción turística”. Y así se reconoce a la CC AA la competencia para promocionar turísticamente su CC AA fuera de su propio territorio y fuera del territorio nacional.

con “la creación de oficinas en el extranjero”.

En términos similares se atribuye esta competencia exclusiva autonómica en la Ley Orgánica 6/2006, de 19 de julio, de reforma del Estatuto de Autonomía de Cataluña (art. 171), así como, aunque algo menos desglosada o especificada, en los más recientes Estatutos de Autonomía (o de segunda generación): Ley Orgánica 5/2007, de 20 de abril, de reforma del Estatuto de Autonomía de Aragón (art. 71.51), Ley Orgánica 1/2007, de 28 de febrero, de reforma del Estatuto de Autonomía de las Illes Balears (art. 30.11),... En cambio, los primeros Estatutos de Autonomía (la mayoría de las CC AA) se caracterizan por la mera reproducción de lo dispuesto en el artículo 148.1.18º de la Constitución; así, la Ley Orgánica 4/1983, de 25 de Febrero, de Estatuto de Autonomía de Castilla y León en su art. 70.1.26.º (“Promoción del turismo y su ordenación en el ámbito de la Comunidad”), la Ley Orgánica 1/1981, de 6 de abril, Estatuto de Autonomía de Galicia en su art. 27.21, etc.

5.3 Las competencias normativas en otras materias conexas o incidentes con el turismo. En especial, los títulos competenciales del Estado más “aflictivos”

El artículo 149.1 de la Constitución atribuye al Estado competencias exclusivas en distintas “materias” que pueden concurrir o incidir en la materia turismo, como ha subrayado la doctrina⁵⁵ y reiterado la jurisprudencia constitucional. Así, el Estado tiene competencias exclusivas en “relaciones internacionales” (apartado 3º)⁵⁶, que afecta a la citada competencia autonómica de promoción del turismo, competencia también afectada por el título competencial estatal del “comercio exterior” (apartado 10º)⁵⁷; la competencia autonómica de planificación y ordenación turística queda influida por el título estatal transversal de “las bases y coordinación de la planificación general de la actividad económica” (apartado 13º), que legitima la intervención estatal al ser el turismo un sector económico de relevancia nacional⁵⁸.

Y también tiene el Estado competencias legislativas compartidas con las CC AA en otras materias conexas o fronterizas, en mayor o menor medida: “sanitaria o de higiene (arts. 148.1.21 y 149.1.7); patrimonio y cultura (arts. 148.1.16 y 17 y 149.1.28); agua y costas (arts. 148.1.10 y 149.1.23); caza y pesca (arts. 148.1.11 y 149.1.19); puertos y aeropuertos (arts. 148.16 y 149.1.20), transportes (arts. 148.1.5 y 149.1.21)”, entre otras” como han destacado Fernández Rodríguez (2013, p. 54) y Jiménez Soto (2016, p. 26)⁵⁹.

5.4 La cooperación orgánica entre CC AA y Estado: la llamada Conferencia Sectorial de Turismo

Dada la difícil delimitación de la materia turismo y otras materias conexas o relacionadas, y dada la mutua interrelación o entrecruzamiento de las competencias en turismo con otras competencias estatales sobre otras materias, no es de extrañar que exista un órgano específico de cooperación llamado Conferencia Sectorial de Turismo, constituida el 29 de noviembre de 1994, y potenciada como todo órgano de cooperación interadministrativa por la reciente Ley 40/2015, de 1 de octubre, de Régimen Jurídico del Sector Público (LRJSP)⁶⁰.

La Conferencia Sectorial está integrada por el Ministro competente en razón de la materia del turismo (actualmente, el Ministro de Energía, Turismo y Agenda Digital, del que depende la Secretaría de Estado de Turismo), y los correspondientes miembros de los Consejos de Gobierno de las Comunidades Autónomas y de las Ciudades de Ceuta y Melilla. Órgano colegiado que preside el Ministro, a quien, por tanto, le compete acordar la convocatoria de las reuniones “al menos una vez al año, o cuando lo soliciten, al menos, la tercera parte de sus miembros” (artículo 149 LRJSP).

El artículo 148 de la LRJSP, tras disponer que “pueden ejercer funciones consultivas, decisorias o de coordinación orientadas a alcanzar acuerdos sobre materias comunes”, añade: “2. En particular, las Conferencias Sectoriales ejercerán, entre otras, las siguientes funciones: a) Ser informadas sobre los anteproyectos de leyes y los proyectos de reglamentos del Gobierno de la Nación o de los Consejos de Gobierno de las Comunidades Autónomas cuando afecten de manera directa al ámbito competencial de las otras Administraciones Públicas o cuando así esté previsto en la normativa sectorial aplicable, bien a través de su pleno o bien a través de la comisión o el grupo de trabajo mandatado al efecto. b) Establecer planes específicos de cooperación entre Comunidades Autónomas en la materia sectorial correspondiente, procurando la supresión de duplicidades, y la consecución de una mejor eficiencia de los servicios públicos. c) Intercambiar información sobre las actuaciones programadas por las distintas Administraciones Públicas, en ejercicio de sus competencias, y que puedan afectar a las otras Administraciones. d) Establecer mecanismos de intercambio de información, especialmente de contenido estadístico. e) Acordar la organización interna de la Conferencia Sectorial y de su método de trabajo. f) Fijar los criterios objetivos que sirvan de base para la distribución territorial de los créditos presupuestarios, así como su distribución al comienzo del ejercicio económico, de acuerdo con lo previsto en la Ley 47/2003, de 26 de noviembre”.

Como órgano de cooperación voluntaria⁶¹ que es, sus acuerdos, que requerirán la previa votación de los miembros de

⁵⁵ RODRÍGUEZ-ARANA (2001, p. 30), GALLARDO CASTILLO (2001, p. 92-93), PÉREZ GUERRA (2014, p. 404-406), SANZ DOMÍNGUEZ (2008, p. 688-691), entre otros.

⁵⁶ Pero el Tribunal Constitucional en su sentencia de 5 de diciembre de 1995, afirma que la dimensión externa de un asunto no puede servir para realizar una interpretación expansiva del artículo 149.1.3 de la Constitución que venga a subsumir en la competencia estatal toda medida dotada de cierta incidencia exterior, por remota que sea, ya que si así fuera se produciría una verdadera reordenación del propio orden constitucional de distribución de competencias entre el Estado y las Comunidades Autónomas.

⁵⁷ La STC de 2 de noviembre de 1984 reconoce la incidencia del turismo: “...la importancia de los ingresos que la actividad turística proporciona a la economía nacional procedentes de la demanda exterior convierten sin duda al turismo en una de las partidas más significativas de la balanza exterior. Por consiguiente, la promoción exterior del turismo adquiere desde esta perspectiva una dimensión que lo sitúa dentro de la competencia estatal del artículo 149.1.10 de la Constitución...”.

⁵⁸ Pero estos títulos competenciales que justifican la intervención estatal en materia de turismo (STC 125/1984, STC 75/1989, de 25 de abril, STC 88/1987, de 2 de junio) no pueden interpretarse de tal manera que vacíen toda competencia autonómica dotada de una cierta dimensión económica, pues ello equivaldría a vaciar casi todo el bloque de competencias asumidas por las Comunidades Autónomas.

⁵⁹ Aparte de estas materias de competencia estatal (exclusiva o compartida con la CC AA), la delimitación de las competencias sobre turismo han de considerar así mismo las competencias exclusivas autonómicas sobre ciertas materias dispuestas en el propio artículo 148.1 de la Constitución: ordenación del territorio y urbanismo (apartado 3º), agricultura y ganadería (apartado 7º), puertos y aeropuertos deportivos (apartado 6º)...

⁶⁰ Véase Sánchez Sáez (2016, p. 424 y ss).

⁶¹ Otra técnica típica de cooperación es el llamado convenio interadministrativo, al que la LRJSP ha prestado un especial atención, como ha explicado Gosálbez Pequeño (2016, p. 265-305).

la Conferencia Sectorial, obligan a los miembros que lo aceptan, no a los que se oponen: “Las decisiones que adopte la Conferencia Sectorial podrán revestir la forma de: a) Acuerdo: supone un compromiso de actuación en el ejercicio de las respectivas competencias. Son de obligado cumplimiento y directamente exigibles de acuerdo con lo previsto en la Ley 29/1998, de 13 de julio, reguladora de la Jurisdicción Contencioso-administrativa, *salvo para quienes hayan votado en contra mientras no decidan suscribirlos con posterioridad...*” (artículo 151)⁶².

BIENES COMUNALES Y BIENES COMUNES: VIEJAS Y NUEVAS ESTRATEGIAS PARA UNA GESTIÓN SOSTENIBLE DEL TERRITORIO

Rafael Pizarro Nevado^{1(*)}
Universidad de Córdoba
(rpizarro@uco.es)

ABSTRACT

La gestión sostenible del territorio es un elemento fundamental de la política de desarrollo rural. La Unión Europea se ha centrado en medidas de reasignación de recursos en las zonas rurales, diversificación de las actividades económicas y de fomento de la competitividad de la agricultura. De acuerdo con este enfoque, el desarrollo de nuevas actividades económicas es esencial, incluidas las actividades no agrícolas: prestación de servicios a la silvicultura ya la agricultura, gestión sostenible de la caza, actividades relacionadas con la salud, turismo, etc.

Todas estas actividades dependen de recursos escasos. Como resultado, la gestión sostenible del territorio se convierte en un instrumento de planificación esencial para decidir sobre los usos de la tierra y, por lo tanto, sobre las actividades que se pueden desarrollar. Sin embargo, se ha prestado poca atención a la ordenación del territorio como herramienta para promover la cohesión social a través de la reforma de los sistemas de propiedad y tenencia de la tierra. La teoría de los bienes comunes puede ofrecer nuevas perspectivas sobre la relación entre la ordenación del territorio, la conservación de los recursos naturales y la cohesión social. Recientemente, los estudiosos se han centrado en los bienes comunes restantes y las han descrito como prácticas sostenibles, inclusivas y alternativas de gestión del territorio. Un ejemplo que en la actualidad sigue funcionando son las “hazas de la suerte” de Vejer de la Frontera y de Barbate.

Keywords: Gestión del Territorio, Cohesión Social, Bienes Comunes, Bienes Comunales.

1. LAS TRANSFORMACIONES DEL MEDIO RURAL ESPAÑOL

España ha experimentado profundas transformaciones sociales y económicas a lo largo del siglo XX, fundamentalmente como consecuencia del tránsito desde un modelo económico basado en la explotación agraria a otro donde las actividades industriales, turísticas y los servicios dieron lugar a la concentración de la población en torno a las ciudades, a la transformación de sus periferias, así como a la creación de nuevos equipamientos e infraestructuras. El proceso se aceleró desde principios de los años 1990, periodo en el que se han producido importantes transformaciones territoriales que han afectado especialmente al ámbito urbano, siendo el área mediterránea una de las más afectadas.

Los cambios más profundos en las últimas décadas están relacionados con la creación de paisajes artificiales, por lo general inalterables, tanto en la franja costera como en las zonas interiores para instalar en ella usos residenciales, comerciales, industriales, equipamientos públicos o diferentes infraestructuras². Los procesos de urbanización se han desplegado ampliamente, no sólo como prolongación del casco histórico, sino se han extendido con significativas discontinuidades espaciales, colonizando el espacio rural, dando como resultado la aparición generalizada de una nueva forma urbana claramente diferenciada de la ciudad tradicional compacta (Nel.lo, 2004; Fera, 2011). Según los datos proporcionados por el Instituto Geográfico Nacional (2014) la tasa de transformación fue de alrededor de 26.000 hectáreas anuales (hasta 2005).

La presión del mercado inmobiliario, sobre todo en la franja costera (para fines turísticos) y en las zonas urbanas de rápido crecimiento, ha dado lugar a la retirada de grandes superficies de tierras agrícolas en las inmediaciones de los focos de desarrollo, y en menor medida a las tierras forestales y arbustivas (ecosistemas silvo-pastorales). De hecho, prácticamente el 70% de las nuevas superficies artificiales se desarrollaron sobre suelos agrícolas próximos a los núcleos urbanos y a los centros de producción, que cambiaron su uso para permitir el crecimiento de las ciudades y la construcción de nuevos complejos residenciales.

Pero las transformaciones no se explican solo por la presión inmobiliaria, ni afectan únicamente a las zonas próximas a los núcleos urbanos. También las tierras agrícolas del interior han sufrido en España cambios notables.

Sustainable land management network (SULANET) es una Red Jean Monnet. Award reference: 564651-EPP-1-2015-1-SK- EPPJMO-NETWORK.

² Aunque se trata de un proceso que se ha dado de forma generalizada por todo el territorio, resulta especialmente intenso en la costa mediterránea y en el área metropolitana de Madrid. Esta dinámica reciente no se explica tanto por razones demográficas, como por la importancia que, en un contexto de fuerte desarrollo económico, ha tenido el sector de la construcción en la economía española, activado por la creación de nuevos desarrollos urbanos (muchos de ellos dispersos), equipamientos e infraestructuras, así como por la actividad turística.

A pesar de la aparente estabilidad de la superficie destinada a los usos agrícolas, se pueden apreciar cambios importantes en el uso de la tierra. Los datos desagregados incluidos en las series estadísticas desde 2002 muestran que las tierras de cultivo y los cultivos permanentes han disminuido constantemente durante el período considerado, mientras que los pastizales permanentes han aumentado constantemente.

También han aumentado las áreas de cultivos de riego (3.006.400 ha en 1985 y 3.672.800 ha en 2004), a pesar de la escasez de agua y la falta de recursos hidrológicos para fines ambientales. Por otro lado, las tierras de secano han disminuido considerablemente (17.409.000 ha en 1985, 14.285.100 ha en 2004).

Además de cambio de usos, las zonas rurales han sufrido también un notable abandono. Como resultado, los ecosistemas forestales han sufrido pérdidas (incendios forestales, roturación de bosques), dando lugar a importantes intercambios dentro de la cubierta forestal. La erosión del suelo y la desertificación también han contribuido a aumentar las tierras baldías.

Un último dato a tener en cuenta ha sido el incremento de las áreas naturales protegidas, como resultado de las políticas ambientales y de conservación de la naturaleza.

Todos estos procesos merecen una atención integral en el seno de las políticas de desarrollo rural y de ordenación del territorio.

2. LA IMPORTANCIA DE LA GESTIÓN DEL TERRITORIO PARA LA PLANIFICACIÓN DEL DESARROLLO RURAL EN LA UNIÓN EUROPEA (UE). POSIBLES HERRAMIENTAS FUTURAS DE LA UE

2.1 La gestión del territorio como instrumento para alcanzar los objetivos de desarrollo rural

La gestión del territorio es un elemento fundamental en cualquier política de desarrollo rural. Así lo ha entendido también la Unión Europea, como se refleja en los objetivos de la política de desarrollo rural recogidos en el artículo 4 del Reglamento (UE) n° 1305/2013 del Parlamento Europeo y del Consejo, de 17 de diciembre de 2013, relativo a la ayuda al desarrollo rural a través del Fondo Europeo Agrícola de Desarrollo Rural (Feader) y por el que se deroga el Reglamento (CE) n° 1698/2005 del Consejo. El segundo de los objetivos establecidos es “garantizar la gestión sostenible de los recursos naturales y la acción climática” (artículo 4 b), para lo cual en el artículo 5 del mismo Reglamento se establece como una de las prioridades de desarrollo rural de la Unión: “restaurar, preservar y mejorar los ecosistemas relacionados con la agricultura y la silvicultura, centrándose en los siguientes ámbitos:

- 1) restaurar, preservar y reforzar la biodiversidad, incluso en las zonas Natura 2000, y en zonas con limitaciones naturales u otras limitaciones específicas, y la agricultura de alto valor natural, así como el estado de los paisajes europeos;
- 2) mejorar la gestión del agua, incluida la gestión de los fertilizantes y de los plaguicidas;
- 3) prevenir la erosión del suelo y mejorar la gestión del suelo”.

También está relacionado con ello el tercer objetivo, que es “lograr un desarrollo territorial equilibrado de las economías y comunidades rurales, incluida la creación y el mantenimiento del empleo” (artículo 4 c). En relación con este objetivo el artículo 5 incluye entre las de desarrollo rural de la Unión: “Fomentar la inclusión social, la reducción de la pobreza y el desarrollo económico en las zonas rurales, haciendo especial hincapié en:

- 1) facilitar la diversificación, la creación y el desarrollo de pequeñas empresas y la creación de empleo;
- 2) promover el desarrollo local en las zonas rurales [...]”.

De hecho, las políticas de desarrollo rural tienen como objetivo mejorar el nivel de renta y la calidad de vida de la población rural a través de medidas económicas, sociales, culturales o políticas. Estas políticas tienen que asegurar también la provisión de servicios públicos básicos e instalaciones; **y lo que es más importante, deben** favorecer las condiciones económicas y sociales que permitan el desarrollo de proyectos personales y colectivos que garanticen un nivel de vida adecuado para todos.

Para lograr este objetivo, junto a las medidas de fomento de la competitividad de la agricultura (facilitando, por ejemplo, la transferencia de conocimientos y la innovación, la reestructuración y modernización de las explotaciones o promoviendo

la organización de la cadena alimentaria), la UE se ha centrado tradicionalmente en la reasignación de recursos de las zonas rurales, apoyando la diversificación de actividades económicas. La diversificación de las actividades económicas y la reasignación de recursos permiten a la población rural reducir el riesgo de dependencia económica y mejorar la prestación de los servicios solicitados por el cambio de las demandas de los consumidores.

De acuerdo con ese enfoque, los actos jurídicos de la UE asumen que para el desarrollo de las zonas rurales es esencial la creación y el desarrollo de nuevas actividades económicas. Estas nuevas actividades económicas pueden adoptar diferentes formas: podrían ser nuevas explotaciones, pero también tender a la diversificación hacia actividades no agrícolas, incluidas la prestación de servicios a la silvicultura y a la agricultura, la gestión sostenible de los recursos cinegéticos, las actividades relacionadas con la integración social, la salud, el turismo, etc. Ese proceso debe desarrollarse en el marco de una política agrícola más ambiciosa, que tenga por objeto mejorar el desarrollo rural y la eficiencia agrícola al mismo tiempo que garantiza un uso racional del territorio y el reemplazo generacional de los agricultores.

Las actividades agrícolas y no agrícolas realizadas en las zonas rurales dependen de recursos escasos, incluido el suelo, y compiten por ellos. Como resultado, la gestión del territorio se convierte en un instrumento de planificación esencial para decidir sobre los usos posibles del suelo y, por lo tanto, sobre los diferentes tipos de actividades que se pueden desarrollar en cada área en particular.

Existe evidencia de las carencias y fallos en la actual Política Agrícola Común (PAC). De hecho, está en marcha un proceso para su reforma que entrará en vigor a partir del año de 2020. Consideramos que la reforma debería corregir una orientación que parece basada simplemente en principios de competitividad, para tender a la consecución de los objetivos de desarrollo sostenible (ODS) -de los que la Unión Europea es signataria-, que incluyen indicadores de referencia (p.ej. biodiversidad, pobreza, salud, etc.).

2.2 La reforma de los sistemas de propiedad y tenencia de la tierra para lograr objetivos de cohesión social

Pues bien, sorprende que en ese contexto se haya prestado poca atención a la gestión del territorio como herramienta para promover la cohesión social a través de la reforma de los sistemas de propiedad y tenencia de la tierra. Cabe recordar que entre los principales retos que afrontan las zonas rurales de la UE siguen estando alcanzar un nivel de vida equitativo para los agricultores³ y reducir la presión sobre el medio ambiente y los recursos naturales.

La PAC actual, basada en pagos por superficie, distribuye los fondos de manera inequitativa y ha provocado un aumento del precio de la tierra, lo que dificulta la instalación de nuevas explotaciones. En muchos casos es inaccesible para aquellos que quieren incorporarse a la actividad agraria. Por ello la PAC reformada debe incluir medidas -y no solo económicas- que favorezcan ese acceso.

Existe un amplio consenso en torno a la idea de que el acceso seguro a la tierra y a su tenencia son condiciones indispensables para garantizar la equidad social en las zonas rurales. Un acceso seguro y duradero a la tierra y a los recursos naturales anima a los agricultores a desarrollar prácticas sostenibles tanto en actividades agrícolas como no agrícolas. Por las mismas razones, el uso excesivo de tierras, el sobrepastoreo, la sobreexplotación del agua, la deforestación y prácticas similares, que pueden conducir a la degradación de la tierra en las zonas rurales, suelen evitarse cuando se garantiza el acceso a la tierra y a la tenencia de la tierra. La Unión Europea, como parte de su política de cooperación internacional, fomenta activamente la aplicación en los países en desarrollo de las “Directrices voluntarias sobre la gobernanza responsable de la tenencia de la tierra, la pesca y los bosques en el contexto de la seguridad alimentaria nacional”, respaldadas por el Comité de Seguridad Alimentaria Mundial en mayo de 2012.

También en el territorio de la Unión Europea puede jugar un papel importante algunas formas de propiedad de la tierra y los sistemas de tenencia de la tierra como instrumento en la política de desarrollo rural de la UE. Más específicamente, la teoría de los bienes comunes puede ofrecer nuevas perspectivas sobre la relación entre la ordenación del territorio, la conservación de los recursos naturales y la cohesión social.

3. CARACTERIZACIÓN DE LOS BIENES COMUNES REGULADOS

La idea de los bienes comunes ha experimentado en los últimos años un renacimiento gracias a las investigaciones realizadas principalmente desde las ciencias económicas y a su utilización en las creaciones intelectuales y culturales (Ostrom, E., 2000; Dolsak, N. y Ostrom, E., 2003). Se presenta como un sistema de tenencia y uso colectivo bastante complejo, pretendidamente alternativo y no sustitutivo a los de mercado y Estado.

Pero no puede asimilarse los “bienes comunes modernos” o *commons* de naturaleza intangible, con los *commons* tangibles, que también han sido objeto de un renacer en los últimos decenios. A nuestro objeto interesan los segundos; y más concretamente los *commons* regulados, por seguir la terminología de Ostrom⁴ (2000). Basándose en datos empíricos, esta autora demostró su **éxito en diferentes contextos** culturales, por lo que entendemos que pueden ser manejados sosteniblemente y ser un instrumento adecuado para facilitar el acceso a la tierra de las comunidades rurales.

Esto presupone que se configuren como sistemas autoregulados, en los que el acceso, uso y derechos de participación se rigen por reglas que fija la comunidad a través de procesos sociales más o menos complejos que dependen sobre todo de la

³ Basta con ver el nivel de insatisfacción de los propios agricultores y ganaderos, ya que un número significativo de los mismos tiene verdaderos problemas para lograr una renta digna. La renta agrícola sigue siendo significativamente inferior a la renta media de la UE.

⁴ No entrarían en el concepto formulado por Ostrom los llamados *commons* globales no regulados o “recursos de acceso abierto” (Buck, 1998), entre los que se encuentran los fondos marinos, el alta mar, la atmósfera o el espacio ultraterrestre, que caen dentro del ámbito de bienes libres o *res nullius* y escapan a la jurisdicción de los Estados. A pesar de su importancia para la subsistencia del hombre o de su interés económico, no interesan al objeto de este trabajo.

naturaleza del recurso, pero también de la constitución de la comunidad de usuarios y de sus instituciones. En cualquier caso, las decisiones deben ser tomadas colectivamente y debe garantizarse la participación de sus miembros en su modificación.

Insiste Ostrom en que para un funcionamiento adecuado debe existir además un mecanismo de supervisión y control recíproco del cumplimiento de las reglas, de sanciones graduales o proporcionadas contra el incumplimiento y un mecanismo de resolución de conflictos, así como de un reconocimiento exterior del derecho de autoorganizarse.

Esto último se aprecia en el reconocimiento por los ordenamientos jurídicos nacionales de las distintas formas comunitarias de propiedad de la tierra. A continuación se expondrá el caso español. Además, s del Tratado de Funcionamiento de la Unión EuropeaE sí

Muchos tipos de bienes pueden ser tratados como bienes comunes, incluyendo tierras, recursos hídricos, bosques, pastos, caza, pesca y casi cualquier otro recurso natural. Cuanto más valioso sea el bien, social o económicamente, más adecuado podría ser el régimen de propiedad común. La comunidad propietaria cuidaría mejor de los bienes si los considera esenciales para su supervivencia. Es probable que surjan prácticas que supongan una gestión adecuada de los recursos, incluida la retención de agua, la mitigación de la contaminación y la protección de los suelos. Pero, incluso si no se consideran recursos esenciales, también es probable que se implementen prácticas de manejo sostenible, si los miembros de la comunidad se sienten dueños reales de los bienes comunes.

Como ejemplo puede citarse la Mancomunidad del Valle de Broto, entidad administrativa que desde el siglo XIV gobierna el uso forestal y ganadero de este valle⁵, incluido en el Parque Nacional de Ordesa y Monte Perdido. Desde entonces se ha regulado de forma exhaustiva la manera de aprovechar los pastos, las fechas de subida a los prados estivales, la rotación de la explotación entre los diferentes puertos, y esto incluye una extensa superficie del Parque Nacional. Como curiosidad digna de mención hay que señalar que entre sus ordenanzas se regula el aprovechamiento en común de pastos entre los vecinos del valle de Broto con los del valle francés de Barèges, lo que permite a los ganados de este valle oscense subir a los pastos franceses a partir del 25 de julio de cada año.

Este sistema comunal de gobernanza ha ido perfeccionándose durante siglos, dando lugar a una serie de normas de manejo del territorio que aprovechan al máximo su potencial productivo para el uso ganadero de estas zonas duras de alta montaña. Pero a la vez, este sistema de gobernanza local es el responsable de la gestión de una vasta superficie de un área natural protegida, el Parque Nacional de Ordesa y Monte Perdido.

Las mancomunidades forestales del Pirineo son solo un ejemplo de las muchas organizaciones comunales que gestionan miles de hectáreas de territorio y recursos naturales en España, como son los montes de socios, vecinales, sociedades de caza, etc. En realidad, España es el país europeo con mayor riqueza y vitalidad de áreas bajo gobernanza comunal, como ha sido reconocido por el Consorcio ICCA⁶, que la reconoce como consideran *Áreas Conservadas por Comunidades Locales*, una figura de conservación reconocida por el Convenio sobre la Diversidad Biológica como estrategia de conservación basado en instrumentos de gobernanza comunal al margen de los Estados.

Lógicamente las reglas que rigen el uso de bienes comunes varían en cada caso particular, lo que permite su adaptación a las necesidades que impone el entorno y el momento considerados. Pero, en todo caso, esas normas deben ser adoptadas de común acuerdo por los miembros de la comunidad, lo que aumenta su nivel de participación en la protección de los bienes y su uso racional. Además, se han dado pruebas de que las viejas normas que rigen las propiedades comunes se consideran parte del patrimonio común de la comunidad.

4. LOS BIENES COMUNALES EN EL DERECHO ESPAÑOL

Todos los rasgos expuestos se dan en una figura de honda raigambre en el Derecho español, los llamados bienes comunales, que disfrutan de reconocimiento y protección en el ordenamiento jurídico vigente incluso con rango constitucional.

4.1 Relevancia histórica y económica

Al igual que en otros países europeos, las propiedades comunes fueron habituales durante siglos en grandes áreas de España, ya que aseguraban la subsistencia de las comunidades rurales. Por lo general, podrían adoptar la forma de pastizales comunes (por ejemplo, para pastoreo de ganado), campos de cultivo comunes o bosques comunes (por ejemplo, para la recolección de leña). Estos bienes y aprovechamientos comunes pertenecían de forma colectiva a los vecinos de cada pueblo y se consideraban *res extra commercium*, lo que implicaba que no podían ser enajenados. Esencialmente ese régimen de propiedad era el mismo en cada pueblo, aunque las reglas de uso y disfrute de los bienes comunes con frecuencia variaban de un lugar a otro.

A partir del siglo XIX ese patrimonio común sufrió un declive continuado, provocado por una serie de medidas legales y económicas que redujeron las propiedades comunes e incluso las eliminaron en muchos lugares, lo que tuvo como resultado el empobrecimiento y la disminución en el nivel de vida de amplios sectores de sus poblaciones⁷. Para explicar el proceso de privatización o desarticulación de los bienes comunales y sus consecuencias en las sociedades campesinas habría que

⁵ Su origen se remonta a la Junta General del Valle de Broto, creada en el primer tercio del siglo XIII a raíz de un privilegio otorgado por Jaime I en el que, entre otras cosas, se reconocía a los habitantes del valle la posesión de los puertos que tradicionalmente habían formado parte de sus términos y el derecho al libre aprovechamiento de sus pastos.

⁶ El Consorcio (ICCA Consortium, en inglés) es una asociación internacional que se encarga de la promoción y reconocimiento de territorios y áreas conservadas y gestionadas por comunidades locales a nivel mundial (Indigenous peoples' and community conserved territories and áreas, ICCAs). Este consorcio colabora con el Programa de Naciones Unidas para el Medio Ambiente (PNUMA), con organizaciones como la UICN, y con otros organismos dedicados a la investigación y promoción de derechos humanos.

⁷ Se ha señalado como ejemplo extremo de las repercusiones provocada por la privatización de los bienes comunales del municipio de Boada, que en 1900 poseía 4.258 hectáreas de bienes comunales. En un contexto de grave crisis económica, la situación de los vecinos se vio enormemente agravada por la privatización de los bienes comunales y el pueblo entero adoptó la decisión de emigrar -todos unidos y con las autoridades al frente- a Argentina, a cuyo Gobierno solicitaron ayuda para financiar el viaje (Calle Velasco, 2014).

considerar no solo factores financieros, jurídicos o políticos; también jugaron un papel importante las corrientes doctrinales dominantes en la época⁸.

A pesar de todo ello, un cierto número de pueblos mantuvo en todo o en parte sus bienes comunes y algunos de ellos han sobrevivido hasta hoy como una reliquia del pasado. Como es lógico en cada lugar el resultado de la tensión entre la actuación del Estado y los intereses locales fue distinta, dando lugar a situaciones muy variadas según regiones. Posteriormente, ya en el siglo XX la legislación española las ha acogido intentando proporcionarles un régimen de protección adecuado.

4.2 Modalidades de bienes comunes en función de su titularidad y régimen jurídico aplicable

Para su comprensión desde el tratamiento que les proporciona el Derecho conviene recordar que los bienes comunes regulados pueden adoptar formas jurídicas diferentes según el lugar y el momento que se analice, aunque normalmente implican la propiedad colectiva de recursos valiosos que pueden ser utilizados o empleados por una comunidad. Además, con independencia de la forma jurídica que se les asigne, estos bienes quedan sujetos a reglas que persiguen un manejo responsable que garantice el uso colectivo, a pesar de su carácter limitado, y que al mismo tiempo eviten su agotamiento y/o depredación.

En el caso español encontramos básicamente dos modalidades. La comunidad puede poseer directamente la propiedad (cada individuo tiene un interés indiviso en toda la propiedad) o atribuirse su titularidad a un organismo público (por ejemplo, un municipio). Además, su régimen legal generalmente confiere una protección especial a estas propiedades, impidiendo su venta o estableciendo condiciones difíciles para su apropiación por terceros.

4.2.1 Bienes comunales

La más extendida en España es la segunda solución, que es la que en sentido estricto en Derecho español se conocen como bienes comunales. Propiamente son bienes de las entidades locales cuyo aprovechamiento corresponde al común de los vecinos (Nieto García, 1964; Colom Piazuelo, 1994; Bocanegra Sierra, 2008). Por su relevancia histórica y por su abundante presencia en buena parte del territorio nacional tuvieron un reconocimiento específico en la Constitución Española de 1978, que establece que «la ley regulará el régimen jurídico de los bienes de dominio público y de los comunales, inspirándose en los principios de inalienabilidad, imprescriptibilidad e inembargabilidad, así como su desafectación».

Su estatuto ha sido posteriormente desarrollado en la Ley 7/1985, de 2 de abril, Reguladora de las Bases del Régimen Local (LBRL) y por las leyes de las Comunidades Autónomas sobre bienes de las entidades locales. En defecto de la regulación anterior se aplicará supletoriamente los artículos 75, 77 y 78 del Real Decreto Legislativo 781/1986, de 18 de abril, por el que se aprueba el texto refundido de las disposiciones legales vigentes en materia de Régimen Local (TRRL), y los artículos 2, 3, 4, 5 y 94-108 del Real Decreto 1372/1986, de 13 de junio, por el que se aprueba el Reglamento de Bienes de las Entidades Locales (RBEL).

En la actualidad lo característico de los bienes comunales es que el disfrute y aprovechamiento corresponde a los vecinos de un determinado lugar⁹, mientras que la titularidad se atribuye legalmente a la entidad local en que residen. Pero como se ha comentado, esto no siempre ha sido así, ni el tratamiento dado en nuestra legislación ha sido constante¹⁰, lo que permitió a la doctrina jurídica sostener su titularidad compartida entre el municipio y los vecinos (Bocanegra Sierra, 1983) y negar su inclusión en las categorías usuales de bienes públicos, puesto que ni eran bienes patrimoniales ni propiamente bienes de dominio público. Reflejo de esa concepción es la sentencia del Tribunal Constitucional de 2 de febrero de 1981, en la que reconocía la «naturaleza jurídica peculiar» que tienen este tipo de bienes.

Pero la legislación española de final del siglo XX -también la aprobada por las Comunidades Autónomas- ha reforzado su protección configurándolos como un tipo de bienes de dominio público¹¹, consagrando su inalienabilidad, imprescriptibilidad e inembargabilidad, por lo que, consecuentemente, su titularidad se atribuye en exclusiva a un ente local, normalmente el municipio¹².

4.2.2 Montes vecinales en mano común

Junto a los bienes comunales típicos, en los que la titularidad se atribuye al Municipio, existe un tercer género de bienes en los que la titularidad corresponde directamente a los vecinos en su calidad de grupo núcleo social, y no como entidad administrativa. El ejemplo más característico de esto último son los llamados montes vecinales en mano común, que son terrenos forestales de propiedad privada -puesto que no pertenecen al municipio- configurados de acuerdo al modelo de comunidad de propietarios de tipo germánico, sin cuotas de participación y sin posibilidad de disolución, pues se niega a los comuneros la *actio communi dividundo* (Bocanegra Sierra, 1986).

Esta modalidad tiene un régimen jurídico especial, que con carácter general se recoge en la Ley 55/1980, de 11 de

⁸ El prejuicio contra los bienes comunales puede encontrarse incluso en siglos anteriores, puesto que el ideario ilustrado responsabilizó de muchos de los males del campo español, por lo durante la segunda mitad del siglo XVIII propugnaron la desamortización de las tierras de carácter concejil y comunal como una parte esencial de la reforma del sector agrario. Del análisis de todo ello se han ocupado, entre otros muchos, López Astudillo (1992) y el Grupo de Estudios de Historia Rural de la Universidad Complutense de Madrid (1994).

⁹ La sentencia de la Sala Cuarta del Tribunal Supremo de 14 de junio de 1968 (Ponente: Cruz Cuenca) lo considera un derecho real administrativo de goce. En su momento, esta sentencia mereció un comentario de Alejandro Nieto (1969).

¹⁰ En sentido opuesto a lo dispuesto por la Constitución de 1978 la Ley de régimen local de 1955 establecía en su artículo 183 que: «Los bienes municipales se clasifican en bienes de dominio público y patrimoniales... Los patrimoniales son de propios o comunales». Y existe abundante jurisprudencia preconstitucional sobre el carácter patrimonial de los bienes comunales (González Ríos, 2001).

¹¹ La LBRL de 1985 se refiere en el artículo 80 a «los bienes comunales y demás bienes de dominio público» y el artículo 2.3 del RBEL de 1986 dispone: «Tienen la consideración de comunales aquellos bienes que siendo de dominio público, su aprovechamiento corresponde al común de los vecinos». Como ejemplo de ley autonómica puede citarse el artículo 50 de la Ley 5/2010, de 11 de junio, de autonomía local de Andalucía. En su apartado segundo establece que «Los elementos del patrimonio de las entidades locales, en atención al uso o servicio destinado, se clasifican en demaniales y patrimoniales. Los bienes comunales, que son aquellos cuyo aprovechamiento corresponde al común de los vecinos, tienen la consideración de dominio público».

¹² La jurisprudencia acepta pacíficamente esa concepción, como se comprueba en las sentencias del Tribunal Supremo de 31 de diciembre de 1986 (Ponente: Gordillo García, Ar. 1696), de 30 de abril de 1987 (Ponente: García Estarús, Ar. 4768) y 3 de mayo de 1989 (Ponente: González Navarro, Ar. 3641).

noviembre, de montes vecinales en mano común. Por su extensa presencia en Galicia, esa Comunidad Autónoma asumió en su Estatuto competencias sobre ellos y aprobó la Ley 13/1989, de 10 de octubre, de montes vecinales en mano común. En ambos casos se ha configurado con gran similitud al de los bienes comunales típicos, pues también son imprescriptibles, inembargables e inalienables y se atribuye a la Administración potestades de deslinde, si fuera necesario, además del fomento y asesoramiento técnico.

4.3 Aprovechamiento de los bienes comunales

En relación con los bienes comunales en sentido estricto, el ente local goza de una titularidad que le permite ejercer sus potestades para su conservación y rescate, además de una intervención en otros aspectos relevantes (ordenanzas, desafectación); pero su aprovechamiento le corresponde a los vecinos. El aprovechamiento de los bienes comunales se regula en los artículos 75 TRRL y 94 y ss RBEL, que establecen como regla general la explotación colectiva o comunal. Sólo cuando esto sea impracticable, está previsto sucesivamente el aprovechamiento tradicional conforme a la costumbre u ordenanza del lugar, en su defecto la adjudicación de lotes a los vecinos o finalmente la adjudicación mediante precio.

Con un celo excesivo para proteger su carácter común, la legislación vigente establece que el aprovechamiento y disfrute de bienes comunales se efectuará preferentemente en régimen de explotación común o cultivo colectivo (artículo 94.1 RBEL), lo que implica el disfrute general y simultáneo de los bienes por quienes ostenten en cada momento la cualidad de vecino. El artículo 103.1 RBEL dispone que *“el derecho al aprovechamiento y disfrute de los bienes comunales, en cualquiera de sus modalidades, corresponderá simultáneamente a los vecinos sin distinción de sexo, estado civil o edad. Los extranjeros domiciliados en el término municipal gozarán también de estos derechos”*.

Sólo cuando tal disfrute fuere impracticable¹³ se permiten aprovechamientos distintos, según costumbre o reglamentación local, o se procederá a la adjudicación de los aprovechamientos por lotes o suertes (artículo 94.2 RBEL). La adjudicación por lotes o suertes se hará a los vecinos en proporción directa al número de personas que tengan a su cargo e inversa de su situación económica (artículo 97 RBEL).

El temor a la apropiación de estos bienes o de ciertos usos explica la adopción de una regulación tan inflexible, que en muchas ocasiones no podrá responder a los cambios sociales (despoblamiento y el envejecimiento de la población), económicos (tecnificación, necesidades de inversión) y ambientales que ha experimentado el medio rural español, por lo que resulta imprescindible explorar

fórmulas de explotación más adaptadas a la situación del entorno en que cada uno de estos bienes se encuentre enclavado y a las necesidades de su comunidad de base.

No se nos escapa que no será siempre fácil, que no faltarán resistencias. Y no solo de quienes se puedan ver directamente afectados. También tendrá un peso importante una concepción doctrinal que debe evolucionar, como se comprueba en algún pronunciamiento jurisprudencial que, con estricta sujeción a lo dispuesto literalmente por los artículos 75 del TRRL y 94 del RBEL, que impone el orden de posibles aprovechamientos de los bienes comunales, niega la posibilidad de adaptar la prelación de aprovechamientos¹⁴.

Pero hay que recordar que esta regulación estatal tiene que tener mero carácter supletorio de la legislación autonómica en la materia, por lo que es perfectamente posible encontrar vías para que las propias comunidades -respetando sus tradiciones y la conservación del bien- ordenen el uso de sus bienes comunales de acuerdo con las circunstancias que se presenten en cada momento. Esto sería más sencillo si la legislación autonómica contemplase esa posibilidad, flexibilizando el mecanismo previsto en el TRRL, como se hizo en la Ley Foral 6/1990, de 2 de julio, de la Administración Local de Navarra. En su artículo 141 se establece que *“Las Entidades locales velarán por la puesta en producción, mejora y aprovechamiento óptimo de los comunales”*, para a continuación establecer una regulación más adecuada a las características físicas de los distintos bienes (terrenos comunales de cultivo, pastos comunales, montes comunales y otras variedades).

Pero incluso en las Comunidades Autónomas donde no exista una regulación similar, cabe interpretar la regulación estatal, que reproduce la mayor parte de las leyes autonómicas, en relación con el contexto, los antecedentes históricos y legislativos, pero también de acuerdo con la realidad social del tiempo en que han de ser aplicadas, atendiendo fundamentalmente al espíritu y finalidad de aquellas (artículo 3 del Código Civil), permitiendo así alcanzar objetivos de sociales y de sostenibilidad ambiental.

No es esto algo ajeno a la lógica de la legislación vigente, puesto que de la misma se pueden fácilmente deducir que está inspirada en estos principios y contempla que cada forma de aprovechamiento, incluso el aprovechamiento en régimen de explotación común o colectiva, se ajuste *“en su detalle, a las ordenanzas locales o normas consuetudinarias tradicionalmente observadas”* (artículo 95 RBEL). Lógicamente estas modulaciones deben ser adoptadas en un primer momento por la comunidad afectada y solo después reflejadas en la ordenanza que aprueba el órgano administrativo.

Pero es que además encontramos reglas específicas en el TRRL y en el RBEL que reflejan la lógica que hemos expuesto. Existe, por ejemplo, excepciones al derecho de los vecinos al aprovechamiento en condiciones de igualdad en los artículos 75.4 TRRL y 103.2 RBEL contemplan que, en aquellos supuestos en que el disfrute y aprovechamiento de bienes comunales se viniese ordenando *“mediante concesiones periódicas a los vecinos de suertes o cortas de madera, de acuerdo con normas consuetudinarias u ordenanzas locales tradicionalmente observadas”*, el Ayuntamiento puede exigir a los vecinos, *“como condición previa para participar en los aprovechamientos forestales indicados, determinadas condiciones de vinculación y arraigo o de permanencia, según costumbre local, siempre que*

¹³ La norma es pues el régimen de explotación colectiva, sin más excepciones que las previstas en el artículo 94 RBEL en los supuestos en que aquélla fuera impracticable (STS de 25 de octubre de 1988). En consecuencia, no procede el reparto por lotes o suertes, si no se justifica sobradamente lo impracticable del uso colectivo (Dictamen del Consejo de Estado de 19 de octubre de 1989).

¹⁴ En la Sentencia de 3 de mayo de 1989 (Ponente: González Navarro) se explica que estos preceptos imponen que el aprovechamiento y disfrute de estos bienes se realice, en primer lugar, en régimen de explotación común o cultivo colectivo y que solo cuando tal disfrute fuere impracticable regirá la costumbre u ordenanza local. El mismo razonamiento se sigue en la Sentencia de 25 de octubre de 1988, en la que se afirma que la norma es el régimen de explotación colectiva, sin más excepciones que las previstas en el artículo 94 RBEL en los supuestos en que aquélla fuera impracticable. Y es también la posición del Consejo de Estado, que afirma que no procede el reparto por lotes o suertes, si no se justifica sobradamente lo impracticable del uso colectivo (Dictamen del Consejo de Estado de 19 de octubre de 1989).

estas condiciones singulares y la cuantía máxima de las suertes o lotes sean fijadas en ordenanzas especiales”, introduciendo una quiebra del principio de igualdad por razones justificadas;

O en el artículo 106 RBEL admite que parte de los bienes comunales sean acotados para fines específicos, entre los cuales se incluye el auxilio a los vecinos necesitados.

5. “LAS HAZAS DE SUERTE DE VEJER”: UN EJEMPLO EXITOSO DEL ENFOQUE DE BIENES COMUNES EN LA GESTIÓN SOSTENIBLE DEL TERRITORIO

Como se ha indicado, en los últimos tiempos se han realizado estudios sobre los bienes comunes que se conservan y sobre el uso que de los mismos se sigue haciendo. Los resultados permiten concluir que son prácticas sostenibles, inclusivas y alternativas de gestión de la tierra. Entre los bienes comunales que hoy siguen en explotación conforme a prácticas ancestrales podemos señalar “Las Hazas de Suerte de Vejer” (Bernabé Salgueiro, 2012; Tejeiro Salguero, 2008).

Vejer de la Frontera es un pequeño pueblo costero situado en el sur de España, junto al Océano Atlántico (Cabo Trafalgar), con una población de apenas 13.000 habitantes. Esta localización ha estado habitada permanentemente desde el Paleolítico y desde entonces ha estado sucesivamente bajo el dominio de los reyes de Tartessos (Edad del Bronce Atlántico), los griegos, el Imperio Romano, el Imperio Bizantino, los musulmanes y, finalmente, los reyes de la Corona de Castilla. Las actividades agrícolas, la ganadería y la pesca han sido sus industrias más importantes durante siglos, mientras que el turismo no se ha convertido en una actividad económica relevante hasta tiempos más recientes. Como consecuencia de su larga historia y de las continuas actividades agrícolas, Vejer de la Frontera desarrolló técnicas específicas de ordenación de la tierra basadas en la idea de la propiedad común de la tierra.

“Las Hazas de Suerte de Vejer” fueron concedidas en 1288 por el rey Sancho IV. Estaban destinados a ser tierras comunes de propiedad colectiva de los campesinos y libres de cualquier jurisdicción señorial. Este privilegio fue confirmado en 1566 por la Real Chancillería de Granada, cuando el Duque de Medina Sidonia intentó apropiarse de parte de las tierras. La sentencia estableció que los terrenos comunes, que se dividían en 356 parcelas de tierra arable, serían adjudicados por sorteo cada tres años (cada cuatro años, desde 1580). De esa forma los afortunados ganadores obtenían medios de subsistencia para ellos y sus familias durante los siguientes cuatro años. Originalmente, se esperaba que cultivasen el terreno asignado por sí mismos. Sin embargo, desde 1868 se permitió a los ganadores cultivar la parcela asignada o alquilarla a un inquilino (los llamados asentados), que debían pagar una renta.

Las “Hazas de Suerte” tienen una extensión total de 3.489,80 hectáreas, divididas en 232 parcelas de tierra cultivable (partidos), que representan el 14% de las tierras arables totales del pueblo y un 26% de las tierras cultivables realmente cultivadas. Las parcelas son típicamente tiras largas de tierra y su área media es cerca de 12,5 ha. El tamaño y la forma de las parcelas tienen por objeto garantizar una distribución equitativa de los suelos buenos y malos entre todos los lotes. En las mismas se practica una agricultura intensiva con rotación de cultivos de trigo, remolacha azucarera, cebada, sorgo, habas y garbanzos.

En la actualidad, los ganadores sólo tienen derecho a cobrar la renta que deben pagar los asentados. El importe de esa renta varía según la calidad de la parcela adjudicada, fluctuando entre 700 y 1.300 euros anuales. Por otro lado, los asentados del pueblo están incluidos en un registro y se les otorga el derecho de cultivar las tierras de por vida a cambio del pago de esa renta. Esta renta es más baja que la renta que habría que pagar a propietarios privados por tierras de similares características, lo que supone una ventaja importante para los asentados que encuentran así una vía más sencilla para acceder a una explotación agraria.

Las parcelas que cultivan los asentados también se rifan cada cuatro años. Cada año bisiesto se realiza un doble sorteo, que tiene lugar el 22 de diciembre: el primero es un sorteo de rentas entre las familias del pueblo y posteriormente se sortean las parcelas entre los asentados incluidos en el registro. La última rifa tuvo lugar el 22 de diciembre de 2016.

La gestión de las “Hazas de Suerte” se ha regido por leyes consuetudinarias no escritas durante siglos. En 1868, el municipio aprobó un reglamento que regía la asignación y gestión de los campos de la suerte y creó un órgano de supervisión, la “Junta de Hazas”. En la actualidad, el Alcalde preside este órgano, que está compuesto por diecisiete concejales y un número igual de representantes del pueblo, elegidos cada cuatro años. Esta Junta se encarga de la organización del sorteo de rentas y de la rifa de parcelas, así como de la supervisión del registro de familias y del registro de inquilinos. El Reglamento que rige las “Hazas de Suerte de Vejer” también ha evolucionado para adaptarse a las nuevas situaciones sociales. Por ejemplo, en 2000 se introdujo la igualdad de derechos entre hombres y mujeres y entre personas casadas, solteras o divorciadas.

Sobre la base de estas tierras comunes y su gestión peculiar se ha desarrollado una fuerte identidad cultural. Los estudiosos han señalado que los vecinos tienden a ver las “Hazas de Suerte” y esa lotería como parte de su herencia cultural (Muñoz Rodríguez, 2007). No sólo son conscientes de que participan en la gestión colectiva de una propiedad común, sino que también tienen la sensación de ser los propietarios reales y legítimos. Las “Hazas de Suerte de Vejer” se han convertido en una parte esencial de su patrimonio cultural y también de su identidad. De hecho, además de los sorteos, el pueblo lleva a cabo múltiples actividades culturales relacionadas con esta tradición cada año, incluyendo exposiciones y espectáculos callejeros que muestran los orígenes históricos de las “Hazas de Suerte de Vejer” y la lucha que los aldeanos mantuvieron durante años con los Duques de Medina Sidonia para conservar las tierras comunes.

Este enfoque ha implicado plenamente a la población en la protección de estos bienes comunales. No sólo los ganadores del sorteo, sino que todo el vecindario está preocupado por el uso sostenible de las tierras y su protección contra las prácticas agrícolas agresivas que podrían agotar los suelos o causar daños a largo plazo a ellos. Cada vecino tiene una expectativa

legítima de ganar la rifa, lo que significa que todos tienen un verdadero interés en la conservación de las tierras de la suerte. Por todo lo anterior, Vejer de la Frontera ha presentado recientemente una solicitud para que las “Hazas de Suerte de Vejer” sean declaradas patrimonio cultural inmaterial por la UNESCO.

ABSTRACT

Con este trabajo pretendemos realizar un análisis de las políticas de acogida e inclusión de la población inmigrante en Europa, tomando como muestra cuatro países de sur de Europa: España, Francia, Italia y Grecia. Este análisis forma parte del proyecto *“Desarrollo de un marco de competencias y de módulos de formación que promuevan la inclusión de los inmigrantes en Europa”* (Proyecto DIME), financiado en la convocatoria europea Erasmus + (2015-2018)

En primer lugar se describe el fenómeno migratorio en estos países teniendo como referencia el contexto europeo, en el que se incluye el perfil socio-demográfico de la población inmigrante y las dificultades en el acceso a la nacionalidad, la educación y la formación, la vivienda, la atención sanitaria y el empleo.

Posteriormente, se describe la situación de discriminación que sufre la población inmigrante, así como las políticas específicas que se han desarrollado en los diferentes países europeos, al objeto de conseguir su inclusión social y laboral, teniendo en cuenta los diferentes tipos de inmigrantes. Se apunta a que estas iniciativas han tenido un desigual impacto en la integración de las personas inmigrantes quedando muy lejos de la necesaria armonización de las políticas migratorias en el seno de la Unión Europea.

1. INTRODUCCIÓN

En el contexto global contemporáneo, la multiculturalidad se ha convertido en la seña de identidad de la mayor parte de las sociedades occidentales. La llegada de inmigrantes está teniendo un impacto cada vez mayor en las sociedades de acogida, evidenciando conflictos y contradicciones a todos los niveles. En este sentido, los planteamientos ideológicos que sustentan las democracias occidentales presentan diversas paradojas y las estructuras socio-políticas se encuentran en pleno proceso de transformación. Como señala Zapata-Barrero (2004: 16): “todas las épocas han tenido sus factores de grandes transformaciones sociales, políticas y culturales. Hoy en día este motor tiene un nombre: multiculturalidad e inmigración.”

Los países del centro y norte de Europa a mediados del siglo XX, como consecuencia de la necesidad de mano de obra fomentaron notablemente la llegada de inmigrantes (López y Giol, 2004). En este sentido, puede afirmarse que los flujos migratorios en Europa han sido, y continúan siendo regulados por el mercado de trabajo. En este periodo hubo un desarrollo económico importante en Europa que tuvo como consecuencia la ausencia de trabas para la entrada de inmigrantes, en la mayoría de las ocasiones procedentes de las antiguas colonias europeas de África.

Por el contrario, durante la crisis económica de los años 70, tuvo lugar un aumento importante del desempleo en Europa y, como consecuencia, comenzaron las restricciones a la inmigración, cerrándose las fronteras. Como resultado no deseado de estas limitaciones, los inmigrantes que ya se encontraban en el territorio europeo pasaron de realizar una inmigración oscilatoria de entrada y salida a quedarse permanentemente, evitando volver a sus países de origen, por miedo a no poder volver a entrar en el país de acogida (Aragón, 2003). Ello influyó a que paralelamente se fuera gestando un clima de opinión negativo hacia ellos, creándose en determinados sectores la falsa creencia de que pues las sociedades de acogida los vislumbraban como potenciales competidores por los bienes suministrados desde el Estado de Bienestar, que se percibían escasos.

Sin embargo, la idea de que la cuestión migratoria era un tema de agenda estatal tardó en aparecer entre los europeos. En un primer momento, se pensó que la llegada de los inmigrantes era algo transitorio. Sin embargo, con el tiempo se fue demostrando, por la vía de los hechos, que la inmigración no era una situación coyuntural de carácter eventual, sino que

se estaba convirtiendo en algo estructural: los inmigrantes se quedaban e incluso intentaban traer a sus familiares (Pajares, 2000). Como consecuencia, el tema de la inmigración se incluyó, aunque tardíamente, en los debates políticos. De hecho en el Dictamen 365/2002 del Comité Económico y Social Europeo se reconocía que las políticas de integración en Europa “sufrieron importantes retrasos debido a los supuestos iniciales sobre la temporalidad de las migraciones”

Por ende, aunque el fenómeno de la inmigración es global y está produciendo un fuerte impacto a todos los niveles en las sociedades occidentales, la gestión política de la misma, tal y como señalaba Zapata-Barrero (2000: 8), “se está construyendo”. Es decir, se trata de un fenómeno en cuyo enfoque predomina la confusión tanto a nivel teórico como práctico. Ni siquiera otros países europeos con una tradición migratoria mucho más larga que la española han sido capaces de dar una respuesta satisfactoria que no evidencie conflictos y contradicciones. En el año 2017 la situación descrita por Zapata-Barrero no ha cambiado.

Por otro lado, cabe destacar que la crisis económica de Europa y la llegada al poder en numerosos países europeos de partidos contrarios a la llegada de inmigrantes y, en algunos casos, claramente ultraderechistas, está dificultando el abordaje político del fenómeno migratorio a nivel de la Unión Europea (UE). Del mismo modo, la crisis siria y la llegada de miles de refugiados están tensionando y retrasando la toma de decisiones en el seno de la misma.

Una vez se describe esta situación, en este trabajo se ha realizado un análisis de las políticas de acogida e inclusión de la población inmigrante en Europa, concretamente en cuatro países de la banda mediterránea, como son España, Francia, Italia y Grecia. Este análisis forma parte del proyecto denominado: “Desarrollo de un marco de competencias y de módulos de formación que promuevan la inclusión de los inmigrantes en Europa” (Proyecto DIME), financiado en la convocatoria europea Erasmus + en 2015. En el mismo participan seis socios de estos países, con diferentes enfoques de la migración y con una destacada experiencia en la formación y la inserción de los inmigrantes en sus respectivos países. Las entidades participantes son: Association Internationale de Formation et de Recherche en Instruction Spécialisée, Santé, Social (AIFRISS); Centro Italiano Opere Salesiane Femminili. (CIOSF/FP); Kinonikes Sineteristikes Drastiriotites Efspathon Omadon (KSDEO-EDRA); Universidad de Huelva; Universidad de Jaén; e Institut Supérieur de Formation Permanente (INSUP), que desempeña la coordinación del proyecto.

2. LA UNIÓN EUROPEA: TIERRA DE INMIGRACIÓN

La Unión Europea es uno de los primeros destinos mundiales para la inmigración y el asilo. Su población aumentó en 1,1 millones de personas por los nacimientos que se produjeron (0,2 millones), pero sobre todo por la llegada de inmigrantes (0,9 millones) (en qué año?). En Europa aproximadamente 1 de cada 10 personas viven en países donde no han nacido. En la mayoría de los países de la UE, el número de inmigrantes es superior al número de emigrantes, con la excepción de Bulgaria, Irlanda, Grecia, España, Croacia, Chipre, Polonia, Portugal y Rumanía.

En 2014, 33,5 millones de personas nacidas fuera viven en países de la UE (es decir, el 3,9% de la población total), mientras que 17,9 millones de personas han nacido en un Estado miembro distinto de aquel en el que residen. En 2013, alrededor de 3,4 millones de personas han inmigrado a un país de la UE y 1,4 millones son personas de terceros países. Hay un ligero predominio del número de hombres en relación a las mujeres y en cuanto a la edad son relativamente jóvenes. De hecho en 2013, la edad media de los inmigrantes en la UE es de 28 años, frente a los 42 años de la población total de la UE.

En 2012, los países que recibieron el mayor número de inmigrantes no comunitarios son Alemania, España, Italia, Reino Unido y Francia. De acuerdo con Balleix (2013), en estos países se ubican las tres cuartas partes de los nacionales de terceros países que residen en la UE.

Como se indica en la Tabla 1, en 2015, la presencia de personas nacidas en el extranjero en España, Italia, Francia y Grecia está dentro de la media europea (en torno al 10%). Con un porcentaje que oscila entre el 9,5% y el 12,7%, España (12,7%), Francia (11,9%), Grecia (11,4%) e Italia (9,5%) reciben una proporción de personas nacidas en el extranjero equivalente a sus homólogos europeos, como Alemania (12,6%) y el Reino Unido (13,0%). Sin embargo, algunos países superan el 15%, siendo este el caso de Luxemburgo (32,5%), Austria (15,2%), Chipre (18,8%), Estonia (16,3%) y Letonia (15,3%).

Mientras que en Francia el número de personas nacidas en el extranjero aumentó un 9% entre 2011 y 2015, se estancó en Italia y se redujo en aproximadamente un 5% en España y Grecia. Esta disminución se explica por la magnitud de la crisis económica que afectó a ambos países. En España, entre 2000 y 2011, la proporción de personas nacidas en el extranjero en relación a la población total aumentó del 4,9% al 14,6%, lo que supuso el mayor incremento porcentual entre todos los países de la Organización para la Cooperación y el Desarrollo Económico (OCDE) durante este período (OCDE, 2014).

Si distinguimos entre los nacidos en el extranjero entre los que nacieron en la UE o fuera de la UE, la situación es un poco diferente. En Francia, España y Grecia, la proporción de personas nacidas en otros países de la UE es bastante bajo en comparación con las que están en Austria, Bélgica, Chipre, Irlanda y Luxemburgo. Por el contrario, la proporción de personas nacidas fuera de la UE es bastante alto en Francia (con una fuerte presencia de inmigrantes de África), en Grecia (debido a la presencia de un gran número de albaneses) y España. Italia combina una presencia moderada de inmigrantes nacidos en la UE o fuera de la UE.

Tabla 1: Porcentaje de personas nacidas en el extranjero en 2015 residentes en países de la Unión Europea

	Nacidas en el extranjero	Nacidas en otro país de la UE	Nacidas en un país fuera de la UE
Alemania	12,6	4,9	7,6
Austria	17,2	7,9	9,3

Por lo tanto, los países de la UE presentan diferencias significativas en los flujos migratorios, y los países participantes en el Proyecto DIME no son una excepción. De hecho, a menudo son el resultado del contexto económico y político de cada país, pero también la migración ha operado de acuerdo con la lógica histórica (pasado colonial), lingüística, o la proximidad geográfica.

A 1 de enero de 2014, la cantidad de personas que residían en un Estado de la UE y que son nacionales de un tercer país era de 19,6 millones, o sea, el 3,9% de la población de la UE frente a 14,3 millones de personas que tenían la nacionalidad de otro Estado miembro. En la mayoría de los países de la UE, el porcentaje de personas nacidas fuera de la UE es superior a la de las personas nacidas en un país de la UE (Tabla 1).

En España, hay una mayor presencia de personas procedentes de los países del Norte de África (fundamentalmente Marruecos), China y Ecuador. Entre las personas extranjeras que proceden de un país de la UE hay un mayor porcentaje de personas de Rumanía, Reino Unido e Italia.

Aunque Francia ha sido durante mucho tiempo el primer país receptor de población inmigrante procedente de Europa, las estadísticas actuales confirman la tendencia, que se inicia en los años 60, a una diversificación de los perfiles de los inmigrantes, tanto de los que proceden de otros países europeos como los de países no europeos. En 2010, los inmigrantes de fuera de la UE representaban casi 2/3 de todos los inmigrantes que vivían en Francia, con una mayor presencia de inmigrantes procedentes de África (43,8%) le siguen los procedentes de Asia (14,3%) y en menor medida de América y Oceanía (5,4%), siendo los argelinos (13,2%) y los marroquíes (12,2%) las comunidades más numerosas. Los procedentes de Portugal, Italia, España y, en menor medida, el Reino Unido son mayoritarios entre los residentes en Francia que han nacido en otros países de la UE (Blum Le Coat y Eberhard, 2014).

En Grecia existe una importante inmigración procedente de Albania y de los países de Europa del Este (búlgaros, rumanos y georgianos y rusos). En 1990, los albaneses representan el 57% de la población inmigrante. Hay que destacar que la situación geográfica de Grecia la sitúa en la confluencia de numerosas rutas migratorias:

- Personas exiliadas que huyen de conflictos bélicos: afganos, kurdos, iraquíes, iraníes, sudaneses, paquistaníes y, más recientemente, los sirios, en ocasiones llegan a Grecia para intentar llegar a otros países de la UE.
- Inmigrantes de África Oriental, Filipinas y el norte de África llegan a través de Turquía.

En la región de Ática se concentra la mayor parte de la población inmigrante, especialmente el centro de Atenas y otras ciudades importantes, como Tesalónica, Patras, Heraklion, o áreas más centradas en el turismo como las islas de Zante y Mykonos.

A principios del siglo XXI, Italia se ha convertido en un importante destino para los migrantes de los países del sur (especialmente de África, Asia y Oriente Medio). También el colapso del régimen soviético ha generado una fuerte afluencia de personas de Europa del Este. Los primeros inmigrantes asentados en Italia fueron de Eritrea debido a su pasado colonial, después los caboverdianos, filipinos y marroquíes se han sumado a estos. Desde 2001 hasta el 2011, los rumanos, albaneses y los marroquíes son las tres principales comunidades extranjeras del país.

El análisis demográfico de la población de la UE muestra que la población extranjera es más joven que la población autóctona, con una mayor proporción de personas en edad de trabajar. En 2013, la edad media de los nacionales fue de 43 años frente a 35 para los extranjeros de países de fuera de la UE. Este fenómeno se observa también en los países del proyecto DIME. De hecho, la edad media de la población española es de 43,2 años frente a los 35 años de los extranjeros. Las edades medias más altas son de los nacionales de países europeos (Reino Unido, Alemania y Francia). Por el contrario, las edades medias más bajas corresponden a personas de terceros países como Marruecos, Pakistán y China. En Grecia, la población extranjera es más joven y con más hijos. Estas diferencias entre extranjeros y nacionales se explican por la edad a la migración (a menudo muy jóvenes), la fertilidad previa a la migración (que implica la presencia de menores) y la antigüedad de la migración (las personas que formaron parte de los flujos migratorios más antiguos han envejecido en el país de acogida, por el contrario, cuando los flujos son recientes este envejecimiento aún no ha sucedido). En Francia, principalmente los nuevos inmigrantes son los que presentan una mayor proporción de jóvenes (44% de los nuevos inmigrantes adultos de 18 a 29 años, 38% de 30 a 39 años y 13% de 40 a 49 años).

De acuerdo con la encuesta realizada por el Ministerio del Interior francés, las principales razones de la inmigración en Europa son de carácter familiar (60%), económica (30%) y humanitarias (10%). Sin embargo, existen diferencias entre los países del proyecto. De hecho, España e Italia se ven fuertemente afectados por una inmigración económica. En Italia, los “inmigrantes económicos” provienen principalmente de la Europa Continental (52,8%), África (20,9%), Asia (18,3%) y en menor medida de América (7,9%). Por el contrario, en Francia y en Grecia hay una importante inmigración familiar. En Grecia, la reunificación familiar afectó a 189.997 personas en 2013 y las razones económicas a 69.875 inmigrantes. En Francia, a los nuevos inmigrantes se les concedió autorización de residencia principalmente por razones familiares (45,5%), le sigue por razones de estudio (30,6%); las razones económicas y humanitarias son invocadas con menor frecuencia (alrededor de un 8,5%). No obstante, conviene distinguir las razones legales para la migración de las motivaciones de los migrantes que son a menudo complejas e involucran múltiples proyectos (profesional, familiar e inseguridad social y política).

Cabe destacar que no se puede realizar un análisis de la migración en los países socios sin tener en cuenta la crisis migratoria que afecta a todos los países europeos en los últimos cuatro años. De hecho, a Europa están llegando, o intentando llegar, un importante número de personas exiliadas víctimas de los conflictos y de las crisis políticas y/o alimentarias procedentes de Oriente Medio y África.

3. POLÍTICAS DE INTEGRACIÓN DE LA POBLACIÓN INMIGRANTE

Un asunto importante cuando se analizan las políticas de inmigración es la repercusión que la inmigración tiene sobre el sistema político democrático de las sociedades de acogida, ya que cuando se formalizaron los Estados, tal y como los conocemos en la actualidad, no se contempló como una posibilidad la presencia de personas procedentes de otras culturas (Zapata-Barrero, 2002). Nadie duda en la actualidad de la existencia de una serie de contradicciones en el seno de dichos sistemas cuando se plantean algunas cuestiones relacionadas con la inmigración en torno a la ciudadanía, a la igualdad de derechos y a la no discriminación, que son las bases sobre las que se asienta el Estado de Derecho. Estos principios están siendo cuestionados por la vía de los hechos con diversas justificaciones.

Una primera noción importante a analizar en este sentido es la de justicia en relación con la inmigración. Ya Walzer en 1993 aborda esta cuestión en su libro “Las esferas de justicia” donde recoge hasta qué punto las sociedades pueden permitir la exclusión de personas con el único criterio de la nacionalidad y duda de que los argumentos que se utilizan para justificar esta exclusión sean justos. Para Walzer todos los inmigrantes tienen el derecho moral a ser tratados iguales que el resto de la población sobre la base de que no es justo que los Estados utilicen a los inmigrantes para mejorar sus economías y que los excluyan de los privilegios de la ciudadanía. Añade, además, que ya desde el primer momento, los Estados deben establecer los criterios que consideren adecuados para regular la entrada a su territorio de inmigrantes, pero una vez dentro, no pueden vivir siempre como extranjeros, sino que el Estado debe posibilitar que se conviertan en ciudadanos.

En este sentido, el hecho de que los inmigrantes estén siendo discriminados, y considerados ciudadanos de segunda categoría con derechos diferentes a los que disfruta la población autóctona, resulta incompatible con el ideal de democracia. No obstante, aunque la mayoría de los países tienen suscrita la Declaración de los Derechos Humanos, donde este principio

de igualdad y no discriminación está consagrado universalmente e incluso explícitamente incluido en la Constitución de cada país, lo cierto es que estos principios están fuertemente restringidos para los inmigrantes.

La puesta en marcha de políticas de integración o acomodación no dará resultados sin el reconocimiento de dichos derechos. La negación de los derechos del inmigrante los sumerge en una situación de exclusión, haciendo difícil su integración y dejándolos en absoluta vulnerabilidad. Esto influye negativamente en sus proyectos de vida, como consecuencia inevitable de la precariedad del trabajo que desarrollan, la incertidumbre sobre su permanencia en el país, la falta de protección social (subsídios, pensiones, desempleo, etc.), etc. Así, viven en una sociedad donde se ha conseguido para la mayoría de los ciudadanos un nivel de protección social importante de la cual ellos no pueden gozar. Aportan la plusvalía de su trabajo y contribuyen, mediante el pago de impuestos, al mantenimiento del Estado, del que obtienen escasos beneficios. El panorama general es entonces altamente contradictorio: se reconoce que a medio plazo sin el aporte de los inmigrantes peligran algunos de los servicios y prestaciones del Estado (la disminución de la natalidad en los países occidentales hace necesaria su aportación como trabajadores y contribuyentes) y sin embargo, se espera que vivan el día a día sin ninguna protección frente a las adversidades que puedan presentárseles (De Lucas, 2002).

Frente a esta discriminación y no-reconocimiento de derechos, las diferentes políticas públicas que se ponen en marcha intentan paliar esta situación arbitrando mecanismos que mejoren las condiciones de vida de la población inmigrante. Lo que no se tiene en cuenta es que si existiera un pleno reconocimiento de sus derechos, esto no sería necesario.

Todo esto tiene además un efecto perverso sobre la opinión pública, ya que legitima de manera institucional el no reconocimiento de los derechos de los inmigrantes. El mensaje que implícitamente se difunde es: “son extranjeros, no son como nosotros y por lo tanto no tienen los mismos derechos.” Como consecuencia, la cobertura de esos derechos se deja en manos de las ONGs o asociaciones o confesiones religiosas, lo cual hace que la problemática pase del campo de los derechos al campo de la caridad y del paternalismo. Si los inmigrantes fueran considerados titulares de derechos, sería el Estado el que tendría la obligación de garantizar su protección o cobertura.

Zapata-Barrero (2004), señala al respecto que en la actualidad existen varias categorías de ciudadanos: los ciudadanos de pleno derecho, los inmigrantes regularizados permanentes, los regularizados temporales y los no regularizados. Cada una de estas categorías tiene reconocidos derechos diferentes. Los inmigrantes irregulares no tienen ningún derecho. Este último grupo, que asciende a millones de personas en toda Europa, se encuentra así en una situación de exclusión y de vulnerabilidad total, y por lo tanto es objeto de múltiples abusos. No tienen derecho a tener derechos, son invisibles para el Estado y están situados en los niveles más bajos de la sociedad.

La política de integración de la población inmigrante en la UE corresponde a cada Estado miembro a pesar de que en los últimos años la UE ha intentado fomentar una armonización de estas políticas. De hecho, hasta el *Tratado de Amsterdam* la inmigración procedente de terceros países no se aborda y no fue hasta la entrada en vigor del *Tratado de Lisboa* cuando se dieron los primeros pasos para estimular y apoyar la acción de los Estados miembros para promover la integración de los nacionales de terceros países que residieran legalmente en su territorio. El *Programa de Tampere* de 1999 instó a los Estados a conceder a los nacionales de terceros países que residen legalmente en su territorio derechos y obligaciones comparables a los ciudadanos de la UE. El programa de La Haya (2004) y de Estocolmo (2009) instaron a una mayor cooperación entre los Estados y el apoyo de la UE a las medidas adoptadas. Algunos de los principios comunes que han sido definidos desde 2004 son: la integración como un proceso en el que se produce una adaptación entre la sociedad de acogida y la población inmigrante, el cumplimiento de los valores fundamentales de la UE, el conocimiento de la lengua, la historia y las instituciones del país de acogida, el acceso a los bienes y servicios públicos en la mismas condiciones que los nacionales, la participación política de los inmigrantes, etc.

A pesar de estas similitudes, las políticas de integración de los inmigrantes en los Estados miembros están condicionadas por la historia, la cultura política y prácticas de las instituciones, siendo diferentes en cada uno de los países del proyecto.

Una primera diferencia radica en la distribución de las competencias sobre inmigración. En Francia, Italia y Grecia, las políticas son coordinadas por el Ministerio del Interior. En España, las competencias están repartidas entre el Ministerio de Interior y el de Empleo y Seguridad Social. En España, Grecia e Italia, son los gobiernos regionales los responsables de la política de integración en colaboración con los municipios. Francia tiene una configuración particular dado su modelo altamente centralizado, a pesar de que existe una política de descentralización adoptada desde 2002 en este área. La política de integración sigue siendo una prerrogativa del Estado a través de sus servicios descentralizados en los departamentos.

La segunda diferencia se observa en el diseño de la acogida de los migrantes en los países de la UE. Por ejemplo, en Francia la integración de los inmigrantes comienza a su llegada al territorio cualquiera que sea la razón de la migración. La recepción a los recién llegados es organizada por la Oficina Francesa de Inmigración e Integración (OFII), dirigida por el Ministerio del Interior, que es responsable de las medidas de apoyo en su proceso de integración. Además, se requiere que los recién llegados firmen un contrato de acogida e integración en el que se comprometen a respetar los valores franceses. El estado ofrece los siguientes servicios: una sesión de información de grupo seguido de un examen médico y una entrevista con un responsable de la OFII para identificar las necesidades en materia de formación, una jornada de formación cívica sobre los valores y principios de la república, un módulo de profundización sobre el acceso al empleo en Francia y a los servicios públicos, una sesión sobre “Derechos y deberes de los padres” y la enseñanza del idioma. En España son en gran medida las autoridades regionales las que gestionan la implementación de programas de acogida e integración.

En la mayoría de los países de la UE, los programas de acogida para los recién llegados procedentes de países de fuera de la UE se han creado a lo largo del tiempo. Estos a menudo consisten en la enseñanza de idiomas, un curso sobre el conocimiento de la sociedad de acogida, así como un seguimiento personalizado. El objetivo es ayudar a los recién llegados a llevar una vida económicamente independiente en la sociedad de acogida y sentar las bases para su integración. En 1998, los Países Bajos fueron los iniciadores de un programa de integración para los recién llegados que sirvieron de ejemplo a otros

países como Alemania y Dinamarca (Michalowski, 2006). Sin embargo, existen diferencias significativas en estos programas en relación con las obligaciones e incentivos, las horas de formación y el nivel a alcanzar.

Por otro lado, a enseñanza de idiomas suele una parte importante de la integración de la población inmigrante en las sociedades de acogida. A menudo es el requisito previo para entrar en el territorio, para obtener un permiso de residencia o adquirir la nacionalidad. Algunos países van más allá y utilizan pruebas para evaluar el nivel de lengua adquirido.

En un informe del Consejo de Europa (2014) se recoge que 22 países de los que participaron en la investigación condicionan la obtención de un permiso de residencia a los conocimientos de la lengua y 14 ofertaban cursos oficiales de idiomas. La participación es obligatoria en cuatro de estos países y opcional en nueve. La duración de los cursos varía de 75 horas a 3.000 horas. Sin embargo, y de acuerdo con el mismo estudio, hay varios modelos de políticas lingüísticas para la atención de adultos migrantes.

Los países del norte de Europa (Alemania, Austria, Liechtenstein, los Países Bajos) requieren un nivel de idioma para conseguir tanto la residencia como la nacionalidad. Por ejemplo, en Alemania, se requiere un nivel B1 y los cursos obligatorios tienen una duración de entre 600 y 900 horas. En los Países Bajos, el nivel A2 es obligatorio para obtener una residencia permanente. Dinamarca ofrece tres cursos gratuitos de acuerdo con el perfil de aprendizaje de 2.000 horas y con una duración de más de 3 años. En Noruega, el número de horas es hasta un máximo de 3.000 horas dirigidas a conseguir los niveles B1 o B2.

En general en los estados socios del proyecto DIME, para obtener un permiso de residencia los inmigrantes adultos deben demostrar su competencia en el idioma del país de acogida (Francia, Grecia e Italia). Sólo en Francia, los recién llegados están obligados a asistir a clases. La situación en España es especial, los inmigrantes no están obligados a demostrar su conocimiento de la lengua pero asistir a clases de español facilita la renovación de determinados permisos de residencia o de trabajo, pero son opcionales. En Grecia e Italia, se requiere el nivel A2 para la residencia. En Grecia, los inmigrantes adultos deben pasar una prueba de idioma y las clases están disponibles para aquellos que deseen obtener la residencia permanente. En Italia, las habilidades lingüísticas tienen que ser certificadas. Tanto Francia, como Bélgica, Luxemburgo y Suiza se sitúan a medio camino entre el modelo de los países europeos del norte y el sur. Los cursos obligatorios están especialmente diseñados para los recién llegados, pero el nivel de idioma requerido es inferior. Por otra parte, el éxito en las pruebas no es una condición para obtener un permiso de residencia, sólo el seguimiento de la formación es obligatorio. En cuanto a la entrada en el país, no hay un nivel requerido y el resultado no tiene ningún impacto en la concesión del visado.

En relación a las condiciones para la obtención de la nacionalidad, el nivel de idioma requerido en Francia es el nivel B1 y en Grecia el A2. En España, a través de una entrevista se evalúa el nivel de idioma para obtener la ciudadanía. En Italia no tienen ningún requisito especial. Los países de Europa del Este tienen pocos requisitos en esta área. El nivel de idioma requerido es poco elevado y son raros los cursos de idiomas que ofrecen.

Además de la enseñanza de idiomas, existe una formación cívica sobre legislación, cultura, historia, valores, etc. en diferentes países europeos. El informe del Consejo de Europa muestra que 18 países establecieron programa de formación para los inmigrantes que desean obtener un permiso de residencia. La participación en estos cursos es en la mayoría de los países opcional. El seguimiento de estos cursos conduce a una serie de derechos y obligaciones. En los Países Bajos, una persona puede recibir una multa si no cumple con sus compromisos. En Dinamarca, si el contrato de integración no se respeta, los migrantes no reciben prestaciones sociales.

España sigue las recomendaciones de la Unión Europea para la formación de los valores de la sociedad, pero no es obligatoria para la emisión de un permiso de residencia y el contenido varían de una comunidad autónoma a otra, participando en la misma las asociaciones y autoridades locales que gestionan muchos de los dispositivos de acogida (Koller, 2007). En España, Grecia e Italia los cursos cívicos se imparten junto con la enseñanza de idiomas como en Austria y el Reino Unido.

3.1 La participación política

El tema del derecho al voto de los residentes extranjeros de larga estancia ha sido objeto de debate en muchos países de la Unión Europea. Si desde el Tratado de Maastricht, todos los ciudadanos de la Unión Europea pueden votar y presentarse en otro Estado miembro para las elecciones europeas y locales, las condiciones de participación política de los extranjeros no comunitarios varían de país a otro. De hecho, algunos permiten que puedan votar en las elecciones locales sin ningún tipo de residencia como en Irlanda desde 1992. Otros, como Suecia, Dinamarca, Holanda, Luxemburgo, Bélgica, Estonia, Eslovenia, Lituania, Hungría, la República Checa y Eslovaquia concedieron el derecho al voto en las elecciones locales a todos los residentes en el territorio que llevarán entre dos y cinco años residiendo en el país. El Reino Unido permite a todos los ciudadanos de la Commonwealth votar en todas las elecciones, incluidas las nacionales. Un total de 15 países de Europa han concedido a los extranjeros el derecho al voto en las elecciones locales. Sin embargo, 12 países se niegan a conceder este derecho, como por ejemplo, Francia.

España, Portugal y la República Checa, permiten a los nacionales de terceros países votar en las elecciones municipales bajo ciertas condiciones de reciprocidad y residencia. En España, los residentes de los siguientes países pueden inscribirse y votar en las elecciones municipales: Bolivia, Cabo Verde, Chile, Colombia, Corea del Sur, Ecuador, Islandia, Noruega, Nueva Zelanda, Paraguay, Perú, Trinidad y Tobago.

En Italia, el Decreto 268/1998 establece la igualdad de derechos y la participación en la vida pública local. En concreto el artículo 9 establece el derecho de los extranjeros no comunitarios al voto para los que tienen concedida una autorización de residencia de larga duración.

Los residentes extranjeros establecidos en Grecia pudieron votar por primera vez en las elecciones municipales de noviembre de 2010, este principio ha sido cuestionado en marzo de 2011 y el Consejo Constitucional ha dictaminado que esta ley es inconstitucional.

3.2 El acceso a la nacionalidad

En 2013, 984.800 personas adquirieron la nacionalidad de un Estado de la Unión Europea, lo que supuso un aumento del 20% en comparación con 2012. Entre ellos, el 89% eran de un tercer país fuera de la UE. Las personas que han obtenido la nacionalidad de un Estado miembro eran personas que mayoritariamente procedían de Marruecos, India, Turquía, Colombia, Albania y Ecuador.

España está entre los países europeos con el mayor número de personas que adquirieron la nacionalidad en 2013 (23% del total de la UE), seguido por el Reino Unido, Alemania, Italia y Francia. Sin embargo, el crecimiento más fuerte en comparación con 2012 se registró en España, Italia, Reino Unido y Grecia.

Los países del proyecto se encuentran entre los países de la UE donde es fácil conseguir la nacionalidad a los inmigrantes de terceros países pero existen diferencias de un país a otro. Los principales receptores de la nacionalidad española en 2013 eran colombianos (17,2%), ecuatorianos (17%) y marroquíes (13,4%). La nacionalidad francesa se le dio principalmente a marroquíes (17,1%), argelinos (13,8%) y turcos (6%). En Grecia, los destinatarios son en su mayoría albaneses (87,7%) y en menor medida rusos (1,3%) y georgianos (1,2%). En cuanto a Italia, los marroquíes son los principales beneficiados (17,1%) seguido por los albaneses (13,6%) y los indios (4,8%).

Estos datos dependen en gran medida de los términos en los que se establece la adquisición de la nacionalidad en vigor. De hecho, no hay reglas únicas en Europa, los Estados miembros tienen sus propios criterios en base a dos filosofías de nacionalidad: *ius soli* y *ius sanguinis*. Algunos países están mezclando estas dos características, como Francia, Alemania o Polonia. Italia, por su parte, hace hincapié en el derecho de sangre.

En la mayoría de los países los procedimientos principales para la obtención de la ciudadanía son dos: la residencia y el matrimonio.

En España y Grecia, se requieren 10 años de residencia en el territorio antes de que puedan obtener la nacionalidad. En España, el periodo de residencia se reduce a 5 años para los que hayan obtenido la condición de refugiado, 2 años para las personas cuya lengua materna es el español, para los filipinos, andorranos y las personas de origen sefardí y 1 año para los nacidos en territorio español o si uno de sus antepasados es de origen español. En todos los casos, los individuos deben haber demostrado buena conducta cívica y suficiente grado de integración en la sociedad. Los apátridas y refugiados en Grecia también se pueden beneficiar de una reducción del tiempo de permanencia de 5 años para adquirir la nacionalidad.

En Francia, se requiere una residencia de 5 años en el territorio para adquirir la nacionalidad francesa. Este período se reduce a 2 años si el solicitante ha completado la educación superior en Francia, si tiene capacidades o talentos excepcionales o si se tiene un nivel superior de integración porque sobresalga en uno de los siguientes ámbitos: civil, científico, económico, cultural o deportivo. El tiempo también se puede reducir si se hizo el servicio militar en el país, o ha prestado servicios excepcionales, u obtuvo el estatuto de refugiado.

En Italia, con la reforma de la normativa que permite la adquisición de la ciudadanía italiana en el año 2015, aprobada por la Cámara de Asuntos Constitucionales, el tiempo de residencia obligatoria en el país pasó de 10 a 8 años. De todos modos, el solicitante debe demostrar su conocimiento de la lengua y la cultura del país.

La nacionalidad también puede adquirirse a través del matrimonio. Los criterios varían considerablemente de un Estado miembro a otro. Mientras que algunos se basan solo en la duración del matrimonio (1 año en España, 2 años en Italia, 10 años de los últimos 12 en Grecia), otros requieren algunas medidas de seguridad adicionales, tales como Francia, que requiere cuatro años de matrimonio y 1 año de residencia.

3.3 El derecho a la salud

A nivel internacional, el acceso a la atención sanitaria es un derecho fundamental para todas las personas, independientemente de su nacionalidad, color, idioma, opinión política, clase social, u origen.

Cada país tiene la obligación de garantizar el derecho a la salud en su territorio. La Unión Europea hizo de la salud un derecho fundamental, aunque a menudo ha estado ausente de sus tratados (Hoyez, 2011). Sin embargo, referencias a la política sanitaria aparecen en el Tratado de Maastricht en 1992 y en el Tratado de Amsterdam en 1997. La Unión Europea se ha fijado como objetivos en materia de protección de la salud, mejorar la salud pública, prevenir enfermedades, promover la investigación e informar a la ciudadanía. En este sentido apoya y complementa las actividades de los Estados miembros en materia de protección social, siendo estos los que diseñan e implementan las políticas sanitarias y la organización de la atención médica en sus respectivos territorios. Las iniciativas de la UE en esta materia son un instrumento de apoyo legislativo y de cooperación para ayudar a desarrollar y armonizar prácticas. A este respecto, en 2002 el Consejo Europeo adoptó tres principios básicos para la reforma de los sistemas de salud: la accesibilidad para toda la ciudadanía, una atención de alta calidad y la sostenibilidad financiera de los sistemas sanitarios a largo plazo. En la práctica esto se traduce en la existencia de sistemas sanitarios diferentes en cada Estado miembro.

En general, en todos los países los extranjeros que están regularizados tienen reconocidos los mismos derechos que los nacionales. De hecho, el sistema de salud (seguridad social y beneficios sociales) se basa fundamentalmente en el principio de residencia. Sin embargo, existen diferencias, en particular entre los cuatro países del proyecto.

En España la Ley Orgánica sobre derechos y libertades de los extranjeros y su integración social especifica los derechos de los inmigrantes independientemente de su estatus migratorio y los que están sujetos a condiciones, entre los que se incluyen los derechos económicos, sociales y culturales. De hecho, los derechos más amplios se otorgan a personas que posean la nacionalidad como el derecho a la salud, el trabajo, la educación, etc. La Ley inicialmente establecía que tenía derecho a la atención sanitaria completa los que estaban regularizados con permiso y contrato de trabajo; sin embargo los que estaban en una situación irregular la tendrían garantizada en estas situaciones: si sufrían una enfermedad grave o accidente que hiciera necesario una atención de urgencia, si eran menores de 18 años y las mujeres embarazadas durante el embarazo, el parto y el

postparto. Y en cualquier caso, todos aquellos que estaban inscritos en el padrón municipal tendrían cobertura sanitaria en el sistema sanitario público.

Esto cambia en el año 2012 con el Real Decreto-Ley 16/2012 de 20 de abril en el que se establece que: los extranjeros no registrados ni autorizados como residentes en España recibirán asistencia sanitaria:

- a) De urgencia por enfermedad grave o accidente, cualquiera que sea su causa, hasta la situación de alta médica.
- b) De asistencia al embarazo, parto y postparto.
- c) Menores de dieciocho años en mismas condiciones que los españoles.

Quedan fuera de la cobertura sanitaria los inmigrantes en situación irregular que no se ajusten a los anteriores supuestos, aunque estén inscritos en el padrón municipal.

En España al estar las competencias en materia de salud transferidas a las comunidades autónomas cada una lo ha regulado de manera diferente. De tal manera que hay comunidades que han continuado prestando atención sanitaria a la población inmigrante con el único requisito de estar inscritos en el padrón, mientras que otras han aplicado literalmente lo que recoge la Ley.

El sistema de salud en Francia se organiza desde 1945 con la creación de la Seguridad Social. En sus inicios, el empleo remunerado era la condición que permitía a las personas el acceso a un seguro de salud, independientemente de su nacionalidad. A partir de los años 90 y como consecuencia de la existencia de desigualdades en el acceso a la asistencia sanitaria se han implementado nuevos servicios como la Asistencia Médica Gratuita y la Asistencia Médica Departamental. Con la creación de la Cobertura Universal de Salud por la ley del 27/07/1999, se extiende el seguro de salud a cualquier persona que viva en Francia, incluidos los extranjeros. Tener trabajo ya no se considera como condición para acceder a la atención sanitaria. En ésta se establecen tres servicios:

- La cobertura por enfermedad básica: permite que los gastos sanitarios puedan ser reembolsados. Las personas sin empleo pueden acceder a él en determinadas condiciones: estar regularizado o tener hecha una solicitud de asilo y estar residiendo en Francia al menos durante tres meses.
- La cobertura por enfermedad complementaria: cubre ciertos gastos, además de la cobertura básica en las mismas condiciones. Uno de los requisitos es no tener más de 716,08 euros de ingresos mensuales.
- La Ayuda Médica del Estado: es un dispositivo que permite que los extranjeros en situación irregular se puedan beneficiar del acceso a la atención sanitaria durante un año, con la condición de tener residencia en Francia durante más de 3 meses y tener ingresos modestos.

En otras palabras, los inmigrantes tienen los mismos derechos desde el punto de vista legal que los nacionales y a los que están en situación irregular se les da asistencia especial con la Ayuda Médica del Estado.

Los sistemas sanitarios italiano y griego proporcionan asistencia sanitaria sin distinción a los extranjeros estén en situación regular o irregular.

En Italia los solicitantes de asilo, los refugiados, los beneficiarios de subsidios de protección y los trabajadores extranjeros gozan de igualdad de trato y de los mismos derechos que los ciudadanos italianos en materia de salud. La inscripción en el Servicio Nacional de Salud es obligatoria y se les proporciona una tarjeta sanitaria con una indicación del médico general y pediatra para los menores, el acceso a la atención ambulatoria y especializada y hospitalización. La atención sanitaria también se concede a las personas en situación de dependencia que residen legalmente en Italia. Para los extranjeros en situación irregular se les presta atención ambulatoria, atención hospitalaria urgente o esencial, incluyendo las intervenciones quirúrgicas, si fueran necesarias. Estos servicios son proporcionados por los servicios públicos y acreditados. Por último, como parte de los servicios prestados a los extranjeros en situación irregular, las siguientes prestaciones están garantizadas:

- La protección social durante el embarazo y la maternidad.
- La protección de la salud de los menores.
- Las vacunaciones.
- Las medidas preventivas internacionales.
- La profilaxis, diagnóstico y tratamiento de enfermedades infecciosas

En Grecia cualquier persona, independientemente de su condición, tiene, en principio, el mismo acceso a los servicios de salud y a un dispositivo dirigido a los extranjeros con problemas. Sin embargo, el acceso a los servicios de salud no significa que haya un uso efectivo por la población inmigrante. De hecho, muchos estudios muestran, sobre todo en Francia, Italia y España, un menor uso de los sistemas de salud por la población inmigrante en comparación con el uso observado entre los nacionales. Las causas suelen ser diversas y están relacionadas con bajos ingresos y la existencia de barreras administrativas, culturales e idiomáticas. En general, los inmigrantes recién llegados son personas con un buen nivel de salud, debido a su edad, y a que suelen emigrar personas con un buen estado de salud. Uno de importante problema que se ha detectado es que debido a su situación socio-económica son más propensos a abandonar la atención sanitaria que necesitan.

3.4 El derecho a la vivienda

El análisis comparativo de las políticas de acogida e integración de los inmigrantes en Europa muestra que pueden acceder a una vivienda social tanto los nacionales como los no nacionales en algunos países de la UE, como Grecia, Finlandia, Suecia, Polonia o los Países Bajos. En Francia, desde 1986, el acceso a la vivienda social está condicionado por la duración de la residencia. En este contexto, extranjeros regularizados y residentes en Francia de forma permanente pueden acceder en las mismas condiciones que los franceses.

La importancia de la vivienda social varía de un país a otro de la UE. En los países del sur (Grecia, España, Chipre, Portugal) y este (Eslovaquia, Lituania, Letonia, Rumania, Bulgaria), la tasa es muy baja, menos del 5% del total de viviendas. Sigue siendo baja, entre el 5% y el 9%, en Italia, Alemania y Bélgica. Francia está en la media, con una tasa de viviendas sociales del 17% muy por detrás de los Países Bajos, que es el país de la UE con la tasa más alta, en concreto un 35%.

Sin embargo, los análisis realizados sobre el tema muestran la desigualdad de acceso a estas viviendas sociales sobre todo en Francia.

Aunque los inmigrantes regularizados teóricamente tienen acceso en las mismas condiciones que los nacionales a una vivienda social, esta igualdad en la práctica no es tal, debido a la escasez de viviendas sociales y los bajos ingresos. Por este motivo la población inmigrante accede a viviendas que están en malas condiciones debido al coste elevado de las mismas (Commission Européenne, 2005).

3.5 El acceso a la educación y a la formación

En la mayoría de los países de la UE, la escolarización es obligatoria y el derecho a la educación y la formación es un principio general, sin distinciones, pero en la práctica, todavía persisten desigualdades. Los estudios estadísticos muestran que los hijos de inmigrantes con mayor frecuencia abandonan la escuela sin conseguir una cualificación, a pesar de la existencia de programas específicos.

En Grecia, hay programas para los hijos de los inmigrantes en los que se incluyen cursos intensivos de idiomas, clases de apoyo, etc. En España, se ha destinado financiación para la integración de los inmigrantes y para el fortalecimiento de los recursos educativos. En Francia, a partir de los años 70, se han desarrollado varios dispositivos en los que se tiene en cuenta las necesidades específicas de la población inmigrante. Su objetivo es facilitar su integración en el sistema escolar y para ello se hace hincapié en el aprendizaje de la lengua francesa. Desde 2012, los menores que han sido escolarizados en su país de origen, se pueden incorporar con “clases puente” para preparar su incorporación a las clases regulares. Se incorporan a clases específicas en la que aprenden los conceptos básicos antes de unirse al curso académico estándar.

En cuanto a la formación continua, aunque por ley los dispositivos están abiertos a los inmigrantes regularizados, algunos estudios muestran que tienen poco acceso a la formación profesional, por ejemplo en Francia en una proporción dos veces menor que los nacionales. Entre 1998 y 2003, el 18% de los inmigrantes han tenido alguna formación frente al 36% de los franceses. Cualquiera que sea el tipo de actividad en la que trabajen, la edad o el sexo, los inmigrantes tienen una tasa de acceso a la formación profesional inferior a los no inmigrantes. En este sentido, no hay que descartar la existencia de otros factores que puedan explicar esta desigualdad en el acceso a la formación profesional, incluyendo la estabilidad en el empleo y el tipo de contrato.

3.6 El acceso al mercado de trabajo

En Europa, las estadísticas son unánimes en cuanto a la situación de los inmigrantes en el mercado laboral. La tasa de desempleo de los inmigrantes es mayor que los nacionales de los países de que se trate. Por el contrario, en Estados Unidos, Nueva Zelanda y Australia, la tasa de desempleo parece estar menos influenciada por el país de nacimiento (OCDE, 2014).

Según el Instituto Nacional de Estadísticas y Estudios Económicos, en Francia 472.000 inmigrantes de entre 15 y 64 años estaban en el paro en el año 2014. Para este grupo de edad, la tasa de desempleo se situó en el 17,4% frente 9,2% para los autóctonos. Hay diferencias significativas en función del país de origen de los inmigrantes. De hecho, la proporción de parados entre los que proceden de países de la UE (9,4%) es similar a la de los no inmigrantes. Por el contrario, los inmigrantes de países que no pertenecen a la Unión Europea se ven particularmente afectados por el paro, en concreto el 20,8% lo está, no existiendo diferencias significativas entre hombres y mujeres.

Este fenómeno se observa también en los otros países del proyecto DIME. Como se indica en la tabla 2, entre 2007 y 2012, las personas extranjeras se ven más afectadas por el desempleo. En 2012, la proporción de extranjeros sin un trabajo es mayor en proporciones significativas: con una diferencia de 12,5 puntos en España, 6,8 puntos en el caso de Francia, 10,3 puntos en Grecia y 3,5 puntos en Italia.

Tabla 2. Tasa de desempleo de inmigrantes y autóctonos. (OCDE, 2014)

	% sobre el total de la población activa			
	Nacidos en el país de residencia		Nacidos en el extranjero	
	2007	2012	2007	2012
España	7,9	22,9	10,3	35,4
Francia	7,4	9,2	13,1	16,0
Grecia	8,4	23,4	8,7	33,7
Italia	6,0	10,4	7,9	13,9
UE-28	6,8	9,9	10,8	15,6

Fuente: OCDE, *Panorama des statistiques de l'OCDE 2014 : Economie, environnement et société*. Elaboración propia

En 2012, la tasa de desempleo de las personas nacidas en el extranjero es particularmente alta en España (35,4%) y Grecia (33,7%) en comparación con la de las personas autóctonas. De manera similar, esta circunstancia se produce en todos los países de la UE (15,6%), incluidos Francia (16%) e Italia (13,9%). En Grecia y España, a los inmigrantes parece haberles afectado la crisis económica de 2008 de manera más acuciada que los autóctonos, cuya situación laboral se ha degradado muy rápidamente. De hecho, en ambos países, la tasa de desempleo de los inmigrantes experimentó un fuerte aumento entre 2007 y 2012 (25 puntos), el aumento ha sido menos significativo en Francia con una diferencia de 3 puntos e Italia con 6 puntos de diferencia.

Esta situación se puede explicar porque la población inmigrante presenta un bajo nivel de cualificación, tiene una presencia masiva en sectores muy afectados por la crisis (construcción, hoteles, restaurantes, etc.) y su situación es más precaria en el mercado laboral (contrato temporal, subempleo, etc.).

En todos los países de la UE, la tasa de empleo aumenta con el nivel de estudio. En otras palabras, tanto las personas que han nacido en su país de residencia como en el extranjero que han estudiado encuentran más fácilmente trabajo y tienen menos probabilidades de estar en paro.

Así mismo se ha observado en la mayoría de los estudios realizados una correlación entre el desempleo de los inmigrantes y la existencia de bajos niveles de cualificación. De acuerdo con un estudio realizado por Lemaitre (2006), los inmigrantes tienen un nivel de educación inferior a los autóctonos. 39% de los inmigrantes han completado la escuela secundaria y el 24% tienen un nivel educativo superior, frente al 48% y 25% para los autóctonos. Esto afecta principalmente a los nacionales de terceros países.

Los inmigrantes de los cuatro países involucrados en el proyecto presentan una escasa cualificación que los excluye del mercado de trabajo. Por ejemplo, en Francia la proporción de personas que han terminado la secundaria o que tienen un título universitario es más baja para los inmigrantes. Estos resultados se confirman también entre los inmigrantes más recientes llegados a Francia, aunque existe una importante heterogeneidad entre ellos en función de su origen. La proporción de nuevos inmigrantes de origen africano sin ninguna cualificación a su llegada es superior en 10 puntos en relación a los inmigrantes de Europa o Asia, y más de 15 puntos comparativamente con los inmigrantes de América y Oceanía.

En 2012, la brecha entre la tasa de empleo de las personas nacidas en el país de residencia que tiene un bajo nivel educativo y las que tienen un nivel más alto es más amplia en España (29 puntos de diferencia), en Francia (30 puntos), en Grecia (26 puntos) y en Italia (31 puntos). Sin embargo, esta diferencia disminuye para las personas nacidas en el extranjero: 20 puntos en España, 21 puntos en Francia, 1 punto en Grecia y 9 puntos en Italia. Esta diferencia más pequeña entre los inmigrantes puede explicarse por el hecho de que tener un alto nivel educativo no garantiza el acceso al empleo de igual manera entre los inmigrantes y los no inmigrantes. Las personas nacidas en el extranjero y que tienen una educación superior tienen más probabilidades de estar desempleados que sus homólogos autóctonos. Por otra parte, en Italia, por ejemplo, el 41,1% de los puestos de trabajo ocupados por extranjeros no se corresponden con sus calificaciones. Los inmigrantes a menudo tienen un nivel de educación más alto que el requerido para su posición.

La situación es más matizada en relación con los bajos niveles de educación. De hecho, en algunos países como Luxemburgo, Grecia e Italia, los extranjeros sin educación tienen una tasa de empleo más alta que los autóctonos que tienen una situación equivalente. El fenómeno se invierte para la mayoría de los países de la UE como Francia, España, Dinamarca, Bélgica y Suecia.

Los beneficiarios de protección internacional también tienen dificultades para lograr la integración, aunque presenten un alto nivel formativo. Los sirios, iraquíes y afganos son las principales nacionalidades de los solicitantes de asilo inicial en 2015. Estas personas tienen dificultades para insertarse en el mercado laboral a pesar de que con frecuencia tienen un alto nivel educativo. Aunque es difícil conocer con exactitud el número de beneficiarios de protección y refugiados que están en una situación de sobre-cualificación en relación con el trabajo que desempeñan, los análisis sobre su perfil sociodemográfico, en particular el nivel educativo, y la actividad laboral realizada previamente, ponen de manifiesto este fenómeno. Por ejemplo, un estudio realizado por la Agencia de Empleo en Austria muestra que los refugiados del Medio Oriente tienen un buen nivel educativo: 61% de ellos tienen educación secundaria, estudios de formación profesional, o estudios universitarios; por nacionalidades el 68% de los sirios, 90% de los iraníes y 73% de los iraquíes tienen este nivel. El estudio también muestra que entre los solicitantes de asilo en busca de trabajo, el porcentaje de personas con educación secundaria y superior es incluso algo mayor que la de los austriacos. Otro estudio realizado por el Centro de Coordinación Francesa de la Red Europea de Migración (REM, 2016)) muestra que en 2014, en Francia, entre los 12.050 refugiados y beneficiarios de protección firmantes del Contrato de Acogida e Integración, la mayoría tenían educación secundaria y una cuarta parte de ellos eran titulados universitarios.

Este nivel de educación no disminuye las dificultades para encontrar un empleo en el país de acogida, de manera similar a lo que sucede con otros tipos de inmigrantes. Los diferentes estudios realizados sobre los puestos de trabajo ocupados por los beneficiarios de protección internacional concluyen que no se corresponden con su nivel de educación, formación o experiencia laboral. Están orientados principalmente hacia ocupaciones que no requieren ningún nivel formativo u otro requisito previo. El desconocimiento del idioma, el problema de la homologación de las calificaciones y la falta de redes sociales son los principales obstáculos para su integración profesional. Más allá del simple reconocimiento de títulos, las limitaciones en la formación profesional existentes en el país de acogida y las restricciones en algunos sectores productivos aumentan sus dificultades de integración y la mejora de su nivel formativo. Todo lo cual sugiere que la escasez de inmigrantes en la formación profesional continua acentúa un problema ya de por sí importante.

Aunque los inmigrantes desempeñan todas las profesiones en el mercado de trabajo europeo, están sobrerrepresentados en ciertos sectores, especialmente donde hay una mayor presencia de trabajos con baja calificación: los trabajadores de servicios, ventas, edificación y construcción, hoteles y restaurantes. Este tipo de trabajos no cualificados constituyen el 19%

de sus puestos de trabajo frente al 8,5% de trabajos ocupados por autóctonos. Por el contrario, tienen una escasa presencia entre los mandos intermedios, líderes y gerentes.

Los estudios llevados a cabo en los países del proyecto confirman la tendencia a la concentración de personas nacidas en el extranjero en los sectores productivos que sufren con mayor intensidad las fluctuaciones cíclicas de la economía.

En España, los inmigrantes tienen más presencia en sectores como la agricultura, el servicio a las personas, la construcción, el comercio y la hostelería. Se trata de sectores donde hay una mayor proporción de trabajo precario, y que además presentan una mayor vulnerabilidad económica. De hecho, el 50% de los trabajadores inmigrantes tienen contratos temporales frente al 25% de los autóctonos.

En Francia, en 2011, había una sobrerrepresentación similar de inmigrantes en la construcción, hoteles y restaurantes. Ellos tienen poca presencia en la administración pública y en el ámbito financiero y de seguros, la educación y la salud. Sin embargo, existen diferencias en función de su país de origen. De hecho, los inmigrantes que proceden de un país de la Unión Europea tienden a ocupar puestos de trabajo más cualificados que los inmigrantes de origen no europeo. Las mujeres inmigrantes, en particular de África y el Magreb, trabajan en el ámbito de los cuidados y del trabajo doméstico, donde existe una mayor proporción de contratos a tiempo parcial.

En Grecia, la transformación de la economía se produjo durante las dos décadas anteriores a la actual crisis económica, lo que llevó a la población autóctona a buscar trabajo en el sector terciario y de servicios y causó una gran demanda de mano de obra especialmente para trabajos técnicos y manuales. Por otra parte, la incorporación de la mujer al mercado de trabajo incrementó la oferta de empleo en el sector de los servicios personales, tareas que tradicionalmente realizaban las mujeres en el ámbito doméstico. Por lo tanto, los hombres inmigrantes trabajaban en la construcción, la agricultura y la industria, mientras que las mujeres ocupaban puestos de trabajo en el ámbito doméstico o en el sector turístico, que ha experimentado un fuerte crecimiento. La reciente crisis ha cambiado la situación y el desempleo está afectando masivamente a los nacionales y más aún a la población inmigrante cuya presencia en el mercado laboral se ha reducido bastante.

En Italia, en 2012 había una importante presencia de inmigrantes en el ámbito de los servicios personales (el 39,3% del total del empleo en este sector), la hostelería (19,2%), la construcción (18%), la agricultura (17,1%), la industria excluida la construcción (10,5%) y el transporte (10,3%). Además, el 35,3% se situaba en trabajos no cualificados (en particular en el servicio doméstico y la hostelería), el 32,6% en trabajos poco cualificados y sólo el 6,1% ocupaban puestos de trabajo cualificados.

En Francia, el 20,7% de los inmigrantes ocupan un empleo a tiempo parcial frente al 17,3% de los no inmigrantes. Las mujeres inmigrantes siguen sufriendo más precariedad en el empleo, de hecho, tienen más contratos a tiempo parcial: 35,9% frente a 8,6% de los hombres, aunque esta diferencia se confirma también para las mujeres no inmigrantes. Los inmigrantes son más propensos a declarar una situación de subempleo, en particular las mujeres procedentes de África. En 2012, entre las mujeres de 15 a 64 años que tienen un trabajo a tiempo parcial, el 16% son africanas frente al 12,3% que presenta el total de las mujeres inmigrantes y el 7,4% de las mujeres nacidas en Francia. La precariedad de los inmigrantes en el empleo también se refleja en la alta tasa de ocupación de puestos con contratos temporales. En 2012, el 15,1% de los trabajadores migrantes de 30 a 54 años tienen un contrato temporal (15,4% para las mujeres y 14,8% para los hombres) frente al 7,2% para los no inmigrantes.

Los inmigrantes tienen más probabilidades de estar en paro que el resto de la población y los trabajos en los que se ubican generalmente son aquellos en los que el dominio del idioma del país de acogida no es esencial, y cuyas habilidades son aprendidas fácilmente. Son trabajos que requieren una baja capacitación, con salarios bajos, que se caracterizan por una alta precariedad y donde predomina el trabajo a tiempo parcial.

4. CONCLUSIONES

En la actualidad, la Unión Europea considera la inmigración como una prioridad a tratar dentro de su agenda, y en los últimos años se han organizado varias cumbres a fin de profundizar en esta cuestión y lograr la creación de una política común en materia de inmigración para todos los Estados miembros. Sin embargo, se ha ocupado comparativamente poco de la integración de los inmigrantes que viven en Europa, preocupándose mayoritariamente por conciliar posiciones comunes en torno al control de fronteras y centrando sus energías en la lucha contra la inmigración ilegal. Esta carencia de políticas de integración de inmigrantes, tanto a escala nacional de cada país miembro como a nivel europeo, ya está mostrando consecuencias negativas y constituye un factor de preocupación a escala internacional.

Esto surge, entre otras cosas, debido a la preocupación de los países receptores que observan cómo el concepto de ciudadanía, que es una de las bases de las democracias occidentales, se encuentra hoy cuestionado como consecuencia de la falta de integración de la población inmigrante. La proliferación de una actitud crítica hacia este concepto resulta inevitable cuando se está produciendo una discriminación hacia un colectivo de personas que son consideradas ciudadanas y sin embargo no tienen los mismos derechos que los habitantes autóctonos. En efecto, la conclusión forzosa de esta situación es la existencia de dos tipos de ciudadanos: unos de primera y otros de segunda; unos con todos los derechos y otros con un recorte importante en los mismos.

No obstante, al no existir una política común en materia de integración de los inmigrantes, cada país de la Unión Europea está regulando de manera diferente el acceso a la nacionalidad, y con ello el acceso a la ciudadanía. Los criterios para concederla son variables, y se basan en el tiempo de residencia, el conocimiento de la lengua, y la suficiencia económica.

En definitiva, aunque existen diferencias significativas, en todos los países europeos la población inmigrante está teniendo dificultades para lograr una efectiva integración. El acceso a la educación y a la formación, a la vivienda, a la atención sanitaria y al trabajo está limitado y presenta barreras importantes. Por ende, la situación de la población inmigrante en la UE ha

empeorado, especialmente en países como Grecia y España, como consecuencia de la crisis económica. Las medidas puestas en marcha por los diferentes países en el ámbito de sus competencias ha sido muy desigual y el impacto de estas medidas también ha sido muy heterogéneo.

Por tanto, en todo caso no existe una armonización de políticas en el seno de la UE, siendo los planteamientos muy dispares y cambiantes en cada país miembro.

ABSTRACT

Solidary social economy is considered an engine of change and justice. A system of Municipal Integrated Cooperative Markets (MERCOIM), today is considered the most conducive means for the integration of the productive sectors of the rural and urban area, standardizing the means of production and business. This work presents, through a master plan and logical framework, an economic-social and solidarity model that invigorates the territorial development of Honduras. Its objectives are: (1) To generate socio-economic changes favorable to a culture of social justice with equity that contributes to avoiding forced emigration and violence; (2) Generate resources in a cooperative way among the less favored sectors with potential for change in Honduras, allowing the marginalized citizens to escape from social exclusion. The organization chart of the cooperation model established through alliances between a company (MERCOIM), a Foundation for Integral Development and Guarantee of Model Audit (FEDSS) and an active cooperative that is an organization of producers and Traders, coordinated under a productive system and fair trade of its profits. As results are visible human promotion, production and trade in the context of solidarity economy, agile, efficient and effective to promote a better quality of life for citizens, as well as cultural wealth that promotes in people their values, food, Education healthy life with security, self-esteem and belonging to the territory.

Keywords: Social Economy, Cooperative, Development, Entrepreneurship.

1. INTRODUCCIÓN

La Economía Social (en adelante ES) la conocemos como la realidad social situada entre la economía pública y la economía capitalista, situándose como alternativa en favor de un desarrollo social, económico y colectivo. En este camino, existe cada vez más un gran reconocimiento institucional de la ES, así como de la articulación de políticas europeas.

En este sentido, existe una gran preocupación y discusión sistemática sobre desarrollo económico de los países pobres y a los habitantes de los países ricos se les recuerda a menudo las condiciones infrahumanas en las que vive gran parte de los pobladores de los países pobres bajo un sistema de economía informal. Estos a su vez, en razón del vertiginoso avance de las tecnologías de la información y comunicación y de los medios de comunicación masiva, se encuentran cada día más expuestos a la influencia de los estilos de vida y las pautas de consumo de los países ricos.

El mercado municipal adquiere gran importancia en el proceso de urbanización del siglo XXI, en cuanto a su capacidad para generar vínculos esenciales entre lo urbano y el mundo rural, para la reducción el hambre, así como para impulsar el empleo y el desarrollo económico tanto a escala local como regional. Los mercados son espacios públicos vitales que permiten el intercambio diario entre compradores y productores locales.

Los mercados públicos –tanto de gestión pública como de gestión privada acumulan un patrimonio cultural e histórico que debemos esforzarnos en conservar, reforzar y ampliar. A diferencia de otras iniciativas comerciales, los mercados públicos no solo son de gestión pública sino que tienen vocación pública. En este sentido, la aspiración de un desarrollo económico equitativo, sostenido y equilibrado con la utilización de Mercados Municipales, se constituye así en uno de los elementos de mayor presión para eliminar desigualdades.

Este trabajo presenta a través de un plan maestro y marco lógico, un modelo económico- social y solidario que dinamiza el desarrollo territorial de Honduras. Los objetivos del mismo son: (1) Generar cambios socioeconómicos favorables a una cultura de justicia social con equidad que contribuya a evitar la emigración forzada y la violencia; (2) Generar recursos de manera cooperativa entre los sectores menos favorecidos con potenciales de cambio en Honduras, que les permita a la

ciudadanía marginada salir de la exclusión social. Se presenta el organigrama del modelo de cooperación que se establece a través de alianzas entre una empresa (MERCIOIM), una Fundación para el Desarrollo Integral y Garante de la Auditoría del Modelo (FEDSS) y una cooperativa en funciones que es una organización de productores y comerciantes, coordinados bajo un sistema productivo y de comercio justo de sus beneficios.

2. MARCO TEÓRICO

Para entender el término de ES hay que remontarse al origen del cooperativismo moderno con la creación de la famosa cooperativa de Rochdale (Inglaterra) donde se formularon los principios cooperativos que más tarde fueron adoptados por toda clase de cooperativas y hoy constituyen el eje vertebrador de la Alianza Cooperativa Internacional (Monzón, 2003) y se convertirán en claves para determinar el concepto de ES (Chaves *et al.*, 2003; Monzón, 2006).

Por su naturaleza, la ES, se sitúa a caballo entre el sector capitalista y el sector público y actualmente son utilizadas numerosas expresiones a la hora de referirse a ella: “tercer sector”, “sector no lucrativo”, “economía alternativa” y “sector voluntario”. Si bien no hay aún una definición clara de ES, este término se ha ido utilizando en los últimos años para definir aquellas empresas y organizaciones privadas que, fundamentadas en los principios de la solidaridad y ayuda a sus asociados, se rigen por prácticas de democracia económica, dando primacía a las personas frente al capital (Juliá, 2004) que por su naturaleza se sitúan a caballo entre el sector capitalista y el sector público.

La ES ha consolidado sectores tradicionales como la agricultura, el trabajo asociado, los servicios, el consumo y las actividades financieras y mutualistas. Monzón (2006) afirma que la Economía Social está formada por empresas y organizaciones situadas fuera del sector público y del sector privado capitalista, con profundas raíces históricas. Chaves, Monzón y Sajardo (2003) afirman que las funciones de las EES, son aquellas relativas a: 1) la producción de servicios vinculados con las necesidades de la sociedad; 2) la redistribución y estabilización; 3) la corrección de los desequilibrios del mercado de trabajo; 4) el pionerismo; 5) la potenciación del desarrollo económico endógeno; 6) el estímulo de la autonomía de los territorios; 7) la contribución al desarrollo sostenible; y, 8) la contribución al fomento de la democracia y el capital social.

La ES es un conjunto vivo, dinámico, muy rico por su diversidad y compuesto tanto por microasociaciones locales y pequeñas cooperativas, como por grandes grupos mutualistas y cooperativos (Saz y Carús, 2008). En definitiva el “movimiento cooperativo” constituye en la actualidad la columna vertebral de la economía social como sector institucional (Mozas y Bernal, 2006). Las diferentes organizaciones que la conforman, en particular las organizaciones del ámbito asociativo, pueden intervenir para impulsar la implicación de diversos agentes y grupos de interés afectados (Muñoz y Briones, 2011).

En el sistema competitivo actual, que está caracterizado por la crisis económica, la turbulencia de los mercados, la desconfianza en los mecanismos de control y la situación cambiante, es importante evaluar el impacto directo de estas vicisitudes en la economía real, la supervivencia de las empresas y de organizaciones representativas de la actividad socioeconómica de los territorios. Entre estas, encontramos a la Entidades de Economía Social (en adelante, EES), las cuales son garantes del desarrollo local de los territorios en Centroamérica y con su creación potencian el desarrollo de los pueblos, el emprendizaje social de muchos negocios y algunas expectativas entre la ciudadanía (Melian y Campos, 2011). Puede decirse que el emprendimiento social es un proceso que incluye un uso innovador de los recursos y en el que se aprovechan las oportunidades para solventar un problema social o catalizar el cambio social necesario para que el problema se reduzca o desaparezca (Mair y Martí, 2006).

Las competencias emprendedoras no solo deben ayudar a los sujetos a desarrollar con éxito una iniciativa empresarial, sino también a cultivar valores y prácticas sociales asentados en principios democráticos. En este sentido compartimos lo que dice Galindo (2006:132), “la adopción de rasgos éticos obliga a adoptar comportamientos emprendedores que beneficiaran a los individuos u organizaciones que lo presentan”. El programa Global Entrepreneurship Monitor (GEM) define el emprendizaje social como “la actividad empresarial que tiene por objetivo hacer frente a los problemas de la sociedad” (Lepoutre *et al.*, 2011).

Así pues, el emprendedor social muestra características como las siguientes (Peredo y Mclean, 2006): a) se enfoca hacia la creación de valor social; b) muestra capacidad para aprovechar las oportunidades y crea una visión; c) es innovador, desde la invención pura hasta la adaptación novedosa de algo, en su creación y distribución de valor social; d) está dispuesto a aceptar un mayor nivel de riesgo en la creación y distribución de valor social; e) suele tener suficiente ingenio como para no dejarse intimidar por la escasez de recursos para la puesta en marcha de su aventura social.

El espíritu emprendedor es una cualidad que poseen las personas que crean oportunidades donde otros no, y que trata de aprovechar esas oportunidades a través de diversas modalidades de organización, sin tener en cuenta a los recursos (Mitchell, 2002).

La política de desarrollo local se ha venido sustentando hasta ahora en los siguientes ejes estratégicos (Tomás, 2008): (1) Fomento de la inversión, tanto interna como externa, y de la creación de empleo. (2) Movilización del potencial de desarrollo endógeno, como garantía de autonomía y sostenibilidad económica del proceso de crecimiento. (3) Difusión de innovaciones y el conocimiento del sistema productivo, como vehículo de competitividad y adaptación al cambio del entorno. (4) Formación, reciclaje del capital humano e inserción laboral, como vehículo de adaptación económica y estabilidad social. (5) Articulación más eficiente del espacio urbano y mejora del atractivo de las ciudades para atraer a las empresas. (6) Creación de coaliciones de desarrollo entre actores privados y públicos e intereses diferentes con el objeto de incrementar la eficacia de las políticas y la gobernabilidad de los procesos de adaptación. (7) Fomento de la internacionalización empresarial para impulsar la base exportadora, las competencias empresariales y la integración de la economía local en la economía global. (8) Desarrollo de las tecnologías de información y de las comunicaciones y su uso por el tejido empresarial y los ciudadanos.

En gran medida, las EES dependen de la capacidad para dotarse de recursos que alcancen ventajas competitivas en términos de calidad, tecnología, innovación y capital humano, con el objetivo permanente de crear empleo, el crecimiento a futuro de sus activos y la diversificación de sus actividades. Por tanto, la ES se está proyectando como una institución necesaria para la estabilidad y sostenibilidad del crecimiento económico, la valorización de la actividad económica al servicio de las necesidades sociales, la distribución más equitativa de la renta, la creación de empleo y riqueza solidaria y la corrección de los desequilibrios en el mercado de trabajo.

3. COOPERACIÓN BASADO EN EMPRENDIZAJE DE MERCADOS MUNICIPALES

Describimos un modelo de cooperación (Marco Lógico 2017-2021) a través de una alianza entre una empresa (MERCOIM), una Fundación para el Desarrollo Integral y Garante de la Auditoría del Modelo (FEDSS) y una cooperativa en funciones que es una organización de productores y comerciantes, coordinados bajo un sistema productivo y de comercio justo de sus beneficios. Este modelo se ha desarrollado en términos políticos a través de la economía social solidaria como motor de cambios y justicia social, con el propósito de aumentar los protagonismos para dinamizar el desarrollo de Honduras y con el resultado de un modelo de Mercados Cooperativos Integrales Municipales con la integración de diversos sectores de población del área rural y urbana, proveyéndoles de medios de producción de negocios y de promoción cultural, educativa, económica dentro de una estrategia social solidaria con familias organizada en 26 municipios de Honduras, dispuestas a superar la exclusión social.

Consideramos que el Modelo de Cooperación implementado servirá para el fomento de la economía social y la imbricación de los siguientes resultados:

- 1) Desarrollará un sistema integral de promoción humana, producción y comercio en el contexto de la economía solidaria, ágil, eficiente y eficaz que impulse hacia el logro de una mejor calidad de vida.
- 2) Impulsará un modelo de crédito y comercio justo que permita usar los recursos más amigables con el proyecto, en concordancia, amigables en inversiones que generen bien común.
- 3) Acrecentará MERCOIM, el sistema de Mercados Cooperativos Integrales Municipales, como el medio más propicio para la integración de los sectores productivos del área rural y urbana, proveyéndoles de medios de producción y de negocios
- 4) Generará un modelo de riqueza cultural que promueva a las personas en sus valores, su salud, alimentación, educación, vida sana con seguridad, les arraigue con sentido de autoestima y de pertenencia.

Mediante la Fundación para la Economía Social Solidaria (FEDSS) y los organismos a ella afiliados, se establece un modelo de proyecto para la vida de las personas con menos oportunidades, basado en la Permacultura y la Economía Social Solidaria como capacidades adquiridas para la generación de un nivel de vida saludable, que asegure la trazabilidad alimentaria y la producción agroecológica como vías de sostenibilidad.

Este proyecto de cooperación tiene los siguientes objetivos que tratan de general un sistema de Producción Cooperativo y de Comercio Justo que permita a las familias pobres producir bienes de empleo y desarrollo de una la línea de distribución equitativa y sana que les permita gozar y compartir bienestar y seguridad.

Tabla 1

MARCO LÓGICO 2017-2021	Objetivos	Indicadores verificables	Medios de Verificación	Supuestos
FIN: La economía social solidaria como motor de cambios y justicia social	Generar cambios socioeconómicos favorables a una cultura de justicia social con equidad que contribuya a evitar la emigración forzada y la violencia.	Puesta en Marcha de MERCOIM: -MERCOIM S.A. (Para la fase constructiva y desarrollo de los Mercados -FEDSS (Fundación para el desarrollo Integral y garante de la auditoría del modelo.	1-Escritura Privada de MERCOIM y su modelo de empresa en funciones 2-Persona Jurídica de la Fundación y su estructura ejecutiva en funciones	Sistema de garantía jurídico administrativo conforme a la legislación hondureña, reúne modelos de participación que garantizan una economía de reparto.
PROPOSITO: Sumar protagonismos dentro del modelo económico social solidario para dinamizar el desarrollo de Honduras.	Generar recursos de manera cooperativa entre los sectores menos favorecidos con potenciales de cambio en Honduras, que les permita salir de la exclusión.	-COOPERATIVA EN FUNCIONES: Organización de base de los y las productoras y comerciantes coordinando el sistema productivo y de comercio justo y generador de beneficios.	3-Persona Jurídica de la Cooperativa, sus organizaciones de base y estructuras funcionando.	Una unidad piramidal que garantiza la participación de base y el goce los beneficios por parte de esa misma base para garantizar el modelo de economía social solidaria.
COMPONENTES				
I- Infraestructura Básica: para Productividad, Industria y Negocios				
II- Educación Empresarial Cooperativa para elevar el nivel cultural de los protagonistas de la acción económica social solidaria.				

III- Formación Cultural de riqueza patrimonial, calidad humana y profesional.

IV- Sistema de seguridad social con Base al desarrollo de los medios de producción y el uso equitativo y solidario del dinero y los recursos alternos que se vaya generando.

Para ello, trata de:

- Desarrollar riqueza cultural asociativa empresarial mediante unidades productivas familiares de alimentación sana y de abasto a los Mercados bajo modelos empresariales de la economía social solidaria denominado MERSOL.
- Establecer sistemas de vivienda sostenible de condominio denominado Eco Barrio conformado por colectivos de vivienda digna combinada con producción hortícola y pecuaria orientada a la generación de productos para los mercados solidarios, que permitan asumir la sostenibilidad.
- Integrar las líneas de producción (MERSOL) al sistema de Mercados Cooperativos Integrales Municipales (MERCOIM) de Comercio Justo Solidario, resguardados por un fidecomiso y el apoyo de financiamiento solidario no reembolsable de fundaciones que se asocien al programa.
- Desarrollar con familias pobres el protagonismo, habilidades técnicas y la cultura propicia para alcanzar capacidad crediticia y productiva que les permita integrarse al sistema de economía formal dentro de un modelo económico social solidario.

Finalmente se configura una estructura organizativa y organigrama de la Fundación para la Economía y Desarrollo Social Solidario que se ilustra en el anexo de esta comunicación.

4. ORGANIGRAMA DE LA FUNDACIÓN PARA LA ECONOMÍA Y EL DESARROLLO SOCIAL SOLIDARIO

La fusión de recursos del Programa MERCOIM (Mercados Cooperativos Integrales Municipales) MERSOL (Sistema de Producción Agroecológica Solidaria) y de la Fundación FEDSS (Fundación para la Economía y el Desarrollo Social Solidario), crea un programa de vivienda y producción agroecológica (Permacultura) de abastecimiento de mercados (MERCOIM) y la generación de unidades productivas y de distribución (MERSOL) que permite a familias pobres adquirir vivienda propia y desarrollo agropecuario permanente en un área de terreno de dos mil quinientos metros cuadrados cuya producción será destinada en un 10% al consumo familiar y el 90% restante al mercado cooperativo, de cuyo importe un 30% será para el pago de su casa y un 60% para su economía familiar.

Este recurso generará unidades de condominio denominadas ECO BARRIO. Barrios ecológicos sostenibles produciendo los recursos para su sostenibilidad. Definidos dentro de un concepto social solidario de calidad de vida con una población meta para los primeros tres años de 750 familias donde se faciliten viviendas, áreas de recreo, sala maternal, sala tecnológica y unidades de producción agropecuaria. Finalmente se crean una serie de productos fruto de la colaboración: (1) Un convenio de actuación interinstitucional coordinado por la Fundación FEDSS para la inversión de recursos de diversas fuentes y el desarrollo del sistema de condominios, Eco Barrios, que permita a las familias pobres tener un acceso asegurado a este modelo productivo y de vivienda; (2) Un Fidecomiso bancario MERSOL que respalde el establecimiento de Eco Barrios y su modelo de Casa Huerto, integradas a un Mercado que asegure la sostenibilidad; (3) Una organización de base cooperativa por municipio que sustente la participación de una base poblacional proactiva y beneficiaria; (4) Un Banco de tierras que permita para establecer el modelo; (5) Un sistema de Mercados donde se comercialice la producción; (6) Una Empresa de Ingeniería que desarrolle los condominios; (7) Dos Ongs y sus programas: Centro Cultural Hibuera y Red de Desarrollo Sostenible.

5. CONCLUSIONES

Los resultados obtenidos en este trabajo ponen de manifiesto la tradicionalmente asumida e importante actividad emprendedora social que realizan las EES, particularmente las sociedades cooperativas y los modelos de cooperación manifiestan capacidad de generar empleo, así como valor añadido a favor del desarrollo de los pueblos y la ciudadanía. Por otro lado, la contribución del trabajo presentado resulta relevante para aquellas comunidades territoriales que aun teniendo una consolidada cultura solidaria, no conocen esta planificación de un proceso cooperativo como una forma de mercado de la economía solidaria. En el caso del emprendedor social al igual que el emprendedor tradicional creará valor económico, sin embargo, la creación de valor social es un eje fundamental y el valor económico es el subproducto del valor social, asumiendo un papel importante de agente de cambio en el sector social

Las áreas donde la economía social florece y se desenvuelve con mayor facilidad son en los servicios de proximidad y los servicios a la comunidad. Como servicios de proximidad se entiende las actividades realizadas anteriormente por la familia en el ámbito doméstico y que ahora son ejecutadas por terceros, pero necesitan de una proximidad y de una relación personal fuerte entre los que las usan y el prestador, tales como: servicios sociales (acogimiento de niños, jóvenes y necesitados de servicios a domicilio, apoyo a los desfavorecidos, tratamiento de ropa); servicios para mejorar la vida de las personas (habitación, seguridad, transportes colectivos, comercio de proximidad, revalorización de los espacios públicos).

El impulso del concepto de MERCOIM- MERSOL, viene a jugar un papel de relevancia en la promoción de la economía social solidaria y su desarrollo en si de una forma inclusiva, sin perder de vista el enfoque consideramos 3 puntos elementales:

- Entrada: Al realizar la elección de los beneficiarios a este concepto de mercados será dirigida a las personas que realmente lo necesitan por lo que utilizamos el Método Delphi, asegurándonos que no se tome este proyecto como una oportunidad inmobiliaria.
- Permanencia: Le llamaríamos permanencia al lograr la sostenibilidad de los empresarios de mercado dentro de esta dinámica comercial, creando sistemas legales y económicos con apoyo tanto del gobierno local como del central, que ellos puedan cumplir, como por ejemplo: Exoneraciones de impuestos o tributos preferenciales, economía de reparto, cooperativismo, economía en volumen y movimiento interno.
- Salida: Asegurarnos que las personas que alcanzan un nivel como trampolín para establecer sistemas de mercados en forma de patrimonio o el comerciante que alcance nivel superior pueda dar oportunidad a un nuevo aspirante que inicie de manera comercial.

Es importante mencionar que dos factores importantes de esto son: (1) El verdadero capitalismo se inicia cuando obtenemos el título de propiedad de algo por eso nuestro concepto incluye la ley de condominios; (2) Para lograr la verdadera transición de la economía informal a la formal, es importante considerar como mínimo para el bienestar social el fondo de retiro de nuestros empresarios de mercado.

La incorporación de MERSOL para lograr el vínculo rural-urbano tiene dos objetivos importantes: Combatir la pobreza rural, ya que la migración de esta población incrementa la pobreza urbana y lograr la vinculación de compra directa aseguramos la trazabilidad alimentaria y evitarnos al intermediario que tanto daño hace al precio de venta al consumidor final. Ahora con la incorporación de MERSOL le damos mayor sostenibilidad a este proceso.

ABSTRACT

The constant changes in the business environment that have taken place during the last decades force companies to adapt and be flexible in order to stay in the market and be competitive. Among the many tools available to achieve this situation, continuous improvement is one of them, a management philosophy that seeks constant improvement of the company. Despite the apparent simplicity of the concept, the implementation is not easy and it is still necessary to develop more research in order to identify the most appropriate path towards the complete implementation of continuous improvement. Therefore, the objective of this work is to analyse the continuous improvement process, namely, to identify the people responsible, the implementation stages and the tools used. We believe that the results obtained can be very useful for those companies that have started or want to start with the implementation of a continuous improvement system.

Keywords: continuous improvement, implementation, stage, tool.

JEL Classification: M10

1. INTRODUCTION

Nowadays companies develop their activity in an extremely competitive environment where constant change is the main characteristic. This situation is the result of a series of phenomena that have happened during the last century, in such a way that the present situation in no way resembles the conditions prevailing in the early twentieth century.

In the last decades, the phenomenon of globalization has caused changes in market conditions. At present, companies faced more dynamic environments characterized by greater competition, a better informed and more demanding customer, a greater importance of service quality and/or product, or a greater awareness of environmental and social issues among other facts.

Therefore, companies need more agile management mechanisms and systems that allow them to adapt and, above all, to be competitive (de Jager *et al.*, 2004; Quesada-Pineda and Madrigal, 2013). Among the different mechanisms available, continuous improvement is considered one of the most important phenomena for companies in the current environment (de Jager *et al.*, 2004; Hamel 2000; Singh and Singh, 2012).

The concept of continuous improvement has been widely studied in the literature. However, there is no unanimous and commonly accepted definition. According to Deming (1982), one of the pioneers in defining it, continuous improvement means steadily improving the production and / or service system.

Despite the apparent simplicity of the idea, the implementation of a continuous improvement system is a complex task in which many companies fail. Therefore, as McLean and Antony (2014) pointed out, more research is needed to analyze the process of implementing continuous improvement.

Therefore, the objective of the present work is to analyze the process of implementing continuous improvement by analysing who was responsible for the implementation, what phases were followed and what tools were used. We believe that the results may be of interest to all those companies that have started the implantation or want to start it.

Once the objective has been described, the rest of the work is organized as follows. Firstly, it includes a theoretical section describing the concept of continuous improvement and the research developed so far on the implementation of initiatives of this type. Subsequently a section that briefly describes the methodology followed for the realization of the study is included. In the following section, the results of the study are collected to finally conclude with a section of conclusions and implications for management.

2. BACKGROUND

2.1 Continuous improvement concept

The continuous improvement concept has its origin in the Japanese expression Kaizen and was initially developed and extended by Masaaki Imai (1989), known as the father of continuous improvement. Since then there have been many research about the concept. For example, one of the most current and synthetic definitions of the concept is the one of

García-Sabater and Marín-García (2009, p. 186), who define continuous improvement as *the planned, organized and systematic process of continuous and incremental change*. For a more detailed analysis of the concept of continuous improvement and its evolution, it is recommended to consult the bibliometric revisions made by Sanchez and Blanco (2014; 2016).

2.2 Continuous improvement implementation initiatives

The method followed by a company when implementing a continuous improvement program will be influenced by the characteristics of the company itself (business objectives, market situation, previous level of development of continuous improvement and other similar techniques, business culture...). Therefore, it could be said that there are as many methods as companies. In fact, even in Japanese organizations, where Kaizen is considered to have originated, there is no uniform pattern or methodology (Brunet and New, 2003, p. 1439), in such a way that in each company the implementation takes place in a different way.

However, the above statement is not conclusive and, throughout the literature, different methodologies have been defined. They pretend to act as “guides” for the implementation of continuous improvement. These “guides” are adapted in each case to the reality of the company and that is where the differences appear. In the work developed by Sanchez (2014), a summary table is included with a total of seven different methodologies. Of these, the best known is the first one, the Deming methodology, widely known as the Deming Cycle or the PDCA Cycle. It is possible that the scarce existence of implementation methodologies is due, in part, to the fact that the Deming methodology is widely accepted and used.

Another aspect analyzed in the field of continuous improvement implementation is the level of development achieved by companies, although, as it was already stated in other studies (Marín-García *et al.*, 2012), this is a field of scarce development that still needs to be further studied. Specifically, only two models were identified in the literature review (Table 1).

Table 1. Continuous improvement evolutionary models

Source: The authors

Based on the literature review, a survey was designed to learn more about the process of implementing continuous improvement and, therefore, to fulfil to the stated objective.

3. METHOD

In order to achieve the previously stated objective, a survey was carried out. In this survey, besides identifying the main characteristics of the companies, questions that dealt with different aspects related to continuous improvement were included: responsible for the implementation, stages followed during the process and tools used.

The survey took place in the Autonomous Community of Cantabria. The survey was addressed to all companies in the region that had more than 20 employees and practice continuous improvement. In the absence of secondary data on the subject, we proceeded to identify the companies that practiced continuous improvement. Once identified, they were sent the survey in which they were asked about different aspects of continuous improvement. Finally, a total of 109 valid questionnaires were obtained.

For the analysis of the results, the SPSS 18.0 program was used for both the descriptive analyzes and the Chi Square test.

4. RESULTS

4.1 Continuous improvement implementation process

In the first place we proceeded to analyze who had been in charge of implementing continuous improvement in the company. The companies had several response options, as shown in Table 2. In addition, the response was not unique and it was admitted that two or more options were indicated.

According to the results, 56 companies indicated a single option (51.38%), 42 indicated two options (38.53%), 10 indicated three options (9.17%) and one indicated the four options (0.92%). In some cases, we understand that companies, when responding, took into account all the mechanisms they had used throughout the process since, for example, selecting

“a single team” and “improvement teams” is certainly contradictory. One possible explanation is that perhaps it initially used a single computer but over time, as the project progressed, the number of computers increased.

Table 2. Continuous improvement implementation mechanisms

	%
Permanent improvement teams	54.13%
Temporary improvement teams	49.54%
External advisers	43.12%
Single team	12.84%

Source: Authors

Table 2 shows that 54.13% of companies used permanent improvement equipment to proceed with the implementation of continuous improvement. Secondly, temporary improvement equipment was used (49.54%); thirdly, external advisers (43.12%) and finally a single team (12.84%).

The obtained results are very interesting. The fact that the permanent teams in which operators are also involved are the most common mechanism is really positive since the success of the initiatives depends to a great extent on the people who participate in it (Sánchez, 2014). In addition, the fact that they are permanent equipment endows the improvement of continuity. There is, however, an important percentage of companies that seek the help of external advisers. This result is not surprising considering that one of the main obstacles encountered by companies is the lack of knowledge and experience (Sánchez, 2014).

From the obtained results, it seemed interesting to analyze if the usage of the different mechanisms varied depending on the level of experience of the companies. Thus, the companies were grouped into three levels: companies with less than 5 years of experience, with experience between 5 and 15 years and with more than 15 years of experience. The results of the comparison are presented in Figure 1.

Figure 1. Comparative analysis of mechanism depending on the experience of the companies

Source: Authors

The comparison of the results allows observing how the presence of external advisers is very important in the first case; important in the second case but behind other mechanisms; and less important in the case of more experienced companies. This result seems coherent and could be interpreted as follows: as the experience of companies increases, they are more independent. However, in the early stages, ignorance and lack of experience make the support of external advisers more necessary.

On the other hand, a small percentage of companies affirm that they develop their program of continuous improvement through a single team. The problem with this mechanism is that it does not involve the whole organization. The other two internal mechanisms, both temporary and permanent, allow the participation of a larger number of people and part of the success of continuous improvement lies precisely there.

After analyzing who was responsible for the implementation process, the process itself was analyzed by asking the companies what phases they had followed. Companies had to indicate what steps they had taken from a list of 18 phases that had been selected following an extensive literature review and consultation with experts. Figure 2 shows the percentage of companies that claimed to have gone through each phase.

According to the results, the stages with the highest percentages, that is, those that most companies chose are “Setting objectives”, “taking action for improvement”, “establishing indicators” and “establishing possible Improvements to be made“. These four stages could be the axis of continuous improvement. That is, well-observed, if the companies carry out

these four activities a system of basic continuous improvement could already be implemented. However, it is true that if we want it to last it is necessary to establish control mechanisms that help to verify if the objectives are being achieved and, if not, to correct the course. However, the results show that this is not the common procedure.

Figure 2. Percentage of companies which followed each stage

Source: authors

Thus, among the less valued stages “Prioritization of improvement actions”, “Standardization and consolidation”, “Setting limits for indicators” and “review of indicators” appear. The fact that these phases are little valued is worrisome. To begin with, non-prioritization of activities can cause the company to spend its time and resources on minor improvements, while the truly necessary improvements are not implemented. Second, if no limits are set for indicators, it is difficult to carry out follow-up work given the absence of objective values or an objective range. In addition, if the values of the indicators are not reviewed, the company may be guided by obsolete values. Be aware that the review of the indicators may be upwards or downwards. If the conditions of the company or the environment are negative, the level of demand should not be the same as in times of prosperity. For this reason the revision of indicators, as well as the standardization and consolidation of the same, are key phases that help the company to progress, to surpass itself. It is not a question of setting unattainable goals, but rather of setting goals that are a little more ambitious each time, always adapting them to the environment and to the company.

In any case, based on the results, it is possible to consider whether the companies are actually proposing the continuous improvement formally. For example, it is striking that some companies do not identify the processes that will improve, how will they improve if they do not determine what will be improved? Here there can be several reasons: either the companies do not disaggregate so much their improvement activities, or there is a problem of concept and it is necessary to impart more training in this respect.

4.2 Tools used during the implementation

The implementation continuous improvement of systems is accompanied by the use and/or development of certain tools that facilitate the process. In this section we will analyze, first, which tools are most frequently used and, secondly, we will try to analyze if the use of certain tools is greater or less depending on different characteristics of the companies.

The companies surveyed had to indicate whether or not they used the tools included in the list shown in Table 3. The selection of tools was based on the literature review (tools that had been analyzed and/or mentioned in studies and research) and the opinions of the experts. The list is not exhaustive but it is broad enough to be able to obtain some conclusions that guide more detailed future research.

Spaghetti flow
Just in Time
KANBAN
JIDOKA
Total Productive Maintenance
Production levelling

Source: Authors

Figure 4 shows the order of the tools according to their percentage of use. Customer surveys, internal audits, the suggestion box and measurement charts are the most commonly used tools. All of them are employed by more than 50% of the companies surveyed in this section. At the other extreme, the least used tools are critical path analysis, Jidoka, peer comparison, weighted selection, attribute analysis, and A3.

In general terms, the tools with the highest level of use are qualitative tools used to collect information (surveys, improvement groups, suggestion boxes) and tools associated with graphical representation (graphs of measurements, process maps ...). On the other hand, tools that are used to a lesser degree are more complex tools (Critical Path Analysis, Jidoka, Level Programming ...).

In addition to the descriptive analysis, we also propose an analysis whose objective is knowing if there is any relationship between the use of the tools and the stage of development of the continuous improvement implementation process in which the company is located. Chi Square test will be used for the analysis of independence since we are working with two categorical variables.

To measure the level of development, among the models discussed in the theoretical section, in this study we decided to follow the model proposed by Bessant *et al.* (2001), for being this author one of the most respected specialists in the subject of continuous improvement (Sanchez and Blanco, 2014) and for the clarity of the model itself. The respondents had to define, according to their perception, in which stage of the 5 raised by the model they considered their company to be in. Figure 3 shows the percentage of companies that are classified in each of the stages.

Figure 3. Percentage of Company in each of Bessant's stages

Source: Authors

In general terms most of the companies are in the initial stages of development. Specifically, 37 companies (34.58%) are in the intermediate stage; 23 companies (21.5%) in the most basic stage and 16 companies (14.95%) in the stage of structured continuous improvement. The upper stages comprise a total of 31 companies, 12 companies in the upper stage (11.21%) and 19 companies (14.95%) in the previous phase.

Table 5 shows the results associated with the Chi Square test. We will say that there are significant differences when the level of significance is less than 0.05. It is observed that the use of many tools is related to the level of development in which the company is (highlighted cases). Among the cases where relationships were identified, two cases can be distinguished. On the one hand, there is a set of tools in which the use is significantly greater in the more advanced stages (improvement groups, process maps, causes analysis, brainstorming, integral scorecard, measurement charts, satisfaction surveys among the employees, failure mode effect analysis, total production maintenance), although it is also practiced among the companies that are in the initial stages. On the other hand, there is a set of tools that are only used in the most advanced stages of the Bessant model (internal audits, customer surveys, SMED, Poka-Yoke, Espaguetti Diagram, Just in Time, Kanban).

Since the companies classified themselves in one or another stage of the Bessant model, the previous analysis has been repeated taking as variable the number of years that has been practicing continuous improvement as a more objective variable. Specifically, companies have been classified into three levels: “beginners” (if they are applying continuous improvement 5 years or less), “professionals” (between 6 and 15 years), and “experts” (over 15 years).

Table 6 shows the results associated with the Chi Square analysis of the variables: tool used and years practicing continuous improvement (level of experience). In this case only relationships were detected in five tools: benchmarking, analysis of critical success factors, failure mode effects analysis, SMED and spaghetti diagram. In all cases, a greater use of the tool has been detected as the level of experience of the company increases, measured by the number of years it has been practicing continuous improvement.

Additionally it seems interesting to know if the use of tools depends on the size of the company. To do this, we perform the analysis of the Chi Square for the variables: use of tools and size of the company. In Table 7 it can be seen that the use of certain tools does depend on the size of the company. In all the cases that have been identified, the larger companies make a greater use of the tools. It could be concluded, therefore, that larger companies make use of a greater number of tools which initially seems logical because the larger enterprise size greater complexity.

To finish this section, we will analyze if the use of tools depends on the type of company in question (manufacturing versus stock, on request, services or mixed). The results are shown in Table 8. It was detected that in a total of 11 tools there is a relationship between the use of the tool and the type of company. Thus, in all cases, the use of the tool is higher in the case of manufacturing or mixed companies than in service companies. This may be due to two reasons: or these tools are truly solely applicable to the manufacturing company, or it is a false belief of service companies. In the latter case, there is a need to train service companies to adapt these tools to their environment. It is true that, since the origin of many tools is related to the manufacturing company, its translation and adaptation to the services sector may not have been produced completely.

In general terms, we can conclude that the use of certain tools depends on the level of experience and the degree of development of the continuous improvement process in which the company is located. In addition, the use of some tools also depends on the characteristics of the company (size or type of company).

5. CONCLUSIONS AND MANAGERIAL IMPLICATIONS

Continuous improvement is a management philosophy that has acquired great importance in recent decades as a means to adapt to new market conditions and achieve business excellence. However, previous research has detected the need to develop further research on the implementation of continuous improvement since a large number of companies fail to implement or even try.

Therefore, the objective of the present study is to analyze in greater depth the implementation process identifying those responsible for the implementation, phases and tools used; in order to do so a survey was carried out among companies of different sectors and sizes of the Autonomous Community of Cantabria.

The obtained results show that each company follows its own methods when implementing continuous improvement and it cannot be said that a universal method exists, but that there are variations depending on the characteristics of the companies.

Thus, the responsibility for implementation can fall both in internal managers (permanent and temporary teams) and external advisers (43% of the companies claimed to have used external advice at some point in the implementation). It was also detected that the presence of external advisers was greater in the case of companies with less experience. From the results it can be concluded that companies that want to implement continuous improvement should combine internal and external responsibility, the latter being more useful in the initial stages.

Regarding the analysis of the implementation stages followed, the most remarkable conclusion is the small importance that companies give to the formal follow-up of the improvement activities. While it is true that no meaningful measurements should be made, as this would lead to more time than needed for the collection and analysis of information, it is important to establish indicators and benchmarks to analyze the evolution of Improvement.

Finally, regarding the use of the tools, all the tools included in the analysis are used by the surveyed companies. However, its level of use varies according to several characteristics. To start the more complex tools are only used by larger companies, which possibly explains why being larger also face more complex problems that require more elaborate solutions. On the contrary, the simplest tools, especially the qualitative ones (surveys, graphs of measurements) are of general use. It is also observed that the more complex tools are more frequently used by the most expert companies, that is, those who have been practicing continuous improvement for more years. Additionally, manufacturing companies seem to make use of a greater number of tools, and so do larger companies.

Overall, it can be concluded that the use of certain tools depends on the level of experience and the degree of development of the continuous improvement process in which the company is located. In addition, the use of some tools also depends on the characteristics of the company (size or type of company). These results confirm the conclusions reached in previous studies where it was stated that the selection and use of tools is not automatic, but must be adapted to the characteristics and conditions of each company at all times (Ahmed *et al.*, 1999; Bunney and Dale 1997; Heras *et al.*, 2009).

We consider that the results obtained are very useful for companies. However, we are aware that the study presents a limitation of scope as the study focuses on the Autonomous Community of Cantabria. However, the size of the sample is large enough for the results to be taken into account.

ABSTRACT

This theoretical article aims to discuss the interference of organized collective action in the transformation of the tourist field, as a way of problematizing the social interactions of the actors present in this dynamic. The collective action has a greater weight in relation to the action of individual actors, thus having more power of interference in the decisions of the field, since they have a greater force. For this discussion, we first resort to the theoretical approach of the sociological theory of social fields of Pierre Bourdieu to deal with the social interactions that exist, in what is considered empirically a social field: tourism. We argue that a small group of actors determine the direction of activity according to their private interests, leading to the exclusion of weaker groups. This relationship may be related to the strictly economic emphasis given the activity, afterwards the social, cultural and environmental spheres, keeping some actors in the centrality of the field. In this way, the inclusion of new actors in the scope of collective action is presented as a potential path to rebalance the existing asymmetry of power. It should be emphasized that this relationship is influenced by pre-established social structures and may depend on a causal moment for its actual effectiveness.

Keywords: Organized Collective Action, Bourdieu, Tourism.

1. INTRODUCTION

This theoretical article aims to discuss the interference of organized collective action in the transformation of the tourism field, as a way of problematizing the social interactions of the actors present in this dynamic. The collective action has a greater weight in relation to the individual actor achievements, thus having more power of interference in the decisions of the field, since they have a greater force.

To sustain our proposition, we begin discussing the theoretical approach of the sociological theory of social fields of Pierre Bourdieu, in order to deal with the social interactions that exist in what is empirically considered as a social field: tourism. We argue that, as in other social fields, in tourism there are small groups of actors, in delimited spaces, considering the diverse levels of reality, that determine the direction of activity according to their reserved interests, leading to the exclusion of weaker groups. This relationship may be related to the strictly economic emphasis given to the activity, in face to the social, cultural and environmental spheres; keeping some actors in the centrality of the field. In addition, the agents inserted in a tourism field needs to, directly or not, be aware and deal with the positions of the others actors in the field. In this way, the inclusion of new actors in the scope of collective action is presented as a potential path to rebalance the existing asymmetry of power. It should be emphasized that this relationship is influenced by pre-established social structures and may depend on a causal moment for its actual effectiveness.

Despite very contributions and efforts already made, there is not yet a unified – or even a hegemonic – theory of tourism. A brief review in literature of tourism show that this is a sub theorized area – or putting in Kuhn's words, a pre-paradigmatic area from an epistemological and theoretical point of view. Hence the strong theory borrow from a sociological theory can be useful to provide some parameters of scientific objectivation of tourism. Particularly, the provision of a structured theoretical framework to comprehend, analyze and enlighten tourism on its multiple levels of reality is contributive in the sense that stating a sociological framework to/about tourism field will lead to understand appropriately how, why and in what extent the different agents get together and sustain their relations vis-a-vis to get their objectives and interests.

This subject has practical consequences in tourism knowledge as led to an alternative explanation to the understanding of tourism as a systematic set of activities or as industrial and practical activity – which we argue is a bad understanding that prevent intervene on its functioning, as it is a limited and pre-scientific form to solve problems.

In this scenario to obtain a broader and efficient system of governance to tourist destination it is necessary to observe how the field is structured, who are the actors that act collectively, what positions they take and what are their dispositions to act in some way at each moment in specific contexts, as these aspects can provide a matrix of relations to guide an empirical destination to identify and manage more accurately its constraints and capabilities to develop.

The essays present three parts, including this introduction. In the second part we state our discussion on social theory of Bourdieu. In the subsequent section social field of tourism is observed as a way of explaining collective action in tourism matters.

2. LITERATURE REVIEW

2.1 The Theory of Social Fields by Pierre Bourdieu

Despite the intellectual precision in composition, selection and crossing a wide variety of concepts and influences from different philosophical traditions to create his own social thought, many commentators argue that the *Bourdieuian* system is relatively “simple” (Jenkins 2006; Thiry-Cherques, 2006).

It consists of a structural core of three concepts: field, capital and *habitus*. Maybe it could be added as fourth the concept of symbolic violence. Around these notions gravitates secondary categories, whose function is to specify and provide greater accuracy, increasing the potential explanatory of this theoretical system (Vandenberghe, 1999; 2009; 2010b).

The metaphor of the field is invoked towards a social arena within which struggles and maneuvers on the access to specific resources (Jenkins, 2006). The idea of field was from the beginning associated with a highly conflictual conception of world, in which there is an ongoing battle for power, prestige and all varieties of capital (Vandenberghe, 2010b). In this sense in the field occurs objective relations between individuals and institutions, that compete for domination of particular spaces (Thiry-Cherques, 2006). Moreover in the social universe - or the theory of social fields -, fields have its own logic that cannot be reduced.

In summary, the social field can be seen as a system of relations between **positions** (which is the objective place in the social hierarchy that each agent occupies in the field), **disposition** (which are the subjective side of the field, given by the *habitus* and the propensity of agents to act according to what they have been internalized), and **taken of positions** (referring to a posture in which those positions are expressed and whose principle lies in the structure and functioning of the field) (Vandenberghe, 2010b).

Referring to a field of forces in which a given structure constrains the agents involved, due to limited availability of resources and the space itself (physical and social) where they are located, and lead to engage in social struggles, as their relative positions in the field, in order to have or increase their access to resources (or capital) existing in the field, culminating with the conservation or transformation of its initial structure (Bourdieu, 1996: 50).

Thus, the relations of power, that is, the possibilities of intervening in reality, are related under the amount of economic, social and cultural capital that each agent possesses. The positions of force orient the dispositions (strategies) that the agents (individually or collectively) look for to safeguard or to improve their position and to impose the principle of hierarchizing more favorable for them (Bourdieu, 2001).

From the perspective of Bourdieu’s genetic structuralism is necessary to recognize that the central focus of research is the analysis of objective structures, but not fixed and tighten as the classic Strauss structuralism, then concerning the analysis of structures relations system, which are spatio-temporally located. Therefore, the structure of the field designates an externality (which is not the field) and an interiority (the institutions and agents that exist and persist for difference). His analysis studies the field as the genesis of a product, i.e., the incorporation of pre-existing structures. The structure of the field is given by the power relations between actors and institutions that fight for hegemony within the field, i.e. the monopoly of authority that grants the power to dictate rules (Thiry-Cherques, 2006).

Due to its objective analysis of structural relationships established, what is assumed by Bourdieu, fields can be analyzed regardless of the character of its occupants, i.e., as a system of objective relations. However, the social fields are not fixed structures or structured spaces of positions at a given time (Jenkins, 2006). Rather, they are products of the history of their occupants’ positions and their dispositions that are in course to be reproduced. “Our position in a field designates how things not only consume, but also education, politics, the arts. Also determines the way we produce and accumulate” (Bourdieu, 1984: 210).

According to Bourdieu and Wacquant (2005) fields result from processes of social differentiation, and the way to be (re) experience the world, embedded in a process of constant evolution of society that gives rise to new fields in a continuous process of distinction. Thus, the entire field is historical product and therefore has a distinct *nomos* (set of laws that govern it).

What determines the existence of a field and demarcate its boundaries are the special interests, economic and psychological investments made by different agents, endowed with a specific *habitus* convergent with that field, and institutions embedded in it, and who want a return on different forms of capital related to capital dominant in that field (Thiry-Cherques, 2006).

In addition, every game presupposes rules and, in this sense, the field’s agents tacitly or explicitly share a consensus on the *doxa* of the field (Bourdieu & Wacquant, 2005), that means the consensus opinion (and replaces the Marxist concept of ideology), referring to what about all agents agree, therefore, as opposed to scientific, and includes everything that is accepted as “being like that” (Thiry-Cherques, 2006). Although each field institutionalize its own object and its principle of understanding, social fields are not self-evident and need to be defined as such, which requires observation and analytical delimitation of the researcher on a particular segment of the social world.

All fields have also a framework that refers to the system “goal” of relations between agents identified in the social space (Thiry-Cherques, 2006).

Bourdieu (2008: 131) argues that “the social world is accumulated history, and therefore cannot be reduced to a concatenation of snapshots and mechanical equilibrium in which men play the role of particles interchangeable.” So, to

address this accumulated history of the social world is that it introduces the concept of capital toward cumulative work, both in matter internalized, as well as the accumulation of capital.

His central thesis is that when individuals or social groups assuming capital, privately or exclusively, allow the appropriation of social energy in the form of reified or living labor [objectified]. Thus, the capital stands as a force inherent in objective and subjective structures, and at the same time as a fundamental principle of internal regularities of the social world.

Schematically Bourdieu recognizes three main forms of capital:

- the economic – which refers to relation in which such an economy, material possessions, income, of cash in short, every form of commercial value of assets gifted and capable of being liquidated;
- the cultural – knowledge, skills, information, etc., skillset intellectuals produced and transmitted by his family, school, etc. has 3 ways: (a) been incorporated as a provision in durable body (e.g. way of performing in public); (b) state the goal as asset ownership (e.g. artwork); and (c) institutionalized state (sanctioned institutions, ex. academic titles);
- the social – that refers to set of accesses social, relationship and networking.

These three types of capital is synthesis by the concept of symbolic capital – the set of rituals of recognition, prestige, honor, etc. The relative position in the field is given by the volume of capital (of three) that the agent possesses. As the social structure generated by the distribution of different kinds of capital, any field can be divided into smaller sections, the subfields that behave like fields (Pimentel & Pimentel, 2013).

Otherwise agents can play so much to increase or retain their capital, and position in the field will command the taking of position in the struggles, both to maintain or transform the social space. Thus, in spite of the existence of a structure, transformations can occur from the action of the agent. The most powerful agents tend to struggle to maintain the power and the habitus of the field, not to promote a real change in the needs and gaps in society. Figure 1 synthetizes all the elements proposed by Bourdieu as necessary to composed a field.

2.2 Organized Collective Action

In this section we address the formation of collective action in the field as a way of intervention in reality. From an identity and knowledge on the part of the different agents, it is possible an organized action in the direction of the transformations in the dominating relations in the field, demanding, for example, participation and decision in the elaboration of public policies, so that these can reach not only a small group but a large number of agents, which dominates and determines these policies according to their interests.

In the theory of organized collective action (Friedberg, 1993), agents from diverse needs of changing begin with their own actions to interfere in the dominant structures, that is, these agents no longer expect and do not want institutions of power to determine the processes of interaction of society, but are inserted and they struggle to make social transformations. Here the collective agents when organized have a greater capacity of intervention in the field, being able to transform or maintain the prevailing structures.

Tarrow claims that collective action has power as it challenges its opponents, awaken solidarity, gaining meaning in certain groups of the population. Define movements as “*collective challenges posed by people who share common goals and solidarity in an interaction with elites, opponents and authorities*” (Tarrow, 1994: 21, emphasis on original). In addition, this author mentions that protest cycles go beyond the visible actions of a movement, leave as a legacy changes by governments, as well as the expansion of popular participation, culture and ideology, generating changes in the social space.

In addition, the contemporary approaches of this millennium highlight the discussions about collective action and social movements in relation to the new requirements of modernity and the redefinition of the rational subject to incorporate cultural identities (Touraine, Melucci), articulation of the subject with the global and local (Giddens), participatory and

deliberative democracy (Castells & Souza Santos), and the issue of autonomy and emancipation (Castoriades & Adorno) (Gohn, 2007; Alonso, 2009).

However, as the field of discussion about collective action and social movements is very dense, we highlight the Model of Structuring of Collective Action, elaborated by Pimentel (2012a; 2016), that starts from the critical realistic perspective, in particular in the sociology of the organizations. This model begins with the delimitation of a field¹ of social activity, then the attempt is made to discover the “game” that is developed in this field, being possible to identify the real players, rules, objects of the game, as well like the adversaries. It is in this physical and social space in reality where structural constraints are formed and become materialized.

Thus, the Model assumes three major levels of analysis that are important to each other, which are presented in levels of social reality, they are:

The first moment (M1) refers to the spatialisation, given by the situation of co-presence, physical or virtual, that allows individuals to share the same situation or the same context of material reality, being possible to observe the actions and elections. This situation of co-presence is that it establishes the basis for the interaction of the entities.

The second moment (M2), refers to the identification, or better the identity, unifies the individuals in interaction. It establishes the limits of the social group, its ideal and affective bases, its values and the feelings of affiliation and belonging of the individual to this social group. Being able to generate a group, still little structured, that delimits from a common identity, that resembles internally and differentiates externally from the other social groups and individuals. As the process of group growth occurs and it becomes more complex, little by little, with the internal division of labour, in specific roles and positions, the mechanisms of power are introduced.

The third moment (M3), refers to the introduction and stabilization of these mechanisms (of power). In terms of the capacity of organized collective action, it manifests itself in the form of social reality, where collective social subjects possess the capacity to exercise coercion, recognized as being the highly structured “formal organization” being increasingly objectified, externalized and independent of specific actions of an individual or a specific relationship. It is here, from this structured organization, that the causal power of public manifestation in the social area emerges, exercising over other social structures and institutions, with the capacity to mould them since they have resources and legitimacy, having the property to exercise power, Reproduce and transform reality.

3. BOURDIEU THEORY APPLIED TO TOURISM

3.1 Synthesis of critique to external and naturalistic conceptual logic

Following Bourdieu, agents in a tourist field, needs to, directly or not, consider and deal with the positions of the others actors in the field and precisely, the stage of development of the tourist destination must consider the internal path of relationship of the agents in a tourist destination, besides the external one.

This latter has been widely studied over the last 30 years, since the proposal of Tourist Area Life Cycle (Butler, 1980). Meanwhile, a large number of papers has been published, applying the concept (Hovinen, 1982), adding some variable (Butler, 2001), trying to modify or expand it (Garays & Cànoves, 2011), or exploring different contexts of using it (Cole, 2009), even questioning its theoretical basis (Hovinen, 2002).

However, it seems that little has been done in terms of social theorization². The huge majority of the existing studies has a naturalistic, external and positivistic point of view (Kuhn, 1975; Harré, 1988). Even more scarce is the reference to critical theory. Pimentel (2013a, b; 2014) has proposed a *Bourdieusian* interpretation of tourism, displacing the traditional notion of system to a new one called field. In this sense the authors introduced some of the implications of the use of *Bourdieusian* concept of field to governance of Tourist Destinations (TD), and proposed propedeutic theoretical framework to study the action of actions by the categories of agents, individuals or collectives, and capitals (Pimentel, 2015a).

Like every field, as the tourist field emerges it brings with it a proper *doxa*, which means a consensual opinion about what is the field and what are important in it. In this sense, one should ask: what is out of question in tourism? Not to travel?! Or, otherwise: what is the ideology of tourism? To travel (Pimentel, 2015b).

Unlike in the ancient times, where travel was an imperious form to get other (social/collective) things, e.g. land possessions (through the war), specific commodities like spices (through commerce); in modern age, travel becomes individual and finalistic form to obtain a proper and exclusivist form of incorporated knowledge. It is a mix of material and ideal process of transformation by which someone pass or get the experience. And there is no return: the experiences, good or bad, are codified in the individual body. Tourism could see by the idea that travel is one human individual necessity and tourism is a way of knowledge and improve human potentials (Pimentel, 2015b).

As a new way to be (re)experience the world, embedded in a process of constant evolution of society, the tourism emerges in the early modern age, exactly when transportation systems and means to expand human capacities to get contact with the world. So, the tourism field was born as a mix of instrumental technologies with the ancient principle of body incorporation of knowledge.

Tourism is a product of the incorporation of pre-existing structures, it means, the practices social distinction allied to the new configuration of technical means of to exercise it. Therefore, the travel is an object that becomes institutionalized in tourism field. There is no option not to travel. This is the basic value of this field. Its internal logic (or most basic principle

¹ Definition used by French sociology, widely used by Pierre Bourdieu.

² We did a simple search on the following databases: Cambridge Journals; Web of Science/Web of Knowledge; Sage Journals; Scopus; Jstor; Emerald; and no one paper was found in this specific way of producing a proper reading of Bourdieu to tourism. It was found some (little) papers that use some concepts of Bourdieu theory but no one uses this framework as a hole to think the tourism as tourist field.

of functioning) is guarantee the existence and continuous flux of travels among different places and spaces in the world.

In this way, the object of contest becomes (physically) the travel and (symbolic) the meaning of it. More specifically the monopoly of its definition and the legitimate attribution of an implication to it. Then a contest for the legitimacy of defining of tourism is imperative to delimitate what is a travel that promotes a cultural enrichment, and in this way become a sort of cultural capital, and what kind of travel is not expanding someone's knowledge.

Then, what determines the existence of a field and demarcate its boundaries are the special interests, economic and psychological investments made by different agents, endowed with a specific *habitus* convergent with that field, and institutions embedded in it, and who want a return on different forms of capital related to capital dominant in that field.

One of the boundaries of tourism are the special interests in a tourist field. These can be viewed as the economic interest in production, commerce and distribution of tourism. In this case, the investments are mainly made by collective agents in machinery (hotel, planes, agencies), technology (system of information, devices, etc.) and techniques (human knowledge as a proper manner to do something). By the other side, there are psychological investments mostly made by individual agents that are getting knowledge of these proper manners to do. Other type of psychological investment is the commitment and adequate the *nomos* and the rules of the field.

Habitus is class and subclass in which positions the agent, who is a predisposition to act according to what he has assimilated throughout their learning process. Tourist *habitus* could be seen by the interjected value of a need in to expand knowledge by the embodied experience, what means a need to get contact whit new objects, places and people. In one word: disposition do travel.

However, who are the agents, individual and institutional ones? How do they appear in tourism? There are two main kinds of individual agents: tourists, for who is drove all the production process of tourism and for who is to be supposed chancel what *is or not* a touristic attraction (and by extension a tourist destination). The second one is the labor force, who is designated to do the operation of tourism system. By your turn, the institutional agents are the organizations that products and operates tourism system and the institutions that represents and congregates these productive and class organizations (Pimentel, 2015b).

What are their returns? Each one has interests in to get and accumulate different forms of capital. Tourists try to get cultural capital, labor force as well productive organizations want economic capital and class organizations (as well local ones and residents too) aim to obtain social capital. Nevertheless, these finalistic forms of capital needs to be intermediated by the touristic capital, which is the primary form of capital generated in a tourist field (Pimentel, 2015b).

In this context, and following Bourdieu's forms of capital, we argue that tourism is a subtype of capital derivate from the cultural capital form. Once that cultural capital encompasses "knowledge, skills, information, etc.," which can be produced and transmitted to different social groups and (a) been incorporated as a provision in durable body, (b) state the goal as asset ownership or (c) institutionalized; we can sustain that the tourism, by the specific operation of displacement of the individual from its original context (what is namely by travel), produces a provision in durable body which gradually becomes incorporated as a way of being (*habitus*) (Pimentel, 2015b).

The touristic capital that means the accumulated knowledge by doing tourism. It is the condition to be touristic or have touristic interests. This implies capacity of to influence and control touristic flux and touristic production.

It is not our attempt to criticize this perspective, as it has already been done. Butler (2011) himself summarizes some of them. Yet, our effort is to modify the starting point of view from a naturalistic perspective to a critical one (Gale & Botterill, 2005).

In this sense, our ultimately goal is to entry in the "black box" of internal arrangements in a TD. The relationships of power, access to resources and capacity to do things in reality are not equally distributed among all the actors presents in a TD (Bourdieu, 2001). Besides, the circumstances, mechanisms and process that drive a TD to a specific "stage", in the TALC model, reference to human actors in a TD, including the tourists and visitors but not only them. So, the political process that leads a specific conjuncture must to be studied. It does not excludes totally the analyses of a TALC model, which could be, in some sense, integrated with this internal political perspective. However, this will be a task for another paper.

Once that our objective was to develop the *Bourdusian* concept of field to tourism, which has been introduced by Pimentel and Pimentel (2013), we can now move forward to understand the agents' internal relationships in a TD – considered as a field, with unequal distribution of capitals (resources) among the agents and these ones occupy different positions in this scenario, which lead them to exercise, with a unequal capacity, its preferences and interests in a TD. By the other side, due to the proper nature of tourism, hardly only one agent can control all the tourist field. So, it is necessary to make coalitions between the agents. But for understand how are the dominant coalition in a TD and what kind of configuration sustains it, analyzes from an internal perspective is required, that could reveal the political dynamics in a TD (Pimentel, 2015a).

3.2 Propaedeutic Analysis of tourist field

According to Bourdieu a field results from process of social differentiation. In tourism it is given by the access to mobility and travel emblematically occurred since II Industrial Revolution (cf. Hobsbawn, 2009). How is broadly written in tourist literature, this social differentiation emerges with the social practices of noblesse in that era. It was one of the forms by this class could sustain its status, by the investment in itself, in the acquisition of embodied cultural capital that could not be equally acquired by the bourgeoisie.

By your turn, this social practice provokes the emergence of a *nomos* (internal logic), what would lead to ulterior appearance of *habitus*, in the sense that travel is a form of obtain, accumulate and expand symbolic capital. Thus, travel becomes a form to acquire cultural capital.

Even more travel is seen as an exclusive form to acquisition by the embodiment (corporification), which means that only the individual could be retain this experience. This one would be personal and not transferable.

Gradually it becomes necessary to establish the boundaries of travels, the kind of travels and its senses. Travels become an object of contest. Different actors want to retain the monopoly about this social practice, even more they want impose their vision – by definition – about what is a travel and its meaning. This contest would lead us, e.g. in the beginning of XX century – to the attempts in the establishment of a definition of tourism. Note that is not by hazard the definition of tourism exclude laborious practices, because a form of cultural enrichment could not be embodied acquired if the body of a person is tied in a laborious practice.

Then a contest for the legitimacy of defining of tourism is imperative to delimitate what is a travel that promotes a cultural enrichment, and in this way become a sort of cultural capital, and what kind of travel is not expanding someone's knowledge.

As summarizes Bourdieu all the fields have:

- a) *habitus*, which in tourism is seen by the interjected value of a need in to expand knowledge by the embodied experience, what means a need to get contact whit new objects, places and people.
- b) framework, in tourist social practice given by producers, regulatory agencies, intermediaries organizations and people and/or organizations that does not pertain to tourism but furnishes goods and services. Nowadays this framework is well acknowledging by the systems theory perspective.
- c) *doxa*, which refers to a consensual opinion about tourism and travel. The *doxa* on tourism could see by the idea that travel is one human necessity and tourism is a way of knowledge and improve human potentials.
- d) *nomos* where travel is a form to obtain cultural capital.

In this context, and following Bourdieu's forms of capital, we argue that tourism is a subtype of capital derivate from the form of cultural capital. Once that cultural capital encompasses "knowledge, skills, information, etc.," which can be produced and transmitted different social groups and (a) been incorporated as a provision in durable body, (b) state the goal as asset ownership or (c) institutionalized; we can sustain that the tourism, by the specific operation of displacement of the individual from its original context (what is namely by travel), produces a provision in durable body which gradually becomes incorporated as a way of being (*habitus*).

3.3 A Framework of Analysis in Tourist Field

Now we can move forward to a schematic form to analyze a tourist field based on the following *criteria* and their descriptions:

- Positions: objective positions of actual agents. Who are in what place right now? Who are tourists? The tourist trade? Public local organizations? In what place, physical and social, are each of them right now?
- Dispositions: what is the propension of each one of them to engage in a specific course of action?
- Taken of positions: what are exactly the courses of action taken by each one of them in a specific situation?
- Specific situation: collective problem that requires a deliberation. Ex.: to do investments in applied researches to get a TD's information system to monitory and control the TD.
- *Manoeuvres* to access specific resources: what each agent does to access specific resources?
- Monopoly of authority: who has the monopoly of industry travel? Private sector. In world level: huge chain hotels and civil air transportation. In national and intra-regional levels: hotels and tour operators.
- Who dictates the rules of tourist field? In world level: Firms of the tourist trade. In a specific destination.

Trying to summarize this discussion in the limited space of this working paper, we present a scheme of the tourist field, as a proto analyze of the internal distribution of the power in this field and a hypothetical configuration of it (figure 2).

Figure 2 - Visual representation of a tourist field

Source: Pimentel (2015b)

Once identified the tourist field, what are its implications for governance on tourist destinations (TD)? In a simplified way grouping actors by the type of actions they perform on the field, we can see the possibilities of collective action (cf. figure 1).

Table 1 - Relational matrix of possible links between the actors

Actor / relation	None relation	Private sector	Public setor	Civil society	Convergence of actions
Private sector		1			
Public setor	0	2	4		7
Civil society		3	5	6	

Source: prepared by the author

The first possibility is that there is no relationship between the actors (# 0) and tourist activity does not happen at the destination, or be marginally exploited by specific companies from the private sector (e.g., charter bus to tour). This situation is very common in the early stages of developing a tourist destination (Butler, 1980).

At a later stage in which there are already different private companies and organizations operating in the tourist destination (# 1), it is possible to have a link between the private companies that offers, in a more complete and aggregated services that make up the tourism product for example, through partnerships between transportation companies and hosting.

Another possibility is a joint effort between the private and public sector (# 2). In this case, the municipality or public agency responsible for tourism legislation and directs the activity, while the private sector is responsible for providing the services.

In (# 3), instead of siding to the government, the private sector seeks support in civil society to improve the quality of tourism or explore possibilities of action together for the promotion of tourism and local quality of life. Here usually enter awareness raising, information and those left out of formal legislation and regulation on the activity.

Otherwise, tourism can present itself as a vocation yet to be explored and perhaps not even perceived by the private sector. In this case (# 4), partnerships between public agencies occur at different levels of government in order to provide conditions for the exploitation of economic activity (e.g., through provision of public goods, such as creating access roads).

Another common form (# 5) is to observe specific actions of municipalities and public agencies of tourism in order to try to raise awareness and attract the attention of other segments of society, for the development of local tourism. Here the government seeks to engage, rather than other public governmental society participation in order to ensure public benefits for the entire local society.

Although there may be forms of articulation between civil society entities, excluding the public and private sectors. Although it is more difficult, it can happen in the case where the local government is not acting nor for tourism development advanced to justify private offers products. Thus some communities have to develop their own initiatives, seek local social and economic development, often through tourism, due to lack of resources or other opportunities.

Finally, it is worth mentioning a possibility (# 7), the articulation of three distinct groups. This is the ideal scenario but it hardly occurs. It would be the most suitable for the development and management of tourism.

4. CONCLUSION

Once that our objective was to develop the *Bourdeusian* concept of field to tourism, which has been introduced by Pimentel and Pimentel (2013), we can now move forward to understand the agents' internal relationships in a TD. It is argued (1) that agents in a tourism field needs, directly or not, to consider and to deal with the positions of the others actors in the field and (2) that the stage of development of the tourist destination must take into consideration the agents' internal path of relationships in a TD, besides the external one. In addition, we can argue the originality of this proposal, which can be viewed by an opportunity to innovate and provide a theoretical contribution. In the same sense, after proposing a sociological framework to/about tourism field, we are led to understand how, why and in what extent the different actors are put together and sustain their relations *vis-a-vis* to get their objectives and interests.

In a field, there is an unequal distribution of capitals (resources) among the agents and these ones occupy different positions in this scenario, which lead them to application, with an unequal capacity, its preferences and interests in a TD. By the other side, due to the proper nature of tourism, hardly only one agent can control the entire tourist field. Therefore, the agents must do new alliances. Nevertheless, for understand how are the dominant group in a TD and in what kind of configuration sustains it, it requires examinations from an internal perspective, that could reveal the political dynamics in a TD.

So, if the proposal presented here is correct, the contributions of this idea is that we can move forward to enlarge our conception about TD and do not consider this one just as an effect of external forces that drives it, but, in fact, as a conjunction of internal and external forces whose effects leads us to a specifics stages or degrees of development in a TD.

The proposal presented here has consequences on academic and practical order. In other words, one can understand the internal dynamic of the agents which leads them to a faster or slower development of a tourist destination. Moreover, being aware of these constraints and how them occur, scholars could be elaborate mechanisms to precise their intervention in practice actions. At the latter, as one has knowledge about these dynamics and how the agents need to be set up to develop a destination, efforts can be made to conform a broader coalition to reach a successful TD.

In the contrary, one can avoids situations in which there is bad configuration to TD development. Besides, it can be possible make more visible the role of every single player in a TD and the amount of capital which one has, as well its capacity of influence the TD as a hole. So once the distribution of agents and capitals are made, and the rules put in action, the TD become a question of collective action, which, by your turn, will demands a institutionalized system of governance.

This theoretical proposal has direct implications over the practice, for example, to governance of TD, since it moves us from an external approach, mainly represented by the TALC model, to a new one, a sociological and political, that can help us to explain why the TD do not develop just with the incoming of tourists. Moreover, will help to explain why there are different stages with the same touristic flux incoming.

So, if the concept of field to tourism and discuss some implications from it to governance of tourist destinations, we can assert the proposal presented here brings at least two contributions. The first one is theoretical and deals to the framework of Bourdieu and its possibilities on theorizing of tourism. The second one refers to the implications from that theoretical framework. A better understanding of tourism, as a hole, can lead us to produce more accuracy tools and interventions on reality, e.g. on the context of management and governance of TD. Thus, if we are correct and considering the necessity to identify, for effective management of the TD, who are the actors involved directly and indirectly in the tourism field, what are their interests and how they seek to achieve them.

In short, if one wants to obtain a broader and efficient system of governance to tourist destination is necessary to analyze how structured the field is, who are the actors, what are their positions and what are their dispositions to act in some way. These elements will provide an internal matrix of relations to guide an empirical destination to identify and manage more accurately its constraints and capabilities to develop.

ABSTRACT

Food is a primary human need, since it depends on his survival and largely his well being, being one of the most important factors in the quality and duration of human life.

During childhood and adolescence, healthy eating is essential for growth and development but also a determinant factor for health in preventing food-related problems.

Of the factors that allow the integration of healthy eating habits, the school plays a key role for the acquisition of knowledge and for development essential attitudes and skills to adoption healthy eating behaviors, being necessary to involve all the school structures, like management bodies, officials, parents and caregivers, teachers, among others, approaching a transdisciplinary and collaborative perspective among the various educational partnerships. The school inserts itself in a context of learning about healthy eating and food education of children and adolescents, complementing the role of the family.

However, food education does not only have this approach to food and nutrition. More complex issues such as the environment, agriculture, consumption, malnutrition, food insecurity and hunger in the world are also related, addressing education for citizenship, developing attitudes of solidarity, commitment to the fight against hunger in the world, and of ecological responsibility.

Keywords: Nutritional Education, Schools, Children's, Adolescents, Interdisciplinarity.

1. INTRODUCTION

Food is a primary human need, since it depends on his survival and largely his well being, being one of the most important factors in the quality and duration of human life.

In order to enjoy good health and be strong physically and mentally, giving maximum performance in our activity, we need to have a healthy diet, assuring the variety, balance and the adjusted quantity of food that should be chosen for its nutritional and hygienic quality, taking always attention to the beneficial culinary manipulations.

During childhood and adolescence, healthy eating is not only essential for growth and development but also a determinant factor for health in preventing food-related problems, not only in the short and medium term, such as anaemia, growth retardation, dental caries, obesity, among others, but also in the long term such as cardiovascular diseases, different forms of cancer, among others. An unbalanced diet can thus lead to serious health problems, which will be reflected not only in childhood, but also in adolescence or later as adults (Corkins *et al.*, 2016).

At these ages, we must bear in mind that children are not endowed with an innate ability to choose foods according to their nutritional value. Eating habits are learned through experience, observation and education. Hence, the binding experiences in childhood and the education that is received in the first years of life until adolescence are determinants (Corkins *et al.*, 2016).

It is therefore necessary from an early age to educate for health and provide the essential conditions for acquiring knowledge and for developing the attitudes and skills essential to the adoption of healthy eating behaviours'.

It is in childhood that the child is developing his senses and diversifying the tastes, and with that forming his own preferences. It is a stage of life dedicated to the acquisition of knowledge, where they develop abilities that favor the learning of healthy eating habits.

If the child is accustomed very early to the various palates and textures of food, it will create a more diverse taste and with positive repercussions on their future choices.

Another great advantage is that good eating habits, when acquired early, tend to persist for a long time, and during childhood are several factors that favor the integration of these habits, so it is essential to bet on the promotion of eating habits at an early age.

It is at these ages that we must bet to intervene and prevent through food and nutrition education.

2. DETERMINANTS OF FOOD CHOICE

When we are going to plan or implement food education, we must necessarily take into account the factors that will determine food choice. First, food choices are influenced by (a) biological predisposition to certain behaviours', such as the taste of the human being at birth for sweet and not liking bitter and sour, hunger / satiety mechanisms; (b) food experience,

since humans have the ability to learn to enjoy food through conditioned association, both physiological and social. The children overcame their fear of new foods (neophobia) through repeated experience of new foods, offered by the family and often reflecting cultural preferences. These two sets of sensory-affective influences strongly contribute to individuals' food preferences (Contento, 2008).

Other determinants are (c) personal factors, not only intrapersonal, but also beliefs, attitudes, knowledge, skills and social norms, as well as interpersonal factors, such as family and social networks. Finally, we have (d) environmental factors, which are essential, since food availability and accessibility, as well as the social environment, cultural practices, material resources, and food marketing, facilitate or hinder to people to be able to act on their beliefs, attitudes and knowledge about healthy eating (Contento, 2008).

3. THE ROLE OF SCHOOL

Of all the agents that allow the integration of healthy eating habits, the school plays a crucial role, inserting itself in a context of learning, where the food education to the children and young people is fundamental, complementing the role of the family, that can not be neglected (Evans *et al.*, 2015; Yip *et al.*, 2016).

The school context plays a very important preventive role. It is a privileged place for health education and represents the main social context where habits and lifestyles are acquired.

It is crucial for the acquisition of knowledge and the development of attitudes and skills essential to the adoption of good eating habits, and it is necessary to involve all school structures, from the management bodies, teachers, employees and parents. This privileges an interdisciplinary approach in which the various educational partners intervene.

At school, this work should not be confined to the classroom or the syllabus content of the subjects, which are important but not sufficient for the success of food education.

Food should have a practical component, seen on a daily basis at school, at home and in the community. There is also a need to match the feeding messages transmitted in the classroom with the food available in this school environment. Only like this, food education will produce its effects centered on a school dedicated to promoting health (Loureiro, 2004).

On the other hand, the school has another central role of the child, since it carries the messages of food education from the school to the family, currently playing a real role as a "family educator".

The school thus becomes a scenario par excellence for learning about healthy eating and in food education for children.

4. THE FOOD AND NUTRITIONAL EDUCATION PROCESS

Food and nutrition education is much more comprehensive than the dissemination of information. When it is exclusively or essentially based on the provision of knowledge it has not been shown to be effective. Food and nutritional education is most effective when it focuses on behaviour / action (rather than simple knowledge), and systematically links theory, research and practice (Contento, 2008; Ray *et al.*, 2016).

In food education it is important that children experiment, that is, to develop practical activities, allowing the manipulation of food. On the other hand, to maintain the interest in learning, one can use with strategy to focus more on the social dimension and the personal life and not so much the nutrients (Loureiro, 2014).

Food education is understood as any combination of educational strategies, accompanied by environmental support, to facilitate the voluntary adoption of food choices and other behaviours' related to food and nutrition conducive to health and well-being (Contento, 2008).

On the other hand, food and nutrition education must be carried out through various locations and involve activities at the individual, community and political levels.

Depending on the purpose for which it is intended, we must have the notion that food and nutrition education can have three components: the motivational one, where the goal is to increase awareness and increase motivation, approaching beliefs, attitudes through effective communication strategies; the aim of which is to facilitate the capacity of people to act through the definition of cognitive self-regulation objectives and competences; and environmental, where educators work with policy makers and others to promote a supportive environment for action (Contento, 2008).

It is important to adapt food and nutrition education to the target population. Know which motivating factors as well as the best forms of learning.

For example, for children, strategies that include exposure to food in a positive social context, using peer and adult reference models, as well as the appropriate use of incentives, are important. For adolescents, behavioural alteration strategies, such as self-assessment, clarification of expectations and values, definition of personal goals, and the capacity for competent choice between alternatives are more convenient (Loureiro, 2004).

In a school environment, it is important not only to invest in the empowerment of students, but also in teachers, staff, parents and other community members to be able to have and transmit healthy behaviours', however, it is also essential to create enabling environments for these choices (Loureiro, 2014; Meiklejohn *et al.*, 2016).

We must not forget that, given the objectives and target population of food and nutrition education, we have to choose the best methodology. For certain situations, the direct method may be useful, in which there is direct contact between the educator and the student, using the spoken word as a means of communication, favouring interaction with the audience, explanation and clarification. Examples include lectures or conferences, and group discussion.

For others, the indirect method may be used, in which there is a space and / or time separation between the educator and the learner, and the spoken word, writing or image as a means of communication is used as a medium Awareness campaigns.

Examples include posters, brochures, the internet, social networks, and videos.

The purpose of food education is to provide the principles that best fit food and nutrition needs; to enable in the school community a reflection on the actions to be undertaken, for all to enjoy a good diet; enable students to participate actively in food education activities; to encourage students to interpret the concept of food and to emphasize its importance, valuing the healthy; and involve family members, essential partners in this educational process and the acquisition of healthy eating habits and promoting an environment of sharing and communication during meals.

Educating for healthy lifestyles through food education in health promotion at school can contribute to improving the global health status of children today and will produce its effects in the future.

Strategies adopted collectively to guide individual and group behaviour should create opportunities for action and remove barriers to healthy eating. Thus, the provision of food at school, whether through school meals in the canteen or in other ways as in school, influence this educational process (Aranceta, 2013), and important to make good food choices.

Reducing difficulties or barriers to accessing desirable food choices is paramount. For example, the greater the perceived barriers, the lower the consumption of fruits and vegetables (Lytle *et al.*, 2003; Ganann *et al.*, 2014).

At school, food services are, for example, a reference point for implementing strategies to encourage the consumption of fruits and vegetables in children and adolescents (Ganann *et al.*, 2014).

School-based food and nutrition education programs should focus on behaviour involving the family, with internal and external intersectoral strategies, always taking into account the needs of children and all school elements. They should influence attitudes, intervening in the school environment, allowing access to healthy foods, and a constant evaluation of the intervention is mandatory (Perez-Rodrigo and Aranceta, 2003).

In food education it is important to have experimentation, such as the manipulation of food itself. Focusing on the social and personal life rather than the nutrients are good strategies to maintain interest in food (Loureiro, 2004).

Approaches involving action, with the participation of students such as school gardens and cooking programs may encourage greater consumption of vegetables and may have a better effect in relation to nutritional education. Providing children with fruits and vegetables in an accessible and free way has been shown to positively affect feeding behaviour (DeCosta *et al.*, 2017).

Capturing the attention of parents and engaging them in healthy eating practices for their children is a way to increase the effectiveness of nutrition education programs (Blitstein *et al.*, 2016).

However, it should not be overlooked that these actions are not enough. At other levels (advertising, marketing, among others) measures should also be taken to promote good eating habits.

Food education is only effective if there is a comprehensive framework, involving continued support not only from all school structures, but also from the rest of the community, which includes, in addition to others, health entities.

In addition to these essential elements in food and nutrition education, there is another very important one: evaluation. When we evaluate our actions it is possible to determine if the objectives have been achieved or if the priorities need to be changed. It also detect elements that need to be modified, and allows to identify ways that activities can be improved. It identifies weaknesses, and makes it possible to test innovative approaches.

5. THE INTERDISCIPLINARITY OF FOOD AND NUTRITIONAL EDUCATION

As mentioned above, of the factors that allow the integration of healthy eating habits, school plays a fundamental role in acquiring knowledge and in developing attitudes and skills at this level. However, it is necessary to involve all school structures, from the management and administration bodies, officials, parents and guardians, teachers, among others, addressing an interdisciplinary and collaborative perspective among the various educational partners, in particular with health professionals (nutritionists, physician, nurses, among others).

On the other hand, it is equally important that this food education not only has an exclusive approach in food and nutrition. It is important to relate to more complex issues such as the environment, agriculture, consumption, malnutrition, food insecurity and hunger in the world, addressing citizenship education, developing attitudes of solidarity, commitment to the fight against hunger in the ecological responsibility, avoiding in this case choices that have a negative impact on the environment.

6. CONCLUSIONS

The importance of food is particularly evident, especially in children and young people as their growth and development depend on balanced nutrition.

For the acquisition of knowledge and attitudes fundamental to an adequate food choice, the school plays a crucial role, complementing the role of the family, being the social context par excellence for a child-centered food education.

However, it is essential that this food education be well planned and structured to achieve the intended effectiveness.

We will have to be able to change behaviours', a task that is not easy, and therefore it is important to choose the best form of communication to achieve our goals. Appealing and dynamic activities, involving the participation of children and young people, are essential elements. However, it is also important to create environmental change that is conducive to change and thus to improve eating behaviours', and it is essential to involve all elements of the educational community as well as the various partners in the communities to achieve efficient food education.

ABSTRACT

Cardiovascular disease represents the leading cause of death in the world and is also the most resource consumer disease of health care among industrialized countries. Therefore, the possibility to associate a non-invasive method of Computerized Angiotomography to the conventional scores can raise the potential of conducts applied to the clinical approach of the patients. The purpose of this study was to analyze the relevance of calcium scores analyzes compared to the conventional Coronary Angiography method (Cardiac Catheterization) in patients at risk of coronary events, taking on account the perspective of quality of life. For this review of literature it was used a qualitative approach with descriptive purposes, based on fundamental analyzes with relevance on focusing the proposed objective. Hence, the achieved results pointed the Computerized Angiotomography as a non-invasive method of diagnosis when compared to the Cardiac Catheterization for no need of hospitalization once it is an elective procedure that relieves the impacts related to the patient's quality of life and of his or her social circle. It was also observed a potential decrease in costs related to the public health, as well as the improvement of the method of diagnosis directed to the search for new medical solutions related to the improvement of the social quality of life, the guaranty of basic rights, such as health, and the viability of social advances in medicine.

Keywords: Cardiac Catheterization, Computerized Angiotomography, Calcium Score, Quality of Life, Coronary Arterial Disease.

1. INTRODUCTION

Measuring the risk of cardiovascular diseases is important to define prognostic, set goals of treatment and motivate patients to change their life style, once it is a fundamental element for clinical observance of patients without previous manifestation of cardiovascular disease. Szarf (2016) affirms that the Framingham Risk Score (FRS) has been one the most usable model, widely utilized in clinical care, to estimate absolute risk of myocardium infarct and coronary death for 10 years. In the last decades, the society has watched great technological advances in the field of health. The arteriosclerosis is a pathology that can affect the brain arteries, heart, kidney and other human vital organs. When the arteriosclerosis phenomenon occurs in the arteries that supplies the heart (coronary arteries), they can lead to a myocardium infarct.

According to Rocha (2005), the Coronary Arterial Disease (CAD) is the main cause of mortality and it is also the most resource consuming pathology in the health fields of industrialized countries. In 1992, just in the USA, it was responsible for almost one million deaths – twice as much as cancer and ten times more than traffic accident. Besides the important advances in medicine, the CAD is the responsible for more deaths than the others combined causes. It is projected that in 2020, the cardiovascular diseases will be responsible for more than 20 million deaths a year (Rebelo *et al.*, 2007).

Luz (2005) affirms that arteriosclerosis starts when the monocytes cells migrate from the blood stream to the arterial wall, transforming into cells that accumulate fat material. As time passes, these accumulated fatty monocytes lead to thickening, in the form of a plaque, in the arterial inner lining. Each thickening area, known as arteriosclerotic plaque or atheroma, consists of several fatty materials, mainly cholesterol, loose muscular cells and connective tissue cells (Figure 1).

Figure 1 – Evolution of atherosclerosis

Source: <http://www.pedrofarsky.med.br/Colesterol.html&usg>

The arteriosclerotic plaques or atheroma can place in large or medium caliber arteries but, they usually form in ramifications of arteries, supposedly because the frequent turbulence in these areas injures the arterial wall, turning susceptible to the atheroma formation. The arteries affected by arteriosclerosis lose their elasticity and, as the atheromas grow, these arteries grow thinner. As time passes, the atheromas accumulate deposits of calcium, which can turn them fragile and break. So, the blood can penetrate into one of these broke atheromas, expanding their size and thus reducing, still more, the arterial inner size. The broken atheroma can also liberate its inner fat contempt giving rise to formation of a blood clotting (thrombus). The clot can still reduce the inner size of the arteries, obstruct them, or even gain the circulation producing an occlusion (embolism).

According to Meneghelo (2005), the diagnosis of CAD is fundamentally established in a very well done anamnesis cared out by the doctor. Technological resources have been applied since 1970 decade in Brazil. The confirmation can be done even by noninvasive methods or ergometric test, perfusion analyzes by nuclear medicine and stress echocardiographic. More recently, with technological advance the diagnosis of subclinical arteriosclerosis can be executed by the means of coronary computerized tomography and, especially, by analyzes of calcium deposit in these arteries. In contrast, Davidson & Bonow (2007), related in their studies that the cardiac catheterization and coronary cineangiography are recommended anytime it makes it clinically important to define the presence or evaluate the severity of a cardiac lesion. Even by the virtue of this procedure present only 1% of complications and with 0.08% of mortality index, there still exists patients unable to be submitted to this laboratory studies activities with safety. One technology capable for previously detect the CAD é preferable, once the previous diagnosis of disease can contribute with the elements that could guarantee the individual quality of life, providing them with a more efficient treatment, by anticipating the diagnosis, besides representing the access to the quality of health and not submit patients to invasive exams that could increase the risks of medical complications related to these procedures.

This study has as objective analyze the potentialities of the use of computerized angiotomography (CAT) in evaluating calcium scores (CE) related to the conventional coronary cineangiography method of study (cardiac catheterization) in increase quality of life in patients with the risk of coronary events. With the qualitative approach for descriptive purposes, this study used a literature review for fundament necessary analyzes to the execution of the proposal subject.

2. THE CHALLENGE OF NONINVASIVE METHOD

Increasingly, the various guidelines about CAD call attention to the proper stratification of the risk and of the importance of primary prevention measures, with the prescription of drugs that reduce the levels of cholesterol and also Aspirin for high risk patients. Nevertheless, it is still a great challenge to the modern cardiology. The analysis of the traditional risk factors helps to classify the patients in groups, but the rate of events is not uncommon for those considered as low risk (0.5% - 1.0% per year) and neither to the high risk ones (2% per year). The coronary arteries calcification (CAC) is an increased risk marker for the acute events and is present only in CAD, and also can be quantified in a rapid and noninvasive way by the means of CAT with evaluation of CE.

The CAC is defined as a hyperattenuating lesion with the density threshold value over 130 Hounsfield unities (HU), in an area of two or more adjacent pixels (Figure 2).

Figure 2 – Tomographic image of the heart of a diabetic patient with the calcium score 725, presenting various plaques of calcification in the Anterior Descendent Artery (AD) and in the Circumflex Artery (CX)

Source: http://www.scielo.br/scielo.php?script=sci_arttext&pid=SO004-27302007000200019

The product of the total area of calcium per a derivate factor of maximal density is equal to the CE, published by Agatston with his name. Till recently, it is been questioned if the CE represented an independent risk factor for coronary events, that is to say, if there was addition of information related to the traditional risk factors. Published and consistent studies evidence that the evaluation of CE can present data on the stratification of risk and change clinic procedures, in order to benefit patients and their families.

In the study performed by Greenland *et al.* (2005) *apud* Azevedo, Rochitte and Lima (2012) including 1.312 non diabetic patients, CE measures were realized by the method of Agatston with the patients follow up period of 8.5 years. This population of intermediate and high risk was evaluated and the results showed that the CE more than 300 implied in bigger chances of coronary events compared to stratification of risk isolated by FRS, especially in the intermediate risk group (10%-19% of events in 10 years).

Raggi *et al.* (2006) in their study, followed up 10.377 asymptomatic individuals (903 diabetics) for five years with the purpose of verify mortality by all causes. The results pointed that in asymptomatic individuals with diabetes, the mortality increases proportionally to CE. Furthermore, those with no CAC present low risk of events in short term, even being diabetic.

According to Meneghelo (2005), based on these studies and on the guidelines published on the American Heart Association (AHA), the followed information related to the CE are accepted:

- CE negative leads to a low probability of CAD and to events;
- CE positive confirms the presence of CAD;
- High scores of CE mean moderate to high risk of events in 2-5 years;
- The CAC measure is an independent predict of events and add prognostic value related to traditional factors of FRS.

The quantification of CAC can change the clinical practice, mainly in patients with intermediate risk

3. THE INVASIVE METHOD – CARDIAC CATHETERIZATION

According to Feres (2005), Werner Forssman realized for the first time, the cardiac catheterization straight in humans, in 1929. In 1950 Zimmerman *et al.*, were the pioneers in realizing the left cardiac catheterization, facilitating in 1953 the description made by Seldinger of the percutaneous puncture method which started using guidewire to change the catheters.

Figure 3 – Diagnostic catheters in cardiology

Source: <http://www.eptca.com/cateter-angiografico.php>

The coronary arteries were visualized in 1945 by Radner by means of injection of radiopaque contrast inside the Ascending Aorta artery. Afterwards, in 1964, Judkins developed pre-casted catheters that would facilitate the coronary catheterization, and also described the percutaneous femoral puncture technic. In clinic procedures for several decades, this exam represents an immeasurable risk discriminator in patients with coronary disease. This method has been passing through advances with the advent of technology, providing the doctors with anatomic images in real time and under low risk of complications (Figure 4).

Figure 4 – Coronary Cineangiography Image, with the injection of contrast to visualize possible coronary lesions

Source: http://web.educastur.princast.es/proyectos/grupotecne/archivoc/investiga/101cateterismo_cardiaco_4.jpg

In addition to other information, such as, collateral circulation, valvopathy, congenital cardiopathies, it also places the extension of CAD as characteristics of the plaques. The demonstration of the coronary arteries angiographically normal is also of great prognostic importance.

According to Davidson (2007), the execution of coronary cineangiography is a procedure relatively safe, but that presents risk of morbidity and mortality. The potential risk is difficult to be analyzed once it can be associated to other comorbid pathologies. The technical advances in this area search for minimize the risk with the use of low osmolarity contrast, smaller size catheters and the professional experience. The death associated to the procedure occurs in 0.08% to 0.75% of patients and can be more elevated among the octogenarians. The risk of myocardium infarction varies from 0.03% to 0.06% and the neurological complications from 0.03% to 0.2%, among other, such as, renal insufficiency, arrhythmia of difficult control, arterial hypertension, angina, aortic valvopathy.

4. FINAL CONSIDERATIONS

The CE is an independent risk marker for coronary events and add prognostic value to the traditional forms of stratify this risk. It can change the clinical procedure, mainly in patients with intermediate risk. The coronary CE correlates with the presence and extension of coronary arteriosclerosis. The absent of CAC, however, exclude the presence of significant stenosis of coronary artery with high predictive value.

Verifying the possible indication of a noninvasive method of diagnosis, such as the CAT, to identify and qualify CE, in detriment to another invasive method, as cardiac catheterization, can represent a relevant cost benefit option to patients, once it doesn't demand hospitalization, use of contrast, minimum financial cost, and above of all, intangible gains to the patients and their families with the reduction of the inconvenience of hospitalization that the cardiac catheterization causes, besides adding quality on the lifestyle of the more interested ones, the patients.

ABSTRACT

Competence-oriented training for professional achievement is an innovative training proposal aimed at achieving a more effective teaching-learning process in vocational students in the current context. This model encourages teachers to observe student performance and feedback to train students with the ability to learn and adapt to changing situations in their professional life autonomously. This educational model demonstrates the need for new learning spaces capable of adapting to a learning based on professional skills measured through competencies. In order for students to acquire these competences, there is an increasing tendency to go beyond the frontiers of the centers and make use of the innovations made by the whole educational community, educommunication and non-formal education. In this article, the need to change traditional learning spaces has been raised. With this aim, the conceptualization of competences has been started, the implications of the competences in the teaching of the teaching staff have been analyzed, and the characteristics that a learning space should have to achieve a competency-oriented training towards professional achievement and innovation have been determined. This paper presents a model of innovative or new generation learning space in function of its formative purpose obtained from the teaching conceptions in recent learning experiences.

Keywords: Learning Spaces, Competences, Learning, Vocational Education and Training.

JEL Classification: I21, I23, D83, Q55

1. INTRODUCCIÓN

El sistema educativo de la sociedad actual está sujeto a grandes cambios de diversas índole: desplazamiento de los procesos de formación desde los entornos convencionales hasta otros ámbitos; demanda generalizada de que los estudiantes reciban las competencias necesarias para el aprendizaje continuo; comercialización del conocimiento, que genera simultáneamente oportunidades para nuevos mercados y competencias en el sector, etc. (Salinas, 2004).

En la última década, se ha producido un gran apogeo en el uso de las competencias como un nuevo instrumento para gestionar los procesos educativos, los procesos de aprendizaje y la evaluación del alumno (Tobon, Pimienta & García, 2010).

1.1 Conceptualización de las competencias orientadas al logro profesional

El concepto de competencia ha sido ampliamente estudiado por diferentes autores, tanto desde el terreno educativo, como desde el mundo laboral y en las distintas acepciones que configuran el significado total de esta palabra, se integran las capacidades, conocimientos, aptitudes y habilidades en los diferentes contextos para desarrollar acciones que no han sido programadas con anterioridad y que incluyen los distintos saberes como son el saber hacer (Lasnier, 2000; Fernández, 2010), el saber ser y el saber estar (Noriega, Moran & García, 2014).

Existen diferentes definiciones del término competencias que hacen referencia al grado de utilización de conocimientos (Kane, 1992) y a su integración (Stephenson & Yorke, 1998), a las habilidades aprendidas para llevar a cabo una tarea, deber o rol adecuadamente (Roe, 2002), a las aptitudes (Perrenoud, 2004) y a las actitudes (Collins, 2007) que capacitan (Prieto, 2008) para actuar de manera efectiva y eficiente.

Por lo tanto, podemos afirmar que la educación por competencias engloba los conocimientos, habilidades, y destrezas que una persona desarrolla de manera integral para identificar, comprender, transformar y llevar a cabo acciones que les permitan resolver de manera adecuada y éticamente los problemas que se le plantean (Padilla *et al.*, 2015).

Esta educación basada en competencias orientada al logro profesional, debe ser comprendida como aquella enseñanza que posibilita que los estudiantes que se enfrenten a los problemas y las adversidades, que les surjan en su desempeño profesional, son capaces de resolver situaciones concretas, mediante la puesta en juego de los recursos que posee: conocimientos, actitudes y valores (Buzón-García, 2005).

La introducción de nuevos aprendizajes encaminados a la formación por competencias orientada al logro profesional requieren de una serie de variables (energía, creatividad, comunicación y liderazgo) que se expresan a través de la cultura de la escuela y que influirán en el éxito o fracaso de las innovaciones que se proponen (Ortega, Ramírez, Torres, López, Servín, Suárez & Ruiz, 2007).

Esta innovación educativa conlleva una transformación cultural en la manera de gestionar y construir el conocimiento, en las estrategias de enseñanza, en la implicación del profesorado para alcanzar la adquisición de estas competencias, en los espacios de aprendizaje, en las nuevas configuraciones institucionales y en los roles de los profesores y los alumnos (Lugo & Kelly, 2012).

Para difundir la formación por competencias orientada al logro profesional entre los jóvenes se debe desarrollar una educación emprendedora desde los centros escolares y, como señala la Comisión Europea (2008), se debe fomentar el espíritu, la cultura emprendedora y la innovación (Alemany, Álvarez, Planellas & Urbano, 2011).

1.2 Implicaciones de las competencias en la docencia del profesorado

En el marco del Espacio Europeo de Educación Superior (EEES) se considera adecuado utilizar entre los estudiantes métodos de aprendizaje activo, implementados en las diferentes técnicas de aprendizaje colaborativo con el fin de mejorar el nivel de atención e implicación del estudiante, incrementar su motivación y facilitar el nivel de desarrollo de algunas competencias necesarias para su profesión, tal y como se propone en las tres modalidades europeas de crecimiento económico. Dentro de este marco conceptual orientado al logro profesional, el profesorado tiene que flexibilizar su conducta, asumiendo una docencia de partida teórico-práctica profundamente fundamentada y que como tal requiere un considerable adiestramiento en habilidades y estrategias profesionales. Por ello, la transferencia de conocimiento ha de cambiar y se han de proveer estrategias que construyan estructuras cognitivas que habrá que integrar en aprendizajes dinámicos a lo largo de toda la vida (Aguayo *et al.*, 2014).

En este sentido, la práctica formativa hacia la difusión del espíritu emprendedor y la gestión de la innovación como cultura empresarial, sería una de las competencias profesionales que se debería fomentar en el aprendizaje y en la docencia. Esta sería valiosa en el aprendizaje cooperativo, y especialmente el informal intercalando clases teóricas-prácticas, y combinando la observación del desempeño de los alumnos y la retroalimentación para formar estudiantes con la capacidad de aprender y adaptarse a las situaciones cambiantes de su vida profesional de manera autónoma. Este modelo educativo pone de manifiesto la necesidad de nuevos espacios de aprendizaje capaces de adaptarse a un aprendizaje basado en habilidades profesionales medidas a través de las competencias.

2. MÉTODO

Teniendo en cuenta lo expuesto anteriormente, el objetivo principal de este artículo es plantear la necesidad de cambiar los espacios tradicionales de aprendizaje para adaptarse a un aprendizaje basado en la adquisición de habilidades profesionales medidas a través de las competencias.

La metodología utilizada se basa en una revisión bibliográfica de literatura científica y artículos de investigación publicados desde el año 2006 hasta la actualidad. Se han consultado las siguientes bases de datos: Google Scholar, ScienceDirect, Dialnet, Scielo y Scopus.

Las palabras empleadas en la búsqueda fueron «espacios de aprendizaje», «competencias», «aprendizaje» y «formación profesional», así como sus homónimos en inglés «learning spaces», «competences», «learning» y «vocational education and training», teniendo en cuenta los operadores lógicos y las funciones especiales correspondientes de cada base de datos.

En Google Scholar se obtuvieron 2.090 documentos que, tras limitar la búsqueda a artículos publicados desde el año 2010, fueron 86, en ScienceDirect fueron 298, en Dialnet 86, en Scielo 25 y en Scopus 28.

Para proceder a la selección se revisaron los abstracts y, en caso necesario, los artículos completos con el fin de decidir si la información que contenían estaba o no relacionada con el objetivo propuesto.

Posteriormente, también se realizó una búsqueda manual de las referencias bibliográficas de los artículos seleccionados con la finalidad de rescatar otros estudios potencialmente incluíbles para la revisión y artículos anteriores al año 2010 que ayudaron a delimitar el marco teórico. Dichos artículos fueron localizados a través de Google Scholar, y de ScienceDirect.

Finalmente, tras su lectura, análisis y evaluación, se seleccionaron 32 documentos relacionados con los objetivos planteados: artículos que siguiesen criterios de calidad científica en su publicación y que estuviesen disponibles en inglés o español. Tras la lectura crítica de los documentos, se han empleado como criterios de validez los siguientes ítems en los artículos seleccionados: a) revisan un tema claramente definido; b) son adecuados para el objeto de estudio; c) son importantes y pertinentes; d) presentan rigor suficiente; y e) son precisos en sus resultados.

De las revisiones sistemáticas se extrajo información sobre autoría, año, finalidad, fuentes de información, y conclusiones. De los artículos originales se extrajo información sobre autoría, revista en la que estaba publicado y año de publicación, país donde se realizó el estudio, tipo de estudio, sujetos y origen, medida de resultado, y conclusiones.

A posteriori, se analizaron en profundidad los diversos estudios seleccionados y con los resultados de este análisis, se extrajeron las conclusiones.

3. DESARROLLO

El término espacios de aprendizaje es utilizado para describir un campo emergente y complejo donde confluyen diferentes disciplinas, incluida la educación (Boddington & Boys, 2011).

Los espacios de aprendizaje denominados como tradicionales no son suficientes para alcanzar este modelo de formación que tiene como punto de partida la adquisición de un aprendizaje basado en habilidades o competencias fomentando que los estudiantes comiencen a pensar como aprendices (Evers, Rush & Berdrow, 1999) y los profesores se posicionen a su lado guiando la adquisición de estos nuevos conocimientos.

De acuerdo con Martínez (2010), con el objetivo de conseguir una formación por competencias orientada al logro profesional y a la innovación, los espacios de aprendizaje deben diseñarse en función de un propósito formativo, un enfoque experiencial y multidisciplinario.

Un espacio de aprendizaje innovador debe promover un aprendizaje entre pares (Wang, Sierra & Fólter, en Cleary & Marcus-Quinn, 2008) donde se facilite la colaboración, la interacción entre los estudiantes, la interactividad mediante la incorporación de las tecnologías y el acceso a recursos de aprendizaje, además de permitir un aprendizaje autónomo y dirigido (Guitert, Romeu & Pérez-Mateo, 2007). Para alcanzar una formación por competencias orientada al logro profesional y a la innovación atendiendo, desde una perspectiva socio-constructivista (Bautista, 2007), a las características del aprendizaje: constructivo, comunicativo e interactivo (Coll Salvador, Rochera Villach & Mayordomo Saíz, 2007; Colomina, Rochera & Mauri, en Álvarez & Guasch, 2006).

3.1 Modelo de espacio de aprendizaje de nueva generación orientada al logro profesional

En este contexto, podemos establecer que el modelo educativo de formación por competencias es aquel que fomentan que los alumnos desarrollen unas capacidades que les permitan aprender y desaprender de manera autónoma adaptándose a los diferentes cambios que se pueden producir a lo largo de su vida (Martínez, Navarro & Sánchez, 2012).

El modelo de formación por competencias orientada al logro profesional y a la innovación pretende hacer más efectivo el proceso de enseñanza-aprendizaje en el contexto actual fomentando en el profesorado la observación sobre el desempeño para poder dar una retroalimentación adecuada al alumnado (De Miguel, 2005; Martínez, 2010).

Para que los alumnos adquieran estas competencias se tiende, cada vez más, a ir más allá de las fronteras de los centros (Ballano, 2013) y valerse de las innovaciones realizadas por toda la comunidad educativa de la educomunicación y de la educación no formal.

Para alcanzar el objetivo que se plantea se deben introducir en el aula actividades de aprendizaje, utilizando las nuevas tecnologías de información y comunicación, ya que van a permitir simular dentro del aula tradicional un ambiente orientado al desempeño (Coll Salvador, Rochera Villach, Mayordomo Saíz *et al.*, 2007), combinadas con otro tipo de actividades complementarias realizadas fuera del aula tradicional.

A continuación, se expone un modelo de espacio de aprendizaje de nueva generación (figura 1) que se ha obtenido a partir de las concepciones docentes en experiencias de aprendizaje recientes en el que se introducirán diferentes actividades, realizadas en distintos espacios, que serán utilizadas en función de su propósito formativo. Puesto que está demostrado que no es suficiente incorporar dentro del aula un ordenador, un proyector y una conexión a Internet para conseguir un espacio de aprendizaje innovador (Martínez, 2010).

Figura 1. Modelo de espacio de aprendizaje de nueva generación en la formación profesional

Fuente: Elaboración propia

4. DISCUSIÓN Y CONCLUSIONES

En los últimos años, se ha puesto de manifiesto que la organización y la disposición de los espacios de aprendizaje influyen de manera crítica en los patrones de aprendizaje (Li *et al.*, 2005) y en la práctica educativa (Brooks, 2012), siendo considerado como un agente de cambio en la enseñanza (Mulcahy, Cleveland & Aberton, 2015).

Los modelos educativos basados en competencias orientadas al logro profesional no deben limitarse a simular desempeños profesionales, sino que deben proporcionar la formación de estudiantes capaces de adaptarse a un aprendizaje basado en habilidades profesionales medidas a través de las competencias. Para que los alumnos adquieran estas competencias se tiende, cada vez más, a ir más allá de las fronteras de los centros y valerse de las innovaciones realizadas por toda la comunidad educativa, de la educomunicación y de la educación no formal. Este modelo educativo pone de manifiesto la necesidad de nuevos espacios de aprendizaje como son los espacios de simulación, mimesis y realidad aumentada, los de investigación, los de interacción, colaboración y conectividad digital, los de desempeño profesional y los espacios abiertos, creativos y multidisciplinarios que promueven el aprendizaje formal e informal. Estos espacios fomentan en el profesorado la observación del desempeño de los alumnos y la retroalimentación para formar estudiantes con la capacidad de aprender y adaptarse a las situaciones cambiantes de su vida profesional de manera autónoma a través de la adquisición de las competencias.

5. LIMITACIONES Y FUTURAS INVESTIGACIONES

En cuanto a las limitaciones de la revisión bibliográfica, cabe mencionar que solamente se incluyeron artículos originales publicados en español o en inglés, por lo que podría haber un sesgo de publicación.

Asimismo, aunque las bases de datos consultadas, tanto multidisciplinarias como específicas, albergan un volumen importante de artículos relacionados con la educación, probablemente exista información científica publicada sobre el tema abordado en informes y documentos o en bases de datos de temática educativa que no fueron incluidas al no consultarse otras fuentes de información.

En futuras investigaciones, se pretende buscar en otras fuentes de información y hallar informes o documentos, no estudiados ahora, con información científica publicada sobre el objetivo de esta publicación.

ABSTRACT

The interdisciplinarity and interprofessionalism aim to integrate areas of knowledge and professionals, respectively, and are constituted as epistemological and pedagogical categories since 1960, demanded by the labor market and later for education. Currently, they are constituted as pedagogical principles that guide the basic and higher education. The research, which originated the article, was constituted as a quali-quantitative one, its instrument for data collection was a semi-structured interview with the students of the researched program and aimed to identify the contribution of interdisciplinarity to the professional training. It is considered that the interdisciplinary practices developed in the program, according to the students, have contributed to the development of capacities to interact, to dialogue with different areas, to exchange experiences, to open to the new, to collectivize, to listen, to share, to contextualize, to relate theory and practice, as well as the dialogue between knowledge and professionals from different fields of study and work, preparing future professionals and masters for a more interactive, reflexive and active action in the work environment.

Keywords: Work and Education, Professional Master's, Interdisciplinarity, Interprofessionality.

JEL Classification: I23

1. INTRODUCTION

In the complement of Notebook II, page XXXIX, Private Property and Communism, in his Economic and Philosophic Manuscripts, Marx (2010), when talking about the integration of the Sciences of Man with the Sciences of Nature, already pointed to the integration of the areas of knowledge. In the Socialist Pedagogy, Pistrak (1981 and 2009) brings the Thematic Complexes that, starting from a complex to be analyzed, articulates and integrates the areas of knowledge to develop the teaching-learning process from this Thematic Complex. In this sense, it is affirmed that it was already in this discussion of Marx and in Pistrak's proposal of curriculum the perspective of interdisciplinarity, of the integration of the areas of knowledge, of theory with practice, of the individual in an individual-effective collectivity, of an omnilateral essence in man, of a whole man.

There are three strands of analysis and interpretation of interdisciplinarity. A humanist, which defends that the realization of an ecumenical and reflexive dialogue between the various areas of knowledge needs a change of mind of the subjects involved in the interdisciplinary endeavor. This indicates that interdisciplinarity depends on changing posture. The component of complexity, which defends different proposals of disciplinary integration based on the incorporation of the complexity theme and systemic perspective. And the social-critical aspect, which considers the historical and social dimension of the production of knowledge subordinated to capitalism, taking as reference the Marxian perspective of reality analysis (Mangini; Mioto, 2009).

Thus, based on Marx's (2010) discussions, in the Economic and Philosophic Manuscripts, on the unity between the sciences of nature and man, in the discussions of complexity and the social-critical strands, the interdisciplinarity and interprofessionalism will be analyzed, as epistemological and pedagogical categories necessary for professional formation in the perspective of integral human formation. In the world of work and education, interdisciplinarity, since 1960, becomes the object of research and interest of researchers and entrepreneurs. As of 2008, it becomes an area of Capes that brings together many academic and professional postgraduate programs.

Interprofessionalism is a category present in the health area and it appears as Interprofessional Education, in view of the interprofessional work in the context of the policy of full health care. Therefore it is argued in this article that these

categories are necessary for professional formation in all branches, given the complexity of the world of work and society nowadays.

The research from which this article resulted is part of the research group on Pedagogical Processes in Professional Education of the Postgraduate Program in Social Management, Education and Local Development of the University Center Una, entitled “Interdisciplinarity in the context of the professional Master’s degree: a case study of the experience of the Professional Master’s in Social Management, Education and Local Development of the University Center Una - interdisciplinary educational practices and formation for work” and was developed in two stages: the first, from 2014 to 2015, analyzed the interdisciplinary practices developed in the program and the students’ evaluation of them. The second, developed from 2015 to 2016, analyzed the contribution of these practices to professional formation. This article presents the data of this second stage.

As for the approach, it was oriented by the quali-quantitative perspective. As for the type of research, it comprised bibliographical research with analysis of books and articles on the contribution of interdisciplinarity in professional formation and case study through which it was aimed to identify, from semi-structured interviews with 12 (twelve) master’s students, the abilities they develop in the teaching-learning process that contribute to professional formation.

From this objective, the following specific objectives were formulated: to analyze, in specialized literature, the relation between interdisciplinarity and professional formation and to identify, in the interdisciplinary educational practices developed in the program researched, the contribution to the professional formation. So, the central axis of analysis was the contribution of interdisciplinarity to the professional formation of master’s students. However, the interprofessionality category appeared in the bibliographic research and began to constitute a theoretical category of analysis in this research.

The text is structured around three main axes. The first is a general discussion of the concepts of interdisciplinarity and interprofessionality and their meanings for the professional master’s degree courses; the second discusses the concepts of interdisciplinarity and interprofessionality from the discussions of Marx (2010) on the integration of the Sciences of Nature with the Sciences of Man, as well as the interdisciplinarity contained in the Thematic Complexes of Pistrak (1988 and 2009); the third presents the data of the research carried out in the Postgraduate Program in Social Management, Education and Local Development of the University Center Una. It is considered that the interdisciplinary practices developed in the program, according to the students, have contributed to the development of capacities that allow to establish a relationship between theory and practice, knowledge and the world of work, as well as the dialogue between knowledge and professionals from different fields of study and work.

2. INTERDISCIPLINARITY AND INTERPROFESSIONALITY IN PROFESSIONAL MASTER’S

The professional master’s degree is constituted, in a *stricto sensu* post-graduation, instituted by the Coordination of Improvement of Higher Level Personnel - CAPES, by means of Ordinance No. 47, dated October 17, 1995.

The professional master’s degrees are developed in Brazilian postgraduate programs since the 1960s, after the promulgation of Law 4024, of December 20, 1961, the Law of Guidelines and Bases of National Education. In 1965, with Statement No. 977/65, in the report by Professor Newton Sucupira, the distinction in Brazil was made between the nature and purposes of postgraduate programs, leading to the regulation of letter b of Art. 69 of the referred law and to the organization of the expansion of these courses.

For Capes, in a text about parameters for analysis of professional master’s projects, from 2002, the professional master’s programs must promote the integration between theory and application, knowledge and technical-professional practice; be a preferential demand of the common interest of academic and non-academic sectors; be an initiative of a qualified institution to offer a professional course that contributes to the development or induction of the rise of fields of professional activity and to have its implementation and development supported by a scheme of common activity between the proposing institution and the non-academic professional sectors related to the areas of the course (BRASIL, 2005b).

So, central elements in the professional master’s degree are the integration between theory and application; its formation potential of qualified professionals both in theory and technically for professional performance and the promotion of the development and induction of the rise of new professional activities that consider the demands of the academic and non-academic sectors of each place. The professional master’s, in this perspective, requires an integration of theoretical formation with the demands of the world of work, as well as with the needs of innovation imposed by current social and economic development. According to Quelhas, Faria Filho and França (2005):

The professional master’s degree constitutes an opportunity for a closer approximation between the works conducted by the university to spontaneous or induced demands by the university itself in the social and professional field, demands for technological, social and, in general, knowledge structuring solutions in professional activities. It presents a dimension focused on the horizontality and verticalization of knowledge and therefore vital to the current needs of Brazil (Quelhas, Faria Filho, & França, 2005, p. 98).

Another important issue is the validity of the professional master’s degree with emphasis on the qualification process for the work in social institutions. According to Feltes and Baltar (2005, p. 74), “the qualification of the professionals who work in different areas of knowledge is a demand both by the market and society in a broad sense.”

According to Giuliani (2010, p. 99), “the professional master’s degree has arisen in areas of the most different natures.” This is another important aspect in this expansion of the professional Master’s degree. There is a variety of professional

master's courses, and this variety adds two important characteristics: the local potential, ie courses that meet the demands, local needs and the pragmatic, practical and applied potential, ie, the courses turn to the needs of a particular area of knowledge in which there is a need to apply scientific, social, cultural and technological knowledge to solve problems. What justifies the fact that, in addition to the dissertation, in the professional master's degree the student has to present a technical product.

But what is the relationship between interdisciplinarity, interprofessionality and professional formation? What is the contribution of these categories in the formation in a professional master's degree? First, one of the objectives of the professional master's degree is the integration between theory and application, knowledge and technical-professional practice; and to seek technological, social and, in general, knowledge structuring solutions in professional activities, in order to solve the current problems, as well as the constant demands of the world of work and life. Another element, quoted by Quelhas; Faria Filho and França (2005, p. 98) "[...] is the horizontality and verticalization of knowledge and thus vital to the current needs of Brazil", that is, it is defended that educational practices that take interdisciplinarity and interprofessionality as a reference allow the formation of professionals with the conditions to help solve the great current problems in the society in general, once they get to such complexity that they require the integration of knowledge and actions of several professional areas. In addition, as will be seen further on, the integration of the areas of knowledge have already been proposed by Marx in the Economic and Philosophic Manuscripts.

This principle of the integration of the areas of knowledge is nothing new, as some imagine, and in the professional master's degree it enables the integration of formation with the world of work and life in general, as well as the dialogue with the knowledge of several areas and among a variety of professionals.

Another relevant aspect that gives meaning to the interdisciplinary and interprofessional categories in the professional master's degree is the requirement of the technical product, that is, thinking of a technical product as a result of a research requires thinking that it will be used and by different subjects. In this sense, the listening, the dialogue and the construction of it presupposes the integration of knowledge, its use, cultures, technologies, etc. This imposes a constant attitude of openness and dialogue between master's students, researchers and the community, society in general.

3. INTERDISCIPLINARITY AND INTERDEPENDENCE BETWEEN MEN FROM MARX, PISTRÁK'S THEMATIC COMPLEXES AND THE SOCIAL-CRITICAL PERSPECTIVE

In the complement of Notebook II, page XXXIX, Private Property and Communism, in his Economic and Philosophic Manuscripts, Marx (2010, p. 112) writes about the *Natural science of man*:

History itself is a *real* part of *natural history* – of nature developing into man. Natural science will in time incorporate into itself the science of man, just as the science of man will incorporate into itself natural science: there will be *one* science. |X| *Man* is the immediate object of natural science; for immediate, *sensuous nature* for man is, immediately, human sensuousness (the expressions are identical) – presented immediately in the form of the *other* man sensuously present for him. Indeed, his own sense-perception first exists as human sensuousness for himself through the *other* man. But *nature* is the immediate object of the *science of man*: the first object of man – man – is nature, sensuousness; and the particular human sensuous essential powers can only find their self-understanding in the science of the natural world in general, just as they can find their objective realisation only in *natural* objects. The element of thought itself – the element of thought's living expression – *language* – is of a sensuous nature. The *social* reality of nature, and *human* natural science, or the *natural science of man*, are identical terms. (Marx, 2010, p. 112)(italics by the author).

Marx (2010) starts from the understanding of history as the development from nature to man and from the humanization of this nature by man to start his idea of integration between man and nature and then to say about the integration of the science of nature with the science of man, that is, the natural science of man.

Moreover, it says that man's first object, man himself, is nature, is sensitivity, and only a science of the natural being in general can promote the knowledge of this man nature about itself. And there is, also as an important element, language as an externalization of thought and necessary in this process of integration.

Therefore, there is in this discussion of Marx on the integration of the science of nature with the science of man the perspective of the integration of knowledge and the necessity of the formation of the total, omnilateral, objective and subjective, social being, provided with senses and feelings, because:

[...] the senses of the social man differ from those of the non-social man. Only through the objectively unfolded richness of man's essential being is the richness of subjective human sensibility (a musical ear, an eye for beauty of form – in short, senses capable of human gratification, senses affirming themselves as essential powers of man) either cultivated or brought into being. For not only the five senses but also the so-called mental senses, the practical senses (will, love, etc.), in a word, human sense, the human nature of the senses, comes to be by virtue of its object, by virtue of humanised nature (Marx, 2010, p. 110).

From Marx, the integration of the areas of knowledge through the Thematic Complex is proposed by the first experience of socialist education, after the Russian Revolution of 1917, by Pistrak (1981 and 2009), that is: "students must have a clear understanding of the regularities of history in its concrete manifestations (exchange of economic forms, development of

productive forces, class struggle, etc.) in the light of marxist understanding” (Pistrak, 2009, p. 411). Hence, the Thematic Complex is not only a way of organizing knowledge, but “a system that guarantees an understanding of current reality according to the dialectical method” (Pistrak, 1981, p. 106), since kinds of knowledge are gathered from a theme, complex and, in an integrated way, these establish relation, in a contextualized and problematized way with reality. There are three great complexes: Nature and Man, The work and The society, and from them the disciplines are integrated. In relation to the complex The work, for example, according to Pistrak (1981), this should be introduced in the school “... as an element of social and socio-pedagogical importance destined to unify around it the whole process of education and formation” (Pistrak, 1981, p. 42). To the Thematic Complex, the categories of “actuality” and “self-organization or self-management” are articulated, being “actuality” the present context, with all its contradictions. The category “self-management” encompasses collectivity and self-organization, which occur in living and organizing collectively. Thus, the integration takes place from the complexes and categories “actuality” and “self-management”.

The social-critical slope points to the analysis of the historical and social dimension of the production of knowledge based on the marxist perspective, which says that modern science is subordinated to the logic of social and technical-scientific division of labor in the capitalist way of production. In this sense, interdisciplinarity for this slope is a necessity, but also, and above all, a problem (Mangini; Miotto, 2009). It is a problem not only regarding its concretization, but also with the appropriation of the concept by other slopes, that is, the humanist and the Theory of Complexity.

So, for Frigotto (1995, p. 26), interdisciplinarity arises from the form from which the human being produces as a social being and as subject and object of social knowledge: “[...] it is based on the dialectical character of social reality, by the principle of contradiction, by which reality can be perceived, at the same time, as one and diverse”.

For Moacir Gadotti (2004), interdisciplinarity aims to ensure the construction of a globalizing knowledge, breaking with the boundaries of disciplines. For this, to integrate content would not be enough. It would be necessary, as Fazenda (1979) says, an attitude, that is, an interdisciplinary stance. Attitude of search, involvement, commitment, and reciprocity in the face of knowledge. For Morin (2005),

The ambition of complexity is to account for the links shattered by the cuts between disciplines, between cognitive categories and types of knowledge. In fact, the aspiration to complexity tends towards multidimensional knowledge. It does not want to give all the information about a phenomenon studied, but to respect its many dimensions: like I have just said, we must not forget that man is a biological-sociocultural being, and that social phenomena are at the same time economic, cultural, psychological and so on. Having said this, in aspiring to multidimensionality, complex thinking has within it a principle of incompleteness and uncertainty (Morin, 2005: 176-177).

So, for the theory of complexity, what is put is the need to articulate the disciplines, the categories and the knowledge and understand the human being as biological sociocultural, because knowledge and reality are incomplete and uncertain.

According to Japiassu (1976, p. 74), “interdisciplinarity is characterized by the intensity of exchanges between the specialists and the degree of real interaction of the disciplines within the same research project”. It is not enough to integrate the disciplines, it is necessary the exchange between specialists and professionals.

It is in the perspective of the integration of professionals that comes interprofessionalism. It includes the integration of professional practices in order to provide more efficient, effective and quick answers to the demands of the work. According to D’Amour and Oandasan (2005, quoted by Araújo and Galimberti, p. 467), “interprofessionalism is a response to the fragmented health practices, developed through a cohesive practice among professionals from different disciplines with a focus on the needs of the user, the family and the community”.

In the area of health, Interprofessional Education (IPE) is defined as “the learning that happens when two or more professions learn about, with and between, in order to improve collaboration and results in health” (WHO 2010, Apud Germani *et al.*, p. 3).

Interprofessional education, as interprofessional work, requires the interprofessional cooperation that, according to D’Amour and Col. (2005 quoted by Matuda, Aguiar and Frazão, 2013, p. 179): “Interprofessional cooperation can be defined as the set of relations and interactions which happen between professionals who work together in the field of health teams. It is a complex, multi-determining process, voluntary and dynamic, which implies constant negotiation”.

Discussions in the health area on education and interprofessional collaboration began in the first half of the 20th century, but it was in the 1970s that, following the same direction as of the discussions on Primary Health Care (PHC), the World Health Organization (WHO) “now considers interdisciplinary education as a complementary strategy to traditional education programs in the formation of health professionals (Oandasan *et al.*, 2004 quoted by Matuda, Lucena and Frazão, 2013, p. 176).

But, in practice, according to Peduzzi *et al.* (2015, p. 8), the formal and informal opportunities for IPE in Brazil are rare, “for example, among the 197 medical courses (42% public and 58% private) and 883 nursing courses (16% public and 84% private)” and only one public university implemented an integrated curriculum based on IPE and only a few courses promote interprofessional practices (Peduzzi *et al.*, 2015).

However, it is perceived that interdisciplinary and interprofessional practices add the necessary skills for the professionals of the various branches, in order to work efficiently, with commitment and social responsibility. In interprofessional cooperation, for example, some skills and concepts are needed, for example:

In a literature review, D’Amour *et al.* (2005) identified terms related to the definition of the concept of interprofessional cooperation, classified according to the following keywords: (1) sharing, described as divisions of responsibilities, sharing of decision making; (2) partnership, referring to affinity relationships, open communication,

mutual respect and trust; (3) interdependency, mutual dependence, participation of each professional in the therapeutic projects; and (4) power, empowerment of each member, which has its power/value recognized by the team (Matuda, Lucena and Frazão, 2013, p. 179).

These concepts and capacities, in view of the complexity of the world of work and life nowadays, and the experience of Interprofessional Education and Work, require pedagogical strategies and practices to be acquired. In the presentation of the field research data, the interviewees talk about the importance of these and others for the professional formation.

4. INTERDISCIPLINARITY AND PROFESSIONAL FORMATION

The Postgraduate Program in Social Management, Education and Local Development of the University Center UNA has a single area of concentration (Social Innovations and Local Development), which aims to produce knowledge, intervention and make professionals with the capacity to develop innovative social actions in the fields of education and social management committed to local development and social innovation. To this area of concentration two lines of research are integrated: Social Management and Local Development and Education and Local Development.

Because it is interdisciplinary and professional, besides having faculty and students of several areas of knowledge, the program develops interdisciplinary practices in an attempt to promote the integration of the knowledge and the diverse experiences of these teachers and students, as well as of those with the reality of life and the world of work for master's students and future masters and professionals. The interdisciplinary practices developed in the program include:

Shared Teaching, in which 2 or 3 teachers together teach a discipline or with a division of the content of the discipline and with meetings with all the teachers and the class at the beginning, middle and/or end of the course.

Interdisciplinary field activity: the interdisciplinary field activity comprises didactic strategy of teaching-learning processes, carried out by professors and academics in the place where the studied phenomenon occurs. The interdisciplinarity in this activity consists in the dialogue and integration of the knowledge of the discipline(s) and of these to the contextualized, analyzed and visited reality. The objectives are to contextualize contents studied in disciplines; to develop the capacity for observation and critical sense; to integrate social practices into academic activity; to form attitudes such as sense of responsibility, cooperation, dialogue and teamwork; to develop skills in collecting, systematizing and analyzing data; to develop the capacity to work with analytical models and concepts to understand the realities observed, especially through interdisciplinary practice; to develop skills related to the methodological procedures appropriate to scientific research; to make possible the exchange of ideas and experiences between the participants in the academic environment and between these and the visited places. The places can be a community, public or private space, association of residents, camping and/or settlement, urban occupation, among others. This activity is developed by the discipline of Fundamentals of Social Management, Education and Local Development (compulsory subject), taught by 3 teachers, and the visit, in the first half of 2015, was to Vila Itaú, in Contagem/MG, in which residents are in dispute with the public power for the permanence and possession of the land of their houses. In the first half of 2016, it was in Rosa Leão Occupation, which is located in the Isidora region, northern of Belo Horizonte, which borders with the city of Santa Luzia. This occupation began on April 13, 2013.

Interdisciplinary Thematic Seminar which comprises a seminar on the issue, theme or activity involving two or more subjects. The Interdisciplinary Thematic Seminar strengthens interdisciplinarity, it starts from a single theme, activity or problem of interest to two or more disciplines that seek foundation and turn their different eyes to the same theme, object of study or problem; provides the diversity of interpretations of teachers and students. It follows the presentation and analysis of the data according to each category of analysis.

3.1 The abilities developed according to the master's students from the interdisciplinary practices

The question that guided the interviews about category 1 was: Explain how the interdisciplinary practices contribute to the acquisition of each of these capacities and learnings and what their importance for the professional performance of your area is: 1- To dialogue with other colleagues from other professional areas; 2. To produce new knowledge; 3- To integrate the knowledge of the disciplines and the exchanges of knowledge and experiences with colleagues from other areas; 4- To develop positive interpersonal relationships and 5- To contextualize the acquired knowledge in the observed reality.

Based on this question, interview data were organized into two categories of analysis: Category 1 Contribution of interdisciplinary practices to professional practice and Category 2 Contribution to the formative process and to personal life.

It is important to clarify, too, that the abilities presented above, that compose the question, were presented by the master's students when they answered the questionnaire applied in the first stage of the research that aimed to evaluate the interdisciplinary practices developed. In this second phase, what was sought was to verify how these capacities, presented by them, contribute to their professional formation and life. The presentation and analysis of the data follows:

CATEGORY 1 - Contribution of interdisciplinary practices to professional practice

All interviewees said that interdisciplinary practices contributed to professional formation and altered their current professional practices, as shown below:

Some situations seen in the master's course have made me change my practice in the teaching itself and some methodologies used in the classroom stimulated me to listen to the other that has a different perspective (Interviewee 3).

The interdisciplinary practice has contributed both to teaching and to the clinic in which I work, due to the more diverse and comprehensive view of the professional work that patients take to the office, because I can talk better to the patients, for they bring unknown areas and it is necessary to enter these areas to understand them better (Interviewee 2).

This, I really felt in the discipline that I am doing now, developing a network that changed my way of acting as a coordinator, and to understand that it is necessary to work in a different way with my students because I understood that I could not develop a top-down approach with my teachers, and so with my students, and I could see that everyone has something to contribute, some more, some less, depending on the emphasis of the event, and during the master's classes, while we were discussing the texts, I changed my behavior and my perceptions and I applied a lot of things to my private groups, even during the classes, trying to get them to participate with me (Interviewee 10).

It happens all the time, and it makes you think hard about your professional practice. The classes are not only expositive, they present the texts before and throw them into the debate in the classroom. In the production of knowledge, it happens all the time, from the moment you study, debate and think about your professional practice, in everything you create things that will contribute to your professional area and to the academic environment, eg: the writing of articles, dissertations (Interview 12).

These lines emphasize the contribution to listen to the other, to dialogue with the other that comes from different areas, unknown ones, but necessary for the professional practice.

The interdisciplinary practices worked in the master's degree helped me a lot in the pedagogical practice, because in children's education the curriculum is a moving curriculum, then the interdisciplinary practices are inserted all the time in this curriculum, in the work in all the languages, where the contents articulate among themselves (Interviewee 5).

The interdisciplinary practices worked in the master's degree made easy the world view that I didn't have, that is, it opened a much larger field that I can work with my students adding new knowledge to this work and the question of adding new disciplines helped us go beyond theories, but also to complement the practice by breaking formalities that were totally closed, and we have been working a little more of that, we are improving our interaction and thus, they are interacting better (Interviewee 6).

In addition to facilitating, broadening the world view, interviewees talk about the contribution of the activities in integrating the disciplines and the practice, breaking the closed, fragmented formalities and opening for interaction, exchange beyond theory.

In my work, in the part of the other's view, I am more open to listening to modify my practices through the other's opinion and view, my opinion now is not the only one, everything starts being relativized. The solutions nowadays are joint and everyone is happy about it (Interviewee 2).

And, after seeing this practice in the master's course, I was able to rethink my day to day work and I saw that everything gets better, and the proposal that I took to the coordination was to insert geography in the daily life of these students, and before I saw things in a fragmented way, and now my view has changed, so the interdisciplinary practices are very important for the work performance (Interviewee 8).

Here, it is possible to rethink the work, to listen to the other's opinion, to relativize and understand that solutions can be built together. It can be noticed, therefore, that the interviewees pointed out contributions of the interdisciplinary practices developed in the program that meet the discussions presented by the theorists regarding the contribution of interdisciplinarity and interprofessional education to professional formation, namely: listening to the other, the different; to dialogue, to open yourself to the new; to share; to integrate theory and practice; to interact; to exchange opinion, knowledge; to share solutions; not to impose your opinion; to enter other areas.

CATEGORY 2 - Contribution to the formation process and to the personal life, which means:

In the master's degree, interdisciplinary practice provides a more open view, to realize that nothing has only one dimension, there are several angles. In life, in general, it is important that we have this interaction [...] (Interviewee 2).

The interdisciplinary practices allow you to relate the content of different areas, your world experience, your conception of place, where you speak from in relation to things, both your formation and your professional performance, and also in relation to the daily life that allows you to have a greater integration, to make a relation between what you study and your professional practice and your world experience and your reality (Interviewee 3).

It is highlighted here what the interviewees talk about the contribution of interdisciplinary practices to school education and to life in general. To see all dimensions, the problem's angles, helps in the formation and the personal life. In this sense, it is also considered that our everyday interpersonal relationships are asking for a more dialogic, interactive posture, beyond tolerance, the need to live with and to dialogue with the different, the divergent, the strange.

Whether we are in modernity or in postmodernity is an intense, controversial, polemical debate, but that we are in a troubled world, in all senses, we may have more concordances. In this sense, to dialogue, to interact, to integrate, to converge, to agree, to get closer, even with differences, divergences, are important actions in the formation and in the practice of any professional nowadays.

5. FINAL CONSIDERATIONS

The article presented the results of the research carried out in a Professional and Interdisciplinary Postgraduate Program on the contribution of the interdisciplinary practices developed in this program for professional formation. For this, it defended that the category of interdisciplinarity was already present in Marx's Economic and Philosophic Manuscripts, when he defends the integration of the Sciences of Nature with the Sciences of Men, as well as in Pistrak through the Thematic Complexes.

Still in the attempt of the theoretical foundation of the thematic, it presented the meanings for the professional master's degree of interdisciplinary practices, once that it demands preparation from professionals that establish integration between scientific knowledge and the demands of the world of work and society, with an innovative character, considering the complexity of this society.

Regarding to the interdisciplinary and interprofessional categories, it has been shown that they occupy the educational and professional scene since the 1960s and aim to contribute to a more efficient, effective and responsible professional formation and action in terms of meeting the demands of the users, from the health area or any other professional ones. Coming from the world of work, they were inserted in the educational environment in an attempt to improve professional formation in view of society's current demands. In this sense, once society has divergences and contradictions, different ways of understanding interdisciplinarity have been placed in the scenario, that is: the humanist aspect, complexity and social-critic.

The social-critic aspect was taken as a reference for the discussion presented on interdisciplinarity and interprofessionality, for which interdisciplinarity understands the human being as a social being and subject and object of social knowledge, and in this process the dialectical character of social reality needs to be considered and it must be noticed, at the same time, in its totality and diversity that complement each other.

Thus, for the master's students interviewed, the interdisciplinarity allowed to develop the capacity to dialogue with the different; integration of knowledge in the many areas; to change the opinion; to relativize; to open to the new; to interact with the other; to exchange knowledge; to collect solutions not only in the work environment, but in life in general. In this sense, one interviewee's speech stands out: "And after seeing this practice in the master's degree I was able to rethink my work in my day to day life and I have seen that everything gets better [...]", that is, despite of the contradictions of the world of work, is there even the slightest possibility of work getting better?

THE IMPLEMENTATION OF A CORE OF UNIVERSITY EXTENSION OF TRANSDISCIPLINARITY AND ENTREPRENEURSHIP: A PROPOSAL FOR PROFESSIONAL COMPLEMENTATION FOR THE MARKET

Celso José de Campos
Federal University of the State of Rio de Janeiro
(celso.campos@uniriotec.br)

ABSTRACT

The purpose of this study is to develop and implant in a University a Nucleus of Transdisciplinarity and Entrepreneurship as a model of strategic mental posture that transforms transdisciplinary epistemology into entrepreneurial attitudes. This study aims to define the existing interrelations of the knowledge acquired in professional training in competitive businesses, both in the social area and in the market. We study, therefore, that transdisciplinarity is a stage after interdisciplinarity, where it is understood that we are highlighting an emerging vision and a new attitude towards professional knowledge and practice. Thus, the predominance of transdisciplinarity deepens the specific knowledge and provides conditions for the development of science and the technological progress we enjoy today. But otherwise, if we think of the course of humanity, driven only by the disciplinary sciences, we perceive singularly its inhumane aspect and the myopia of the disciplinary “way of thinking” of the specialists. According to De Freitas (De Freitas *et al.*, 1994), human history is full of expert solutions that put the planet and humanity at risk. In this way, considering the transdisciplinary attitude (rigor, openness and tolerance), this nucleus will seek to cultivate the lucidity, creativity, prudence and daring of the learner student who seeks to undertake business, be they short, medium or long term, With objectives well delineated within an approach of sustainable development of the society and of the human being.

Keywords: Entrepreneurship, Transdisciplinarity, Strategy, Sustainability, Market.

1. INTRODUCTION

The purpose of this study of the implantation, in a University, a Nucleus of Transdisciplinarity and Entrepreneurship as a proposal of professional complementation for the Market. This Nucleus is to develop and implant an institutional academic model of research and reflective practice on transdisciplinary epistemology into the current areas of knowledge, education and work, considering the interrelationships between them. It is observed, therefore, that transdisciplinarity is a stage after interdisciplinarity. This is here considered as the interaction between two or more disciplines. In this case, when we speak of transdisciplinarity what is between, through or beyond the disciplines, we are highlighting an emerging vision and a new attitude towards knowledge. Respecting the transdisciplinary attitude (rigor, openness and tolerance), this study tries to cultivate in the participants the lucidity, the creativity, the prudence and the daring to undertake in businesses to be created or already developed, be they, of short, medium or long term, In order to contribute to the sustainable development of society and the human being.

2. THE PROBLEM AND ITS JUSTIFICATIONS

The problems of life are solved with transdisciplinary thinking, but the problems of knowledge tend to follow a Cartesian reasoning of objectivity, linearity and decontextualization. Nature is not linear. Linearity is a lens constructed by classical logic, it is part, but nature has a complex logic. The predominance of disciplinarity deepened the specific knowledge and gave conditions to the development of science and the technological progress we enjoy today. But if we think of the course of humanity, led by the disciplinary sciences, we will see its inhuman aspect and the myopia of the disciplinary “way of thinking”. In this context, Morin (Morin, 1998) states that “human history is full of this short-sightedness”, stressing that “a specialist who is only a specialist is a danger to the world and to humanity, and specialized science does not explain life.” This, according to the author, only acquires meaning when being contextualized, through all accumulated knowledge, recognizing the right of every human being, whatever its truth, religion, sex, culture and race to exist and inhabit this planet, living and Contributing, respecting and being respected by individual and group differences. This change of attitude, at the local level of university communities, begins with a sense of tolerance and openness in dealing with human differences. “To love the equal is to love oneself, the challenge lies in loving the different.” (De Freitas *et al.*, 1994). In this case, the purpose of this study is to propose the implementation of a “University Extension Nucleus of Transdisciplinarity and Entrepreneurship, being a proposal of complementation in the professional formation of the students of a University for the market”, in the sense of developing and implanting a An institutional academic model of research and reflective practice on transdisciplinary epistemology and its generation of projects aimed at its implementation in the current areas of knowledge, teaching and work, considering the interrelationships between them.

3. THEORETICAL DEVELOPMENT

3.1 Transdisciplinarity and Its Impact on Professional Training

Transdisciplinarity, in this case, represents a shift in thinking about research and education challenging the division of academic work into traditional disciplines such as quantum physics, museology, anthropology, philosophy, etc. (Freeland, 1992). In this case, teaching must be transcended. The advent and development of transdisciplinarity demonstrate emerging ways not only of organizing, but of thinking about knowledge and research in a world that has become “too big to be known” (Weinberger, 2011). Mahan’s (Mahan, 1970) study of literature in the philosophy of social sciences indicates that while transdisciplinarity may have been a new term, the concerns that gave rise to such a notion were already present as undercurrents in the writings of twentieth-century scholars, which he quotes. Although it does not provide a concise definition of transdisciplinarity, it at least gives us an idea of what it thinks it means and how it can improve the quality of academic work. Yet, according to Mahan (Mahan, 1970), transdisciplinary research would be characterized by a common orientation to transcend disciplinary boundaries and an attempt to bring continuity to research and knowledge. Other characteristics, he continued, would be: (a) attention to the breadth, context and frame of reference of the survey and knowledge; (B) interpenetration of boundaries between concepts and disciplines; (C) exposing disciplinary boundaries to facilitate understanding of implicit assumptions, research processes, and resulting knowledge; (d) humanistic reverence for life and human dignity; (E) desire to actively apply knowledge to the improvement of man and society. New discoveries on many fronts have also led scholars and scientists to think of large macro systems (including cosmic awareness, intelligent life outside Earth, Intergalactic Village, etc.) and to develop meaningful links between superficially held subjects. The glorious moment of our civilization was the spectacular realization of the landing of the man on the moon in 1969. Thus some utopian speculation began on the future possibilities for universities, and some of this was expressed in the early writings on transdisciplinarity. In fact, new colleges and universities were established based on some of these new theories. Interdisciplinary cooperation and collaboration, long established in higher education in the United States, continued at an accelerated pace, advancing in the 1970s in women’s (and later gender) studies, environmental science, urban studies, and cognitive science. Klein, 1996). Later, other pieces of interdisciplinary innovation can be seen in new specialties, including disability studies and peace and conflict studies, to name two successes. As courses and academic programs were created around these new concentrations, the curricula needed to be defined and ratified and the resources needed to be allocated. However, the notion of transdisciplinarity introduced in the early 1970s remained underdeveloped and almost parted up to the early 1990s. Therefore, although the words transdisciplinarity and transdisciplinary with their basic meanings involving transcending the established framework of traditional academic disciplines, were first used around 1970, the conditions for initiating transdisciplinary work did not materialize for at least two decades. (Kessel & Rosenfield, 2008). Issues of sustainability and the global environmental crisis were key words in moving the previously unused concept of transdisciplinarity to the forefront of science and planning debates. At the world summit, called the “United Nations Earth Summit” in Rio de Janeiro (Brazil) in 1992, the key interlocutor in the debates on new combinations of disciplines in education identifies, as the inflection point, awareness about the need for action in the academic and scientific communities. Shortly thereafter, in 1994, the First World Congress of Transdisciplinarity was held at the Arrábida Convent in Portugal, producing a Letter of Transdisciplinarity, attributed to Romanian physicist Basarab Nicolescu, Portuguese painter Lima de Freitas and French transdisciplinary Edgar Morin. (Morin, 1994). Nicolescu’s views are evident in the Charter, and he has taken the lead in developing a theory and program for transdisciplinary work. In this and other works, Nicolescu (2010) explicitly describes transdisciplinarity as complementing disciplinary approaches. His concept of transdisciplinarity focuses on complexity as a fundamental feature of reality, on the premise of different levels and dimensions of reality and on what he calls the logic of the included medium, challenging the Aristotelian axiom of the excluded environment, suggesting that in the spirit of mechanics Quantum theory, scientists “rethink” the traditional absolute separation of subject and object. The transdisciplinarity of Nicolescu (Nicolescu, 2010) seems applicable to the integration of the humanities, including spiritual subjects such as religion, philosophy and education with subjects of physical sciences such as those existing in laboratories and space observatories. As Sue McGregor (McGregor, 2015b) explains, Nicolescu is concerned with the meaning of going beyond disciplines and states that “transdisciplinarity identifies with a new understanding of what is between, beyond and beyond disciplines”. Exactly the same year in that the First World Congress of Transdisciplinarity took place, another project appeared presenting a somewhat different approach to transdisciplinarity. The book “The New Production of Knowledge” (Gibbons *et al.*, 1994) produced at least as much impact as Nicolescu’s theoretical framework, but presented a different vision and program for transdisciplinarity, where his work was seen as more immediately practical than the programmatic and oracular work of Nicolescu, even though he lacked his daring visionary visions. The fact that his work is collaborative is significant in itself, since part of his message concerned the collaboration of experts from various fields in specific projects that transcended the boundaries of specific disciplines. Its innovation was the “Knowledge 2” knowledge production concept, involving the knowledge developed for a specific application and involving the work of experts drawn from academia, government and industry. Gibbons (Gibbons *et al.*, 1994) also emphasizes that such knowledge production and problem solving are not merely applied research and development, nor are they limited to sciences, technology or medicine, but also extend to the humanities, such as museums, architecture and modes of research that rely on “information technology”.

The production of Mode 2 knowledge, according to Gibbons (Gibbons *et al.*, 1994), linked to transdisciplinarity, came with increasing globalization as the Cold War ended. Instead of offering a philosophy of transdisciplinarity, as did Nicolescu, Gibbons’ study was descriptive and analytical. He has helped subsequent readers understand transdisciplinarity and has influenced paving the way for research on the sociology of science, technology, and higher education as well as policies in those fields. Even if we do not fully accept Gibbons’s postulation of Mode 2 knowledge production, the interconnections

between academia, industry, governments, and nongovernmental organizations are clearly central to understanding knowledge production in today's world. This new social, economic, political and bureaucratic organization is crucial in the works of some transdisciplinary.

As has been said so far, transdisciplinarity emerged in the latter part of the twentieth century in response to a number of concerns about the pitfalls of specialization and the compartmentalization of knowledge due to a globalized economy, changes in the center of gravity in the production of knowledge, Research ethics and the environmental crisis. It has become more than a critique of Disciplinarity and gained recognition as a mode of research applied to real-world problems that need not only be understood in new ways but also require practical solutions. For the transdisciplinary concerned with justice, sustainability and the eradication of poverty, war, genocide, famine or other such bad problems, theoretical solutions are not enough, although they realize that perverse problems by definition may be impossible solve. However, transdisciplinarity is not necessarily applied or practical. Those who focus on the educational benefits of transdisciplinarity insist that transdisciplinarity is as much about the liberal arts as about cultural symbolism. What differentiates transdisciplinarity from other approaches is their acceptance and their focus on the inherent complexity of reality when a university examining board judges a problem or phenomenon of multiple angles and dimensions in order to "discover hidden connections between different disciplines." It is by using this multidimensional complexity to analyze problems, communicate and teach alternative solutions about them, that is where the contribution of transdisciplinarity is. As disciplinarity has withdrawn the meaning of life, filling it with values of adaptation to the current system, modern education is no longer concerned with the integral development of young apprentices in universities. It simply prioritizes the rational dimension trying to equip them with the necessary to integrate and give continuity to the current system. In dichotomizing the subject of the object, the being of knowledge, we consider the phenomena of subjectivity as emotion, feeling, intuition, sensibility, as being a second category aspect, "source of errors" in Descartes's words. But globalization itself indicates a new way of educating young people, suggesting the rescue of this dimension omitted throughout modernity. Transdisciplinarity thus transgresses the epistemological boundaries of each disciplinary science and builds a new knowledge "through" the sciences, an integrated knowledge in function of humanity, rescuing relationships of interdependence, since life is constituted in the relations maintained by the individual with the environment .

3.2 Entrepreneurship and Employability

As already discussed above, transdisciplinarity transgresses the epistemological boundaries of each science, building a new knowledge, applied to the problems of the real world. In this case, innovation then comes from this knowledge. Thus, the term entrepreneur of the knowledge has gained remarkable prominence and becoming essential for the academic formation of the students of superior course. We say that a knowledge is produced when there is a codification, a communication and an acceptance of it by a collective of people, mainly by the scientific community. The entrepreneur of knowledge is defined by many researchers as "an ability to recognize or create an opportunity, producing or carrying out an innovative practice of knowledge..." As Gibbs (Gibbons *et al.* Mode 2 knowledge production concept aims to develop knowledge for a specific application, involving the work of specialists drawn from academia. Rather than producing knowledge, a public or private market oriented organization is needed that is capable of sustaining itself through the production of such knowledge, discarding public funds or research grants. It would be sustainable entrepreneurship of knowledge, becoming the most important characteristic of the entrepreneur of knowledge would then be the ability to boost, coordinate and manage himself and his team in order to increase scientific knowledge. This characteristic is already born in university courses, and without it, any form of teamwork, or concrete results with respect to the creation of knowledge, would be impossible. The word entrepreneurship has been a subject in the main media and used in several areas, making it difficult to perceive the real meaning and its use. In our view, the common components in all definitions of entrepreneur: has initiative to create a new business and passion for what it does; Uses the resources available in a creative way transforming the social and economic environment where it lives; Accepts taking risks and the possibility of failure. Thus, Dolabela stresses (Dolabela, 2010) that "The entrepreneur is someone who dreams and seeks to transform his dream into reality". Taking as reference the Brazilian companies established in 2007 and the information on these companies, available at the Federal Revenue Service - SRF, until 2010, the survival rate of companies with up to 2 years of activity was 75.6%. This rate was higher than the rate calculated for companies born in 2006 (75.1%) and born in 2005 (73.6%). As the mortality rate is complementary to that of survival, it can be said that the mortality rate of companies with up to 2 years fell from 26.4% (born in 2005) to 24.9% (born in 2006) and to 24, 4% (born in 2007), according to the Global Entrepreneurship Monitor survey -GEM in 2015. (Gem, 2015). However, in Brazil, although Micro and Small Enterprises (SMEs) are dominant among formal companies, management difficulties are evident, since they are born more of the enthusiasm of their idealizers and follow operations carried out with little planning. Faced with this scenario, education agencies at all levels can provide training to the population and work towards creating a culture conducive to entrepreneurship in Brazil. The intensification of studies in the field of entrepreneurship invariably leads us to attempts to associate the entrepreneur's profile with economic and social factors and implications (Drucker, 1987). Historically, Schumpeter's studies (Schumpeter, 1988) were determinant for to attribute to the entrepreneur the character of expansion factor of an economy. However, under the prospect of the effects of economic globalization, we are led to believe that the necessary economic growth is not enough to generate development. From the point of view of sustainability, besides economic efficiency, it is also necessary to consider the issue under the dimensions of social equity and environmental conservation. In this sense, the incentive to strengthen organized regional structures of small enterprises is the response to competitiveness and, especially, to reduction of social problems (Buarque, 2002). According to Dolabela (2006): "The foundation of entrepreneurship is citizenship, the concept of entrepreneurship deals not only with individuals, but with communities, cities, regions, and countries." In this way, entrepreneurship assumes connotations

of social phenomena. However, in order for micro and small enterprises and their entrepreneurs to be drivers of solutions to chronic social problems - for example, by generating jobs and better income distribution - the development of their development requires their preparation for the formulation (Gomes, 2005). In this paper, we present the results of a study of the social and economic development of the Brazilian economy. The Global Entrepreneurship Monitor survey (Gem, 2015) - a study done in more than 50 countries, representing together 90% of the GDP and 2/3 of the world population - among several aspects highlight the evolution of the rate of entrepreneurship by motivation (need or opportunity). According to the Micro and Small Business Support Service (SEBRAE, SEBRAE, 2013), entrepreneurs by opportunity generally use maximum innovation potential, and in Brazil, business tends to use a minimum potential for innovation. Lack of resources of the majority of the Brazilian entrepreneurs and also because the businesses are opened, for reasons of survival and the lack of jobs in the country.

3.3 Teaching of Entrepreneurship in Universities

The concept of “entrepreneurship” was popularized by economist Joseph Schumpeter in the year 1945 as the basis of the theory of Creative Destruction. Second, (Schumpeter, 1954), According to him, the entrepreneur is a versatile individual with techniques and skills to know how to produce based on capitalism. The author pointed out that the measure for a society to be considered capitalist is to know if it entrusts its economic process to the man of private business, that is to say, the entrepreneur. However, our school system, mainly in Latin America, is designed to learn how to master analytical questions, where the student spends years, from primary to university, in a relationship of almost passivity with learning. To know if entrepreneurship can be taught, we must adapt the pedagogical approach to the logic of each discipline or field of study. One can not teach entrepreneurship as one teaches other subjects (Filion, 1994). Also, Filion (1994) states that it is perfectly possible to offer programs and courses as learning systems adapted to the logic of this field of study, making it interesting to have this type of pedagogical challenge. The same author also points out that the people who enroll in these courses do not want everyone to become entrepreneurs, but several want to discover the world of the entrepreneur. Therefore, it is necessary to make distinctions between the categories of courses they deal with, both awareness-raising and management practices. Therefore, educational institutions are now able to institute certificates and diplomas in this field. Today it is very easy to find courses on entrepreneurship, including case studies, fieldwork and contacts with people who experience this world. Entrepreneurship arises from cultural contexts that develop around entrepreneurs who run small businesses. (Oliveira, F. M, 2012). In Oliveira (Oliveira, F. M, 2012), we find the information that, about a hundred years ago, the creation of schools and the phenomenon of education for the population was aimed at separating learning from its context and its practical application. So if we ask ourselves who is more prepared to teach the discipline: the researcher or who practices entrepreneurship? The most appropriate response tends to a combination of the two. In fact, several researchers were interested in the issue. Thus, also emphasizes Oliveira (Oliveira, F. M, 2012), that university students tend to prioritize elements of conceptualization and abstraction, while entrepreneurs generally prefer the most concrete. It is recognized that there is no link between the level of school learning and success in business. As the trend among students is to define success according to own achievement criteria, where priorities are no longer accumulation and status, but balance of quality of life, entrepreneurship teaching aims to strengthen this idea, seeking to encourage the student to develop Creative processes that explore their capabilities and capabilities. Previously, entrepreneurship education was centered on the business plan. Currently, the mainly in Latin America, it is designed to learn how to master analytical questions, where the student spends years, from primary to university, in a relationship of almost passivity with learning. To know if entrepreneurship can be taught, we must adapt the pedagogical approach to the logic of each discipline or field of study. One can not teach entrepreneurship as one teaches other subjects (Filion, 1994). Also, Filion (1994) states that it is perfectly possible to offer programs and courses as learning systems adapted to the logic of this field of study, making it interesting to have this type of pedagogical challenge. The same author also points out that the people who enroll in these courses do not want everyone to become entrepreneurs, but several want to discover the world of the entrepreneur. Therefore, it is necessary to make distinctions between the categories of courses they deal with, both awareness-raising and management practices. Therefore, educational institutions are now able to institute certificates and diplomas in this field. Today it is very easy to find courses on entrepreneurship, including case studies, fieldwork and contacts with people who experience this world. Entrepreneurship arises from cultural contexts that develop around entrepreneurs who run small businesses. (Oliveira, F. M, 2012). In Oliveira (Oliveira, F. M, 2012), we find the information that, about a hundred years ago, the creation of schools and the phenomenon of education for the population was aimed at separating learning from its context and its practical application. So if we ask ourselves who is more prepared to teach the discipline: the researcher or who practices entrepreneurship? The most appropriate response tends to a combination of the two. In fact, several researchers were interested in the issue. Thus, also emphasizes Oliveira (Oliveira, F. M, 2012), that university students tend to prioritize elements of conceptualization and abstraction, while entrepreneurs generally prefer the most concrete. It is recognized that there is no link between the level of school learning and success in business. As the trend among students is to define success according to own achievement criteria, where priorities are no longer accumulation and status, but balance of quality of life, entrepreneurship teaching to strengthen this idea, seeking to encourage the student to develop Creative processes that explore Their capabilities and capabilities. Previously, entrepreneurship education was centered on the business plan. Currently, the Business Plan is increasingly used as a conclusive step. Another point to emphasize, within the purpose of teaching to enhance individual capacities, is the cultural issue. For many years, our parents educated us to seek a good and stable job in a large company. This paradigm led to an unfounded perception that those who had chosen the entrepreneurial career were those who did not like to study. Setting up the business itself was the only way out of the incompetent. Another important issue to be addressed is that it is rare for teachers with masters or doctorates to specialize in entrepreneurship or to teach this discipline. Although the growth of entrepreneurship

courses in higher education is good news, the offerings are still timid in terms of number of subjects on the subject, being in most cases optional. In the United States, where capitalism is at its peak, entrepreneurship is a subject that is deployed in several obligatory and elective disciplines, in addition to several other extension courses, such as corporate entrepreneurship, social entrepreneurship, franchising, family businesses and venture capital. Few areas have in their studies the discipline of entrepreneurship. Stories of entrepreneurs, cases of failure, dilemmas of managers, serve as fundamental tools for the teacher. The task of the educator is arduous, it is incumbent upon him to instill the seed of curiosity about the subject in his students, helping them to know this career possibility and showing them the paths to self-development. The task of transferring this passionate knowledge leads us to infer that, as important as academic knowledge, the teacher should have had the entrepreneurial experience in his / her life history, be it as a specialized official, consultant or entrepreneur. This would be the ideal way to recognize that there is no link between the level of school learning and success in business. As the trend among students is to define success according to own achievement criteria, where priorities are no longer accumulation and status, but balance of quality of life, entrepreneurship teaching aims to strengthen this idea, seeking to encourage the student to develop Creative processes that explore their capabilities and capabilities. Previously, entrepreneurship education was centered on the business plan. Currently, the business plan is increasingly used as the conclusive step. Another point to be emphasized, within the purpose of teaching to enhance individual capacities, is the cultural issue. For many years, our parents educated us to seek a good and stable job in a large company. This paradigm led to an unfounded perception that those who had chosen the entrepreneurial career were those who did not like to study.

Setting up the business itself was the only way out of the incompetent. Another important issue to be addressed is that it is rare for teachers with masters or doctorates to specialize in entrepreneurship or to teach this discipline. Although the growth of entrepreneurship courses in higher education is good news, the offerings are still timid in terms of number of subjects on the subject, being in most cases optional. In the United States, where capitalism is at its peak, entrepreneurship is a subject that is deployed in several obligatory and elective disciplines, in addition to several other extension courses, such as corporate entrepreneurship, social entrepreneurship, franchising, family businesses and venture capital. The task of the educator is arduous, it is incumbent upon him to instill the seed of curiosity about the subject in his students, helping them to know this career possibility and showing them the paths to self-development. The task of transferring this passionate knowledge leads us to infer that, as important as academic knowledge, the teacher should have had the entrepreneurial experience in his / her life history, be it as a specialized official, consultant or entrepreneur. This would be the ideal way for him to find the best balance between theory and practice, conceptual and instrumental. (Oliveira, 2012).

The creation of an Entrepreneurship Center at the University should strive to penetrate effectively the academic environment, seeking to share relevant knowledge and cultivate the entrepreneurial spirit within this community. The introduction of a strategic mindset in the opening of business, based on the mastery of several broad disciplines in the scenario, where the business is inserted, introducing new pedagogical methodologies directed to the “learn-by-doing”, is intended as follows:

- 1) Familiarize students with the underlying concepts of entrepreneurship and entrepreneurship, as well as those inherent in the transformation of an idea into a business plan;
- 2) Familiarize students with the steps necessary to create a business with a higher value;
- 3) Provide students with the minimum legal knowledge required for the creation of companies and businesses; Provide students with the main tools for assessing the risks and resources needed to create business and businesses, within a framework of efficiency and effectiveness of allocation and results;
- 4) Familiarize students with the main forms of investment financing in the scope of incentives to entrepreneurship; Provide the students with the necessary knowledge to create and develop companies and businesses responsible for the integrated development of the societies where they settle and with whom they develop trade.

But not everything is perfect. As young companies grow and have to deal with the demands of size and complexity, they become bureaucratic. As the bureaucracy deepens, the sparks of entrepreneurship disappear. This is how insurgents of yesterday become the stragglers of today. We know that entrepreneurship is declining and the conglomeration of organizations are increasing. This is a problem, since it is impossible to create a truly vibrant economy if it is dominated by companies that are politically isolated and trapped in the bureaucracy chain. The challenge, then, is not merely to encourage more entrepreneurial spirit in universities but to develop in students a “strategic awareness”, enabling them to undertake more within large established organizations. (Hamel, G. & Zanini M., 2017).

4. THE STAGES OF THE PROCESS OF IMPLEMENTATION OF A UNIVERSITY EXTENSION CORE OF TRANSDISCIPLINARITY AND ENTREPRENEURSHIP IN UNIVERSITIES

The purpose of this study is to conceive, as its general objective, the “Implementation of a Nucleus of University Extension of Transdisciplinarity and Entrepreneurship NEUTE, as a proposal of professional complementation for the market in the Universities”, with the creation of an institutional academic model Research and professional practice. To this end, as specific objectives of the proposal, the NEUTE also aims: to reflect on the epistemology, the theory and the transdisciplinary methodology for the enterprise; To create bridges between theory and practice, through the three pillars of transdisciplinarity: complexity, the different levels of reality and the logic of the third included; Promote virtual and

face-to-face conferences and meetings; Offer face-to-face, semipresential and distance learning courses; Coordinate research groups and monitor the implementation of pilot projects; Produce, translate and publish transdisciplinary texts with bias for entrepreneurship; And, to establish partnerships with institutions, associations, private companies and national and international centers. The study also includes, as specific objectives, to propose a model that meets the centrality of life in the planetary discussions, proposing a change in the reference system, supported by three requirements: consider several levels of reality; Work with the logic of the Third Included Term; And, encompassing the vision of the complexity of social and economic phenomena to be undertaken. At the end of the project, with the implementation of NEUTE, the students of the Higher Education Institutions (IES) will add to their professional specialties, transdisciplinary entrepreneurial knowledge that, once used continuously, should provide them with an entrepreneurial and intrapreneurial attitude in future businesses where Will become professionalized:

- e) In relation to the organizational structure and processes of the business: by creating the value chain to provide superior services in the NEUTE, students will realize that the employees of the business organization in which they work, receiving constant training for the new challenges Proposed, they will feel valued in their day-to-day performance and can always plead for better working conditions and rewards. The users of these services provided by the organization will be the greatest advocates of the employees for any claim in that direction;
- f) In relation to the users of the services provided by the business: greater knowledge of the market and the profile of the consumer and target citizen, as well as the community where the business will be inserted. With this, it will be possible to anticipate decisions about the services that will actually meet the real needs of this final consumer;
- g) In relation to business technology: the development of a continuous process of improvement of the training in information technology, defined from the needs perceived in the development of the business in line with its peculiar characteristics;
- h) Regarding the sustainability of the business venture to be created: the continuous improvement in the process of innovating and applying market knowledge, by reducing the time of execution of activities and minimizing errors with the consequent modernization of the processes that seek to satisfy, Or perhaps, enchant the target consumer;
- i) In relation to the benefits to be achieved with the business:
 - Facilitating and streamlining the provision and use of information;
 - Be the main source of market information for consumers involved in strategic decisions;
 - Creation of a discussion forum with the community, where the business operates;
 - Creation of a granary of structured information that supports the development of business plans; Reducing the cycle of development of services provided, reducing costs, increasing efficiency and developing new innovative solutions.

Through stages, the operationalization process of a nucleus of university extension of transdisciplinarity and entrepreneurship in the HEI requires a set of operational actions, dimensioned in two distinct and integrated modules, composed as follows:

Module 1 - First Moment of Market Entrepreneurial Practice: divided into two integrated and distinct actions: a) Knowing the final consumer of the business; B) Awareness raising for stakeholders and the public market in general.

Module 2 - Second Moment of Market Entrepreneurial Practice: development of an organizational structure to sensitize the market in a transdisciplinary way. We briefly describe here what we hope to develop in these two parts:

- 1) About Module 1 - First moment of market entrepreneurship: this module is divided into two distinct actions and integrated with the whole:
 - a) Knowing the final consumer of the business: a methodology will be used that includes a set of actions to be identified the true consumers of the business, be it a public or private business, thus defining their real needs;
 - b) Awareness of the business market in a transdisciplinary way: a training and improvement model will be developed for business employees, in the sense of raising awareness and awareness of the market, aiming to awaken in management a new mentality in the conduct of the organization's business, where Every effort of the employee's contribution will be strictly focused on the satisfaction of the target consumers. With this, the revolutionary transdisciplinary vision in the offer of products and services to the target consumers of the business is that in which all internal process is only justified when it adds value superior to the final consumer. With this transdisciplinary approach to business, the production of knowledge of Mode 2, proposed above by Gibbons (Gibbons *et al.*, 1994), involving the knowledge developed for a specific application and also involving the work of specialists, drawn from academia, government And industry, such knowledge production and problem solving extend to the humanities, as in museums, architecture, and modes of research that rely on "information technology." In this way, the social cell, where the expected internal behaviors such as: openness, systemic thinking, creativity, personal effectiveness, market awareness and capacity building will take place, will only take place with the integration of these practices aimed at the full satisfaction of needs of the target consumer.
- 3) About Module 2 - Second moment of market entrepreneurship: this module only comprises a distinct and more integrated action with the whole: Development of an Organizational Model of Effective Management for the Market: this module aims at the entrepreneurial development of a An organizational model for the creation of emerging, market-sensitized organizations, based on an integrated system of internal actions, forming a lucrative chain of enduring services for the final consumer. This presupposes a spirit of cooperation and synergy of internal processes throughout the organization to ensure that all service provided internally is of high value and strictly focused on meeting and meeting the real needs of the organization's target market. We aim at the model, the object of this practice, is for transdisciplinary entrepreneurs to be personally involved in analyzing and discussing the carefully constructed facts and at the same time engaging with the research of the relevant factors that affect the organization

to be undertaken and which should be considered in the decision-making process. The strategy to be adopted in the organization, corresponding to Mode 2, mentioned above, will be to always seek a great involvement and a high attention of all the stakeholders responsible for the results of internal excellence. This strategy will have the characteristic of being action oriented instead of just being in the process and therefore will have a greater chance of being well implemented.

As the central objective of the NEUTE model is to establish an entrepreneurial transdisciplinary organization, aware of its role in the market, with the constant aggregation of superior value in the delivery of a product or service to the target consumer. Thus, culture is considered as an integral part of a group's learning and experience process, in which six key intervention points and processes will be tackled to make the model feasible, namely: (1) learning to innovate with knowledge Acquired in transdisciplinary studies; (2) constantly changing the strategic mindset of the business manager; (3) to justify the behavioral changes of the organization's stakeholders to the market; (4) to communicate cultural messages about behavior change to the market; (5) to hire and socialize new members who "fit in" into the transdisciplinary entrepreneurial culture totally geared towards the market; And, finally, (6) constantly train members who deviate from the desired market-oriented culture and consumer satisfaction.

5. FINAL CONSIDERATIONS

Several scientific-academic productions were researched and analyzed in order to measure the importance of the concepts of transdisciplinarity and entrepreneurship focused on the needs of the market and the training of undergraduate and postgraduate students with some or no professional experience. With this, we could understand the elements that seem to indicate that, in Brazil:

- a) Transdisciplinarity does not seem to be a subject of wide recognition and treatment in the field of scientific-academic production, although it is a subject of interest in a considerable number of fields of research, including education under a diversity of looks (teacher training, technologies Education, curriculum development, supervision Pedagogical);
- b) The different aspects in which this thematic category has been approached, which undermine both our personal capacity to deal with a variety of complex social problems and the very capacity of universities to respond to the challenges and demands arising from the rapid and constant changes Social, cultural, economic, technological and political; and
- c) The thematic scope of the idea of transdisciplinarity as a new model of teaching in undergraduate and postgraduate knowledge in educational institutions in Brazil. (Cruz, E. and Costa, F.A., 2015). With all this, the results obtained and the reflection resulting from these elements may make it possible to propose a set of initiatives that will allow to go a little deeper and further than what has been achieved here. The creation of the University Extension Nucleus of Transdisciplinarity and Entrepreneurship becomes, in this case, one of the first steps to be taken in the direction of sustainability of this academic activity with the suggestion of expanding this object of study, considering not only the deepening above Of the diverse sources of research and scientific production that constantly feed this context to the specific domain of theory and curriculum development. In addition to this, it is necessary to create a mentality focused on the need for sustainable employability of our students, in a critical moment in our world economy. Finally, in this study, we sought to identify the theoretical perspectives that aim to inform the approaches of a transdisciplinary nature, as well as to define the teaching and learning strategies and methodologies that are in line with the practice directed to the market knowledge aiming at the creation of innovative businesses.

THE PHASES OF SERIAL KILLERS

Alberto Pintado Alcázar
 Universidad de Murcia
 (alberto.pintado@um.es)

RESUMEN

La figura del asesino en serie ha existido desde tiempos inmemoriales, pero no fue hasta los años 80 cuando comenzó a tener una repercusión mundial gracias a las investigaciones llevadas a cabo por el jefe del FBI, Robert K. Ressler. A partir de ese momento, su incidencia en el mundo criminal reviste gran importancia debido a la crueldad con la que estos sujetos cometen sus acciones.

Un *serial killers* es aquella persona que comete un número indeterminado de asesinatos, siendo tres la cifra que se estima mínima para ser considerado como tal. Es necesario destacar que, entre crimen y crimen, estos individuos padecen un período de enfriamiento que puede ir desde determinadas horas hasta varios años.

No obstante, es importante destacar que todos los *serial killers* seguirán un proceso criminal, con independencia de la tipología concreta en la que se les pueda agrupar. En este sentido, dentro de la doctrina criminológica existen determinados investigadores que hablan sobre la existencia de diferentes fases dentro de dicho proceso, las cuales pueden condicionar la futura acción delictiva de los asesinos en serie.

El objetivo del presente artículo se fundamenta en profundizar en los principales factores que inciden en la evolución del comportamiento criminal que desarrollan los asesinos en serie.

Palabras clave: Asesinos en Serie, Fases, Período de Enfriamiento, Crimen.

1. INTRODUCCIÓN

La figura del asesino se remonta a épocas pasadas, siendo considerado como aquella persona que actuaba contra otra u otras personas arrebatándoles la vida. En determinadas ocasiones, estos asesinos podían ser vistos como justicieros de una determinada sociedad que peleaban por salvar a los ciudadanos, luchando contra las clases altas.

En la actualidad, lo verdaderamente llamativo para la opinión pública es la presencia de un individuo que lleva a cabo un número indeterminado de muertes, lo que induce a un gran revuelo social debido a la inseguridad que genera y al miedo colectivo que provoca dicha actuación.

A lo largo de la historia, todos los países y civilizaciones se han tropezado con diversos casos de asesinatos, ya que no se contempla la posibilidad de un Estado que presente un nivel de delincuencia de este tipo con índices negativos, ya que es poco probable que no se haya cometido ningún caso de asesinato durante un período de tiempo concreto. Al respecto, es relevante destacar que este tipo de sucesos se consideran como un fenómeno social y criminológico que poco a poco va generando más investigaciones, debido al creciente desarrollo que se ha producido desde los años 60, dejando de ser un acontecimiento aislado (Pozueco Romero, Romero Guillena y Casas Barquero, 2011).

Salfati y Canter (1999) consideran necesario establecer una serie de pautas para discernir la voluntad que presentan los asesinos respecto a sus víctimas. Las diferencias entre los comportamientos violentos de los agresores han llevado a clasificar a las acciones más agresivas y violentas en una dicotomía hostil e instrumental, dependiendo de los objetivos o recompensas buscadas por el autor. Por ello, cabría distinguir entre:

Tipo de agresión hostil: Hacen mención a aquellas respuestas a determinadas acciones que inducen al insulto o el ataque físico. El propósito de este tipo de ataque es hacer que la víctima tenga un sufrimiento extremo.

Tipo de agresión instrumental: Se produce como resultado del capricho que presenta el delincuente hacia la obtención de una serie de objetos de los cuales carece, y son poseídos por su futura víctima (las joyas o el dinero suelen ser los objetos más deseados).

2. DEFINICIÓN DE ASESINO EN SERIE

El origen del asesinato en serie se debe a la creciente concentración de violencia debido a la complejidad de la sociedad y la violencia entre personas, lo que se traduce en una expansión de las diferencias culturales que generará una sociedad en la que dichas civilizaciones se enredan unas con otras sin respetar las costumbres de cada una de ellas. Ressler (2010) espetó que estos delitos violentos tendrán un aumento considerable “allí donde la gente se sienta apartada de la sociedad, donde los vecinos apenas se conozcan entre sí, donde las familias no mantengan una relación estrecha, donde los adolescentes deambulen por calles peligrosas, donde la violencia aparezca como respuesta viable a los problemas”.

No resulta anómalo creer que determinadas acciones cometidas por una persona sean consideradas propias del mundo cinematográfico. Estas vicisitudes se producen cuando determinadas personas cometen una serie de asesinatos a lo largo de un período de tiempo sin ser atrapados por las Fuerzas y Cuerpos de Seguridad del Estado. Estos hechos se traducen en la figura del asesino en serie o *Serial Killers*, el cual debe de llevar a cabo una serie de procesos para poder ser considerado como

tal, no siendo confundido con otro tipo de homicidas como podrían ser los asesinos en masa o el asesino itinerante, también llamado *Spree Killer*.

Muchos investigadores han estudiado a este tipo de sujetos aportando cada uno de ellos su propia conclusión al respecto. Resultando de gran interés las aportaciones que llevó a cabo el investigador del FBI, Robert Ressler quien acuñó el término de “asesino en serie”, modificando la expresión “asesinatos de extraños” que se utilizaba con anterioridad para definir a estos individuos y que no resultaba del todo acertada, ya que en determinadas ocasiones los asesinos sí conocen a sus víctimas, siendo incluso amigos de los propios verdugos o familiares directos de los mismos. Resulta llamativa la forma mediante la cual Ressler estableció la expresión de “asesino en serie”, ya que dicho vocablo fue el resultado de su presencia como asistente en una conferencia realizada en Inglaterra, donde se utilizó el término “crímenes en serie” para referirse a aquellas reiteraciones de violaciones, robos o asesinatos, lo que le llevó a sugerir la modificación de la expresión antes utilizada para referirse a ese tipo determinado de sujetos, “ese término me pareció una manera acertada de caracterizar los asesinatos de las personas que matan una y otra vez y lo hacen de un modo bastante repetitivo [...]. La nomenclatura no nos pareció un asunto trascendental en aquella época; era simplemente parte de nuestro esfuerzo general por entender estos crímenes monstruosos, por buscar maneras de comprenderlos y, de ese modo, detener más rápidamente al siguiente asesino en serie”. Ressler (2012) concluyó definiéndolos como “un don nadie que quiere ser alguien, no a través de la fama positiva, sino de la infamia. Cualquier tipo de reconocimiento es importante para él. [...], son adolescentes o adultos que se comportan igual que lo hace un niño cuando quiere llamar la atención”.

Conceptos de asesinos en serie hay muchos, si bien todos se constituyen sobre dos criterios identificativos: i) cuantificación numérica; y ii) requisito temporal. Por ello, la definición que más relevancia ha tenido en la doctrina criminológica es la aportada por Ressler (2004), quien establece que será “aquel sujeto que mata a tres o más víctimas transcurriendo un período de enfriamiento entre cada una de ellas”.

Otros autores se centran en predecir la existencia de diferentes emplazamientos en los que los asesinos llevan a cabo sus acciones criminales. Este es el caso de escritores como Schechter (2004), quien establece que para determinar una definición propicia para hacer mención a estos sujetos es necesario tener en cuenta tres factores fundamentales: a) Cantidad: Al menos deben de realizarse tres asesinatos; b) Localización: Se llevarán a cabo en diferentes lugares; y c) Tiempo: Debe de existir un periodo de reflexión entre los crímenes, dicho espacio temporal puede persistir desde diversas horas a varios años.

Scott (2008) también se muestra partidaria de esta tesis estableciendo una ligera apreciación al respecto, ya que no sólo habla de los sujetos que matan a tres o más individuos, sino que también hace hincapié en aquellos individuos que han expresado una intención o voluntad de llevar a cabo dichos asesinatos. Al respecto, establece que para ser incluido dentro de la clasificación de asesinos en serie se debe tener en cuenta que “es una persona que ha intentado o que ha matado a tres o más personas. Estos asesinatos, o intentos de asesinatos, se llevan a cabo durante un período prolongado de tiempo con un período de enfriamiento entre los mismos [...]. Mientras que los hombres exteriorizan motivos relacionados con la fantasía sexual, las mujeres cometen estos crímenes por razones más instrumentales, como podría ser el beneficio económico”. En consecuencia, Scott introduce la motivación criminal del asesino.

Otros investigadores se centran en buscar el lado humano de estos sujetos ya que no los consideran distintos al resto de la sociedad, sino que experimentan una serie de habilidades que lo hacen diferente al conjunto de la comunidad. Al respecto, Skrapek (2008) establece que “aunque consideremos los asesinatos en serie actos <<malinos>>, los individuos que los cometen son indudablemente humanos. Su <<maldad>> radica en la premeditación con que planean acabar con vidas humanas. En este sentido, los asesinos en serie no son distintos de nosotros, sino que muestran aspectos extremos del ser humano”.

Actualmente, determinados autores siguen considerando que el criterio principal para clasificar a estos sujetos viene determinado por el hecho de haber cometido al menos un triple asesinato, así se entiende que serán aquellos individuos que cometen de forma reiterada y premeditada, sin que haya un motivo para llevarlos a cabo, tres o más asesinatos con la existencia de intervalos temporales entre un acontecimiento y otro (Torre y Silva, 2013).

3. FASES DE ASESINOS EN SERIE

A la hora de hacer referencia a las etapas por las que transita un criminal que comete sus actos delictivos en espacios de tiempo correlativos, hay que tener en cuenta que la doctrina criminológica ha establecido que dichos períodos se fundamentarán en base a una categorización genérica donde, principalmente, se hará hincapié en la diferenciación de este tipo de criminales.

3.1 Ressler, Burgess y Douglas

La primera clasificación relacionada con los asesinos en serie que revistió gran interés fue la impuesta por estos autores, la cual fue propuesta en 1988. Con la finalidad de poder discernir las diferentes fases por las que atraviesan estos sujetos, intentaron comprender la forma de actuar de los mismos para intentar descubrir la personalidad que se encontraba detrás de dichos acontecimientos criminales. Para ello, llevaron a cabo una investigación sobre treinta y seis delincuentes, cuyo propósito se centraba en poder descubrir todas aquellas etapas por las que estas personas transitaban antes de conseguir su propósito final: el asesinato de las víctimas que habían elegido.

Esquema 1. Etapas de un asesinato en serie

Fuente: Ressler, Burgess and Douglas (1995)

A) Antecedentes. Dentro de esta fase, estos autores establecen una serie de escenarios concretos, los cuales son considerados necesarios para que el individuo perturbado alcance su meta: el asesinato.

- a) Factores estresantes. Diversos acontecimientos externos al sujeto pueden llegar a perturbar al mismo, llegando a alterar su estado mental y emocional. Por este motivo, estos elementos pueden ser desencadenantes de determinadas agresiones hacia otras personas.
- 1) Conflictos con mujeres. En los estudios desarrollados entre más de ochenta asesinos, Ressler, Burgess y Douglas descubrieron que en más de la mitad de los casos, estos individuos habían presentado problemas previos con mujeres antes de cometer los crímenes.
- 2) Conflictos con los padres. Al igual que en el supuesto anterior, más de la mitad de los sujetos estudiados presentaron factores de estrés previos al crimen, los cuales estarían relacionados con enfrentamientos con cualquiera de sus progenitores.
- 3) Problemas económicos. Contexto que puede provocar en el sujeto una situación de estrés, el cual podría generar una sucesión de acciones violentas ante determinadas personas.
- 4) Problemas laborales. Aquellas situaciones en las que determinados individuos están desempleados y no encuentran trabajo, inconveniente que puede generar en el criminal una respuesta agresiva.
- 5) Conflictos maritales. Es un escenario que no representa un porcentaje muy elevado en el cómputo general, ya que uno de cada cuatro asesinos en serie presentan problemas previos con su pareja. Durante este período, sus fantasías de violación y asesinato se intensifican.
- 6) Otros factores estresantes. Existen otras situaciones que pueden provocar en el sujeto una reacción violenta, tales como: problemas legales, lesiones físicas o el fallecimiento de una persona importante.
- g) Estado de ánimo. Se podría asociar con el mecanismo de interpretación de los acontecimientos externos. Este período, cuando se identifica con criminales, revelará un elevado índice de emociones negativas, las cuales se representarán en situaciones concretas, tales como: frustración, hostilidad, agitación y excitación. También revisten gran importancia aquellos síntomas relacionados con una ansiedad interiorizada, es decir; nerviosismo, depresión, miedo, calma o confusión.
- h) Planificación previa. Estos sujetos premeditan determinadas acciones criminales con la finalidad de poder desarrollarlas en un período de tiempo cercano. En esta fase también incide un aura de impulsividad para cometer el acto, la cual estará muy presente en estos individuos. Tienen conocimiento de lugares propicios para cometer los asesinatos y han elaborado una estrategia para conseguir a sus víctimas.
- i) Acciones previas. Generalmente, estos individuos, en los días previos al asesinato, están involucrados en actividades delictivas. Durante las horas previas a la acción criminal, suelen buscar a sus futuras víctimas entre aquellas que más se adapten a sus pretensiones. En definitiva, un determinado comportamiento agresivo podría ser predecesor de un futuro asesinato.
- j) Selección de la víctima. Se centra en calificar a aquellos asesinos en serie que presentan una serie de fantasías sexuales, las cuales provocan en el mismo una necesidad interna relacionada con la búsqueda de personas que se asemejen a su proyecto victimario.
- k) Factores desencadenantes. La fantasía se configura como el principal componente delictivo que puede originar determinadas conductas criminales. No obstante, existen una sucesión de procesos que pueden inducir a la repetición de dicho resultado, entre las que destacaría el alcohol.

B) Asesinato. Como su propio nombre indica, en esta fase se produce el fallecimiento de la víctima. En este momento es cuando el individuo se percata de que la fantasía no se asemeja al completo con la realidad vivida, pudiendo sentirse más nervioso de lo esperado o teniendo que utilizar más violencia de la prevista para poder cometer el crimen.

C) Disposición del cuerpo.

- a) Patrones de eliminación. Algunos métodos de eliminación de la víctima serán más desarrollados que otros, llegando a ser perfeccionados por el criminal a través de la reiteración de asesinatos. Cada sujeto actuará de forma diferente, atendiendo a las posibilidades que le ofrece su propia fantasía.
- b) Estado del cuerpo. Atendiendo a la forma en la que el asesino procede sobre el cuerpo de la víctima, se pueden encontrar diferentes características referentes al mismo. Para ello, se tendrán en cuenta la visibilidad del cuerpo del fallecido, el posicionamiento del mismo y el estado de sus ropajes.
- c) Localización. El emplazamiento final del cuerpo de la víctima puede variar dependiendo de la intencionalidad del criminal.

D) Actuaciones posteriores al crimen. Las reacciones de los asesinos pueden variar una vez cometidos los respectivos actos delictivos. No obstante, dichos comportamientos posteriores pueden evidenciar que la fantasía continúa dentro de ellos.

- a) Respuesta inmediata. Inminentemente después de abandonar la escena del crimen, el asesino puede sentir una fuerte sensación de alivio. En determinadas ocasiones, algunos sujetos regresan a su domicilio y duermen profundamente.
- b) Respuestas posteriores. Generalmente, las reacciones del asesino después de cometer el crimen se fundamentan en la necesidad de autoprotección. No obstante, sus comportamientos pueden ir en contra de las acciones previstas para evitar la atención en su persona. Por ello, se establecen cuatro acciones concretas: Retornar a la escena del crimen, observar el descubrimiento del cuerpo, guardar recuerdos, y participar en la investigación.

3.2 Norris

A raíz de una serie de investigaciones, referentes a las experiencias vividas por los asesinos en serie, Norris (1989) describió a finales de la década de los ochenta una serie de etapas por las que pasa todo criminal encuadrado en dicha categoría, y que terminó perfeccionando a través de la elaboración de más de medio millar de entrevistas realizadas a distintos asesinos convictos. Su conclusión final estuvo coronada con la determinación de establecer siete puntos característicos dentro de dichas fases que desarrollan estos sujetos, las cuales siguen estando presentes en las investigaciones actuales debido al éxito alcanzado a la hora de elaborar un esquema relacionado con los ciclos de violencia por los que transcurren estas personas. Siguiendo las investigaciones realizadas por Norris, pueden establecerse las siguientes fases psicológicas que imperan en el asesino en serie.

Esquema 2. Ciclo psicológico de los asesinos en serie

Fuente: Norris (1989)

- a) Aúra. El sujeto sufre un abandono relacionado con el sentido de la realidad y penetra en su propio mundo de fantasías perturbadas, aislándose de cualquier tipo de interacción humana, lo que provocaría el inicio de un cambio de comportamiento. Tienen el presentimiento que el tiempo avanza más lento de lo normal, sus sentidos se alteran percibiendo colores más vivos, sonidos y olores más intensos de lo habitual. Este período no representa un ciclo de tiempo determinado ya que puede persistir un momento específico o, incluso, prolongarse durante varios meses. Sería

en esta fase cuando el sujeto divisa su alrededor para así poder buscar posibles objetivos a los cuales culpar de una determinada situación vivida, exteriorizando con ello su ira y odio.

El individuo convive con un desarrollo continuado de la tentación criminal que padece, produciéndose en la mente del asesino una serie de fantasías sexuales y violentas, que se identificarían con la posterior comisión de un asesinato. Al respecto, Ressler (2012) estableció que los asesinos a los cuales entrevistó durante largos períodos de tiempo “asesinaban para llevar a la realidad lo que habían visto una y otra vez en su mente desde la infancia y la adolescencia. Cuando eran adolescentes, en lugar de desarrollar intereses y actividades normales con sus iguales sin tener un estricto control sobre todo, estos asesinos se refugiaron en fantasías sexualmente violentas donde sí podían controlar el mundo a su alrededor. Sobrecompensaban las agresiones sufridas en la infancia repitiendo el maltrato en sus fantasías, pero ya no como víctimas, sino como agresores”. Dentro de esta fase es común que los sujetos estén relacionados con un abuso constante de drogas y alcohol.

- b) Búsqueda. Una vez superada la fase del áurea, el asesino comienza a buscar su próxima víctima, centrando especial atención en aquellos emplazamientos donde tenga mayor probabilidad de encontrar el tipo de individuos que anda buscando, sin olvidar la ubicación donde realizaría el acto y en el que tendrá previsto deshacerse del cuerpo. El sujeto experimenta una serie de modelos del comportamiento compulsivos, frenéticos y paranoicos, que lo transforman en un ser que se encuentra en un estado exaltado de alerta y concentración.
- c) Seducción. Una vez superadas las dos fases anteriores, el asesino en serie centra sus esfuerzos en ganar la confianza de su víctima mediante el uso de su encanto personal, intentando atraerla hacia una determinada trampa que tiene preparada para poder llevar a cabo su cometido.
- d) Captura. Esta fase hace referencia al evento mediante el cual el asesino comete un acto repentino sobre la víctima, dejándola desconcertada y desprotegida, impidiendo con ello su intento de fuga. En muchas ocasiones, estos sucesos se refieren a un golpe fulminante en la cabeza, un empujón inesperado o un secuestro, lo que supondrá una dificultad extra para el sujeto pasivo por no esperar dichos acontecimientos. Para cometer sus actos, el asesino esperará el tiempo necesario hasta que víctima elegida se encuentre sola e indefensa. Los mecanismos utilizados para llevar a cabo las capturas de victimarios se llevarán a cabo de modo distinto dependiendo de la personalidad y actuación de los asesinos en serie.
- e) Asesinato. El asesino en serie comete el asesinato que anteriormente había planificado lo que conlleva un alto valor emocional para estos sujetos. Esta etapa se identificaría con aquellos supuestos en los que el fallecimiento de las víctimas genera un desahogo sexual tan importante que se traduce en un sentimiento continuo de triunfo, lo que generará una serie de orgasmos espontáneos por parte de los sujetos activos. Al igual que ocurría en la fase de captura, el asesino va a actuar de distinta forma a la hora de cometer el asesinato, ya que algunos proceden a matar a sus víctimas de manera inmediata, mientras que otros prefieren torturarlas para así tener un sentimiento de grandeza prolongado en el tiempo.
- f) Fetichismo. Debido a que la emoción derivada de sus actos criminales comienza a desvanecerse rápidamente, el asesino en serie decide prolongar su deleite mediante el robo de unos determinados recuerdos o fetiches que considera que están asociados a sus víctimas, lo que le provoca un recuerdo agradable de la fantasía que tuvo y que desembocó en un hecho real. Puede darse la especial circunstancia que determinados sujetos decidan guardar como trofeo determinadas partes del cuerpo de sus víctimas que posteriormente utilizaran como ajuar o para fabricar prendas de ropa, lo que sería más propio de los asesinos en serie desorganizados.
- g) Depresión. Constituye la etapa es la última del ciclo por el que pasa todo asesino en serie, y se traduce en una decepción emocional debido a la desigual situación acontecida entre su propia fantasía y la realidad del hecho criminal. Una vez fallecida la víctima y con el fin de superar dicha frustración, el sujeto comienza a planificar un nuevo asesinato en el que vuelve a dar comienzo el proceso psicológico por el cual comete el acto, interiorizando una nueva fantasía delictiva e intentando mejorar todos aquellos errores cometidos en el crimen previo. Este proceso se repetirá en reiteradas ocasiones debido a que los asesinos en serie no satisfacen sus fantasías y atesoran la necesidad de seguir intentando alcanzar un nivel de complacencia pleno.

3.3 Holmes y Holmes

De manera contraria a lo expuesto por Norris, existe un sector doctrinal que considera que no es necesario que se produzca el desarrollo de todas las fases expuestas anteriormente, sino que sería idóneo establecer un catálogo de mínimas concurrentes en la generalidad de supuestos. Así, a modo de ejemplo, Holmes y Holmes (2001), como se puede apreciar en el siguiente esquema, establecen un modelo con cinco fases que difieren del comúnmente aceptado, en tanto determinan que no sería necesario que en un mismo asesinato se produzcan todas las fases propuestas, sino que consideran que dichas etapas pueden variar dependiendo del hecho cometido y de la forma de realizarlo.

Esquema 3. Fases establecidas por Holmes y Holmes

Fuente: Holmes and Holmes (2001)

- a) **Fantasía.** Constituye la existencia de una serie de ideas o pensamientos que impulsan la actuación del individuo, configurándose como la parte fundamental del proceso de creación de este tipo de sujetos, siendo considerada como la primera fase dentro de este círculo delincencial.
En consonancia, hace referencia a aquellos procesos que padecen todos los asesinos en serie y que se relacionará directamente con las necesidades, las motivaciones y las esperanzas que el sujeto tiene depositadas en el pensamiento criminal que está desarrollando. Generalmente, estas imaginaciones se centran en aspectos sexuales, codiciosos o, incluso, demoniacos convirtiéndose en los motores necesarios para el futuro proceso criminal.
- b) **Acecho.** En este supuesto es frecuente encontrar a estos criminales organizando la futura escena del crimen para intentar conseguir los resultados que desean obtener, algo que sería propio de los asesinos en serie psicópatas, no estando presente en los desorganizados.
En esta fase se producirá una vigilancia constante por parte del sujeto hacia su víctima y variará en función del tiempo, de la oportunidad, así como de la necesidad que muestren estos individuos por llevar a cabo el acto criminal en un período de tiempo más efímero.
- c) **Secuestro.** Dentro de esta fase es recomendable destacar que a la hora de cometer sus actos criminales, no todos los asesinos en serie llevan a cabo un rapto previo. En este caso, no es necesario distinguir entre organizados y desorganizados ya que cualquiera de las dos tipologías puede realizar este acto u omitirlo, dependiendo de la motivación criminal que presente dicho sujeto.
Partiendo de la base de que el asesino lleve a cabo un secuestro previo, estos pueden variar, presentándose de forma muy sencilla o, por el contrario, con un perfil más complejo. En este supuesto, la captura sería llevada a cabo por un asesino en serie organizado que habría planeado con anterioridad el acto criminal y todas las acciones que debería realizar para poder cumplir con su fantasía.
- d) **Muerte.** Se produce el fallecimiento de la persona que el sujeto había seleccionado. Es importante destacar que dicho acontecimiento se puede realizar de diversas formas:
 - Con rapidez: El acontecimiento criminal se realiza de forma decisiva e inmediata.
 - Mediante un proceso más lento: El acto se centra en un deseo o sensación de potencia/control sobre la víctima. El sujeto presenta un guión que desea realizar. En este caso, el padecimiento de la persona damnificada será más elevado que en el supuesto anterior.
- e) **Eliminación del cuerpo.** El proceso finaliza cuando el sujeto accede a la quinta fase propuesta por Holmes y Holmes. Al igual que ocurría en el apartado anterior, el sujeto puede llevar a cabo este acto de diferentes maneras, dependiendo de su forma de actuación:
 - El asesino no se molesta en mover el cuerpo de la escena del crimen, dejándolo en el mismo lugar y posición que cuando cometió el acto criminal.
 - En el lado contrario, se puede observar como el individuo traslada el cadáver de un lugar a otro, colocándolo en un lugar visible u ocultándolo. En determinadas ocasiones, hay asesinos que han transportado los cuerpos de sus víctimas cientos de kilómetros para intentar con ello que no sean descubiertos y poder prolongar su sensación de poder.

4. CONCLUSIONES

Como se ha podido apreciar, establecer una definición concreta que haga referencia a los asesinos en serie resulta una tarea de difícil realización, ya que muchos autores establecen sutiles matices que provocan la diferenciación entre los términos aportados por cada uno de ellos.

En este sentido, considero primordial aunar esfuerzos con la finalidad de concretar una definición eficaz que sirva para definir a estos individuos, sin necesidad de ir seleccionando todas aquellas pinceladas que consideremos útiles dentro de cada una de las ilustraciones aportadas por los diferentes investigadores.

Por otro lado, una vez expuestas las diferentes etapas por las que pasa un asesino en serie a la hora de cometer sus crímenes, considero importante poder establecer una nueva clasificación con las fases que desde mi punto de vista son imprescindibles para intentar comprender las acciones de estos sujetos.

Esquema 4. Etapas propias de los asesinos en serie

Fuente: Elaboración propia

- a) **Fantasía.** Es aquí donde se producen los primeros síntomas relacionados con los asesinatos seriales. Dentro de esta fase se encuentran todos aquellos pensamientos que angustian a los asesinos en serie y que, con posterioridad, intentarán trasladar a la realidad. Será en esta etapa cuando empiezan a comprender la necesidad de realizar estas acciones para intentar lograr un sentimiento de superioridad a través de los posibles actos cometidos. Esta fase será propia de todas las tipologías establecidas para catalogar a los asesinos en serie, ya que tanto los organizados, los desorganizados o los mixtos necesitan de una fantasía previa donde cada uno de ellos comience a visualizar sus futuras acciones criminales.
- b) **Escaso control.** Una vez aparecida la fantasía criminal en la mente del asesino en serie, estos sujetos muestran un pobre dominio de sus propios pensamientos, lo que les lleva a no saber apreciar la gravedad de los actos que van a cometer.
- c) **La fantasía los oprime,** no siendo capaces de detener ese dominio fatuo, pudiendo utilizar para ello el razonamiento lógico que manejaría cualquier persona para discernir entre lo que está bien y lo que está mal. Cuando el sujeto se encuentra en esta fase, dependiendo de la motivación criminal de cada uno, es el momento en el que comienzan la búsqueda de sus víctimas; realizan un plan; si es necesario, utilizaran su encanto personal y procederan a secuestrarlas o asesinarlas en el propio domicilio de la persona damnificada. Son individuos que se muestran incapaces de controlar sus impulsos y, por ello, proceden a plasmar el asesinato.
- d) **En lo referente a la selección de sus víctimas,** diferentes estudios llevados a cabo por Quinet (2007, 2011) demuestran la inexistencia de datos fiables que hagan referencia a aquellas personas que desaparecen pero que no se reportan como desaparecidas (*the missing missing*), referencia importante para poder llevar a cabo un recuento eficaz. Dentro de este estudio se podrían incluir: prostitutas, niños en hogares de guarda legal, jóvenes expulsados de sus hogares por sus padres, individuos fallecidos cuyos cuerpos nunca fueron encontrados o aquellas personas que fallecieron por causas desconocidas. En estudios posteriores, Quinet destacó que el porcentaje relacionado con las prostitutas se ha incrementado sustancialmente a lo largo del tiempo, convirtiéndose en el grupo de desaparecidos con mayor incidencia.
- e) **Asesinato.** En esta fase se produce el fallecimiento de la víctima, convirtiéndose en el punto culmen del asesino. Obedeciendo a la tipología de los criminales seriales, estos sujetos podrán llevar a cabo sus acciones de una forma más violenta, cruel o esporádica, dependiendo de lo que a estos individuos les produzca una mayor satisfacción personal.
- f) **Fetichismo.** Desde mi punto de vista, todos los asesinos en serie muestran su lado fetichista a la hora de escoger un recuerdo de sus víctimas, lo que para ellos será un trofeo que les hará recordar las sensaciones vividas. En este caso, creo conveniente distinguir entre dos tipos de individuos:
 - **Organizados:** Estas personas, una vez realizada su acción criminal, seleccionan algún objeto de la víctima para llevársela con él y así poder tener un recuerdo de la misma, por ejemplo: joyas, tarjetas, ropa interior, etc. En determinadas ocasiones, estos trofeos se centran en la necesidad que presenta el sujeto de visitar reiteradas veces la escena del crimen o en realizar fotografías de los fallecidos en una posición o con unas vestimentas que serán elegidas por el propio asesino.
 - **Desorganizados:** Si bien es cierto que su forma de actuación es completamente diferente a la de los organizados, estos sujetos también mostrarán su lado fetichista cuando decidan seccionar una parte del cuerpo de sus víctimas para poder realizar con ellas diferentes alhajas o, por el contrario, para mantenerlas como elemento de decoración en su propio hogar.

ESPACIOS VERBALES DEL LENGUAJE VISUAL: ARTETERAPIA Y SECUENCIAS NARRATIVAS EN PERSONAS MAYORES

Juan Román Benticuaga

Universidad de Huelva, Departamento Didácticas Integradas. Área Artes Plásticas

(milyunaformasdemirar@gmail.com)

RESUMEN

Las palabras se han esculpido como rostros y ahora muestran su gesto anónimo, obras realizadas a través de la memoria visual, de la plasticidad de las imágenes, introyectos y proyecciones de vidas vividas y por vivir. De esta forma personas diagnosticadas con Alzheimer o con otros trastornos neurocognitivos han conseguido a través de la imagen construir palabras en una estructura sincrónica que permite no solo evocar. Sino también construir a partir de su discurso su propia descripción íntegra de la realidad, tal y como los resultados manifiestan.

Palabras clave: Alzheimer, Arteterapia, Expresión, Palabra, Visual.

1. INTRODUCCIÓN

El programa “Arteterapia para personas con alzhéimer” se propone transferir los conocimientos y recursos generados a partir de la aplicación evaluada de un programa de arteterapia realizado, desde 2012 hasta la actualidad, en el geriátrico San Joaquín y Santa Ana, de San Juan del Puerto. Este programa, evaluado según estándares científicos, ha generado evidencia sobre la eficacia y eficiencia de la arteterapia (AT) como tratamiento para personas afectadas de la enfermedad de alzhéimer (EA) u otras demencias seniles en fase moderada o avanzada. Por tanto, se trata, de, sobre la base de la evidencia obtenida, extender los constatados beneficios de la intervención arteterapéutica a nuevos colectivos con el mismo perfil clínico (personas mayores afectadas de alzhéimer u otro trastorno neurocognitivo –TNC- mayor prevalente en la vejez).

El programa aquí propuesto, sería implementado en la sede de San Juan del Puerto (Huelva) durante el año 2017-2018.

El programa se aplica a enfermos de alzhéimer u otros TNC prevalentes en la vejez en una sesión semanal por grupo de 2 h. de duración cada una, coordinadas por un arteterapeuta profesional y monitorizadas por dos psicólogas con experiencia acreditada en arteterapia, todos ellos formados en la Universidad de Huelva y en colaboración con los medio y el personal Estancia univesitaria de la Universidad del Algarve.

2. OBJETIVOS

- Crear técnicas y recursos que permitan composiciones visuales a partir de la memoria plástica y visual de la palabra, su evocación, sentido, definición única y personal, y los trazados creativos que la secundan.
- Demostrar que la construcción de mensajes visuales a través de las palabras es universal, no limitándose a creadores en función de sus conocimientos académicos, personales o culturales.
- Validar técnicas creativas que faciliten composiciones visuales con las palabras.
- Construir la palabra como elemento de transformación personal.
- Convertir en expresión artística a través de la palabra como imagen, el conocimiento biográfico y significativo de nuestras experiencias vitales.
- Evocar la palabra como forma de representar visualmente, emociones, biografía e historias de vida con trascendencia y belleza.
- Modificar la naturaleza de la palabra para su transformación y sus posibilidades de expresión natural.
- Reconocer al autor de cada yo creativo que construye a través de la representación visual de sus palabras biográficas, extrapolando su creación a la individualidad de la creatividad mayestática.
- Identificar géneros de construcción visual como medios de incorporar la palabra a su proceso creativo.
- Inferir posibilidades creativas para géneros alternativos vinculados a otras disciplinas de conocimiento.
- Disfrutar de la palabra como medio artístico, plástico y expresivo, motivando a la creación de autobiografías, aprendizaje e historias de vida. La palabra como una forma de belleza.

3. METODOLOGÍA

La experiencia visual de las palabras es la expresión didáctica de experiencias e intervenciones reales con el fin de crear expresiones creativas a través de la palabra. La persona, como sujeto de inteligencias múltiples sobre las que actúa con un sí mismo descompensado, busca significados coherentes e integrados de las que pueda disponer.

Experiencias reales, activas y vividas, recreadas en la vida plástica y respiradas por mujeres de la Asociación de Voluntarias del Barrio del Castillo de Alcalá de Guadaíra, estudiantes de grado de las disciplinas de Educación Infantil,

Graduados y doctorandos de enfermería y educación, alumnos y alumnas de primaria y secundaria, personas sin titulación básica y dificultades de alfabetización, residentes en centros de mayores con alzhéimer y otros trastornos neurocognitivos, construcciones experimentadas desde el yo propio y único que representa cada yo que lo expresa.

La expresión visual de las palabras se ha construido con la participación de colectivos diversos en situaciones y entornos diversos y en condiciones socioeconómicas diversas, de esta manera se conjuga cada una de las formas desde la igualdad expresiva de la evocación, símbolo distintivo de ser, llegar a ser, querer, saber y tener. Historias de vida, juegos espontáneos, vínculos biográficos y construcciones autobiográficas, fuera de la demostración reconocida de falsas transformaciones.

La memoria visual de las palabras es la construcción de imágenes a través de la evocación, recuerdos, sensaciones, vidas, proyecciones, introyectos en los que habitamos y en los que nos dejamos vivir, palabras fotografía y referencia, nombres de lugares, personas, objetos, situaciones que forman parte de la definición de lo que somos, polisemia continua y continuada, una mesa de cocina, la misma y distinta, Germán, un nombre, amigo, evocado, viviente y vivido, uno entre los definidos.

Las palabras tienen patria y *matría*, no asisten a la determinación, su evocación provoca la continuidad de generosas arquitecturas visuales, plásticas y artísticas, al tiempo que permiten la construcción de mensajes dentro de un proceso creativo y de comunicación en el que el diálogo entre obra, palabra y sujeto interactúa en una suerte de igualdad modificada por la participación activa de interferencias, canal, situaciones y contextos.

La memoria resuelve expresiones que forman parte de narrativas explícitas y visuales donde la estructura profunda hace sinergia con la superficial, vomitando lo explícito y rescatando la palabra como elemento válido de la representación visual de la escena. La palabra, a través de la creatividad, permite universalizar toda construcción artística como producto inclusivo para cualquier sujeto actor de la creación, independientemente de su condición académica, cultural, social, ya que las palabras proponen evocaciones vinculadas a la memoria y biografía personal, válida, hábil y real en cualquiera de las historias de vida en las que habitamos.

No se trata de producciones vinculadas a la escritura creativa condicionada por los elementos narrativos, coherencia y cohesión, sino que participa estrechamente de la función catártica y terapéutica de la palabra como expresión artística y composición, así como de las funciones estética y comunicativa que le son propias.

Las posibilidades de expresión de la memoria visual de las palabras permiten la conversión y la búsqueda de nuevas formas de expresión creativas, visuales y biográficas, en las que la identidad personal y la palabra se nutren de estructuras tan espontáneas, como automáticas y visuales, próximas a la retórica; enumeraciones, metonimias, simetrías, etc. como otras alternativas, títulos, repeticiones, formatos gráficos de representación, soportes y medios varios enfáticos de significación, significativo y sentido, y cuya denotación promueve un estadio preactivo de la expresión: *Una pluma, unas gafas; El amor y las ciudades; Una conversación; Los domingos; Hacer números; Valle del recuerdo; Los recordados; Toda una vida; Una música; La realidad; Una carta, dos vidas; Deshoras*,¹ etc. *Escrito en un instante* como referencia de estilos y pseudogéneros, títulos de evocación sinestésica y personal. Antonio Muñoz Molina como ejemplo de escritura biográfica donde la intertextualidad supera los límites de las artes para corresponder en la vida, intertextualidad como paseo, mirada, ciudad, taxi, regreso, aeropuerto, ventana, escuchar, contar, música, más allá del texto, la intertextualidad como relación individual con las formas personales de evocar, fluir, memorar, recuperación visual de los episodios de nuestras vidas, traducidos en obras creativas de belleza plástica, visual, artística y trascendental.

Las técnicas creativas, la expresión plástica como recurso y el fomento dialógico, nos permiten poemas visuales, imágenes escritas, gradación de colores, espacios de miradas, expresiones verbales construidas desde la representación no explícita de la palabra.

Y siempre volviendo a la intertextualidad del paseo, Stendhal, Nietzsche, Josep Plà, Pío Baroja, Walser, Thoreau, a las posibilidades mediáticas y la necesidad de transformación de la palabra por encima de la evocación, como producto personal, creativo, estético, catártico y expresivo; artístico.

La expresión visual de las palabras son paseos por la belleza, los motivos y recorridos de vida, pasados y lastres, recuerdos y felicidades, un regalo para el alma que se plantea por qué seguir viviendo, mientras construye belleza y memorias transformadas. La convivencia en un sí mismo habitado.

Literatura, psicología, arte... la memoria visual de las palabras altera y participa diversas disciplinas académicas, invitando a las más expresivas, a compartir la comunicación e introyección como posibilidad de expresión artística y plástica, concentrando su intención en consignar la creación visual como un elemento de trascendencia biográfico, que argumenta sus antecedentes en el sí mismo creativo.

- La expresión visual de las palabras es habilitar álbumes fotográficos, cuajados de referencias sintomáticas de lo que somos, la esencia particular de vivir tiene un carisma propio de las escenas: imágenes.
- Somos la realidad que visualizamos y construimos, hacer de la acción e interacción una modalidad de expresión artística lleva a concretar la creatividad como una posibilidad donde lo correcto se evade para transformarse en lo explícito, formas no significadas parte de las nuevas composiciones afectadas por sema, significativo y asociaciones transformadoras. La evolución del pensamiento verbal como una suerte de imaginación pertrechada por la mirada personal, la alternancia, las posibilidades y el juego.

4. ESTADO DE LA CUESTIÓN

La palabra, como elemento de creatividad artística, permite y facilita la evocación, lectura y escritura puesto que se nutre de la palabra y el relato biográfico como forma de extender el medio de aprendizaje.

Gianni Rodari, en su obra *Gramática de la fantasía* (1983) recupera algunos aspectos de la expresión pero no redundando

¹ Títulos de Antonio Muñoz Molina para las entradas de su blog www.antoniumunozmolina.es en su sección Escrito en un instante.

en las posibilidades que puedan ofertarse a otro tipo de colectivos exentos de formación académica o en otras situaciones sociales, médicas o económicas.

La palabra como experiencia plástica y visual no solo consigue alcanzar el futuro necesitado de otros colectivos sino también profundizar en la manifestación no verbal de la palabra como forma de la que no consta alternativa argumentada ni bibliográfica para su consecución, aunque existen algunas formas originales y creativas vinculadas a un conocimiento previo de la lengua y su expresión distintos de la palabra como mensaje de experiencia visual que argumentadas permiten pluralizar las transmisión de mensajes, que no la socialización de la palabra, eje vertebrador de ese concepto.

No existe bibliografía acogida directamente al tema planteado pero si se pueden encontrar apoyos en Gianni Rodari y su *Gramática de la fantasía* y en la estética y filosofía general de la imagen y la palabra como puede ser *La poética del espacio* (1957) de Bachelard.

5. LA EXPRESIÓN VISUAL DE LAS PALABRAS

Soy la boca de una madeja
que flota en tu laberinto²

Cuando escribe su nombre no percibe otra sensación que la del color rodeando una forma, líneas concéntricas que se acumulan sobre el rastro de una palabra que es ella.

Ochenta y siete años esperando para contar a través de un agujero que se escapa todos los miércoles, con la literalidad suficiente para no soportar el lastre de la soledad que la acompaña cuando mira desde su silla antes de intentar ponerse en pie: *una madeja de lana, una boca, un flotador, un laberinto, una colchoneta*, soy más de lo que siento, soy lo que me represento, una imagen que evoca y resucita, la simpleza de un juego que traslada una vida que le pertenece y no poseía, tercera persona de quien se es, primera de quien medita, segunda para quien habla, cuenta y escribe.

Cada analogía se convierte en el cauce de una nueva palabra, la misma idea en la misma conversación, construyendo relatos y autorrelatos: todas y la única biografía posible que se traslada a la realidad de la realización y autorrealización personal, la estética de la identidad, el introyecto de vida, el pasado fusionado en la hermosura de lo contado, de lo que existe, de la sensación creadora en la autoría, he hecho, has hecho, hemos creado, la construcción del yo y todas sus posibilidades, como si una tercera persona distinta, ajena y creadora nombrara mi nombre, produjera mi espacio, recuperara mi estar y lo contara explícito, con la convulsión efímera de lo que soy, de la belleza que es distante y próxima (Eisner, 2004).

“Las formas de representación son medios por los que se hacen públicos los contenidos de la conciencia. (...), el proceso de hacer público el contenido de la conciencia es una manera de descubrirlo, estabilizarlo, revisarlo y compartirlo”.³

Nombrar el mundo, nombrar la realidad, una narrativa visual de lo que soy, nombrarlo para que las palabras se conviertan en la memoria reconstruida de biografías en las que he vivido, evocaciones espontáneas, provocadas o simuladas de las posibilidades que represento, sin el acto de nombrar y la sustancia de su sema, sin su presencia visual, grafía y forma no existen los estadios posibles de memoria, realidades paralelas, alternativas identitarias y vidas habitadas.

Macondo era entonces una aldea de veinte casas de barro y cañabrava construidas a la orilla de un río de aguas diáfanas que se precipitaban por un lecho de piedras pulidas, blancas y enormes como huevos prehistóricos. El mundo era tan reciente, que muchas cosas carecían de nombre, y para mencionarlas había que señalarlas con el dedo.⁴ (García Márquez, 1987)

Nombrar el mundo para nombrar la memoria representada en palabras, el contenido superficial de su forma sobre la construcción real de su estructura profunda, la connotación sobre la denotación, el juego tácito y personal de la metonimia y la metáfora como confusión cierta con la realidad, porque la intriga íntima de lo que soy se representa con una forma y tantos fondos como alternativas sugiere mi vida, historias he vivido y personas he habitado, como voces he escuchado y pieles he ocupado, vidas vividas y posibles, vidas no vividas y ocupadas, vidas observadas, vidas... El diario El País una mañana de calor y agosto titula *Todo lo que se nombra existe*⁵, con determinación de forma y soporte en que se representa lo nombrado, voz, grafía, papel, aire, etc. puesto que el sentido de propiedad biográfica y su trascendencia se nutren de su simbolización.

El mundo nombrado se representa desde la memoria visual. El pensamiento lógico hilvana las secuencias temporales que el pensamiento divergente traduce en diversidad y alternativas, superando los prejuicios creadores, arrancando desde la sema íntima de los imaginarios, como otro yo posible entre todos los yoes habilitados, conversaciones sin cuerpo a través de la distancia, como personas hechas de teclados y tiempo, existiendo en las redes virtuales y comunicando sobre el soporte efímero de la espontaneidad y el instante de su definición, habitualmente esas vidas se llevan más tiempo, imaginación y deseos que las vidas materiales cargadas de rutinas y faltas de imaginación. Se rodean de actos y proyecciones personales, que el desbloqueo creativo asume nombrar y transcribir.

Nombrar el mundo, toda su diversidad y personalidades, contextos, experiencias, edades y fórmulas posibles, individualidad

² Fragmento de la experiencia creativa realizada con personas mayores con Alzheimer u otro trastorno neurocognitivo. 2016

matemática que nos lleva a la gramática de lo colectivo, viaje de la creatividad emergida desde el instante individual hasta la autoría personal, tantas miradas como sucesos acontecen en cada vida, posibilidad, relato y alternativa. La palabra tiene formas tan vinculadas a su fondo, que se convierten en epítetos fijos de su significado en la evocación visual y personal de cada una de ellas.

Las palabras tienen memoria. Es una memoria innata instalada en el largo plazo y amarrada a su existencia. Las palabras se recorren como ciudades, anotando los números de posición en los que habitan, esperando lugares desvestidos, memorias confusas, recuerdos que permanecen tácitos e indelebles, espacios y personas en los rincones de miradas, gestos, situaciones, belleza podrida en un motivo divergente que se sostiene de nada, del aire del nombre, del nombramiento nómada que duele, se condena, disfruta y entiende.

Las palabras tienen tanta memoria que, escritas, pueden leerse, escucharse y transformarse, con sus pulsos y sus antorchas, con la capacidad erigida en fiebre, no son más que trozos desfragmentados de pasado en los que proyectamos el presente, una palabra evoluciona y se hace plástica, representa lo que no es y quisimos y se vuelve literatura en la medida que se construye.

Hay palabras que no son literatura, que se sumergen de la mano de una voz que las nombra y hace prisioneras, vidas instantáneas que no son la espontaneidad de vivir, porque inventado y escrito, el azar es menos fortuito que la vida.

Una palabra se transforma y condena, vinculada a la biografía objetiva y subjetiva de cada yo, que es otro y no puede serlo, y su manifestación es el arte de la exhibición de los desnudos, cuerpos memoria no deteriorados por el tiempo, referencias conjuntas que no son definiciones sino más que evocación insólita de quien se es, yo era, tu eres, él es, ella es, una conjugación dispuesta a la palabra, al sema, a la inducción del determinismo en el género de construcción artística que es la expresión de cada vida, como un lexema origen que vincula y justifica su presencia física y evocadora, el trazo, la forma, el fondo, la perspectiva, el color, sonido, representación, simetría, sincronía y anacronía, su tiempo, la palabra como un género no sustantivo sino original, dotado de la creación tácita de sus recreadores, palabras diseñadas para la identidad desfragmentada del pasado, de lo propio, íntimo y personal, y que se manifiesta sobre soportes físicos y etéreos, sobre desestructuras gramaticales, normalizadas, correctas, aceptables, la palabra como una expresión identitaria, plástica, consecuencia visual de la memoria de sí misma.

Hay palabras dotadas de poder para reptar por el suelo. Tienen que ver con los pies y con las manos, con la textura de lo blando y de los cuerpos, con la orina y con la tierra, con la pobreza y con las cosas groseramente digestivas. Merodean el recuerdo de los primeros sabores, el aroma a hojas quemadas y las manos frías de alguien que te importa; palabras que de pronto en el exceso cotidiano de teclas e imágenes te sorprenden, ¡caramba, hay cuerpo! Son sobre todo palabras del tocar y del oler, de la muerte, de la boca y de la carne.⁶ (Zafra, 2015)

Palabras sinestesia, palabras biográficas, palabras exentas de teoría, pulsadas de yo, de introyectos reales, imaginarios, representaciones, evocaciones, significado y grafía, el nombre de una panadería, su neón encendido, el pulso escrito, el tiempo vinculado al pan y aquella panadería, la voz de la panadera, la forma hecha palabra de los mismos hábitos, en los mismos lugares, en el mismo tiempo, en el ciclo anacrónico en el que se representa la validez de sus sonidos equiparada a la de sus palabras, porque su pronunciamiento es la voz en la que significa, rotunda de lo que es.

Hay nombres de lugares, personas, palabras que no existen más que en una voz y una garganta, y que rompen su significado a través de otra pronunciación, palabras que se evaporan lejos de los tonos y los timbres originales, paisajes sonoros no transcritos que se pueden escuchar evocando la memoria personal y biográfica de quien hemos sido y somos, los cerramientos de un ciclo que se detesta o entiende y habita próximo a la marginación, al reverso, bucle o recuerdo preciso, imágenes como palabras que se esparcen con la necesidad de trascender su vida, representación gráfica y visual de las voces y significados esenciales a los que pertenecen. Existen palabras tan vinculadas a otras personas que no existen en otro pulso, tono ni voz, aparecen enterradas en voces distintas, copias fraudulentas de la realidad que evocamos, un rostro, un presente y una mano que la memoria se empeña en compartir y que, fuera de su imaginario, se modifican, prejuicios del plagio en que la insinuamos.

Lo que importa es que las vidas no sirven como modelos. Sólo las historias sirven (...). Sólo podemos vivir en las historias que hemos leído u oído. Vivimos nuestras propias vidas a través de textos. Pueden ser textos leídos, contados, experimentados electrónicamente, o pueden venir de nosotros, como los murmullos de nuestra madre, diciéndonos lo que las convenciones exigen. Cualquiera que sea su forma o su medio, esas historias nos han formado a todos nosotros y son las que debemos usar para fabricar nuevas ficciones, nuevas narrativas.⁷ (Heilbrun, 1988)

No hace falta comenzar para retener las imágenes que concede una palabra: mesa, la de la cocina, blanca, con sus cuatro sillas alrededor, respaldo metálico, inoxidable, abierta, extensible, ala izquierda para José, ala derecha para el abuelo. Mesa, en la voz de mamá, es la mesa, en nadie más la misma; cambia su significado, la imagen de su evocación, la de los gritos encerrados, roces y mediodías de cocina.

Las palabras representan la fotografía inconsciente de nuestro álbum de miradas, lugares encontrados que no llevan a ningún sitio porque no hay creencia en la resistencia que ofrecen, el objeto es concertado por el pensamiento pero su grafía puede no corresponderse con su significado, no hay una palabra concisa, hay una noción de experiencias personales que son más que el juego del que participan.

Las palabras tienen memoria, recuerdan movimientos, sonidos y espacios, recuerdan colores, gestos y cumpleaños,

⁶ Zafra, Remedios. (2015). Ojos y capital. Bilbao. Consonni. Página 11.

⁷ Heilbrun, Carolyn. (1988). Writing a woman's life. Ballantine books. New York. Página 62.

recuerdan personas, viajes y lugares, ventanas y taxis antes del aeropuerto, transiciones y momentos que el pensamiento conserva en el silencio ruidoso e inconsciente, intrahistoria de sí mismo, áreas en la que se es y está sin tiempo alguno ni espacio propio, el viaje, cada Ítaca.

de una vida feliz es aprender a lograr el fluir del mayor número posible de las cosas que hacemos. (...) El mundo es de nuestra incumbencia, y no podemos saber qué parte de él se ajusta mejor a nuestro yo, a nuestras potencialidades, a menos que hagamos un esfuerzo serio por aprender tantos aspectos de él como sea posible.⁸ (Csikszentmihalyi, 1997)

Las vidas son creatividad de acción, pruebas continuas de perspectivas y experiencias mediatizadas por sesgos culturales, poderosas razones para nuestra transición. Fluir surge de la inercia provocada por cambios coyunturales y estructurales en defensa de la vida y la evolución personal, sintonizando con la sociedad, herrajes de agilidad anímica en la que los desbloques creativos se expresan como antecesores fundamentales del hecho. El desbloqueo como ejercicio de reivindicación de la mirada, la persona, el hecho, la perspectiva y la creación, contienen una vocación de ser y hacer, una decisión de posibilidades en cada una de sus alternativas.

No siempre se acuerda uno de todos los episodios decisivos de su vocación. Hay descubrimientos que nos afectaron y que nos importaron mucho, que nos despertaron a mundos que habíamos ignorado hasta entonces y que, con el tiempo, se olvidan, igual que se olvidan libros y películas o canciones que por un motivo u otro dejaron de tener un efecto consciente sobre nuestra imaginación (...).⁹ (Muñoz Molina, 2013)

La palabra, trascendiendo los géneros biográficos y literarios, comporta la posibilidad de hacer de sí misma una representación plástica y visual, evocando y permitiendo que la creatividad se integre en las miradas, fluya nombrando el mundo y cualquiera de sus perspectivas, recreando significativo y significando como constructores de nuevas experiencias, reivindicando grafías, soportes y formatos desde la memoria visual de lo representado.

Toda palabra requiere un alejamiento de la realidad a la que se refiere; toda palabra es también una liberación de quien la dice. Quien habla aunque sea de las apariencias, no es del todo esclavo; quien habla, aunque sea de la más abigarrada multiplicidad, ya ha alcanzado alguna suerte de unidad, pues que embebido en el puro pasmo, prendido a lo que cambia y fluye, no acertaría a decir nada, (...) ¹⁰ (Zambrano, 1996)

El viaje, la mirada, estares y habitares, y la palabra como referencia biográfica y representación visual enrocan con la creatividad la opción de vomitar alternativas en continuo diálogo con la expresión y la producción artística. *Escrito en un instante* calcina formas arbitrarias de creación, conjugación de vida posible, autor y obra a partir de su interacción. La comunicación como espacio artístico donde las referencias son perspectivas implicadas en un proceso de creación alternativo, la palabra como expresión visual.

5.1 Habitación de mapas

Intrahistorias de una vida que continúa despacio, hoy desesperada, ayer expectante. Las voces se derraman alrededor y el tiempo se confina como un diario, anotaciones que existen sin trascender, con el dominio de la purga de lo que somos, desprendimientos de anécdotas en la estructura que contemplamos, si yo fuera o hubiera sido, si yo hiciera o hubiera hecho, si yo estuviera o ... desnormalizar la escritura nos convierte en una creación al margen que reconoce la autoría, yo creo, al tiempo que te hablo, buscando un formato que me enseñe que eres tú quien me escucha, tú, a setenta y siete kilómetros o cincuenta y tres centímetros de largo, tu cuerpo pequeño y agarrotado, los ojos en la esquila de los movimientos que no confunden los abrazos, el número ciento dieciséis y la espera. Llego a dormir donde se encuentra la calma, el paisaje fabuloso de otro viaje, la paz, el mar, los ojos cerrados, el coche, todo contenido en la música de jazz que suena a no más de las once, sin naufragio ni posibilidad, y lo cuento, te escribo en un espacio donde la norma es el argumento de una imitación, donde romper el trazado del hacer es la copia explícita de la memoria visual.

Te recuerdo en una palabra, en el papel de unos tickets de comida que envejecen con una fecha, la anotación por detrás de un número de teléfono, hoy, cualquier día, tu mensaje de whatsapp, y no existe lo que exhibes, existe lo que espera, cualquier palabra acumulada que me lleva a la habitación de los mapas de mi vida, la cartografía existente de la memoria que me retrotrae al descubrimiento de las veces que me he enamorado, las condiciones de cada consecuencia, las paradojas de cada estafeta. Música, busco música en las estanterías de los libros, pulsaciones del desayuno antes de la cama, te espero, la puerta cerrada y la noche caída, jueves, un sendero de mensajes que acaban en el sofá donde me esperas, es mi habitación de mapas, los retales de cartón sobre los que escribes con tu letra más decidida, el mensaje que te presto en el desayuno o pones sobre mi ordenador, mi habitación de mapas, las trabas para no contar lo que no he sido y las posibilidades que tengo de serlo, mi vida estructurada sin guión ni argumento, recuerdos amontonados sobre restos de papel y centros de depilación, ofertas de pizza y llamadas a distancia, ahora que las redes me permiten encontrarte para ser la persona que mi vida recuerda a las trece, una calle de Madrid, una mesa de cocina, una palabra grabada en la sien de un paisaje sonoro, habitar, habito, la palabra en que descanso.

¹⁰ Zambrano, María. (1996). *Filosofía y poesía*. Madrid. Fondo de Cultura Económica de España. pág 21.

Haces la cena y murmullas, juegan, la vida en la mesa del teclado fluye precisa, si escribiera a mano no podría encontrar esta disertación, porque tengo la necesidad de que el pensamiento fluya con la expresión, con la palabra, con la desinhibición explícita de lo que procede. Miro mi pluma, el cuaderno rojo, el bolígrafo, acompañantes previos de la belleza de una papelería en Reina Mercedes, en los comerciales donde practicábamos este juego que quiero relatar, cuadernos manuales, encuadernados de cinta adhesiva y papel reciclado, con un color leve y distinto del blanco, ésta es la sinestesia, la necesidad de que mi habitación de mapas se construya como mi cartografía, y tenga miedo de recelar de su contenido, donde escribo opciones de mis carreras, anotaciones similares a un diálogo próximas a no ser compartidas, porque yo no soy trascendente, no escribo como Munch aunque creo como un acto, no soy el escritor que presenta *Escrito en un instante* y lo instala con la seguridad de que alguien alabaré, aplaudirá, leerá, compartirá, expondrá sus razones sobre lo leído, porque en lo comercial no hay tregua para el intelecto, no soy ni pretendo la pareja que anima el ánimo y lo construye sin soledad, la misma indulgencia con la que se trastabillan las palabras y no logran su sentido antes de perjudicar la pausa.

Escribía cualquier cosa: diarios, poemas, arranques de obras de teatro o de novelas, críticas futuras que los periódicos internacionales publicarían sobre ellas. Escribir era una tarea completamente material: la pulsación de los dedos, los golpes de las teclas sobre el papel ceñido al carro, el timbre que avisaba del final de la línea. También el olor a grasa y a metal de la máquina. Eran los dedos y la máquina los que me llevaban, no la inteligencia, ni la imaginación. Escribir algo a mano y pasarlo luego habría sido hacer trampa: la escritura era inseparable del medio en el que se hacía.¹¹ (Muñoz Molina, 2010).

Mi habitación de mapas es la caja de mi vida, la historia contada en parcelas de calma, cada uno de los mensajes que me dejas, la palabra precisa con la que me adornas, la factura del hotel de Aracena, su nombre y la palabra, el recibo del ingreso de la hipoteca, el seguro del coche, la parte que sólo reconozco, y yo, y los nosotros que somos y hemos sido, el ticket del peaje a Lisboa, los nombres de lugares y su metonimia, logos que son la palabra representada, los titulares del periódico que recuerdo y recreo en una cadena de sentido, las noticias que recorto, los archivos de historias que sólo leo en su inicio, y forman parte de la ficción que vivo tan real como irreal e instintiva. Las imágenes de la cabecera del periódico, El País, temprano, la palabra clave habitual que anoto en google, y me lleva con el desayuno a las rutinas que recuerdo, habitación de mapas.

Mi habitación de mapas son todos los lastres de una vida contada por la propia memoria, donde las evocaciones directas provocadas por soportes, medios y mensajes (Puig beso mujer araña) son capaces de hacer del documento, la presencia con la que intervenir artísticamente sobre la plasticidad de la palabra y su pensamiento visual, con la oportunidad de transformarlo.

La palabra creativa, biográfica y su representación visual se nutre de la materia prima de cada habitación de mapas, de las estanterías que la adornan, la paz de su incienso y las esquinas de sus delitos, la acumulación de objetos, papeles y sabores, se nutre de lo efímero, conservando las pequeñas cosas en el valor de su emoción, la observación y la mirada diaria, el recorrido del mismo paseo, de habitaciones de mapas tan particulares como universales, únicas y comunes, donde la literatura no es la escritura del argumento, sino donde la palabra se pronostica como construcción artística de la imagen de lo que soy, yo, cualquier yo, también todos los que somos en una sola vida.

5.2 Siete formas

En *Siete maneras de decir manzana*, Benjamín Prado comparte apuntes para explicar un género que se construye a través de la creatividad y la representación visual, buscando formas de expresión de la palabra, que tiene por causa y efecto la construcción de imágenes, bien como poesía, bien como modelos alternativos para evocar, nombrar, transcribir o fragmentar la realidad.

La originalidad, la introyección, y prospección de la palabra conforman el germen original del ser original en el mundo *desoriginal* que habitamos, a través de la autoría como sinónimo de creación.

Se experimenta con las formas gramaticales la expresión visual que el pensamiento simbólico otorga a la palabra con finalidad no solo comunicativa, sino terapéutica, creativa, innovadora, personal, socializadora y artística, derivando a su vez en una propuesta de géneros creativos en los que conviven los cuadernos personales con el diario, la historia de vida, el relato, etc.: La palabra como un modelo de narrativa visual.

Una región psíquica y afectiva en la que el lenguaje debe cumplir un papel muy diferente del que tiene fuera de la vida real,...inventarle algún nuevo sentido a las palabras, establecer asociaciones inéditas entre ellas o descubrirles atributos desconocidos,...urden imágenes que nunca habíamos visto,...se estiran y mudan de forma, intercambian su sentido, acogen significados nuevos,...las propias palabras se canjean por objetos, para explicar qué son,... un nuevo significado equivale a una nueva palabra,... ¿Y qué serían entonces las imágenes? Lo que se ha de percibir sólo una vez, siempre una vez y sólo ahora y sólo aquí,... todas las palabras son, a lo sumo, palabras aproximadas,..., ¿De qué manera puede actuar la imaginación?¹² (Prado, 2008)

Un texto es un escenario, y también el apunte de un lector sobre el cuaderno desordenado, tachones ensimismados que aprenden palabras copiando y reproduciendo cada mensaje, para reflexionar el valor que compartimos, reproduce las sensaciones del paseante profesional de flexo, café y tarde, de campo, ruido y soledad que, en una palabra, intenta convertir un mensaje, y que anota, y escribe, sobre cualquier papel y en cualquier margen, sobre cualquier línea y cualquier párrafo,

¹¹ Muñoz Molina, Antonio (2010). Una primera tentativa.. En www.antonio-munozmolina.es. Recuperado de <http://xn--antonio-munozmolina-nxb.es/index.php?s=una+primera+tentativa>. Consultado 2 de julio de 2010.

¹² Prado, Benjamín. (2008). *Siete maneras de decir manzana*. Madrid: Visor. Página 45.

con post it y colores, fluorescentes y rayas, tachones y formas, ocupando los límites del libro, y escuchando el poder de la acera, la mirada sobre los zapatos, y la flexión de su rodilla, donde se juntan Bécquer, Lorca, Valery, Rilke, Lowell, Wallace Stevens, Octavio Paz, Guillén, Azorín, Celan, Pound, Cernuda, Gil de Biedma, Valente, justificando que cada forma de anotar pertenece a la anotación, no a la justificación. De esta forma reivindica la exploración de los sentidos a través de la mirada y las formas en las que se presenta, el papel del observador, la escucha de la que somos testigos en primera, segunda o tercera persona, y del ciclo vital al que nos conduce el álbum fotográfico y visual que representamos con las palabras, como un bodegón de memoria.

6. LA PALABRA PLÁSTICA

Desde lo biográfico, la palabra determina su pensamiento en pos del proceso, acompañamiento y géneros procuradores de la demanda, modelos que actúan por sí mismos como desbloqueantes por el valor no solo empático sino pedagógico que representan, insistir en el encuentro como teoría de aproximación, es hacer material el encuentro verbal, físico u orgánico, donde las palabras de forma física intervienen en una sistemática de huida de espacios de salón a lugares en otra plaza, ese movimiento es la provocación de que las palabras en su enunciado contengan un contenido visual exclusivamente vinculado a la existencia de cada yo, las referencias objetuales, personales, implícitas en la sinestesia y gesto acodado en la empatía, concluye por producir la entelequia de mensajes dispuestos para su transformación, así el reconocimiento e interlocución evadida de la escucha, proporciona el milagro de la creación, la mirada hacia el cumplimiento de la estética, la comunicación, el llanto que reúnen unos dedos al escribir, una voz al pronunciar, un oído al escuchar desde la sabiduría corporal de un cuerpo que no sabe que lo sabe, pero sabe que lo puede saber y necesita demostrarse que saberlo y representarlo es el síntoma de su propia trascendencia, del valor de una vida construida en un sentido, de las ventanas abiertas para que el paseo continúe su dirección, catarsis, estética, comunicación de una vida que el bolsillo de la satisfacción ahueca en una lágrima.

El ensayo verbal de esa visualización se integra en lo plástico, posibilidades, el derecho a la elección de cada optativa, con el sentido de su participación.

El valor biográfico de la palabra procura el sema de su imagen, la gramática una posibilidad de su trazo, el significante una denotación de su significado, la obligatoriedad de irrumpir en la normatividad como un trazo lo hace sobre la materia. Cabe en la garganta la pronunciación, así embolsadas las palabras precisan de un soporte y un medio que las determine plásticamente, no sólo para la producción sino también para el flujo de sus pesquisas, la forma distinta y distante con la que brotarán fortalecidas por los elementos externos y los auto generados por la motivación implícita de los obstáculos esquivos, desbloqueo.

Y en esa perspectiva con la ciudad al fondo, el paseo por la mirada se convierte en el parabrisas de una línea continua, donde los kilómetros se caen manteniendo su estructura, transformando las distancias en paisajes ya no míticos, lugares a los que se accede más allá de la imaginación y que a su regreso contienen otra memoria visual, la de la palabra proferida en el accidente, el lugar, el punto mismo, la carretera, la chocolatina de la merienda, hace cuarenta años, antes si eres tú, después si soy yo, no existe una chocolatina que en esa palabra tenga otro sabor, valor, precio, hora, calle, tienda, vendedor, retinas retenidas en el mensaje visual que concentra una chocolatina, la misma que recojo del supermercado y sigue siendo la que era, aún con la forma deformada de lo que representaba, la memoria como un objeto que evoco en una palabra y connota más allá de ella y pide transformarse para el regodeo del recuerdo de su belleza, buscando fórmulas, entrenamientos no concentrados, miradas inéditas, formas de conservar su recuerdo con la misma diligencia que el paso del tiempo lo hace sobre ellas.

Te quiero, es lo que recuerdo del aparcamiento del coche y las veces que me he enamorado, las luces apagadas, tu cuerpo rendido y el nombre en los labios, hoy, antes los tuyos. Sara es un nombre, definición de un personaje sin construir que forma parte de una memoria, unos años, una conversación y una mesa, quinientos kilómetros, los lugares de Alcalá, Torrellano y Barcelona, los pantalones y las campanas, la noche de los cuerpos, julio y agosto, no son recuerdos, no es la memoria continua de un relato, sino la narración visual que el propio nombre de Sara recuerda, único, como los números indescifrables que en una combinación probable y distinta se manifiestan en el orden del lector de tu rostro 656393973, continuidades casuales, numeración asociada a la plasticidad enumerada de un nombre, también viceversa, porque hay palabras voluntarias que en combinaciones consisten en recrear el tiempo sincrónico de la belleza de los tiempos vividos, conjugando desde la analogía, la asociación, la forma, el soporte, el medio, todos los estilos de belleza posible.

Las premisas son evocaciones que continúan el gesto de la emoción, las palabras, la facilidad del componente retórico como herramienta visual, las dimensiones fónicas, semánticas y sintácticas como agujeros de expresión artística, plástica. Palabras horizontales por forma, fondo, contenido o evocación, *murmullo*, moviéndose despacio hasta huir del soporte, con la verticalidad de su forma y la horizontalidad de su sonido, con la profundidad sin escorzo de su lema ni la evocación reciente de su carisma, línea de tierra que se evade del conflicto en una tabla de referencias donde no cabe más que el sonido.

Palabras verticales por forma y fondo, la agudeza con la que cae un *plato* en mi memoria, la verticalidad de su forma *p* embarazada, cabeza, pipa, trompeta, sonido, *l* caída, así hasta una suma de analogías embebidas de ellas mismas, la combinación de las grafías y el significado. Te espero con la letra clara y específica de la mano, porque la grafía es la configuración perfecta de un calendario vital que se arruga en los confines de su sentido. Sentido, significado, espera, estética de una belleza avanzada que se idealiza en la realidad de su visión, incluyendo la perspectiva lineal de su tiempo y la longitud emocional de la sensación, analogías, asociaciones, vínculos, cuando los trazos se cruzan y descubren nuevos colores, los similares son los intercambios desordenados de sintagmas que no llegan a enfrentarse en su espera, transcripción de paisajes sonoros en los que las voces comparten instantes, segundos exactamente perfectos, tiempos idénticos y espacios exactos, con una inspección temporal donde no cabe la confusión entre tiempo y espacio y han de practicar la compañía sobre el soporte,

Preguntas de un lead que interrogan las analogías, dónde, cuándo, quién, qué, por qué, cómo, el juego creativo que en clave serena obtiene los trajes y sombreros verdes, rojos, ... que De Bono prefiere para el rescate. Jugar, representar, la misma ilusión que lleva hasta el aprendizaje y experimentación del juego, los elefantes, espectogramas, maneras, la selección a ciegas, los contrastes que hacen de la palabra una representación, la magia de una isla que entiende el paisaje en el que resiste. La escritura ciega, con diversos medios, en diferentes soportes, la escritura de impresión inversa, la combinación de grafías, las nuevas palabras de la propia, su concatenación en la estructura de tu cuerpo, los cuadernos de nombres, juguetes, recuerdos, regalos, objetos, cuadernos fríos combinados de nuevo y depurados a la vez donde lo explícito es la memoria visual congénita de la sustancia que representan, las conjunciones, determinantes, pronombres como nexos cotidianos aferrados a las palabras, límites de los trazos del papel que se entorpecen sin decir nada, el retrato del silencio con las pausas aguerridas, la velocidad precisa de la sucesión, enumeración, hasta evaporarse en la coma y punto final del silencio de la muerte similar a la persona que no está y te inscribe sin proceso, las multiformas de cada palabra, formas curvas, cíclicas y paralelas, líneas de fondo y de tierra, palabras circulares que empiezan, rectas, curvas, puntos de luz en el trazado del subrayado de una materia que es la palabra, línea de márgenes, palabras retornos, palabras estándar, industriales y explícitas, palabras ruidosas, bélicas y concebidas, en vientres confidenciales que conocen la derivación como transformación de su naturaleza, prefijos, sufijos, lexemas, leyes de la transformación productora de imágenes que reconquistan la fortaleza del mensaje, que esparcen fogonazos y demoras, a y o coinciden, a o s, masculino, femenino, plural, cuántas elecciones hay en tu nombre, cuántos diálogos existen en tu piel, personajes fluyen de tus formas o elegantes de tu garganta. No hay textualidad, hay orificios de materia, plasticidad combinada de mensajes que se enganchan a la creatividad sin la crisis del ánimo.

Lo racional como una postura de juicio en el imán de la razón imbricada con su cambio. Alternativas, miradas, otras, las mismas, diferentes, mirar con la norma y para ella, en contra de su quien se resiste. Concentración intensa y ordenada en la felicidad improvisada y prevista, casi automática, la palabra como vivencia de integración, obra fluida que nace del elemento en el que reposa, próxima a la pasión creadora como acción autotélica en la que dificultad y destreza se alían en contacto con la actividad y la conciencia creadora.

La palabra prescribe términos asiduos, la comodidad de traducir su realidad sistémica al certamen cultural en el que convive, incluyendo las facciones idiomáticas, y palabras con capacidad de forma y contenido nombrado. La personalidad cultural como un mensaje que se mantiene en círculos concéntricos evadiendo su calor desde el yo hasta el nosotros como comunidad global de convivencia, el modelo artístico, una referencia hábil que dialoga consigo mismo lejos del límite de un título, la palabra con forma, no como ilustración de la forma, la palabra como color primario que grada su energía en el escenario de la imagen.

¹³ Composición de la conjugación de la palabra como recurso visual.

Imágenes esporádicas, imágenes vencidas, imágenes en palabras que sufren manipulables, dúctiles, flexibles, dinámicas, amorfas, líneas sobre una imagen que tuercen su sentido y agarran su sema, devastándolo, haciendo un juego continuado de sufijación, prefijación, lexema, sin respeto por la raíz y conjura por el significado, visualizando palabras comprensibles que no se desbaratan en nada, proyectos sobre un cartón que significa tanto como su propio contenido y que no aísla la palabra de su sentido evaporado.

Las palabras son palabras únicas, modifican y alteran los semas en función de su significante representación, adiós con prisas, adiós hasta siempre, adiós María, no te he vuelto a ver, y el marco donde sucede y el asfalto del escenario, una pista de deporte a los catorce años. Si la sema se enriquece, cada palabra aumenta su valor significativo en la forma de lo que representa, no de lo que es, la transformación de la palabra convierte imágenes en perspectivas de sí misma, jugando no sólo con la condición de forma, tamaño, grafía, soporte y medio en un plano puramente plástico, físico y visual, sino que a través de su sema, las modificaciones aplicadas, la actuación sobre su enraizado, y la deconstrucción y conversión de su estructura formal, permiten imbricar y persuadir su propio sentido, significación y aceptabilidad, en cuanto a su experiencia visual y su trazado formal en condiciones gramaticales, incluso reconstruyendo su imagen por elipsis o zeugma de la expresión original.

La palabra es una experiencia global de comunicación, denostada por la unidireccionalidad de su intencionalidad verbal, expresa drásticamente los sonidos no arbitrarios de las percepciones humanas, considerando la estructura gramatical palabra como entidad en una dimensión no arbitraria, aquélla que fallece y se rinde ante los intentos incondicionales de las primeras palabras de un niño de un año, las expresiones que forman parte del acervo cultural y casi industrial de personas que publican mensajes con su rostro, su memoria, su recuerdo y que los afrontan diversificando y ampliando la memoria, palabras familiares, derivadas de las correctas, imbricadas con pronunciaciones y unidades fonéticas deslavazadas y que, en cumplimiento de su función redundaban en la sonrisa provocada por la imagen que representan.

Una palabra es la vertical de una fotografía, su carácter visual es personal y compartido, no transferible, se comparte en distintos significados, contextos y evocaciones para plenarla de implicaciones, connotaciones, estructura superficial capaz de retratar segmentos temporales, arraigos y raíces, lexemas, leyes tergiversadas que hacen que lo global, universal y arbitrario de la palabra no se traslade el significado biográfico sino la entidad neutra no evocadora. La palabra como referente visual no define, evoca, recuerda, sonríe, tiene, vomita, olvida, no quiere, espera, es, somos, soy.

6.1 Verbalizar a través de la imagen.: Proyección Artística de la palabra

“Un espacio donde la flexibilidad, aceptación, confrontación con sus emociones y tolerancia son reales”.
(Pérez Fariñas, 2004, p. 249).

Sobre el producto creativo descansa la expresión subjetiva y personal de la autoría. Este hecho permite establecer de forma integral funcionalidades tanto catárticas como expresivas o estéticas según la disposición intrínseca, innata o sugerida del sujeto creador.

La proyección artística ofrece la oportunidad de involucrar percepciones, sensaciones, emociones, pensamientos, situaciones, estancias, habitares,... observarlos y explorarlos. Rigo Vanrell (2004) destaca la expresión subjetiva de la imagen en el grado de implicación, las reacciones de fobia, rechazo o afinidad que surgen durante el proceso creativo: temáticas elegidas, carga simbólica, elección y modo de aplicación de técnicas, el estado de ánimo, el grado de aprobación y satisfacción de las realizaciones propias o ajenas revela la personalidad, no sólo se trata de lo representado sino de la afección con la que se ha engendrado. (Omenat, 2006).

El uso de los medios artísticos, el pensamiento visual y espontáneo amplía la capacidad expresiva y comunicativa de una persona en el acceso a sus estados mentales, especialmente en situaciones en las que el lenguaje verbal se encuentra bloqueado o limitado por falta de dominio, inhibiciones o disfunciones físicas, cognitivas o emocionales. La persona se exterioriza, formaliza la realidad de sus apegos, inquietudes, deseos, conversiones, simientes,..., invocando la oportunidad de inhibir el tiempo personal a través de la actuación del pensamiento visual y la palabra como catalizadores del proceso.

Case y Dalley (1992) destacan la supervivencia en el tiempo de las imágenes como una herramienta muy útil, especialmente en situaciones donde la persona no puede verbalizar lo realizado y entra en contradicción con el uso de la palabra, que reúne las mismas características si se llega a ella a través del pensamiento visual, estando presente en su trascendencia.

La creación se inspira en el juego simbólico y la interiorización biográfica como una estrategia para fomentar el proceso creativo. El uso de los medios artísticos fomenta el desarrollo de actitudes asociadas al deseo de expresión.

7. LA PALABRA COMO EXPERIENCIA

7.1 Técnicas de creatividad artística

Creemos fórmulas para contagiar de creación a la propia palabra, todo este escrito parece un circunloquio de lo que no es, pero se trata de representar textual y artísticamente expresiones que pasan por ser historias de vida, acontecimientos, vidas propias, descompuestas o no, voces y rostros en silencio, pasando por querer fortalecer la autoestima, acobardada, letal, la fortaleza de los que quieren y no pueden, la fortaleza de los que quieren y pueden, la repetición de palabras como un escondite donde crear arte, expresión artística evocar momentos, recuerdos, situaciones, nombres, personas, instantes. lo fugaz como un eterno en la madeja de los pasados.

La creación artística como un trazo, de forma y fondo, de características que validan todas sus funciones, naciendo de lo plástico o viviendo de lo escrito, estrategias de construcción de textos a través de paisajes sonoros, composiciones visuales de gramática morfológica, gradación de colores, historia de vida como retrato, la palabra como fotografía, lo simbólico como

imagen, palabra después del color único y compacto, y viceversa, el juego de la analogía en el hecho, la palabra, la sílaba incluso la letra, la matemática de la palabra como forma artística de su representación, suma de analogías que confieren arte a lo artístico y creación a lo creado, dibujo, formas de trazados, ¿Qué es?, ¿Quién soy? Conjugaciones personales, cadáver exquisito, transformaciones de la palabra utilizando su idéntico significante y su más precisa fonética, el espectograma como forma de creación única y diversa en la medida del interlocutor, las formas que pluralizan las posibilidades al trabajarlas en combinación con otro lengua, idioma, dialecto o habla, la creación de diálogos a partir de las analogías, las respuestas, procedentes o no, pero su naturaleza vital e envidiable, la pausa como texto, la tilde como orden y gerencia de mando, el caligrama a través de formas no azarosas sino extremadamente delimitadas por la propia palabra, el autopoema como una reflexión social de nuestra presentación en vida social, cómo nos somos y nos representamos, quiénes nos miran, cómo nos ven, el juego como técnica plástica, la manualidad del recorte de palabras como voz identitaria que concluye con la frase que es, soy, o puede ser. La búsqueda de sentido sin él mismo, completar la fotografía de una palabra, actuar sobre ella, modificar sus negativos morfológicos, derivaciones, pausas, sufijaciones. Reformular las preguntas con una plástica visual elevada, llegando hasta dónde no se llega con la palabra plana, lisa y defectuosa, elevar ese crecimiento al yo personal, al que estima la prudencia de lo puro y lo impuro, y tomarlo como medio de transformación; la historia continuada, el arte como un medio cooperativo, convertir la retórica en pincel, la enumeración en sintonía y proclamar así la libertad de los colores con o sin sentido, dentro de lo biográfico y global, de lo alternativo, como noticia de quien se es y vuelve a descubrirse, quién quiere saberlo

La creatividad artística hace de la palabra una posibilidad ilimitada, para los que escriben y para los que no lo hacen, permiten que el arte sea de quien lo necesita, de quien lo espera, de quien se arroja en él con el sentido de la no pérdida, la aparición. Te quiero, te lo he dicho muchas veces, pero aprovecho el texto para decírtelo antes de tenga aún más miedo, y estos reptiles gráficos que se arrastran por el papel, conforman lo que es la realidad artística del arte bañado por la palabra

Para cambiar todo lo que no he hecho.

Lo que no he hecho para cambiar.

Hecho todo para no cambiarlo.

Todo no lo he hecho.

¿Cambiarlo para qué?

¿Qué lo para?

Lo hecho.

Cambia¹⁴.

Y así buscando, explorando formas que le permitan a la palabra estar convincente en su razón artística, desde la identificación, el reconocimiento y la transformación, haciendo también comanda de una entidad arteterapéutica fundamental para el proceso expresivo y catártico del arte que todos practicamos y necesitamos como revisión transformadora de estares, seres y haceres.

Comportamientos, experiencias, vivencias y sus espacios físicos, o no, como los cuerpos. No es una forma de construir escritura creativa sino de utilizar el arte y la expresión escrita para buscar nuevas formas y significados “Un escritor puede malograrse si nadie le hace ningún caso, y también si le hacen demasiado; si descuida el tono de su voz para convertirse en portavoz de algo” “la grandilocuencia es lo contrario de la literatura”, el arte no. “La literatura es precisión a una escala casi molecular, brillo o el golpe seco de una palabra justa, la chispa como de pedernal golpeado, la reacción química cuando se combinan dos palabras bien elegidas, imantadas entre sí. La literatura es lo que no puede ser dicho de otra manera y lo que necesita ser leído despacio y en voz alta, al menos dos veces, en soledad o en pareja, en un grupo reducido”.

7.2 Coplas para vivir

Los miércoles son los mejores días de cada semana, se relacionan con los símbolos y apuntan signos de complacencia, construyendo imaginarios que son reales. Son cada uno de mis miércoles, las voces, preguntas y respuestas que los pueblan, cada icono como un bolígrafo en su lugar, un teclado sobre la mesa o la inauguración de un diálogo que no entenderá nadie. Los miércoles permiten construir, desde su palabra biográfica pasando por las miradas, mirando para no desatender las escenas, evocando en la almohada sus idilios abrazos, besos y despedidas, y buscando la sinonimia incorrecta, el sema aceptado para subrayar la palabra miércoles en relación con todas las relaciones expeditas de su propia nominalidad, miércoles como besos, ordenador, naranja, agua, mochila negra, conversación, abrazo intenso, deseo controlado, miércoles como una sucesión de palabras que admiten la construcción fotográfica de la evocación, pura, real, decisiva

Las miradas cansadas a sus noventa y dos años destiñen el papel que sujeta con la mano. No es un relato, la realidad expulsada es el alegato de la vida, la música, las ruedas que los trasladan a la sala de un gimnasio, mesas, colores, abrazos, besos, agradecimientos, escritura pintada, pellizcos de besos, grafías de relatos en bucle que construyen argumentos con líneas rojas de rotulador. No parar, no dejar, mantener en la orilla la versión de la condena, la misma de la semana que viene, la otra, y la que le sucede, y su escritura, y su dibujo, grabación fónica de lo que expresa, y una historia, escrita con pinceles, con lápiz académico que le recuerda el papel de estraza. ¿Hemos terminado de vivir? ¿Cuántas vidas no conozco?

La bolsa es un sobre desarrapado. Adjetivación automática amedrentada por los consuelos, preposiciones en sintagma que alargan el título, fuerte vientre de levante en la Huelva azul sonora y natal de los que recuerdan y viven. Se alza una mano,

¹⁴ Fragmento de la obra El Castillo se vuelve esencia de mujer.

“caminar” rotulado en un papel que elige José, poema, Bienvenida, poesía, Carmen, fiesta, Zapatito, y ahora la tristeza inunda este escrito como lo hace el mismo momento de yacer, Zapatito, ya no está.

Las palabras aleatorias como relación expresa y escogida de los participantes, términos afines, positivos y fluidos que permiten la evasión, la identidad y la abstracción para crear a través de la evocación provocada, los deseos, retenciones y esperanzas, la compañía, la realidad o los olores, el ruido, la flexibilidad de un espacio que solo se evade en palabra propia, la escogida.

Y sus palabras, y sus representaciones, su plástica traducida y sus composiciones. Coplas para vivir, ¿Cuántas vidas cabe en una copla?, ¿Cuántas coplas tiene una vida?

*Vivir, primavera, recuerdos, hablar, música, poesía, río, compartir, fiesta, tiempo, sonreír, flor, ilusión, luchar, esfuerzo, risa, paciencia, caricia, emoción, idea, ola, calle, ánimo, luna, beso, fe, poema, manos, amigo, etc...*¹⁵ palabras posibles, instantáneas de los minutos, del exterior interno, collage de imágenes sobre las que descansa nuestra vida, la de los brazos en los besos. Te echo de menos.

Los sintagmas contruidos y elegidos aleatoriamente no solo promueven la motivación y externalización personal de los deseos sino que son copa de la producción visual y artística desde lo biográfico.

*Que tus recuerdos vivan la primavera,
tu música hable de poesía
Y tu río comparta su fiesta.*

*Porque somos...
La risa de la paciencia
La música de una caricia
La forma de una ola
La plaza de una idea
La calle del ánimo
Un beso de la luna
La amistad de la alegría
La fe de un poema
Las manos de un amigo.
Todo en un abrazo*

*Así que...
Camina con tus manos
Triunfa en tu jardín
Lucha en una idea
Sueña en la calle
Besa el sol.
Canta una caricia
Ama una canción*

*Comparte tu paciencia
Cumple con el río
Quiere los besos
Vive en los abrazos
Acompaña una flor
Escoge la palabra libertad
antes que una paloma.*¹⁶

Creatividad con el respeto del aprendizaje personal.

La palabra, como elemento de creatividad artística permite y facilita la evocación, y la lectura y escritura para personas con dificultades, discapacidades o incidencias para hacerlo, puesto que se nutre de la palabra biográfica y del relato biográfico como forma de extender el medio de aprendizaje. Gianni Rodari, en su obra *Gramática de la fantasía* recupera algunos aspectos de la expresión pero no redonda en las posibilidades que puedan ofertarse a otro tipo de colectivos exentos de formación académica.

La palabra como experiencia plástica y visual no solo consigue alcanzar el futuro necesitado de otro colectivos sino también profundizar en la manifestación no verbal de la palabra como forma, y conseguir la construcción de belleza a partir de la individualidad, independientemente del contexto y estado social del sujeto participante.

No existe bibliografía acogida directamente al tema planteado pero si se pueden encontrar apoyos en Gianni Rodari y su

¹⁵ Palabras escogidas para la evocación vital y visual del grupo de personas mayores con alzhéimer u otro trastorno neurocognitivo mayor para la composición Coplas para vivir.

7.3 Instrumentos de observación/medición y método

7.3.1 Instrumentos de observación/medición

Los siguientes instrumentos son aplicados a ambos grupos, control y experimental, antes y después de la intervención. Se utiliza pues la técnica de retest con un máximo de dos utilizaciones con el fin de evitar contaminaciones por sobreutilización, a excepción del MMSE, que es aplicado cada 6 meses según el protocolo de seguimiento habitual en esta institución.

Depresión: BDI-II

Deterioro cognitivo: MMSE

Estado funcional y calidad de vida: COOP/WONCA

7.3.2 Instrumentos de valoración cualitativa: observación y entrevista

La psicóloga del Centro ha realizado un seguimiento continuo del programa mediante observación y entrevistas. Las propias sesiones han sido objeto de esa observación, centrándose ésta en el comportamiento de los sujetos y de los arteterapeutas, los climas generados, la implicación en las tareas y las conductas interpersonales. Entre sesiones, la psicóloga ha observado la existencia o no de modificaciones en las relaciones interpersonales de los residentes, consideradas cuantitativa y cualitativamente, la implicación de éstos en las actividades vinculadas a la autonomía personal, el estado de ánimo y su nivel de participación en otras actividades (como rehabilitación y fisioterapia) ofrecidas por la institución.

Las entrevistas permitían complementar la información obtenida mediante observación con una exploración en las vivencias subjetivas implicadas en los aspectos observados, tal como son percibidas e informadas por los propios residentes.

7.3.3 Lugar de realización de las intervenciones

La siguiente institución ha aceptado la realización de este proyecto con las personas mayores residentes en sus espacios. Este proyecto está previsto para su aplicación con personas permanentemente residentes en un centro residencial. Es preciso agradecer la magnífica acogida y el espíritu de colaboración del equipo psicológico y directivo de la institución.

Residencia San Joaquín y Santa Ana
Asociación San Joaquín y Santa Ana
C/ Huelva, 8-10.
San Juan del Puerto, 21610 Huelva

7.3.4 Equipo de trabajo

El estudio requiere la participación de un equipo multidisciplinar constituido básicamente por:

- Arteterapeutas: su misión es llevar a cabo intervenciones directas con la aplicación de técnicas de AT.
- Personal de la institución residencial donde están internados los sujetos, colaboradores del proyecto: psicóloga y directora. Facilitarán los trámites burocráticos para la implementación del programa, aplicarán tests y entrevistas, harán seguimiento y emitirán sus valoraciones.
- Evaluadores externos: interpretarán y valorarán los datos, obtenidos mediante tests, y las observaciones cualitativas de las entrevistas. Emitirán una evaluación de resultados.

7.3.5 Coordinación

Pilar M^a Domínguez Toscano

8. RESULTADOS

8.1 Descripción e interpretación de resultados cuantitativos

Los análisis estadísticos de las medidas de Depresión (instrumento utilizado: BDI-II), Estado Funcional y Calidad de Vida (instrumento: COOP/WONCA) y Estado Cognitivo (instrumento: MMSE) son calculados por un equipo de metodólogos, evaluadores externos de este programa. Los cálculos se hacen a partir de los tests administrados por la psicóloga del centro residencial. El grupo experimental está constituido por 16 sujetos en la primera fase de la intervención, y 12 sujetos en el grupo control. Y 13 sujetos en el grupo experimental al término de la segunda fase de intervención, 12 en el grupo control; esta segunda fase es objeto de evaluación de seguimiento.

Como estadístico de contraste de medias se utiliza *T* de *Student* para dos muestras independientes. Se utiliza un nivel de confianza del 0.95 ($\alpha = .05$) y 26 grados de libertad.

8.1.1 Medidas del estado funcional y calidad de vida

Datos

	Interv. Pre	Control Pre	Interv.Post		Control post	
	Media	Media	Media	S ² Insegada	Media	S ² Insegada
Forma física	4.74	4.69	4.78	0.72	4.71	0.49
Sentimientos	2.51	2.46	1.72	0.68	2.70	0.58
Act. Cotidiana	3.16	2.94	2.48	1.25	3.02	1.20
Act. Social	1.79	1.64	1.17	0.70	2.57	0.30
Cambio salud	3.19	3.26	2.77	0.44	3.33	0.32
Estado salud	3.52	3.55	2.95	0.70	3.72	0.50
Dolor	2.90	2.68	2.45	0.99	2.77	1.32
Apoyo social	1.92	1.99	1.22	0.68	2.08	0.79
Calidad vida	3.35	3.13	2.60	0.70	3.37	0.55

Interpretación de resultados

Con un nivel de confianza del 0.95 ($\alpha = .05$) y 26 grados de libertad, los datos de Estado Funcional obtenidos arrojan resultados significativamente diferentes entre los grupos experimental y control para las medidas post, en el sentido de mejora de Estado Funcional en el grupo de intervención en 6 de las 9 escalas, y mejora que no alcanza en nivel de significación en las escalas restantes puesto que no supera el nivel crítico.

Desglosados los resultados, no se aprecian resultados significativos en la escala Forma Física ($T = 0.23$), en la escala Dolor ($T = -0.79$) y en Actividades Cotidianas ($T = -1.28$) en el sentido de escasa mejoría en el grupo de intervención que no alcanza el nivel de significación.

En el grupo de intervención, respecto al control, se observa mejora significativa pero moderada en Cambio de Salud ($T = -2.36$), Calidad de Vida ($T = -2.54$), Estado de Salud ($T = -2.58$) y Apoyo Social ($T = -2.65$); el grupo intervenido con arteterapia ha obtenido una mejora significativa y alta en Sentimientos ($T = -3.22$) y Actividades Sociales ($T = -5.05$).

8.1.2 Medida de depresión

Datos

Se ofrece a continuación los datos de Depresión medida con el BDI-II, expresados mediante un índice de tendencia central (media) y otro de dispersión (varianza insegada):

	Intervención				Control			
	Pre		Post		Pre		Post	
	Mayor	Menor	Mayor	Menor	Mayor	Menor	Mayor	Menor
M	25.03	26.82	23.37	23.92	24.92	26.76	25.08	26.55
S ² _{inses}	2.66	2.89	3.06	2.95	3.11	2.76	3.06	2.56

	Intervención		Control	
	Pre	Post	Pre	Post
M	26.03	23.68	25.99	25.93
S ² _{inses}	2.79	3.00	2.90	2.76

Gráfico 1: comparación de medidas pre y post en grupos experimental y control con mayor y menor deterioro

Descripción e interpretación de resultados

El contraste de medias de medidas post de depresión en grupos de mayor deterioro proporciona un valor de $T = -2.57$. Para el contraste de medias de medidas post de depresión en grupos de menor deterioro, se obtiene un $T = -4.14$. Del contraste de medias de medidas post de depresión en ambos grupos, resulta un $T = -3.47$.

Los datos muestran que las mediciones de depresión previas a la intervención son mayores en sujetos con menor deterioro, es decir, el aumento del deterioro fundamentalmente cognitivo no implica incremento en la depresión, sino que puede darse la tendencia inversa: las personas que padecen EA u otras demencias seniles en grado moderado sufren mayor trastorno del estado de ánimo (mayor depresión) que las personas en fase más avanzada de su demencia. Sin embargo, las menos deterioradas son más sensibles a la intervención, por lo que, en ellas, la reducción de la depresión es mayor que en las que sufren mayor deterioro cognitivo.

8.1.3 Medida del estado cognitivo

Los datos fueron obtenidos por la psicóloga del centro residencial tras aplicar el MMSE (adaptado por Lobo *et al.*, 1979).

	MEDIDAS PRE		MEDIDAS POST		MEDIDAS SEGUIMIENTO	
	Intervención	Control	Intervención	Control	Intervención	Control
M	3.1	3.2	3.0	2.8	2.7	1.8
S ² _{insesg}	0.70	0.50	0.58	0.44	0.49	0.59

Gráfico 2: comparación de mediciones pre, post y seguimiento en sujetos experimentales y controles

Gráfico 3: comparación de mediciones pre, post y seguimiento en sujetos experimentales y controles, diferenciando mayor y menor deterioro

Descripción e interpretación de resultados

Se utiliza T con 26 g. l. y $\alpha = .05$.

Tras el cálculo del estadístico de contraste de medias T para dos muestras independientes, experimental y control, entre medidas pre y post y medidas pre y seguimiento y medidas post y seguimiento, se obtiene lo siguiente:

T para medidas pre control y experimental = - 0.33

T para medidas post control y experimental = - 0.73

T para medidas seguimiento control y experimental = -3.25

Estos resultados muestran que, en todas las mediciones comparativas entre el grupo intervenido y el no intervenido, tanto tras la primera fase del programa (medida post) como en la segunda (medida de seguimiento), se observa una mejora comparativa a favor del grupo intervenido. Este efecto no alcanza el nivel de significación en la medición post, y sí en la medición de seguimiento.

Tal diferencia parece indicar que, si bien el programa de arteterapia incide beneficiosamente en los niveles de estado cognitivo, cuando la intervención es de 4 meses (primera fase) este efecto no es significativo, pero sí lo es cuando aumenta el tiempo de intervención (primera y segunda fase, 16 meses en total).

8.2 Descripción de resultados cualitativos

Éstos han sido obtenidos mediante observación (continua) y entrevistas semiestructuradas (pre y post, más las de seguimiento) realizadas por la psicóloga del centro. Respecto a la autoestima, variables implicadas en el fortalecimiento

emocional (aparte de la Depresión, ya analizada), motivacional y actitudinal, más conductas relacionadas con las relaciones interpersonales y la implicación en actividades dirigidas a la autonomía personal, los resultados muestran mejora en las personas participantes en el programa, más acusada que a nivel cognitivo.

9. CONCLUSIONES

En suma: los datos de Estado Funcional y Calidad de Vida obtenidos mediante la aplicación del COOP/WONCA arrojan resultados significativamente diferentes entre los grupos experimental y control para las medidas post, en el sentido de mejora en varios parámetros indicativos del Estado Funcional en el grupo de intervención. Desglosados los resultados por escalas, no se aprecian resultados significativos en la escala Forma Física, Dolor y Actividad Cotidiana en el sentido de escasa mejoría en el grupo de intervención que no alcanza el nivel de significación. En este grupo, respecto al control, se observa mejora significativa moderada en Estado de Salud, Cambio de Salud, Apoyo Social y Calidad de Vida. La mejora es significativamente alta en Sentimientos y Actividad Social.

La reducción de la Depresión en el grupo experimental respecto al control es significativa, debida tanto a la reducción intrínseca en el experimental como al aumento de Depresión en el control.

Se observa en el grupo intervenido una mejoría que no alcanza el nivel de significación en los parámetros cognitivos medidos mediante el MMSE tras la primera fase de la intervención. Tras la segunda fase, esta mejoría sí es significativa. No obstante, tal diferencia parece deberse más al aumento del deterioro en el grupo control que a la mejoría intrínseca en el grupo experimental, lo que puede ser indicativo de que el estado mental empeora con el paso del tiempo, pero que ese empeoramiento puede frenarse o desacelerarse mediante intervenciones como la aquí informada.

En conjunto, la evaluación realizada por personal psicológico y tratamental del centro, más la emitida por evaluadores externos, concluyen en afirmar que el programa de arteterapia ha mejorado notoriamente la percepción de calidad de vida, ha desacelerado el deterioro cognitivo y disminuido los niveles de depresión de las personas participantes en el mismo.

COPLAS PARA VIVIR

Manual de canciones

Coplas para vivir es un manual de instrucciones para canciones de vida, creado por deseos y palabras de compañía, tantos, que desbordan lágrimas antes del abrazo.

Cada canción es una mirada, un viaje de lo que somos, una secuencia de palabras que se encuentra en cada vida, cantando.

¿Cuántos miércoles tiene una copla?

¿Cuántas coplas tiene una vida?

Autores

Bienvenida

Carmen

Curro

Rosa

Rosario

Rocío

Zapatito

Y todos los que vivimos cada copla de vida, Daniel, Teresa, Isidora, Ana,
Paca...

*Ay, qué desgraciaita
gitana tú eres teniéndolo to.*

María de la O.

Que tus recuerdos vivan la primavera,

tu poesía hable su música,

y tu río comparta su fiesta.

Que tu vida camine por el jardín,

tu sol quiera una familia,

y tu canción cante su amor.

Que tu tiempo sonría una flor,

y tu ilusión luce por su esfuerzo.

Porque somos...

La risa de la paciencia,

la música de una caricia,

la forma de una ola,

la emoción de una idea,

la calle del ánimo,

la luna del beso,

la amistad de la alegría,

la fe de un poema,

las manos de un amigo,

y un abrazo de todo.

Así que...

camina con tus manos,

triunfa en tu jardín,

lucha en una idea,

sueña en la calle,

vuela en una vida,

besa en el sol.

Canta una caricia,

sonríe tu alegría,

ama una canción,

comparte tu paciencia,

juega con cariño,

escucha tu viaje,

quiere los besos,

vive en los abrazos,

acompaña una flor.

Canta tu poesía,

habla con un poema,

confía en tus recuerdos,

pinta una ilusión.

Y escoge la palabra libertad...

...antes que una paloma.

San Juan del Puerto,
Otoño de los miércoles de 2015 y 2016.

Gracias por enseñarnos la vida antes de que ocurra, por hacer de cada miércoles una lágrima de emoción, por vuestras manos y la espera, por cada rueda de vuestro tiempo, y por el color de vuestra voz.

Gracias por regalarnos el futuro, antes de que nos pertenezca.

*Te quiero más que a mi vida,
más que el aire que respiro,
y más que a la mare mía.*

Y sin embargo te quiero.

Residencia San Joaquín y Santa Ana, San Juan del Puerto, en Huelva, otoño
y noviembre de 2015 y 2016.

PARALLEL SESSION III

LOS TRABAJADORES FRONTERIZOS Y SU AFECTACIÓN TURÍSTICA

Alejandro Zalvide
 Universidad de Huelva
 (alejandro.zalvide@dam.uhu.es)

RESUMEN

Uno de los movimientos internacionales de personas que originan una situación ciertamente singular, es la de los trabajadores fronterizos, ya que al desplazamiento que se produce para esta finalidad, se une la frecuencia de los mismos, originando una corriente repetitiva en el cruce de fronteras que se genera especialmente en zonas territorialmente limítrofes. Estos viajes de ida y vuelta, cuyo objetivo principal es trabajar, han de ser analizados tanto desde una perspectiva laboral como desde una perspectiva turística.

Partiendo del reconocimiento en el espacio europeo del derecho a la libre circulación de trabajadores, donde se contempla expresamente al trabajador fronterizo, como una manifestación más de dicha movilidad; interesa delimitar esta figura y su evolución conceptual en el panorama de la Unión Europea (UE). Hay que destacar dos factores determinantes en su configuración, el territorial y el temporal; en el factor territorial se integran, dos espacios diferenciados que son el lugar de residencia y el lugar de trabajo; y en el factor temporal, hay que tener en cuenta que es un viaje de retorno, el cual ha de desarrollarse dentro de una determinada frecuencia, ya sea diaria o semanal, lo que supone una repetición constante de trayectos, cruzando la misma frontera y con la misma finalidad. Como consecuencia de todo lo anterior, hay que valorar los elementos coincidentes con los viajes turísticos según los criterios marcados por la Organización Mundial del Turismo (OMT), para posteriormente poder calificar la verdadera naturaleza turística o no, de estos visitantes internacionales.

Palabras clave: Trabajador Fronterizo, Visitante Turístico, Viaje Internacional, Laboral, Frontera.

1. INTRODUCCIÓN

Un tipo de desplazamiento entre distintos países por motivos profesionales que originan una situación ciertamente singular, es la de los trabajadores fronterizos, ya que al desplazamiento en sí que se produce para esta finalidad, se une la frecuencia reiterativa de los mismos y su especial motivación. Esta situación hace que este tipo de viaje de ida y vuelta, con el objetivo claramente marcado de trabajar, precise ser matizado tanto desde la perspectiva laboral como desde la perspectiva turística.

En el espacio común europeo encuentra esta situación un reconocimiento dentro del marco general de la libertad de movimiento de personas, en concreto en el derecho a la libre circulación de trabajadores, donde se reconoce expresamente como una manifestación más de esta movilidad dentro del territorio de la Unión, la de los trabajadores fronterizos (Reglamento UE 492/2011). De hecho, los mercados de trabajo son menos cerrados y el número de individuos que cruzan las fronteras para trabajar se ha incrementado en las últimas décadas (Ortiz y Nestares, 2003). Estos sujetos precisan desplazarse de un país a otro para acudir a prestar su trabajo ordinario, originando una corriente repetitiva en el cruce de fronteras que se genera más fácilmente en aquellas zonas territorialmente limítrofes, donde se ve más factible el desplazamiento de trabajadores de un Estado a otro para desempeñar la actividad laboral, para una vez concluida, regresar de nuevo al lugar de residencia habitual.

Esta situación conlleva la existencia de una serie de circunstancias que van a condicionar el desarrollo de la misma, destacando el factor territorial y el factor temporal. Dentro del factor territorial se integran, dos espacios diferenciados que son el lugar de residencia y el lugar de trabajo, a lo que hay que sumar el desplazamiento necesario y el traspaso de fronteras. En cuanto al factor temporal, hay que tener en cuenta como cuestión principal que es un viaje de ida y vuelta, el cual ha de desarrollarse dentro de una determinada frecuencia, ya sea diaria o semanal, lo que supone una repetición constante de trayectos, cruzando la misma frontera y con la misma finalidad.

En cualquier caso conviene delimitar este supuesto en el que se ven afectados dos territorios con jurisdicciones diferentes, pero sobre todo la figura del trabajador fronterizo y su evolución conceptual en el panorama de la UE, para saber a su vez, como ha de ser tratado dicho sujeto desde la perspectiva turística. Para ello hay que analizar como eje fundamental, la normativa reglamentaria europea que ha ido definiendo este sujeto trabajador a los efectos oportunos.

2. EL CONCEPTO DE TRABAJADOR FRONTERIZO EN EL REGLAMENTO 1408/1971 DE LA UNIÓN EUROPEA

2.1 Delimitación conceptual

En los movimientos de trabajadores migrantes, existe una falta de coincidencia entre el lugar de trabajo y el de residencia habitual, pero no solo son puntos geográficos diferentes, sino que su particularidad estriba en el hecho de estar situados en países diferentes. Este escenario donde existe una dualidad territorial y por tanto con ordenamientos jurídicos diferentes a los que someterse, sirvió como detonante para que desde la UE se atendiera esta situación laboral y su repercusión, con la

finalidad de coordinar esta realidad y su sistema de protección en temas relativos a los regímenes de seguridad social dentro del espacio común europeo (Reglamento CEE 1408/71).

La regulación se establece como garantía hacia los trabajadores y sus familias que precisan desplazarse dentro del territorio europeo, para lo cual se trata de clarificar el ámbito de protección social aplicable. Aunque al margen de atribuir los regímenes pertinentes de seguridad social a estos trabajadores y sus familias; establece la norma, una cuestión de índole definitoria que sirve para reconocer la figura del trabajador fronterizo. Así, el Reglamento inicia sus disposiciones generales estableciendo qué ha de entenderse por trabajador fronterizo, considerando como tal “a todo trabajador por cuenta ajena o por cuenta propia que ejerza su actividad profesional en el territorio de un Estado miembro, y resida en el territorio de otro Estado miembro, al que regresa en principio cada día o al menos una vez por semana”.

Aparece así, el concepto de trabajador fronterizo de forma novedosa, abarcando inicialmente tanto la actividad de trabajo dependiente o por cuenta ajena, como la realizada de forma autónoma o por cuenta propia, sirviendo en todo caso para ambos supuestos. Se manifiesta de esta manera el reconocimiento de esta figura como una garantía más de la libre circulación de trabajadores en el marco europeo, ordenando cuestiones de aplicación relativas al ámbito de la seguridad social, en el que van a verse afectados distintos Estados con el movimiento de este personal trabajador.

Sobre estos desplazamientos que se dan entre distintos territorios y que se generan por motivos de trabajo, interesa delimitar su elemento subjetivo desde la perspectiva del trabajador fronterizo, y su diferenciación con otros sujetos afines que también intervienen en estas corrientes migratorias. Asimismo, existen una serie de factores determinantes que conviene aclarar para saber cuándo se está ante situaciones de estas características, ya que de otra forma no va a corresponder con la figura del trabajador fronterizo. De tal suerte, que el alcance de dicha condición y sobre todo la motivación que subyace en este tipo de viajes, van a condicionar asimismo la naturaleza de estos movimientos internacionales desde una óptica turística.

2.2 Factores determinantes

Dos son los factores que condicionan este tipo de flujo de personas, por un lado, el factor territorial, en cuanto a la existencia de dos espacios geográficos diferentes que hacen necesario el desplazamiento, y por otro, el factor temporal, para saber la frecuencia en la que se han de dar estos movimientos y hasta cuando ha de durar la condición de trabajador fronterizo.

a) El factor territorial

El desplazamiento lleva implícito un lugar desde donde se inicia el trayecto, que para estos casos según la normativa de referencia ha de corresponder necesariamente a un Estado miembro de la UE, donde el trabajador ha de tener fijada su residencia, y el lugar de destino, donde se va a ejecutar la actividad laboral, que ha de corresponder igualmente a otro Estado perteneciente a la UE. Por tanto el espacio territorial donde se va a dar la circulación de estos trabajadores, es el europeo, tanto para considerar el punto de partida y llegada, como para conectar la nacionalidad del sujeto ejecutante de la acción.

La “residencia” del trabajador según este Reglamento ha de considerarse como la estancia habitual, a diferencia del término “estancia”, que lo considera como la estancia temporal. Es decir, ha de entenderse desde el punto de vista de su localización, el primer territorio, como el de residencia habitual, y el segundo, como el de lugar de trabajo. Por consiguiente se marca tanto el lugar que ha de servir como punto de partida del viaje (y a la vez de regreso), y el lugar de destino donde va a desenvolverse la actividad del viajero trabajador.

Se da en el caso del fronterizo un desplazamiento necesario entre el lugar de residencia y el de trabajo, que a los efectos turísticos, hay que conectarlo con el concepto de entorno habitual, entendiendo que en principio solo se van a considerar como viajes turísticos aquellos que se realicen fuera de este espacio geográfico. La delimitación del entorno habitual para con el sujeto no es tarea fácil, al ser este concepto ciertamente ambiguo, por depender de varios criterios de referencia que no alcanzan la suficiente precisión. En cualquier caso sí resulta indudable que el lugar de residencia como origen del desplazamiento, corresponde al territorio habitual del viajero, luego hasta ese instante se cumple al menos con la premisa turística de ese tipo de viajes, de tener que realizarse fuera del entorno habitual.

La cuestión no parece tan evidente cuando de lo que se trata es de considerar como entorno habitual el territorio del destino, es decir el que corresponde al lugar de trabajo, máxime si como además sucede en este tipo de caso, hay que cruzar de un Estado a otro. Sin embargo, es significativo señalar la previsión que se hacía en la definición de entorno habitual a efectos estadísticos por parte de la Comisión Europea (Decisión de 9 de diciembre de 1998), cuando consideraba que “los lugares visitados con frecuencia (como media una vez a la semana o más a menudo), de manera regular, forman parte del entorno habitual de una persona, aunque estén situados a una distancia considerable del lugar de residencia (o en otro país)”. De tal forma que el tenor literal de esta definición parece estar hecho a la medida del trabajador fronterizo, ya que al igual que en dicho concepto, el trabajador se desplaza una vez a la semana o con una frecuencia mayor, que dicho movimiento se realiza de forma rutinaria, que se encuentra a una distancia determinada del lugar de residencia habitual, e incluso se da la particularidad, igualmente prevista en la definición, de tener que dirigirse a otro país. Luego siguiendo este criterio interpretativo habría de considerar los desplazamientos realizados por el sujeto fronterizo para realizar su trabajo, como parte del denominado entorno habitual, y por tanto sin que suponga una salida hacia un espacio diferente, tal y como se prevé que ha de ser en los viajes de orden turístico.

Sin embargo, la última definición dada de “entorno habitual” desde Europa (Reglamento UE 692/2011), a efectos estadísticos, no parece ser tan clarificadora. De tal suerte, que se utiliza como elemento definitorio principal, la habitualidad de las actividades que se lleven a cabo en este espacio, sobre la base de criterios generales como: el traspaso de fronteras, la distancia desde la residencia habitual, la duración, la frecuencia y el objetivo. Dejando por tanto un amplio margen interpretativo en lo que ha de entenderse como entorno habitual, más allá del rasgo tautológico de habitualidad, que no

hace sino volver a incidir en lo mismo, sin realmente establecer una delimitación a la medida. De hecho los dos criterios territoriales a utilizar como indicadores de referencia, poco parecen aclarar para estos casos, o incluso pueden llegar a desviar el verdadero sentido de esta actividad; ya que en estos supuestos, se va a dar un traspaso de fronteras, lo que inicialmente parece alejar al sujeto de su entorno, y en cuanto al factor distancia desde la residencia habitual, ha de entenderse por pura lógica que no debería ser muchas para no alejarse del espacio habitual, pero que sin embargo para el caso del viajero trabajador puede llegar a ser considerable, como se pondrá de manifiesto.

El ámbito territorial conecta también con la nacionalidad que ha de poseer el sujeto fronterizo, toda vez que la previsión justificativa de la libre circulación de trabajadores, parte de la ostentación de la nacionalidad de un Estado miembro, y por tanto bajo la naturaleza de ser ciudadano de la Unión Europea (Tratado de Funcionamiento de la Unión Europea-versión consolidada-). Previsión de carácter nacional que en cualquier caso no se prolonga más allá de compartir una cualidad concéntrica con el criterio de residencia o lugar de trabajo, que igualmente han de corresponder a Estados miembros de la UE. Por tanto, siempre y cuando se mantenga la condición comunitaria del trabajador, lo que realmente va a someter la situación desde la perspectiva reglamentaria va a ser el factor territorial tanto de residencia como de trabajo.

De hecho el criterio de la residencia habitual prevalece por encima incluso de la nacionalidad para otorgar la condición de trabajador fronterizo, de tal suerte que el nacional de un Estado miembro donde además trabaja, que conservando el empleo en su país de procedencia traslade su domicilio a otro Estado miembro, se entiende que ejerce desde entonces su actividad profesional como trabajador fronterizo pudiendo invocar su condición de trabajador migrante (STJCE 2007/199). Es decir el ciudadano de un país que vive y trabaja en su mismo territorio pero que traslada su residencia a otro Estado, pasa a considerarse como trabajador fronterizo a los efectos oportunos, sin que sirva de impedimento el hecho de disponer de la nacionalidad del territorio donde además trabaja; en el mismo sentido y por extensión, ha de ser igualmente considerado como trabajador fronterizo, el sujeto que ostenta una nacionalidad, reside en otro Estado y trabaja en un tercero.

Por consiguiente, lo determinante va a ser el elemento locativo en el que se desenvuelve el sujeto, en cuanto a lugar de residencia y trabajo, siempre y cuando se respete en ambos casos la regla de pertenencia al espacio común europeo; y no tanto, el de la nacionalidad del trabajador, que en todo caso ha de ser de un país comunitario. No obstante, hay que matizar que el ostentar una determinada nacionalidad sin ser determinante en la aplicación de la norma, siempre ha de estar presente como requisito de fondo en cuanto a su tratamiento como trabajador fronterizo.

En el panorama turístico (OMT, 2010) el criterio determinante también viene marcado por el país de residencia habitual, y no por la nacionalidad, de tal forma que sirve de base para delimitar la salida de su entorno habitual, pudiendo desplazarse como turista al territorio del que se posee la ciudadanía.

El desplazamiento de los trabajadores por el espacio europeo es el objeto de atención general de la norma, pero es la dualidad geográfica, entre el lugar de residencia y el de trabajo, la que genera un tratamiento específico, aplicando reglas particulares para determinadas prestaciones a los trabajadores fronterizos y/o los miembros de sus familias (Reglamento CEE 1408/71). Siendo precisamente esta marcha desde un país de partida, donde el trabajador tiene su domicilio, hacía otro de destino, donde va realizar su prestación de trabajo habitual, la que ocasiona un cambio de ordenamiento jurídico de un Estado a otro, que precisa ser regulado bajo un criterio uniforme de carácter supranacional, con el que dar respuesta a las necesidades especiales de este colectivo de trabajadores y por extensión a su entorno familiar más cercano.

El factor territorial también condiciona el sometimiento de estos trabajadores a una normativa diferente según el lugar que se tenga en consideración. Para estas situaciones el principio general de *lex loci laboris* juega con normalidad y, por tanto, el trabajador fronterizo queda incluido en el ámbito de la Seguridad Social del país donde desarrolla su trabajo (Bonete, 2006). No obstante, el propio Reglamento establece una excepción a dicho principio general, para el caso concreto de los trabajadores fronterizos que se encuentren en situación de desempleo total (Decisión 2006/351/CE). La jurisprudencia europea también se hace eco de esta cuestión (STJCE 1997/50), como consecuencia del cambio de residencia de un trabajador fronterizo al Estado miembro competente, reconociendo que el hecho de encontrarse en situación de desempleo origina una ficción jurídica con el sometimiento a la legislación del Estado de residencia “como si” dicho Estado fuera el del último empleo.

Es también significativo desde el punto de vista territorial, que pese a la apariencia calificativa en la denominación trabajador “fronterizo”, el Reglamento no establece el carácter limítrofe entre los territorios afectados como requisito necesario para la existencia de esta figura, centrando la cuestión en el hecho físico de tener que traspasar una frontera para trabajar. Aunque el tratamiento dado sobre esta cuestión no haya sido el mismo en el ámbito del turismo en cuanto a la recogida de información estadística (Decisión CE, 1998), ya que para estos casos se aludía a los trabajadores fronterizos, como aquellos que residen cerca de la frontera de un país y trabajan en otro. Denominación por tanto que estaba limitada para estos casos a territorios contiguos y a situaciones de cercanía, término este último además, poco preciso por ser indeterminado en cuanto al factor distancia.

En cualquier caso, seguramente el supuesto del fronterizo estaba previsto en origen para el movimiento de trabajadores en territorios colindantes, con una distancia relativamente corta entre el domicilio y el centro de trabajo, porque tal vez en ese momento no se imaginara otro escenario posible. Sin embargo, hoy en día se permite interpretar otro tipo de actuaciones, debido en gran medida al avance de las comunicaciones y los medios de transportes, siendo perfectamente factible el desplazamiento de un país a otro no fronterizo (máxime si la frecuencia del retorno no es diaria sino semanal), y no por ello se ha de perder el carácter de trabajador fronterizo. Quiere ello decir, que lo determinante va a ser el desplazamiento de un Estado a otro para el desempeño de una actividad profesional, con independencia de si dichos países comparten o no frontera.

Este planteamiento sin duda altera uno de los criterios básicos de referencia de lo que ha de interpretarse como entorno habitual en los viajes turísticos, en concreto el factor distancia. De hecho en el supuesto de territorios no limítrofes y frecuencia semanal, la distancia desde el lugar de residencia habitual al centro de trabajo, puede ser bastante considerable como para entender que pueda influir a la hora de formar parte de su entorno habitual. Lo que a su vez tampoco obsta, para

que sirva a modo de impedimento para alcanzar dicha consideración si tiene a bien el cumplimiento de otros criterios que de igual forma han de servir de mera referencia, sin que existan unos verdaderos parámetros que han de darse, y sin que en realidad exista un criterio uniforme para todos los países.

b) El factor temporal

El factor temporal gira en torno a la frecuencia, estableciéndose una regla general que contempla el regreso del lugar de trabajo al domicilio cada día o al menos una vez por semana; siendo esta última y en principio, la posibilidad más distante que reconoce la norma para otorgarle la calificación de trabajador fronterizo. Esta previsión temporal de regreso se mantiene constante hasta la actualidad desde el plano normativo-definitorio de este colectivo de trabajadores, luego, la frecuencia diaria o semanal es la referencia temporal para este tipo de desplazamientos. Este regreso necesario, supone una importante restricción dentro del conjunto de trabajadores que realizan su actividad económica en otro Estado distinto del que residen (García, 2008), dejando así al margen a un contingente significativo que realizan ciertas actividades cíclicas y/o eventuales.

El regreso diario de estos trabajadores una vez finalizada la jornada se da como la de cualquier empleado normal, con la particularidad de que en estos casos se produce cruzando una frontera. Esto origina un movimiento fronterizo que se asemeja al que se da en la figura turística del excursionista, el cual desde el punto de vista temporal, también permanece menos de veinticuatro horas en el destino. Se da por tanto un criterio de semejanza entre estos trabajadores que cruzan diariamente a otro país para trabajar, y los visitantes del día o excursionistas que son aquellos que por su propia denominación entran y salen del territorio en el mismo día.

Desde la perspectiva del excursionista se incide en su temporalidad corta pero necesaria, cuando en las Recomendaciones internacionales dadas para estadísticas de turismo (OMT, 2010), utilizando el mismo criterio que en el ámbito europeo de considerar solo como turísticos los viajes realizados fuera del entorno habitual, se define otro componente necesario de estos viajes, la “visita turística”. En este sentido se considera como “visita turística” la estancia en un lugar visitado durante un viaje turístico, aclarando que no es necesario que la estancia incluya una pernoctación para que se considere como visita turística, pero sí ha de suponer necesariamente la realización de una parada, tal y como sucede en el caso del excursionista. Es más, caso contrario ni tan siquiera va a ser considerado como tal, es decir, la entrada en una zona geográfica sin realizar una parada en la misma, no presupone la realización de una visita en el sentido turístico. Por tanto en el ámbito del turismo, el término “estancia” significa la realización en el lugar visitado de al menos una parada, no siendo necesario en cualquier caso la pernoctación, situación que evidencia y caracteriza al denominado visitante de día o excursionista.

Para el caso de los trabajadores fronterizos en relación a sus desplazamientos se ha de realizar una estancia en el lugar donde se va a ejecutar la prestación de trabajo, que a los efectos de su definición ha de ser en otro Estado, siempre con carácter temporal en referencia al regreso necesario al territorio de partida que a estos mismos efectos debe coincidir con el del domicilio habitual. Lo que viene a significar su coincidencia en cuanto a la estancia prevista con los viajes turísticos, ya que de igual forma se precisa al menos una parada en el destino, cuestión que se da plenamente en el caso del fronterizo, el cual va a acudir a otro territorio donde va a parar al menos durante la jornada de trabajo, al ser esta la frecuencia mínima prevista desde el punto de vista conceptual para poder alcanzar la consideración de trabajador fronterizo. Luego al igual que sucede con respecto a los excursionistas y su estancia prevista para la visita turística, va a cumplirse en el caso del trabajador fronterizo, donde no solo es perfectamente factible sino incluso mucho más frecuente la estancia diaria en el territorio donde se va a desarrollar la actividad laboral. Por tanto se evidencia un paralelismo temporal entre el visitante del día o excursionista y el trabajador fronterizo, todo ello con independencia de otras cuestiones de fondo que pueden ofrecer una perspectiva bien distinta, fundamentalmente en cuestiones como la motivación de estos desplazamientos.

En cuanto a la posibilidad de ampliar la frecuencia del regreso a una vez por semana, parece indicar que en esta ocasión el trabajador por la circunstancia que sea, o no puede o no le interesa el regreso diario, pero su vuelta se materializa una vez disponga del preceptivo descanso semanal que corresponde a todo trabajador por cuenta ajena, permaneciendo en todo caso el ánimo del retorno al domicilio. Para estos casos la similitud viene de la figura central en los movimientos turísticos, el turista, el cual por definición ha de viajar por un periodo no superior a doce meses consecutivos.

Por tanto, se cumple con respecto al reconocimiento del entorno habitual del viajero turístico, el criterio de la frecuencia, que para los fronterizos ha de ser preceptivamente de carácter diario o en todo caso semanal, circunstancia esta, que condiciona además otro de los indicadores de referencia, el de la duración. Este criterio de la duración si puede servir para aclarar la no pertenencia al entorno habitual cuando las estancias son medias o largas, pero no parece ser tan clarificador para otras posibilidades viajeras como la del excursionista o viajes de corta duración (entendiendo por ello menos de una semana), los cuales podrían acoplarse perfectamente a esta modalidad de viajero trabajador.

La frecuencia contemplada con carácter general para el regreso (diario o semanal), se ve no obstante ampliada por la propia norma a renglón seguido, cuando establece una previsión excepcional para el trabajador destacado. Se entiende como tal, aquel trabajador fronterizo que se encuentra destacado por la empresa de la que depende, o que preste servicios en el territorio del mismo Estado miembro o de otro Estado miembro, conservando la condición de fronterizo pese a que esta circunstancia le impida regresar con la continuidad prevista como regla general. Luego la prestación laboral desempeñada por el trabajador se ve sometida a una de las vicisitudes previstas en las relaciones laborales para este tipo de circunstancia, como es la movilidad geográfica, sea de orden nacional o transnacional, es decir, se produce el desplazamiento del trabajador hacia un lugar distinto y posiblemente distante del centro de trabajo habitual, impidiéndole el regreso a su lugar de residencia habitual. Para este tipo de situación de desplazamiento coyuntural, se amplía la regla temporal hasta cuatro meses, y por tanto, pese a no darse el retorno diario o semanal, se mantiene la calificación de trabajador fronterizo durante ese periodo de tiempo.

Otra cuestión temporal que sin duda afecta a la consideración de trabajador fronterizo, es saber hasta cuándo se mantiene esta cualidad, ya que la situación parece poder prolongarse más allá del espacio temporal en el que se mantiene el vínculo

contractual. Esta circunstancia se planteó como cuestión prejudicial para saber si un trabajador fronterizo pierde esta condición por el hecho de hallarse en situación de desempleo total, a lo que la STJCE 1991/277, responde negativamente y por tanto no se pierde la condición de trabajador fronterizo en situación de desempleo total. Es decir, se da una prolongación temporal de dicha cualidad, en aquellas circunstancias en las que realmente ya no existe la relación laboral que originaba el movimiento transfronterizo entre los Estados de residencia y trabajo, pero que sin embargo, ha servido como causa necesaria para originar la situación posterior de desempleo total, y por tanto el reconocimiento a los efectos oportunos como trabajador fronterizo.

3. LA SIMPLIFICACIÓN DEL CONCEPTO EN LOS REGLAMENTOS 883/2004 Y 589/2016 DE LA UNIÓN EUROPEA

El Derecho Comunitario trata de actualizar el Reglamento existente desde 1971, como consecuencia de las modificaciones que se habían ido sucediendo fruto de la evolución natural desde entonces en el ámbito europeo, así como de la jurisprudencia suscitada al efecto, y de las diferentes legislaciones acaecidas en los panoramas nacionales. Como consecuencia de todo ello se elabora el Reglamento (CE) 883/2004, que trata de coordinar los sistemas aplicables de seguridad social dentro del marco de la libre circulación de personas.

Sin embargo, con independencia de la aplicación correspondiente en materia de seguridad social, la cuestión conceptual sobre los trabajadores fronterizos, no solo no se ve actualizada, sino que se ve simplificada, definiendo como tal a “toda persona que realice una actividad por cuenta ajena o propia en un Estado miembro y resida en otro Estado miembro al que regrese normalmente a diario o al menos una vez por semana”. De tal suerte, que ya no aparece incluida en la misma, ninguna mención sobre el trabajador fronterizo destacado, obviando la equiparación temporal que durante cuatro meses se hacía en la norma precedente que seguía considerando a estos trabajadores como fronterizos, pese a la falta de regreso diario o semanal.

Siguiendo el orden cronológico, todavía se llega a una mayor simplificación del concepto, cuando el Reglamento 589/2016 de la UE, sobre la red europea de servicios de empleo (EURES), el acceso a los servicios de movilidad por parte de los trabajadores e integración de los mercados de trabajo; considera como “trabajador fronterizo”: “el trabajador que realice una actividad por cuenta ajena en un Estado miembro y resida en otro Estado miembro al que el trabajador en principio regrese a diario o al menos una vez por semana”.

Se llega por tanto al concepto más restrictivo de trabajador fronterizo en el que solo va a tener cabida el trabajador por cuenta ajena o asalariado, dejando al margen al trabajador por cuenta propia o autónomo, que hasta entonces se reconocía como fronterizo en las reglamentaciones precedentes. Bien es verdad, que se realiza a efectos de esta norma, sin que a priori pueda interferir en la definición dada anteriormente a efectos de prestaciones sociales; pero no lo es menos, que se hace en el marco de la libre circulación de trabajadores en lo que ha de ser un verdadero mercado único de trabajo europeo, y por tanto, con unificación de criterios a la hora de definir el elemento subjetivo del que ha de partir su posterior aplicación normativa.

4. DIFERENCIACIÓN CON FIGURAS AFINES

4.1 La distinción entre trabajador fronterizo y trabajador transfronterizo

La denominación utilizada en la normativa europea de “trabajador fronterizo”, para definir a las personas que atraviesan fronteras para trabajar y regresan posteriormente a su lugar de origen, no coincide con la mencionada en la legislación española para describir esta situación. De hecho la ley de extranjería (RD 557/2011) lo denomina como “trabajador transfronterizo”, definiéndolo como aquel “que haya sido autorizado para desarrollar actividades lucrativas, laborales o profesionales por cuenta propia o ajena en las zonas fronterizas del territorio español, residiendo en la zona fronteriza de un Estado limítrofe al que regrese diariamente”.

Pero no solo parece una discrepancia literal, sino que efectivamente describen realidades diferentes, de hecho, ya en el ámbito temporal, la frecuencia prevista para el regreso del transfronterizo es solo de carácter diario, a diferencia de la previsión para el fronterizo que abarca también la de carácter semanal. Dicha previsión temporal conecta a su vez con el ámbito territorial, toda vez que en el caso de los transfronterizos, según la definición, tanto el lugar de desempeño del trabajo, como el lugar de residencia, han de estar situados en zonas fronterizas de Estados limítrofes. Cuestión en la que incide el legislador, cuando prevé como uno de los requisitos necesarios para poder obtener la autorización para trabajar en nuestro país, en el hecho de “residir en la zona fronteriza con territorio español de que se trate” (RD 557/2011, art. 183. a) y b), 3º). No existe a este respecto la misma previsión territorial en la reglamentación europea para el caso de los trabajadores fronterizos, los cuales han de residir y trabajar en diferentes Estados miembros, sin más precisiones al respecto, dejando por tanto abierta la posibilidad que se desarrolle en zonas no necesariamente limítrofes.

Pero sobre todo, lo más significativo es precisamente, el hecho de que el trabajador transfronterizo necesite de una autorización previa para poder desarrollar la actividad en nuestro territorio, toda vez que para los ciudadanos de la UE rige el principio de libre circulación de trabajadores, y por tanto estarían exentos de dicha autorización. Lo cual nos lleva a concluir que en España la denominación utilizada ha de referirse a una realidad diferente, en el sentido de que con la expresión “trabajadores transfronterizos” se hablaría de trabajadores extracomunitarios, mientras que la expresión “trabajadores fronterizos” aludiría a los trabajadores comunitarios (Vázquez, 2009).

4.2 Trabajador fronterizo y trabajador de temporada

Con independencia del tratamiento correspondiente a efectos de seguridad social, se define por el Reglamento (CEE) 1408/71 en términos parecidos al fronterizo, al trabajador de temporada, considerando como tal, a aquel trabajador que igualmente se desplaza de un Estado a otro para efectuar un trabajo, regresando al de residencia una vez finalice el mismo. Luego sin duda coincide con el trabajador fronterizo en cuanto al hecho de tener que cruzar la frontera de un país a otro por motivos de trabajo y el regreso posterior, pero a partir de aquí, existen notables diferencias, en cuanto a que, para los temporeros, el trabajo a efectuar ha de tener carácter estacional, y en cuanto a que, el regreso al lugar de residencia habitual no se da con carácter repetitivo, sino de una sola vez.

La figura del trabajador de temporada también es objeto de atención en la normativa española, concretamente en la conocida como Ley de extranjería que solicita al ejecutivo la regulación reglamentaria de la autorización de residencia y trabajo para los trabajadores extranjeros en actividades de temporada o campaña (LO 4/2000). En dicha norma se perfilan ya, los rasgos más significativos de este supuesto, en el sentido de ir dirigido expresamente al personal extranjero, el cual ha de precisar de una autorización para poder trabajar, por tanto dejando al margen al personal comunitario, incluidos los trabajadores fronterizos, que no necesitan de este permiso.

Por otro lado, la exigencia de una autorización de residencia temporal, indica la permanencia necesaria por el periodo de tiempo que ha de durar el trabajo, con el límite máximo de nueve meses (RD 557/2011); dejando claro que ha de ser un trabajo temporal de carácter estacional. Cuestión muy distinta a la prevista para los trabajadores fronterizos, los cuales pueden prolongar su actividad sin límite, de forma indefinida, siempre y cuando no permanezcan en lugar de trabajo más allá de una semana de manera continuada, toda vez que para estos trabajadores se exige el regreso reiterativo al territorio de residencia.

Se manifiesta por todo ello, la diferencia existente entre el trabajador fronterizo y el temporero, ya que este último necesita permiso de residencia y trabajo, permanece en el país mientras dura la campaña de trabajo, normalmente vinculada a actividades agrícolas o estacionales, que no tienen por qué darse en el fronterizo (San José, 2013), y regresa al domicilio una sola vez al finalizar la temporada, tiene además carácter cualitativamente temporal, y sobre todo por el hecho de ser realizado por trabajadores extranjeros no comunitarios.

4.3 Otros supuestos afines

Existen otras situaciones en las que también se da el movimiento de personas de un territorio a otro por razones de trabajo, y en los que al igual que en el caso de los trabajadores fronterizos, no coincide el Estado de residencia con el Estado de trabajo. Estos supuestos obedecen a panoramas bien distintos, que podemos agrupar en dos grandes bloques, por un lado las relaciones que se desarrollan en el marco de prestaciones transnacionales de servicios, y por otro, aquellas otras destinadas a ejercer un trabajo por cuenta ajena de duración determinada en otro país.

En cuanto a la prestación transnacional de servicios, supone en esencia, el desplazamiento de trabajadores que realizan las empresas para trabajar en otro Estado miembro distinto al que lo hacen normalmente, en lo que se considera como transnacionalización de las relaciones de trabajo (Directiva 96/71). Esta situación también denominada “expatriación”, es distinta del traslado de un trabajador ya contratado en la contratación para prestar servicios en el extranjero (Valverde y otros, 2016). Este supuesto en el espacio europeo supone una manifestación más de la libre prestación de servicios que se prolonga para estos casos en la libre circulación de trabajadores, pero este tipo de prestaciones también puede afectar a trabajadores extranjeros provenientes de empresas no pertenecientes a la Unión Europea (RD 557/2011).

Este supuesto de hecho coincide con el previsto para el caso del trabajador fronterizo en la existencia de dos territorios distintos, el de residencia habitual y el de trabajo; sin embargo a partir de aquí existen notables diferencias. De tal forma, que en el caso del trabajador desplazado de carácter transnacional, el trabajo habitual era el que se desempeñaba en el territorio de residencia, siendo el actual de carácter meramente transitorio, sin que suceda lo mismo en el caso del trabajador fronterizo, que su trabajo habitual coincide con el actual, que desempeña de forma no necesariamente temporal. Tampoco se da el regreso continuado propio del trabajador fronterizo, y donde además el vínculo laboral sigue existiendo con la empresa del territorio de origen, no así en el caso de los fronterizos. Por último, en cuanto al sujeto en sí, puede ser no solo ciudadano europeo como se regula para el trabajador fronterizo, sino también extracomunitario, eso sí, siempre y cuando en este último caso medie la pertinente autorización para su ejercicio, de residencia y trabajo.

El resto de supuestos afines serían aquellos que se integran en el bloque de los que van a ejercer un trabajo por cuenta ajena de duración determinada en otro país. En particular la normativa española contempla a los que se realizan como obras o servicios para ciertas actividades de: montaje, construcción o de instalación y mantenimiento; otros de carácter temporal de alta dirección, deportistas profesionales, artistas y otros posibles colectivos; y en su caso para formación o prácticas profesionales (RD 557/2011).

Para este conjunto de supuestos sirve extender los mismos argumentos comparativos esgrimidos entre trabajadores fronterizos y de temporada, en el sentido de que para estos últimos y a diferencia de los primeros, se necesita permiso de residencia y trabajo, que no regresan al país de residencia habitual de forma reiterativa, que tienen carácter temporal y que quienes lo realizan son según la normativa trabajadores extranjeros, en el sentido ya aludido de extracomunitarios.

5. CONCLUSIONES

El derecho fundamental de carácter general a la libre circulación de trabajadores dentro del territorio de la Unión Europea, se manifiesta también como una parte representativa de los movimientos de personas de un Estado a otro por

motivo de trabajo, con el reconocimiento de la figura del trabajador fronterizo. Este reconocimiento se ve plasmado en la reglamentación europea, sobre todo para ordenar cuestiones de prestaciones sociales referente a estos trabajadores en los distintos territorios que se vean afectados, ante lo cual se define el elemento subjetivo como parte fundamental sobre la que ha de girar toda esta normativa.

Sin embargo, la delimitación de este sujeto trabajador ha ido evolucionando en lo que parece ser una deriva legislativa, de un concepto integrador con inclusión de cualquier movimiento causado por una actividad profesional, e incluso con la equiparación de un supuesto inicialmente ajeno, hacía un concepto netamente restrictivo en cuanto a la única consideración como fronterizo, de los trabajadores por cuenta ajena sin más opciones ni equiparaciones. En cualquier caso, lo que sí se han mantenido han sido los mismos criterios territoriales y temporales, tratando de delimitar esta figura y sirviendo en gran medida como factores diferenciadores de otros supuestos afines, que al igual que en el caso de los fronterizos, originan movimientos migratorios de trabajadores. No quiere ello decir, que dichos criterios estén exentos de debate sobre su necesaria adaptación a los tiempos actuales, en lo que debe ser una nueva fórmula que dé respuesta a la verdadera realidad en la que se encuentran este tipo de trabajadores “inter- fronteras”.

De todo lo cual se desprende el uso de criterios diferentes según las necesidades normativas, sin haber conseguido establecer un concepto uniforme que sirviese como base delimitadora para ordenar las necesidades reales de estos trabajadores en todas las cuestiones en las que puedan verse afectados desde la perspectiva laboral, u otras que igualmente tuviesen alguna repercusión, como puede ser la materia fiscal. Por tanto hay que valorar la especial situación en la que se encuentran estos trabajadores con sometimiento a ordenamientos jurídicos diferentes según los territorios de origen y destino, que hacen aun más necesaria una definición uniforme y actualizada del trabajador fronterizo, que pueda ser aplicable a todos los ámbitos normativos en lo que viene siendo una demanda histórica (Resolución UE de 28 de mayo de 1998), que conviene resolver para dar garantías de un verdadero ejercicio del derecho a la libre circulación de trabajadores en el espacio de la Unión Europea.

Una vez hecha la delimitación del elemento subjetivo de estos movimientos desde un punto de vista jurídico-normativo de la UE como base reguladora del trabajador fronterizo; hay que conectar esta figura y los desplazamientos que originan desde una perspectiva turística. En este sentido, partiendo del supuesto de hecho que se genera en cuanto a desplazamiento de un sujeto fuera de su país de residencia habitual hacía otro territorio y su regreso posterior, parece coincidir con la base de los viajes de naturaleza turística. Sin embargo, los caracteres que rodean a esta figura laboral en relación con los que han de corresponder con los viajeros turísticos, son en cierta medida diferentes.

En este sentido, la primera circunstancia en la que presentan discrepancia es precisamente la que sirve de territorio de salida de los desplazamientos, de tal forma que si para este viajero trabajador ha de ser necesariamente el Estado de residencia, para el viajero turístico ha de ser lo que se denomina como entorno habitual. Cuestión que en una inmensa mayoría de los casos va a ser coincidente, pero que en realidad son conceptos diferentes, ya que el llamado entorno habitual engloba no solo el lugar de residencia, sino el espacio en el que ordinariamente se desenvuelve el sujeto. Este espacio tiene un carácter ambiguo, por la falta de precisión en los criterios utilizados como referencia, y por el hecho de tener una conexión individualizada que va a depender en definitiva de las peculiaridades de cada sujeto. No obstante, cabe entender objetivamente que la asistencia regular al lugar de trabajo, aun suponiendo un cambio de demarcación territorial como sucede en estos casos, e incluso en aquellas posibles situaciones en las que la distancia pueda ser considerable, o que ni siquiera se desplacen desde un Estados limítrofe; ha de ser considerado como una práctica inherente a la condición de cada sujeto como derecho-deber, y por tanto ha de formar parte de su entorno habitual.

En cualquier caso aunque los criterios de identidad puedan tener un cierto paralelismo en el que se den coincidencias territoriales y temporales, se diluyen en cuanto al ámbito motivacional de estos viajes, ya que en el caso del fronterizo viene claramente definida la intención de trabajar que provoca el desplazamiento, distando bastante de las opciones previstas para el turista. Tan es así, que desde el propio concepto de viaje turístico se excluye única y expresamente de su consideración, los desplazamientos cuya finalidad principal sea la de ser empleado por una entidad residente en el país o lugar visitado, cuestión que se da plenamente en el supuesto del trabajador fronterizo, quien por tanto ha de ser excluido de dicha calificación turística. Por si acaso, en la clasificación estadística de turismo de los visitantes internacionales, se excluye con carácter taxativo a los trabajadores fronterizos, lo que en definitiva viene a corroborar la separación que debe existir entre este tipo de “viajero trabajador” y el “viajero turista”.

RESUMO

A avaliação de conhecimentos dos estudantes é uma, das muitas, atividades desenvolvidas pela generalidade dos professores. Na maioria dos casos, essa avaliação é feita através da aplicação de testes académicos construídos pelos próprios professores. Estes testes são compostos por itens que podem assumir os formatos de resposta construída ou de escolha múltipla. Ambos os formatos de itens apresentam vantagens e desvantagens. Contudo, muitas das limitações que se apontam aos itens de escolha múltipla podem ser reduzidas, ou mesmo eliminadas, se eles forem construídos corretamente.

Neste artigo, elaborado com base numa revisão da literatura e na experiência da construção de um teste de conhecimentos de Matemática, o PMAT, apresentam-se técnicas de construção de testes de escolha múltipla, onde se inclui a aplicação de regras de redação dos itens que integram os testes desta natureza. Também se referem algumas técnicas elementares de análise de testes que podem identificar erros cometidos na sua construção e, por isso, facilitam a revisão e melhoria do teste quando se tem em vista o seu progressivo aperfeiçoamento.

Palavras-chave: PMAT, Construção de Testes, Itens de Escolha Múltipla, Avaliação de Conhecimentos.

1. INTRODUÇÃO

Os testes de avaliação académica, aos quais se restringe este artigo, são utilizados para avaliar resultados do processo de ensino e de aprendizagem. Em qualquer área disciplinar e em qualquer nível de escolaridade, os professores constroem e aplicam testes desta natureza para avaliarem os conhecimentos dos seus alunos nos conteúdos que lecionaram nas aulas, tendo como objetivo a classificação dos alunos ou o aperfeiçoamento do processo de ensino e de aprendizagem – ao verificarem se os objetivos definidos (conhecimentos a adquirir e capacidades a desenvolver pelos alunos) foram alcançados e se os métodos de ensino (meios pedagógicos para atingir os objetivos) foram adequados, podem, se necessário e possível, reformular os objetivos ou os métodos. Enquanto no primeiro caso a aplicação do teste é, normalmente, o fim de um processo, no segundo é um meio para o melhorar. Ainda no âmbito da avaliação formativa, os testes também são úteis para os estudantes fazerem a autoavaliação, para identificarem os tópicos sobre os quais os seus conhecimentos ainda não são suficientes para atingirem a meta que pretendem.

Qualquer prática pedagógica deve ser fundamentada na avaliação do nível de desempenho dos estudantes, das suas lacunas e necessidades de aprendizagem. Com o propósito de identificar, de forma objetiva e uniforme, os conhecimentos em Matemática dos estudantes à entrada do ensino superior de ciências e tecnologias, construiu-se um teste estandardizado, o PMAT (Monteiro, 2016), que se revelou apropriado para organizar recomendações de medidas preventivas e de melhoria efetiva das práticas de ensino nas unidades curriculares de Matemática do 1.º ano de cursos superiores.

O PMAT é um teste com itens de escolha múltipla. As características metroológicas que se pretendiam para o PMAT, a quantidade de estudantes a quem se iria aplicar e o interesse na rápida pontuação dos itens, fizeram com que a equipa que elaborou o teste decidisse que ele fosse composto por, apenas, itens de escolha múltipla. Tomada esta opção, desenvolveu-se uma pesquisa sobre a construção de testes com itens deste formato, a qual permitiu obter um instrumento de avaliação com características que lhe conferem objetividade e fundamentação científica na descrição dos conhecimentos dos estudantes. Neste artigo, apresentam-se os resultados mais relevantes desse estudo, os quais se aplicam a testes de conhecimentos dos estudantes em qualquer disciplina e em qualquer ponto do seu percurso escolar. Estes e outros resultados encontram-se descritos de forma mais detalhada em Monteiro (2016).

Os testes de conhecimentos, de utilização primordial em contexto educacional, são instrumentos de medida cognitivos, construídos em função da área do saber que se deseja medir. Pretende-se que descrevam quantitativamente o grau ou a quantidade de aprendizagem dos indivíduos, sob condições uniformes e estandardizadas de observação (Haladyna, 2004; Cohen, Swerdlik, & Sturman, 2013).

Como qualquer outro instrumento de medida psicológica, um teste de avaliação académica deve medir com rigor os conhecimentos que se querem medir, deve inspirar confiança aos seus utilizadores - quanto maior o grau de precisão e de adequação das medidas aos objetivos da avaliação, maior a convicção nas inferências feitas a partir dos resultados do teste. Estas características metrológicas são avaliadas através de indicadores que se conhecem após a administração do teste, observando e estudando os seus resultados.

A análise crítica da precisão e da legitimidade dos resultados de um teste, das medidas que ele proporciona, também faz parte do processo da sua construção - a análise faculta indicadores, para os itens ou outros fatores, que devem ser corrigidos no sentido de o melhorar. Daí que na última parte deste artigo se faça referência a procedimentos, muito simples, para obter determinados indicadores sobre a qualidade de um teste de escolha múltipla, depois de se mencionarem alguns tópicos sobre técnicas de construção de qualquer teste e se apresentarem diretrizes de redação de itens de escolha múltipla, caracterizados na primeira parte.

2. ITENS DE RESPOSTA CONSTRUÍDA E ITENS DE ESCOLHA MÚLTIPLA

Os testes são, normalmente, compostos por várias questões, instruções ou outras formas de solicitar respostas, que se designam por itens.

De um modo geral, um item tem três componentes: o enunciado (estímulo para a resposta) que pode ter a forma de pergunta aberta, de uma afirmação incompleta ou de uma instrução que requer uma resposta verbal ou comportamental; algumas condições fixadas para a resposta; o método de pontuação.

Para responder a cada item, pode ser necessário elaborar a resposta, ou selecioná-la de entre várias opções disponibilizadas. É em função do modo como a resposta é dada que se distinguem os formatos dos itens quanto à estrutura. Neste sentido, os itens podem ser agrupados em:

Itens de Resposta Construída - solicitam uma resposta que deve ser elaborada sem qualquer informação além da que se encontra no enunciado;

Itens de Escolha Múltipla - solicitam uma resposta que não é elaborada, mas selecionada entre as várias opções que são apresentadas, podendo esta seleção ser feita, por exemplo, entre o *sim* e o *não* ou entre o *verdadeiro* e o *falso*.

Os itens de escolha múltipla com dois níveis de pontuação (certo/errado) dizem-se dicotómicos, em oposição aos politómicos.

Entre os **Itens de Resposta Construída** diferenciam-se dois tipos de formatos:

- *Resposta fechada*: resposta dada através do preenchimento de espaço(s) em branco – numa frase, numa tabela ou outra estrutura – apresentado(s) para completar.
- *Resposta aberta*: resposta completa e estruturada do modo que parecer mais conveniente ao respondente que, na maioria dos casos, deve explicar como obteve essa resposta.

Entre os **Itens de Escolha Múltipla**, distinguem-se os seguintes formatos, de acordo com Haladyna, Downing e Rodriguez (2002):

- *Escolha Múltipla Convencional* (conhecidos por, simplesmente, itens de escolha múltipla): item composto pelo enunciado e por três a cinco alternativas de resposta ou opções - uma correta, a chave, e as outras erradas, os distratores (o avaliado deve indicar a chave).
- *Escolha Alternativa*: item composto pelo enunciado e duas alternativas de resposta - uma certa e outra errada (o avaliado deve indicar a resposta certa).
- *Verdadeiro-Falso*: item que consiste numa afirmação que pode ser verdadeira ou falsa (o avaliado deve indicar se a afirmação é verdadeira ou falsa).
- *Múltiplo Verdadeiro-Falso*: item formado pelo enunciado e por 3 a 30 opções, verdadeiras ou falsas (o avaliado deve indicar, para cada opção, se é verdadeira ou falsa).
- *Associação*: item constituído por grupos de opções (3 a 12) que o avaliado deve associar, em função de uma questão ou tarefa solicitada.

Exemplo: Ligue, com um traço, cada proposição verdadeira do grupo A a uma proposição falsa do grupo B.

Grupo A	Grupo B
$\sqrt{x^2} = x$, para todo o $x \in \mathbb{R}$	$\frac{x^2+2x^3}{x^2} = 2x$, com $x \in \mathbb{R} \setminus \{0\}$
$\sqrt{10^2 - 4^2} > 8$	$(n+2)^2 \neq n^2 + 4$, com $n \in \mathbb{N}$.
$3 - 5 \times 2 = -7$	$x^2 + 2x = 3 \Leftrightarrow x = 1 \vee x = 3$

- *Escolha Múltipla Complexa*: item formado pelo enunciado seguido de afirmações, numeradas, que são agrupadas em três a cinco alternativas de resposta, só uma delas correta.

Exemplo: Quais das seguintes afirmações são verdadeiras?

1. $2 - 3 \times 4 = -10$

2. $\frac{1}{3} + \frac{2}{5} = \frac{3}{8}$

3. $4^2 \div 4^{-2} = 4^4$

- A) 1 e 2
- B) 2 e 3
- C) 1 e 3
- D) 1, 2 e 3

- *Conjunto de Itens Dependentes do Contexto*: conjunto de 2 a 12 itens, com um dos formatos anteriores, cuja resposta depende do mesmo estímulo, dado por um poema, uma fotografia, uma tabela, um gráfico ou outro material visual.

Exemplo (Retirado de Preparing for the ACT, 2009/2010):

Utilize a informação que se segue para responder às questões 1 - 3.

Antes da eleição para Presidente da Câmara de Springdale foi selecionada uma amostra de 200 eleitores. Todos eles indicaram um de quatro candidatos em que iriam votar. Os resultados da sondagem são apresentados na tabela abaixo.

Candidatos	Número de Votos
Blackcloud	50
Lue	80
Gomez	40
Whitney	30

- Que percentagem, de eleitores da amostra, escolheram Whitney para Presidente da Câmara?
 - A. 15%
 - B. 20%
 - C. 25%
 - D. 30%
 - E. 40%
2. Se a sondagem for indicativa de que os 10.000 eleitores de Springdale votarão na eleição, qual das seguintes é a melhor estimativa do número de votos que Lue irá receber?
 - A. 1.500
 - B. 2.500
 - C. 4.000
 - D. 5.000
 - E. 8.000
3. Se a informação da tabela for convertida num gráfico circular (sectograma), quantos graus medirá o ângulo ao centro do sector correspondente a Gomez?
 - A. 54°
 - B. 72°
 - C. 90°
 - D. 108°
 - E. 144°

Um teste pode ser organizado com itens do mesmo formato ou de formatos diferentes. Como exemplo do primeiro caso, tem-se o teste de Matemática de acesso às escolas francesas que integram a *Fédération des Écoles Supérieures d'Ingénieurs et de Cadres (FESIC)* (Concours Puissance 11, 2017). Os exames nacionais portugueses de algumas disciplinas ou os testes do PISA são exemplos de testes constituídos por itens de vários formatos.

Desde a natureza dos processos cognitivos a medir até aos recursos disponíveis, são diversos os fatores que condicionam a escolha do formato dos itens que irão compor um teste académico, quer seja um teste típico de aplicação em sala de aula, quer seja um teste de larga escala - teste que avalia o desempenho dos estudantes de vários países, incidindo em conteúdos de aprendizagem definidos por programas de ensino diferentes, como o PISA ou o TIMSS.

Considerem-se as vantagens dos itens de escolha múltipla (EM) em relação aos itens de resposta construída (RC) e vice-versa.

Vantagens dos itens EM em relação aos itens RC¹:

- O procedimento da pontuação dos itens EM pode ser feito automaticamente ou por alguém que não é perito na matéria avaliada, o que os torna mais económicos do que os itens RC (normalmente, é atribuído 1 ponto a quem escolhe a alternativa de resposta certa e 0 pontos a quem escolhe uma opção errada ou não responde ao item; há casos em que se atribui uma pontuação negativa a respostas erradas);
- A facilidade da pontuação dos itens EM permite apurar os resultados mais rapidamente do que nos itens RC, o que proporciona, aos avaliadores e aos avaliados, o *feedback* sobre o desempenho de um modo mais oportuno;
- A pontuação dos itens EM é objetiva e relativamente fiável, pelo que são mais equitativos para os estudantes do que os itens RC;
- O grau de dificuldade dos itens EM não aumenta para os alunos que têm dificuldade de expressão, o que pode acontecer nos itens RC;
- Os enunciados dos itens EM são, geralmente, mais objetivos que os dos itens RC;
- Os itens EM podem ser respondidos mais rapidamente do que os itens RC, pelo que um teste pode ter um maior número de itens EM e, assim, abranger mais tópicos dos conteúdos a avaliar.

Vantagens dos itens RC em relação aos itens EM:

- Um item RC é mais fácil de construir do que um item EM;
- Um item RC permite obter toda a gama de respostas dadas pelos estudantes e incentiva a criatividade;
- Ao responder com as suas próprias palavras a um item RC, o estudante revela melhor o seu nível de conhecimentos de que num item EM;
- Por não ser mostrada a resposta certa, o estudante que não a conhece tem menos probabilidade de responder corretamente do que num item EM;
- Os itens RC são mais adequados para medirem aptidões, pois elas exigem processos construtivos, frequentemente complexos.

As vantagens dos itens de resposta construída em relação aos outros têm promovido muitas investigações no sentido de minimizar as limitações dos itens de escolha múltipla, de identificar o tipo de aprendizagens que estes itens avaliam eficazmente ou de comparar os resultados de testes com itens de um ou outro formato. Refira-se, por exemplo, o estudo de Ng e Chan (2009) relacionado com experiências que visam desencorajar as respostas dadas por intuição ou acaso para permitir que as respostas reflitam conhecimento parcial por parte dos estudantes; ou o de Lissitz e Hou (2008) que consistiu em avaliar o impacto da remoção de itens de resposta construída das provas Maryland High School Assessments (provas de final de curso, constituídas por quatro testes, cada um composto por itens de resposta construída e itens de escolha múltipla). Nem uns nem outros autores apresentam desvantagens na utilização dos itens de escolha múltipla. Tal como Willingham e Cole (1977, como citados em Beller & Gafni, 1996) que, na sequência de uma revisão global sobre Género e Avaliação Justa/Imparcial, concluíram que o formato de escolha múltipla dos itens não é suscetível de apresentar um problema significativo de equidade.

Em face das conclusões destas e de outras investigações, a maioria de natureza empírica, pode-se afirmar que não há formatos de itens melhores que outros, em sentido absoluto. Cada formato tem características que o tornam mais adequado, em função dos conteúdos a avaliar, da natureza dos avaliados e das condições de aplicação e procedimentos de apuramento dos resultados do teste. São essas características que devem determinar o formato, ou formatos, dos itens de um teste de avaliação académica.

3. TÉCNICAS DE CONSTRUÇÃO DE TESTES DE ESCOLHA MÚLTIPLA

Uma vez que o item é a unidade básica do teste, a primeira etapa da construção de um teste consiste na tomada de decisões que irão orientar todo o sistema de produção dos itens, determinante para o valor metrológico do instrumento de medida.

3.1 Decisões prévias

Atendendo às recomendações da Psicometria (ramo da Psicologia que se ocupa dos desenvolvimentos teóricos e metodológicos que fundamentam a construção, avaliação e utilização de testes psicológicos (APA, 2009)), ao formular os itens que vão compor um teste de conhecimentos, deve-se ter sempre presente *o que* se vai avaliar, *para que* se vai avaliar e *quem* vai ser avaliado. Segundo Almeida e Freire (2008), é com a definição destes parâmetros que, de facto, se inicia a criação de um teste. Ainda de acordo com estes autores, o passo seguinte é decidir:

- Qual a forma como o teste vai ser aplicado (forma papel-e-lápis ou digital, com ou sem formulário, com ou sem calculadora, individual ou coletivo, etc.);
- Qual o grau de dificuldade ou o nível de complexidade que se deverá imprimir ao teste, em face dos sujeitos e dos objetivos a que ele se destina;
- Qual o conteúdo dos itens (sobre que tópicos vão incidir);
- Qual o formato dos itens;
- Quantos itens vai ter o teste.

¹ Excluindo os itens de resposta construída fechada que solicitam a resposta marcada numa folha de respostas, de acordo com um determinado código.

Os especialistas em técnicas de construção de itens para testes académicos, como Haladyna (2004), recomendam que cada item represente um único tipo de conteúdo e envolva um único tipo de processo cognitivo - se um item medir vários conteúdos ou processos, pode não se tornar possível compreender o significado das respostas dadas pelos estudantes.

Quem constrói um teste deve ser perito no que se pretende avaliar, conhecer o tipo de ensino e de aprendizagem dos indivíduos que vão ser avaliados e saber qual é o objetivo da avaliação em questão. Estas informações irão facilitar-lhe a tomada de decisão em relação a cada uma das questões atrás mencionadas. Algumas dessas decisões estão interligadas, na medida em que a resolução de uma influencia ou determina as outras, como por exemplo: o uso de calculadora num teste de Matemática poderá condicionar o seu conteúdo, a dificuldade e o formato dos itens; testes com itens de um determinado formato podem abranger mais conteúdos, do que se tiverem outro formato, o que poderá ser relevante se houver limite de tempo para a realização do teste. Esta e outras consequências de cada formato de itens são fundamentais para refletir e fixar as condições de construção do teste.

Relativamente ao PMAT, o teste que foi construído de acordo com os tópicos apresentados neste artigo, tomaram-se as seguintes decisões prévias: ser aplicado a estudantes do 1.º ano/1.ª inscrição de cursos superiores de ciências e tecnologias que realizaram o exame nacional de Matemática A; ser administrado na primeira semana de aulas do ano letivo, na forma papel-e-lápis, individual, sem calculadora nem formulário; o conteúdo, a linguagem e o grau de dificuldade dos itens serem do nível do 12.º ano; o teste ter 32 itens, todos de escolha múltipla (convencional), sendo atribuído um ponto por cada resposta certa e zero pontos por cada resposta errada ou omissa².

3.2 Matriz dos Itens

Tomada a decisão sobre o formato dos itens e estabelecidas todas as outras condições da construção do teste, antes de começar a redigir os itens é imprescindível elaborar a **Matriz dos Itens** - tabela de dupla entrada onde se distribui o número total de itens em função de dois critérios de classificação estruturantes do teste: área de conteúdo e nível de complexidade, no caso de testes de conhecimentos.

A área de conteúdo de um item é definida pela matéria em que ele vai incidir.

O nível de complexidade de um item pode ser classificado em *baixo*, *moderado* ou *elevado*, consoante o processo ou processos mentais envolvidos. Segue-se uma possível descrição destes níveis de complexidade, influenciada por Martin, Olson e Wilson (2008), com identificação das categorias da clássica Taxonomia de Bloom relacionadas com cada nível. Adaptados de Bloom (1956), referem-se os objetivos cognitivos das categorias e os verbos que lhes estão associados.

Nível de Complexidade Baixo - Itens que exigem recuperação da memória ou reconhecimento de conceitos ou princípios previamente aprendidos; especificam o que o estudante deve fazer ou envolvem a utilização de procedimentos automatizados. Não se exige que o estudante utilize um método de resolução original.

Categorias da Taxonomia de Bloom:

- *Conhecimento*: recuperação de informação memorizada.

Verbos associados: reconhecer, definir, identificar, reproduzir, rotular, designar, mostrar, listar.

- *Compreensão*: compreensão do significado, interpretação ou extrapolação de instruções e de problemas.

Verbos associados: compreender, traduzir, interpretar, justificar, explicar, descrever, resumir, demonstrar.

Nível de Complexidade Moderado - Itens que exigem flexibilidade de pensamento e escolha entre alternativas de solução; que exigem resposta sem especificação de procedimentos ou que envolvem mais do que um passo de resolução. O estudante deve decidir que estratégias de resolução utilizar, recorrendo a conhecimentos de diversos domínios.

Categorias da Taxonomia de Bloom:

- *Aplicação*: utilização de conhecimentos na resolução de uma nova situação ou problema; utilização espontânea de abstração.

Verbos associados: aplicar, apurar, calcular, determinar, resolver, solucionar, fazer, construir, mostrar, ilustrar, experimentar.

- *Análise*: separação de fenómenos ou conceitos em componentes de modo a compreender a organização de uma estrutura; separação entre factos e inferências.

Verbos associados: analisar, relacionar, comparar, distinguir, classificar, categorizar, organizar, agrupar, arranjar, discriminar, diferenciar, deduzir.

Nível de Complexidade Elevado - Itens que exigem raciocínio abstrato, planeamento, capacidade de síntese, juízo avaliativo e pensamento criativo. O estudante tem que pensar de maneira abstrata e complexa.

Categorias da Taxonomia de Bloom:

- *Síntese*: construção de uma estrutura ou padrão a partir de diversos elementos; associação de partes de modo a criar uma nova estrutura ou um novo significado.

Verbos associados: sintetizar, integrar, projetar, combinar, compor, formular, inventar, criar, imaginar, inferir, produzir, predizer.

² A possibilidade de alguns estudantes não responderem a um item por não terem a certeza absoluta da resposta certa, levou os autores do PMAT a não atribuir pontuação negativa às respostas erradas. Tanto mais que investigações empíricas realizadas para analisar as vantagens ou desvantagens em descontar a pontuação das respostas erradas às certas não produziram resultados consistentes, como refere Frary (1988).

- *Avaliação*: emissão de juízos de valor relativamente a ideias ou fenómenos.

Verbos associados: avaliar, julgar, criticar, corrigir, verificar, discutir, escolher, decidir.

Preenchida a matriz dos itens, uma vez fixados a percentagem ou o número de itens relativos a cada área de conteúdo e, entre estes, quantos devem pertencer a cada nível de complexidade, estão reunidas as condições para iniciar o processo da construção dos itens.

Antes de se construírem os 32 itens do PMAT, foi decidido que 35% deles seriam da área de Análise, 30% de Álgebra, 15% de Probabilidades e Estatística, 15% de Geometria e 5% de Lógica e Teoria de Conjuntos; dentro de cada área de conteúdo, tanto quanto possível, 35% dos itens teriam nível de complexidade baixo, 50% moderado e 15% elevado.

3.3 Construção de Itens de Escolha Múltipla

As características dos itens de escolha múltipla e as suas vantagens em relação aos outros itens podem determinar a sua preferência para construir, total ou parcialmente, um teste de conhecimentos. No entanto, a opção por itens de escolha múltipla requer que, no processo da sua elaboração, sejam consideradas as limitações e críticas que lhes são apontadas, algumas das quais podem ser minimizadas, ou mesmo eliminadas, se os itens forem bem construídos.

Visando nortear e facilitar o trabalho de construir itens de escolha múltipla que venham a integrar um teste com boas propriedades metrológicas, existem algumas listas de diretrizes de redação ou regras básicas para a construção destes itens, como a que é proposta por Haladyna (2004), a de Zimmario (2010) ou a de Moreno, Martínez e Muñiz (2006). Apesar de a lista de Haladyna (2004) não ser a mais recente, a brevidade, clareza e objetividade das suas normas determinaram que ela fosse a preferida para este trabalho. Apresenta-se de seguida, adaptada da original, com a recomendação do autor de que as diretrizes devem ser aplicadas de modo criterioso mas não rígido.

Diretrizes para a Construção de Itens de Escolha Múltipla:³

Relativamente ao Conteúdo

- 1) Cada item deve refletir um conteúdo específico e um único processo cognitivo, de acordo com a matriz dos itens do teste;
- 2) Cada item deve incidir num conteúdo importante da aprendizagem e devem evitar-se conteúdos triviais;
- 3) Devem ser usados conteúdos ou cenários diferentes dos referidos no manual ou nas aulas para medir a compreensão e a aplicação de conhecimentos e de competências;
- 4) O conteúdo de cada item deve ser independente do conteúdo dos outros itens do teste;
- 5) Devem ser evitados conteúdos demasiado gerais e demasiado específicos;
- 6) Devem ser evitados itens baseados em opiniões;
- 7) Devem ser evitados itens com rasteiras.

Relativamente ao Estilo e ao Formato

- 8) A estrutura do item (disposição das alternativas de resposta) deve ser vertical e não horizontal;
- 9) A ideia central de um item deve ser apresentada com clareza;
- 10) A escrita do item deve ser correta quanto à construção gramatical, à pontuação, à ortografia e ao uso de letras maiúsculas;
- 11) O vocabulário do item deve ser simples, de modo a que a compreensão da leitura não interfira com o que se pretende avaliar;
- 12) O tempo de leitura do item deve ser o menor possível, devendo evitar-se palavras desnecessárias (como iniciar cada alternativa de resposta com a mesma palavra);
- 13) Deve ser feita a revisão de cada item (uma boa regra: se, no final da revisão do teste, forem localizados três erros, provavelmente ficou um por encontrar).

Relativamente à Escrita do Enunciado

- 14) As instruções, no enunciado, devem ser o mais objetivas possível (ao ler o enunciado, o estudante deve saber logo o que o item foca);
- 15) O enunciado deve ser o mais curto possível;
- 16) A ideia central do item deve estar no enunciado e não nas alternativas de resposta;
- 17) Deve ser evitada informação irrelevante;
- 18) O enunciado deve ser escrito na positiva (se, com cuidado, forem usadas palavras na negativa, como **NÃO** e **EXCETO**, elas devem ser escritas com letras maiúsculas e a negrito).

Relativamente à Escrita das Alternativas de Resposta

- 19) Deve ser criado o maior número possível de alternativas de resposta, mas duas ou três podem ser suficientes;
- 20) A posição da resposta certa deve variar entre os itens, devendo esta posição ser escolhida aleatoriamente;
- 21) As alternativas de resposta devem ser colocadas numa ordem lógica ou numérica;

³ Algumas destas diretrizes não se aplicam diretamente ao formato Verdadeiro-Falso.

- 22) As alternativas de resposta devem ser independentes, não devem ser sobrepostas;
- 23) As alternativas de resposta devem ser homogêneas no conteúdo e na estrutura gramatical;
- 24) As alternativas de resposta devem ter comprimentos sensivelmente iguais;
- 25) A alternativa “Nenhuma das anteriores” deve ser usada com moderação;
- 26) Evitar usar a alternativa de resposta “Todas as anteriores”;
- 27) Evitar usar palavras na negativa, tais como NÃO ou EXCETO;
- 28) Evitar alternativas de resposta que dão pistas para a resposta certa;
- 29) Os distratores devem ser plausíveis;
- 30) Devem ser usados erros típicos dos estudantes para escrever os distratores;
- 31) Pode ser usado o humor, se ele for compatível com o professor e o ambiente de aprendizagem.

Refira-se também uma recomendação de Zimmaro (2010) que parece pertinente na construção de itens para testes de conhecimentos em Matemática: as alternativas de resposta devem ser identificadas com letras e não com números.

Seguem-se exemplos de itens de escolha múltipla que não obedecem a algumas das diretrizes apresentadas (são exemplos de maus itens) com o intuito de ilustrar a necessidade de cumprir essas regras para reduzir o número de respostas certas dadas por estudantes que, de facto, não as conhecem - ou porque conseguem identificar a resposta certa por intuição, seguindo pistas não intencionais, ou porque têm algum conhecimento que lhes permite eliminar os distratores ou ainda porque, por intuição ou conhecimento parcial, excluem algumas respostas erradas e, por acaso, selecionam a certa entre as opções que restaram. Combater estes procedimentos dos estudantes é, acredita-se, o maior desafio que se apresenta a quem pretende construir um teste com itens de escolha múltipla.

Exceto a primeira, todas as regras mencionadas nos exemplos estão relacionadas com a escrita das alternativas de resposta. A resposta certa de cada item está assinalada com *.

➤ **O conteúdo de cada item deve ser independente do conteúdo dos outros itens do teste.**

1. Qual dos seguintes valores é igual a 2^7 ?	2. Qual deve ser o valor de n para que $2^n=128$?
A. 14	A. 7^*
B. 49	B. $\sqrt{128}$
C. 128^*	C. 64

Se o mesmo teste contiver estes dois itens, os estudantes encontram no item 2 a solução do item 1 e vice-versa. Esta dependência do conteúdo dos itens, um erro trivial da construção de testes de escolha múltipla, mas nem por isso raro, pode ocorrer quando os itens são revistos individualmente e não no seu conjunto - deve ser feita uma revisão completa do teste, antes da sua administração.

➤ **A posição da resposta certa deve variar entre os itens, devendo esta posição ser escolhida aleatoriamente.**

➤ **As alternativas de resposta devem ser colocadas numa ordem lógica ou numérica.**

3. Qual dos seguintes valores é igual a $15,33 \div 15$?
- A. 0,122
B. $1,022^*$
C. 1,02

Ao construir os itens, algumas pessoas tendem a colocar as alternativas de resposta corretas nas mesmas posições, normalmente nas centrais, padrão que pode ser detetado pelos alunos que respondem por intuição. Também se tem verificado que os alunos que respondem ao acaso têm tendência a rejeitar a primeira e a última opção. Para contrariar esta vantagem de quem não conhece a resposta certa, as alternativas de resposta devem ser distribuídas aleatoriamente pelas várias posições. Além disso, estas alternativas devem ser colocadas numa ordem numérica ou lógica (alfabética, comprimento das opções ou outra). Esta disposição das opções, além de desencorajar a resposta intuitiva, não aumenta o grau de dificuldade que se pretende para o item, como por vezes acontece quando as opções não são colocadas nesta forma.

O item 3 poderia ser melhorado escrevendo as alternativas de resposta por ordem decrescente (ou crescente) e com o mesmo número de casas decimais: A. $1,022^*$; B. 1,020; C. 0,122.

➤ **As alternativas de resposta devem ser homogêneas no conteúdo e na estrutura gramatical.**

➤ **Evitar alternativas que dão pistas para a resposta certa.**

4. A soma das idades do João e da sua irmã Ana é igual a nove e, daqui a três anos, a Ana terá o dobro da idade do João. Portanto, o João
- A. Tem menos cinco anos que a Ana.*
B. É 1 ano mais novo que a Ana.
C. É 2 anos mais novo que a Ana.

A opção A, por se distinguir das outras no formato de redação, poderá ser a escolhida por quem responder por intuição. O item tem uma pista para a resposta certa, o que é de evitar. No caso de a opção B ser substituída por “Tem menos um ano

que a Ana”, fica a opção C a distinguir-se das outras e, neste caso, o item dá uma falsa pista, o que vai contra as regras de escrita de itens (regra 7). Substituir também a opção C por “Tem menos dois anos que a Ana” evita a heterogeneidade das alternativas de resposta e, por consequência, pistas para a resposta certa ou rasteiras para os alunos.

➤ **As alternativas de resposta devem ser independentes, não devem ser sobrepostas.**

➤ **Os distratores devem ser plausíveis.**

5. Qual dos seguintes períodos se inclui nos anos em que, em Portugal, vigorou o Estado Novo?

- A. 1920 - 1950
- B. 1930 - 1950
- C. 1940 – 1970 *
- D. 1940 - 1980

Um aluno que não conheça o período em que vigorou o Estado Novo em Portugal poderá fazer o seguinte raciocínio para eliminar distratores: Se A fosse a opção correta, também B seria, logo A deve ser incorreta; entre C e D acontece o mesmo. Portanto, a resposta certa será B ou C.

Para evitar a sobreposição das alternativas de resposta deste item, admita-se a seguinte alteração: A. 1900 – 1940; B. 1920 – 1950; C. 1940 – 1970*; D. 1960 - 1980. A resposta certa poderá ser escolhida entre as opções B e C por um aluno que repare que o período indicado em A começa antes da Implantação da República Portuguesa e que o indicado em D termina depois de ter ocorrido a Revolução de 25 de abril. Embora estas alternativas de resposta não se sobreponham, dois dos distratores são facilmente identificados - não são plausíveis. Em boa verdade, tanto esta versão do item como a anterior, apesar de terem quatro opções, só têm um distrator para os alunos que não sabem as datas de início e de fim do Estado Novo mas têm alguns conhecimentos sobre História de Portugal.

Pretende-se que um item seja respondido corretamente apenas pelos estudantes que têm um elevado grau de conhecimento. Para que tal aconteça, qualquer distrator deve ser plausível, isto é, não deve revelar facilmente que é uma resposta errada a quem não tem o conhecimento necessário para ter a certeza da resposta certa. Um distrator que não seja plausível, não é um distrator eficaz. Depois de o teste ser aplicado, um distrator deste tipo identifica-se pelo número reduzido de indivíduos que o selecionaram como resposta certa (menos de 5%, segundo Linacre (2012) e Haladyna e Downing (1988)).

Como se observou, tanto a primeira como a segunda versão do item 5 poderão ser respondidas corretamente por um aluno que não conheça a resposta certa mas seja capaz de, com algum conhecimento parcial, eliminar opções erradas. Este item justifica a primeira diretriz relativa à escrita de alternativas de resposta: Deve ser criado o maior número possível de alternativas de resposta, mas duas ou três podem ser suficientes.

Com a aplicação de “Deve ser criado o maior número possível de alternativas de resposta” pretende-se reduzir a probabilidade de um estudante acertar a resposta por acaso - quantas mais opções tiver, menos hipóteses tem de escolher a correta. No entanto, nem sempre se consegue construir quatro ou cinco alternativas de resposta eficazes, e o item acaba por ficar, na realidade, com um ou dois distratores plausíveis. Nestes casos, em vez de ter “falsas” opções, talvez seja preferível ter só duas ou três “verdadeiras” opções. Daí a advertência, “mas duas ou três podem ser suficientes”.

Haladyna, Downing e Rodriguez (2002) justificam esta aparente contradição com o facto de 70% da literatura que reviram aconselhar a construção do maior número possível de opções (do total, apenas 4% defende quatro opções e os restantes abstêm-se de fazer qualquer recomendação), mas eles serem a favor de poucas alternativas de resposta.

Uma das diretrizes para a escrita de itens de escolha múltipla propostas por Moreno, Martínez e Muñoz (2006) indica que três é o número adequado de alternativas de resposta, embora um número maior também o possa ser. A eficácia dos itens de escolha múltipla com dois distratores também é defendida por outros peritos na matéria, como Bruno e Dirkzwager (1995) que se fundamentam numa investigação teórica e Rodriguez (2005) que efetuou um investigação empírica.

Além das propriedades metrológicas dos itens e do teste que justificam os itens de escolha múltipla com três opções, Rodriguez (2005) acrescenta argumentos práticos persuasivos:

- É necessário menos tempo para criar dois distratores plausíveis do que três ou mais;
- Podem ser administrados mais itens com três alternativas de resposta, por unidade de tempo, do que com quatro ou cinco, o que potencia uma maior abrangência do conteúdo a avaliar;
- Mais alternativas de resposta podem resultar no fornecimento de pistas para a resposta certa e para outros itens.

Para criar um teste com itens de escolha múltipla, os peritos recomendam que se construam mais itens do que os que se pretendem ter na versão final do teste - Almeida e Freire (2008) sugerem o dobro dos itens; segundo Haladyna (2004), devem ser construídos 250% do número de itens decidido para o teste. Reunidos todos estes itens, selecionam-se e organizam-se os mais adequados, de acordo com a matriz dos itens previamente definida e, como sugere Prieto (2010), dispondo os itens segundo a, esperada, ordem crescente de dificuldade para os estudantes. Com este procedimento, obtém-se a primeira versão do teste.

4. ANÁLISE DOS RESULTADOS DE UM TESTE

A aplicação de um teste subentende o objetivo de obter uma pontuação que represente o nível dos indivíduos, a quem é administrado, num determinado construto latente (um traço ou uma dimensão latente do comportamento de um indivíduo, como os conhecimentos de uma disciplina após um período de aprendizagem). Os indicadores dos níveis desse construto, uma entidade abstrata, não observável, terão sido identificados numa variável observável (a pontuação) por quem construiu

o teste (Prieto, 2010). Dessa identificação depende a qualidade do teste como instrumento de avaliação.

A qualidade de um teste não depende apenas do rigor técnico da redação dos itens. Depois de aplicado, há que analisar as suas características metrológicas e o respetivo impacto nos seus resultados. Este estudo tem por objetivo averiguar se as medidas proporcionadas pelo teste são suficientemente precisas para, então, se poder examinar se ele mede, de facto, o que se pretende (Monteiro, Afonso, & Pires, 2013). Embora esta análise se imponha na criação de um teste estandardizado, um instrumento de avaliação objetiva, com resultados generalizáveis e replicáveis, ela não é viável na construção de um teste académico realizado pelo professor para os seus alunos. Contudo, existem técnicas para obter indicadores da qualidade de um teste desta natureza que, utilizando uma folha de cálculo, podem ser aplicadas com relativa facilidade. Considerem-se alguns exemplos.

- O índice de dificuldade de um item define-se como sendo o número de respostas certas dadas a esse item a dividir pelo número de indivíduos que fizeram o teste. Na situação ideal, 80% dos itens têm um índice de dificuldade entre 0,20 e 0,80, 10% dos índices são superiores a 0,80 e os restantes inferiores a 20%.
- O índice de discriminação de um item é igual à correlação entre as pontuações, dos participantes, no teste e no item. Este índice é tanto melhor quanto maior o seu valor, uma vez que é maior a sua capacidade para prever o resultado de um indivíduo no teste, considerando-se aceitável se for superior a 0,30 e inadequado se for negativo.

Adaptando um procedimento sugerido por Linacre (2012) a uma primeira abordagem à qualidade de um teste, podem ser feitos os seguintes exercícios:

- Antes de se conhecerem os resultados do teste, escrever os itens pela ordem crescente de dificuldade que se espera para os estudantes a quem vai ser aplicado o teste. Se essa ordem for igual à que se vier a verificar, então o teste tende a medir o que se pretende.
- Antes de se analisarem os resultados do teste, anotar o nível de desempenho que se espera dos estudantes que resolveram ou vão resolver o teste. Se, depois de conhecidas as pontuações, os estudantes ficarem ordenados de acordo com o que se esperava, então o teste deve ter utilidade preditiva.

A utilização das técnicas apresentadas podem ser suficientes para identificar itens que devem ser revistos para melhorar a qualidade do teste, em particular quando se pretende repetir a sua aplicação. Com esta identificação fecha-se um ciclo do processo de construção do teste, um processo que, em rigor, nunca está concluído, pois exige constante escrutínio empírico, revisão de conteúdo e aperfeiçoamento técnico (Monteiro *et al.*, 2013).

5. CONCLUSÃO

Como já foi referido, o PMAT é um teste de escolha múltipla, que avalia conhecimentos em Matemática, construído com base nos procedimentos atrás mencionados. A análise dos resultados do PMAT, bastante mais desenvolvida do que a apresentada (fundamentada na Teoria Clássica dos Testes e na Teoria da Resposta ao Item), qualificam-no como um instrumento de avaliação com características que conferem legitimidade às inferências feitas sobre o nível de desempenho e de competência dos estudantes avaliados. O PMAT também faculta resultados que constituem uma base sólida e científica para a caracterização do tipo e do nível de conhecimentos em Matemática dos participantes, organizada a partir da interpretação das opções feitas pelos estudantes em cada item, face à redação do respetivo enunciado e das alternativas de resposta. Desses resultados fundamentados, destaca-se a identificação de necessidades de formação e lacunas de aprendizagem dos estudantes. Também é de referir a identificação de itens, ou subáreas de conteúdo, que são significativamente mais fáceis ou mais difíceis para os alunos do que para as alunas, assim como para os estudantes de engenharia do que para os estudantes de ciências sócio-económicas.

As potencialidades do PMAT resultaram, em grande parte, do rigor técnico da construção dos itens de escolha múltipla que o integram. A forma como eles foram elaborados permitiu obter um teste sem itens acertados por acaso por um número significativo de participantes; um teste em que, para qualquer item, a média do nível de competência dos indivíduos que acertaram o item é superior à dos indivíduos que o erraram e ao nível de dificuldade desse item; um teste que distribui os estudantes, em função da sua competência, de forma uniforme em torno do valor médio; um teste que facilita a interpretação dos erros cometidos pelos participantes que, por sua vez, proporciona a organização de práticas pedagógicas fundamentadas.

Do exposto, mostra-se como um teste de escolha múltipla pode constituir um bom instrumento de medida de conhecimentos, quer no âmbito da avaliação sumativa quer no da avaliação formativa.

RESUMO

O motor de conhecimento computacional Wolfram | Alpha, desenvolvido pela Wolfram Research, é uma ferramenta dinâmica e interativa, de acesso livre e manuseamento intuitivo, que explora tópicos de várias áreas do conhecimento. Estas características facilitam a sua utilização no ensino e propiciam a criação de um contexto de aprendizagem ativa em sala de aula.

O Wolfram | Alpha foi utilizado, no ano letivo 2013/14, em aulas de Cálculo I, disciplina transversal a diversos cursos de ciências naturais na Universidade do Algarve, com o objetivo de consolidar conteúdos programáticos adquiridos durante o ensino secundário e de tornar mais interessante a aquisição de novos conceitos matemáticos nas áreas do Pré-Cálculo e do Cálculo Diferencial. Com o propósito de recolher e analisar as opiniões dos alunos sobre a importância da utilização do Wolfram | Alpha como instrumento de aprendizagem em Cálculo I foi elaborado um questionário e recolhidas as opiniões dos alunos matriculados na respectiva unidade curricular e que se submeteram à avaliação.

Palavras-Chave: Prática Pedagógica, Wolfram | Alpha, Cálculo.

JEL Classification: C02, C65

1. INTRODUÇÃO

Atualmente, ao ensinar Matemática, é geralmente reconhecida a importância da utilização de software educativo como uma ferramenta eficiente para ajudar a ultrapassar as dificuldades que os alunos têm em associar as representações algébricas gerais com as diversas representações numéricas e gráficas específicas (ver, por exemplo, (Conceição *et al.*, 2015), (Kilicman *et al.*, 2010) e (Prado *et al.*, 2010)). Obviamente, os cálculos com o apoio de tecnologia digital não são um substituto para os cálculos com papel e lápis, e devem ser devidamente combinados com outros métodos, incluindo o cálculo mental.

O Wolfram | Alpha (Figura 1), motor de conhecimento computacional desenvolvido pela Wolfram Research, foi utilizado em aulas de Cálculo I, para alunos inscritos em cursos de ciências naturais na Universidade do Algarve, com os objetivos de consolidar conteúdos programáticos adquiridos durante o ensino secundário e de tornar mais interessante a aquisição de novos conceitos matemáticos nas áreas do Pré-Cálculo e do Cálculo Diferencial.

Figura 1: <http://www.wolframalpha.com/>

O Wolfram | Alpha é uma ferramenta dinâmica e interativa, de acesso livre e manuseamento intuitivo, que explora tópicos de várias áreas do conhecimento (Figura 2). Estas características facilitam a sua utilização no ensino e propiciam a criação de um contexto de aprendizagem ativa em sala de aula, ou seja, a sua utilização adequada propicia um contexto de ensino-aprendizagem onde alunos e professores são igualmente convidados a contribuir.

Figura 2: Imagem ilustrativa de diversos tópicos que podem ser explorados através do motor de conhecimento computacional Wolfram|Alpha

2. DESCRIÇÃO DA PRÁTICA PEDAGÓGICA

2.1 Objetivos e público-alvo

O Wolfram|Alpha foi utilizado, no ano letivo 2013/14, na unidade curricular de Cálculo I, disciplina transversal a diversos cursos de ciências naturais na Universidade do Algarve. Esta utilização em sala de aula teve como objetivo estimular o interesse e participação dos alunos na apropriação e consolidação de conceitos, promovendo novas formas de raciocinar, ensinar e aprender que facilitam o processo ensino-aprendizagem.

2.2 Metodologia

Nas aulas teóricas e teórico-práticas, os conteúdos programáticos da disciplina foram explorados através da utilização do Wolfram|Alpha, sempre que foi considerado útil pelo docente responsável (resolução de equações e inequações, cálculo de limites, cálculo de integrais indefinidos e definidos, cálculo de áreas de regiões planas, cálculo de comprimentos de curvas, resolução de equações diferenciais ordinárias, entre outros). Foi também sugerida a sua utilização no trabalho autónomo dos alunos fora da sala de aula, nomeadamente como ferramenta de validação das resoluções dos exercícios propostos (Figura 3).

Apesar da área de interação do Wolfram|Alpha ser muito intuitiva, alguns pormenores devem ser explicados em sala de aula. Por exemplo, é importante referir que nem sempre a solução de $f(x) \neq 0$ corresponde a todos os números reais que não sejam solução de $f(x)=0$ (Figuras 4 e 5).

Figura 3: Exemplo de utilização do Wolfram | Alpha: cálculo de áreas de regiões planas

Figura 4: Exemplo de utilização do Wolfram | Alpha: resolução de uma equação

O docente deve fornecer aos alunos informação de como se representam alguns símbolos matemáticos (Figura 5) para evitar que o aluno perca muito tempo no seu estudo autónomo (Figura 6).

O docente deve também alertar os discentes que nem sempre a resposta apresentada por este motor de conhecimento computacional é a mais adequada pois depende da disciplina e do nível de ensino em causa (ver, por exemplo, (Fernandes and Conceição, 2014)). Por exemplo, caso se considere funções reais de variável real não é aconselhável utilizar o Wolfram | Alpha para representar graficamente funções logarítmicas (Figura 7).

Figura 5: Exemplo que ilustra como representar $\neq$ ($\neq$) no Wolfram | Alpha

Figura 6: Comentário de um aluno que não assistiu à aula onde foi explicado como representar $\neq$ no Wolfram | Alpha

Comentário:
ontem foi um castigo para colocar
o sinal de " $\neq$ ".

Figura 7: Exemplo de utilização do Wolfram | Alpha para representação gráfica de funções

Adicionalmente, esta experiência pedagógica motivou a adaptação de alguns dos elementos de avaliação, permitindo a inclusão de questões com carácter mais conceptual e desviando um pouco o foco da mera aplicação mecânica de fórmulas e do simples cálculo numérico (para uma geração dependente da máquina de calcular).

2.3 Avaliação

Com o propósito de recolher e analisar as opiniões dos alunos sobre a importância da utilização do Wolfram | Alpha como instrumento de aprendizagem em Cálculo I foi elaborado um questionário dicotómico (Figura 8) e recolhidas as opiniões dos alunos matriculados na respectiva unidade curricular e que se submeteram a avaliação.

Figura 8: Questionário utilizado

2 – Wolfram|Alpha (responda SIM/NÃO)

2.1 - Conhece o motor de conhecimento computacional Wolfram|Alpha?

2.2 - Utiliza o Wolfram|Alpha?

2.3 - A utilização do Wolfram|Alpha em sala de aula foi útil em Cálculo I?

2.4 - A utilização do Wolfram|Alpha em trabalho autônomo foi útil em Cálculo I?

2.5 - Recomendou a alguém a sua utilização?

Comentário:

O questionário foi apresentado aos alunos durante a última semana de aulas. Foram recolhidas 35 respostas tendo sido validados 31 questionários.

Figura 9: Frequência absoluta das respostas às questões dicotômicas do questionário

Observando o gráfico de barras das frequências absolutas das respostas às questões dicotômicas do questionário, apresentado na Figura 9, é possível constatar que os alunos, em geral, consideraram a utilização do Wolfram|Alpha útil no processo de ensino-aprendizagem de Cálculo I. A maioria dos alunos sentiu-se motivado a estudar e a aprender novos conceitos com a utilização deste recurso digital (Figuras 10 e 11).

Figura 10: Comentário de um aluno relativamente à utilização do Wolfram|Alpha em Cálculo I

Comentário:
*É um excelente programa, e ajuda bastante no estudo autónomo quando se
 resolve os exercícios de programação.*

Figura 11: Comentário de um aluno relativamente à utilização do Wolfram|Alpha em Cálculo I

*Em geral, com as aplicações deste tipo o estudo
 tornou-se mais interessante.*

3. CONCLUSÕES

Atualmente, é imprescindível o recurso a software educacional para alcançar os objetivos e competências exigidos pelos programas modernos de matemática, nos diversos níveis escolares (Conceição *et al.*, 2015).

Por si só o Wolfram|Alpha é um recurso valioso para a construção de um profícuo processo de ensino-aprendizagem e reveste-se de especial importância quando num contexto de aprendizagem ativa.

Com o propósito de recolher e analisar as opiniões dos alunos sobre a importância da utilização do Wolfram|Alpha como instrumento de aprendizagem em Cálculo I, foram registadas as opiniões dos discentes através de um questionário

dicotómico. A análise das respostas aos questionários indica que a utilização do Wolfram|Alpha em sala de aula, e em trabalho autónomo, é considerada uma mais-valia para os alunos inquiridos. A maioria dos alunos sentiu-se motivado a estudar e a aprender novos conceitos com a utilização deste motor de conhecimento computacional desenvolvido pela Wolfram Research. Este resultado vem ao encontro das expectativas adquiridas por observação direta pelo docente em sala de aula.

Num futuro próximo pretende-se delinear e implementar um estudo para aferir o impacto da utilização do Wolfram|Alpha na aquisição e consolidação de conceitos e de que modo esse impacto se traduz numa eventual melhoria das classificações obtidas pelos alunos.

A utilização do motor de conhecimento computacional Wolfram|Alpha para a introdução de novos conceitos num contexto de aprendizagem ativa é uma metodologia de ensino necessariamente enriquecedora em qualquer área de conhecimento.

Tendo presente os tópicos explorados por esta ferramenta, a prática pedagógica descrita pode ser adaptada a outras áreas de formação como Ciências Médicas, Ciências da Terra, Ciências da Vida, Economia, Física, Química, entre outras (Figura 2).

ABSTRACT

In recent years, increasing interest in the study of different cooperation mechanisms in the field of international business has been observed. This paper analyzes the Innovation and its influence on Cooperation and Performance in agribusiness from Murcia (Spain). It is in this region where a larger number of Spanish exports occur. These companies have always been characterized by an innovative and cooperative spirit to meet the demands of its customers. In order to achieve this aim a model of structural equations is proposed. The model analyzes the mediation between Innovation and its influence on Cooperation and Performance in agribusiness since indirect or mediated effects constitute a type of relationship between constructs that often occurs. The results of the model reveal that the Innovation carry out a partial mediation between the cooperation and the performance increasing positively this relation, In addition, the model demonstrates empirically and reliably that innovation has a positive effect on agribusiness.

Keywords: Agribusiness, Cooperation, Innovation, Performance.

1. INTRODUCCIÓN

Las organizaciones están constantemente adaptándose a los cambios económicos con la intención de tener mayores posibilidades de supervivencia en el mercado. Un factor clave para ello es la innovación (Bernardo, 2014). Por otra parte, la innovación se define generalmente mediante la inclusión de los productos y servicios, así como los procesos de gestión. Por ello, las empresas, deben establecer aquellos procedimientos y herramientas que estén alineadas con su estrategia corporativa (Bocquet, Le Bas, Mothe, & Poussing, 2013) the authors identify two types of firms (strategic versus responsive ya que actualmente la importancia de la innovación es reconocida como un elemento diferenciador que permite alcanzar ventajas competitivas en las empresas (Melé, Argandoña, & Sanchez-Runde, 2011), ya sea en bienes y servicios como en procesos de gestión, que cada vez se están aplicando en mayor medida en un número creciente de empresas, sin embargo la investigación en agronegocios es escasa.

Así pues, tras realizar una revisión conceptual sobre innovación, cooperación, y performance, el presente trabajo trata de verificar a través de hipótesis como las empresas dedicadas a los agronegocios en la Región de Murcia fomentan la innovación, tanto en productos como en procesos, la cooperación y logran con ello mejorar su *performance*.

La metodología utilizada en el presente trabajo se basó en el análisis de los cuestionarios obtenidos, y el estudio de las variables dependientes que se incluyeron en el mismo, tanto para el estudio de la innovación y la cooperación como del performance a través de un modelo de ecuaciones estructurales.

El trabajo se estructura en cuatro secciones: (1) planteamiento de hipótesis, a través de una revisión de las contribuciones teóricas y empíricas a las relaciones de las variables incluidas en el modelo de estudio, mediante las cuales fijamos los objetivos de la investigación, (2) la metodología empleada, (3) resultados obtenidos y (4) conclusiones, discusión y limitaciones.

2. OBJETIVOS

Uno de los referentes más utilizados en la literatura para caracterizar la innovación es el trabajo de Damanpour, (1991) que distingue los tipos de innovación, de un lado en función a su naturaleza distinguiendo entre técnica y administrativa; y de otro, en función a la radicalidad diferenciando entre radical e incremental. Por ser una de las tipologías más aceptadas, en este trabajo, se considerarán las innovaciones técnicas, siendo éstas las que suponen cambios en los productos/servicios

y en la tecnología de procesos, dividiéndose en innovaciones de producto y de proceso, mientras que las innovaciones administrativas involucran a la estructura organizativa y a los procesos administrativos y de gestión.

Algunas conceptualizaciones de la estrategia de innovación como novedad apoyada en Damampour y Gopalakrishnan (2001) determinaron algunas de las dimensiones que consideramos para este estudio. En este sentido, si la cultura empresarial inciden en la innovación a través de cambios en la dinámica de sus trabajadores incorporando personal especializado; la tasa de cambio tecnológica, puede resultar crítica para sustentar la capacidad de innovación de la empresa (Damanpour & Schneider, 2006) o el establecimiento de acuerdos de cooperación y alianzas estratégicas. Por tanto, considerando la innovación como una estrategia llena de aspectos básicamente organizativos -puesto que son ellos los que más influyen en la misma, según Damanpour (1991), el estudio de la innovación será dependiente de la gestión propiamente dicha, y un factor determinante reflejo de los diferentes elementos sobre los que incide el *performance*.

Las fuentes que determinan la innovación no residen exclusivamente en la empresa, sino que también se asocian con la interacción con otras organizaciones, las interrelaciones mediante los acuerdos de cooperación que se establecen con otras organizaciones permiten el acceso a recursos complementarios tanto de competidores como proveedores, clientes, centros de investigación o universidades (Montoro-Sánchez, Mora-Valentín, & Ortiz-de-Urbina-Criado, 2012).

Si la innovación se entiende como una estrategia empresarial, esta puede ser fruto de la colaboración entre empresas y resultado de las relaciones interorganizativas, es decir, es fruto de la cooperación que se establece entre empresas y en colaboración con otras instituciones, universidades y centros de investigación permitiendo a la empresa trabajar en un entorno global, por ello formulamos la siguiente hipótesis:

H1. La cooperación influye positivamente en la innovación de los agronegocios

Hasta el momento la literatura existente proporciona información sobre el comportamiento innovador de la industria agroalimentaria, pero no proporciona una exploración en profundidad de sus efectos a largo plazo sobre el rendimiento económico (Alarcón & Sánchez, 2013). Así pues, se formulan la segunda y tercera hipótesis de investigación como sigue:

H2. La innovación en los agronegocios tiene una influencia positiva en el rendimiento económico de las empresas.

H3. La cooperación en los agronegocios tiene una influencia positiva en el rendimiento económico de las empresas.

El objeto del presente trabajo es conocer el estado de la cooperación en los agronegocios, tratando a su vez de analizar cómo ésta afecta a la innovación, tanto en productos como en procesos y por tanto, a mejorar los resultados empresariales y el desempeño de la organización (*performance*). Este objetivo se resume en la figura 1.

Figura 1: Modelo conceptual

3. METODOLOGIA

En los últimos años han aparecido estudios que además de realizar el análisis factorial, utilizado principalmente en trabajos cuya base de estudio se basa en encuestas (Rodríguez Gutiérrez, Fuentes García, y Sánchez Cañizares, 2013) y utilizar técnicas de regresión, han incorporado el análisis a través de ecuaciones estructurales, como Gallardo-Vázquez & Sánchez-Hernández, (2013) y Chen y Chang (2011). Para la realización del análisis se ha recurrido a un modelo de ecuaciones estructurales (SEM). Los SEM son procedimientos estadísticos para comprobar la medida de las hipótesis funcionales, predictivas y causales siendo estas herramientas estadísticas multivariantes esenciales para entender muchos elementos de investigación y llevar a cabo investigación básica o aplicada en las ciencias del comportamiento, de gestión, de salud y sociales (Bagozzi & Yi, 2011).

Además, los modelos de ecuaciones estructurales incluyen dos niveles de análisis (el modelo de la medición (outer models) y el modelo estructural (inner models) (Hair Jr, Sarstedt, Hopkins, & Kuppelwieser, 2014). En el análisis del modelo de medición se verifica cómo los constructos hipotéticos se miden en términos de las variables observadas (indicadores) y el modelo estructural examina las relaciones entre los constructos (Chen & Chang, 2011). En definitiva, el modelo estructural trata de realizar un análisis similar al de la regresión pero con poder explicativo (Gallardo-Vázquez & Sánchez-Hernández, 2013), estudiando los efectos directos e indirectos del conjunto de los constructos.

La técnica elegida dentro de SEM es la conocida como Partial Least Squares (PLS), por diferentes razones pues: (1) se ha utilizado previamente en las investigaciones relacionadas con la agronegocios (Heyder & Theuvsen, 2012); (2) el uso de PLS es más adecuado para aplicaciones causales (análisis exploratorio) (Roldán y Sánchez-Franco, 2012) aunque también puede ser utilizado para la confirmación de dichas teorías (análisis confirmatorio) a través de la bondad de ajuste del modelo estructural global (Dijkstra & Henseler, 2015) (3) PLS puede estimar modelos con indicadores reflexivos y formativos sin ningún problema de identificación (Vinzi, Chin, Henseler, & Wang, 2010) porque trabaja con compuestos ponderados en lugar de factores (Gefen, Rigdon, & Straub, 2011). Por lo tanto, utilizamos PLS como un instrumento estadístico destacable para la gestión y la investigación de las organizaciones.

El software utilizado fue SmartPLS 2.0 M3, desarrollado por Ringle, Wende y Will en 2005. Dado que SmartPLS es un modelo de estimación y análisis SEM, utiliza el proceso de estimación en dos pasos evaluando el modelo de medida y el modelo estructural (Hair Jr *et al.*, 2014). En primer lugar, se estima el modelo de medida, donde se determina la relación entre los indicadores y el constructo (Roldán & Sánchez-Franco, 2012) y en segundo lugar, se realiza la estimación del modelo estructural, donde se evalúan las relaciones entre los diferentes constructos, a través de los coeficientes path, su nivel de significación (R^2) y la redundancia validada cruzada (Q^2) (Hair Jr *et al.*, 2014).

Esta secuencia asegura que tenemos los indicadores adecuados de los constructos antes de tratar de llegar a conclusiones sobre las relaciones incluidas en el modelo interno o estructural (Roldán & Sánchez-Franco, 2012).

Como ninguna de las variables consideradas respecto a las hipótesis establecidas es directamente observable, se definieron escalas de medida Likert para aproximarnos a sus valores, formadas por varios indicadores que recogen las percepciones de los directivos de las empresas consultadas en línea con otros estudios (p.e. Bernal-Conesa, De Nieves Nieto, & Briones-Peñalver, 2017) a structural equation model is presented to study the adoption of a strategy of Corporate Social Responsibility (CSR). El cuestionario está formado por varios indicadores considerados en el marco conceptual y consultado a los directivos y propietarios de las empresas en línea con la revisión de la literatura académica sobre cooperación e innovación en los agronegocios.

4. RESULTADOS

La investigación en agronegocios se realizó mediante encuesta postal, obteniéndose 226 cuestionarios completos. De los 226 cuestionarios completos empleados en el presente proyecto, 84 se obtuvieron vía postal, como respuesta a los cuestionarios enviados. Por lo que la tasa de respuesta se sitúa en un 15,46%, con un error del 10% para $p = q = 50\%$ y un nivel de confianza del 95,5%. Los 142 cuestionarios completos restantes, fue necesario obtenerlos mediante entrevista personal. Para ello, se realizó un desplazamiento a todas las oficinas de COAG concentradas en la Región de Murcia, siendo los técnicos de esta asociación los encargados de llevar a cabo la entrevista personal a sus asociados.

En primer lugar, antes de pasar a contrastar las hipótesis planteadas, previamente enumeraremos algunos aspectos descriptivos del tipo de agronegocios estudiados. Así, de las 226 empresas estudiadas, se obtiene que la actividad principal es la producción agrícola en un 46% de casos, y la preparación y conservación de frutas y hortalizas en un 23%, sumando ambos alcanzan cerca del 70% de casos analizados. El 30% restante está compuesto por agronegocios dedicados a la venta de abonos, fitosanitarios, riego y equipos agrícolas, semilleros, diseño y asesoría de riego, e invernaderos. Atendiendo a la identificación de los productos comercializados, observamos respecto a la actividad principal de las empresas, que el 51.85% está dedicado a la venta de frutas y hortalizas, mientras que el 24.81% está dedicado a la venta de ganado. El 23% restante se reparte entre venta de bienes y servicios relacionados con la agricultura (14.81%) venta de cítricos (5.92%) y venta de frutos secos (2.6%).

Como bien es sabido, el sector agrario de la Región de Murcia comercializa sus productos, tanto en el mercado nacional (79.37%) como al internacional (21.22%), siendo los destinos principales la Unión Europea, Latinoamérica y Norte de África.

4.1 Análisis modelo de medida

En el modelo de medida se definen las variables latentes que el modelo va a usar, y se le asignan indicadores a cada uno, por tanto contempla las relaciones entre cada constructo y sus indicadores y se basa en el cálculo de los componentes principales. En los modelos de medición reflexivos, este análisis se lleva a cabo con referencia a los atributos de fiabilidad individual del indicador, la fiabilidad del constructo, la validez convergente (Tenenhaus, Vinzi, Chatelin, & Lauro, 2005; Fornell & Larcker, 1981) y la validez discriminante (Hair, Sarstedt, Ringle, & Mena, 2012).

La fiabilidad de cada elemento individual se evalúa mediante el análisis del factor de cargas estandarizadas (λ), o correlaciones simples de los indicadores con su respectivo constructo (Hair Jr *et al.*, 2014). La fiabilidad del elemento individual es considerado adecuado cuando un indicador tiene un λ mayor que 0.707 en su respectivo constructo (Carmines & Zeller, 1979). En este estudio, todos los indicadores reflexivos tienen cargas por encima de 0.721 (cifras en negrita en la tabla 1).

Tabla 1: Cargas y cargas cruzadas para el modelo de medición

Indicador	Innovación	Cooperación	Performance
16.1	0,814	0,380	0,449
16.2	0,803	0,341	0,378
16.3	0,878	0,401	0,464
16.4	0,844	0,457	0,461
16.5	0,721	0,306	0,446
20.2	0,403	0,777	0,268
20.3	0,376	0,835	0,340
20.4	0,277	0,738	0,326
21.1	0,361	0,788	0,495
21.2	0,404	0,809	0,353
21.3	0,391	0,821	0,361
21.5	0,374	0,781	0,364
28.1	0,437	0,338	0,852
28.2	0,521	0,451	0,835
28.4	0,364	0,328	0,797

En los modelos de medida con indicadores reflexivos, se debe obtener la fiabilidad compuesta (r_c) (Hair Jr *et al.*, 2014) y el α de Cronbach (Castro & Roldán, 2013) para evaluar la consistencia interna de medidas de los constructos. Interpretamos ambos valores con las directrices que ofrecieron Nunnally y Bernstein (1994), los cuales sugieren un valor de 0,7 como punto de referencia para una fiabilidad modesta aplicable en las primeras etapas de investigación. En nuestra investigación, los tres constructos analizados tienen una alta consistencia interna ya que superan los niveles recomendados, así pues para la fiabilidad compuesta, incluso se supera el umbral más restrictivo propuesto por Nunnally y Bernstein (1994) de 0.8 (ver tabla 2).

Para valorar la validez convergente se calcula la varianza media extraída (AVE), la cual deber ser al menos igual a 0,5 (Fornell & Larcker, 1981), por lo que un AVE de 0,5 muestra que el constructo explica más de la mitad de la varianza de sus indicadores.

La validez discriminante representa el grado en que el constructo es empíricamente distinto de otros constructos o, en otras palabras, el constructo mide lo que pretende medir. La validez discriminante se analiza mediante dos métodos (Gefen & Straub, 2005). Por un lado, un método para evaluar la existencia de validez discriminante es el criterio de Fornell y Larcker (1981). Este método establece que el constructo deber estar formado con más varianza de sus indicadores que cualquier otro constructo. Para probar este requisito, la raíz cuadrada de la AVE de cada constructo debe ser mayor que sus correlaciones con cualquier otro constructo. Esta condición se cumple para todos los constructos en relación con sus otras variables (ver tabla 2). La segunda opción para la verificación de la validez discriminante se realiza examinando las cargas transversales de los indicadores. Este método, requiere que las cargas de cada indicador en su constructo sean más altas que las cargas cruzadas en otros constructos, como así ocurre en la tabla 1.

Tabla 2. Fiabilidad compuesta (r_c), coeficientes de validez convergente y discriminante

	r_c	α	AVE	Cooperación	Innovación	Performance
Cooperación	0,922	0,902	0,629	0,793		
Innovación	0,907	0,871	0,662	0,46	0,813	
Performance	0,868	0,775	0,686	0,458	0,542	0,828

Nota: Elementos de la diagonal (negrita) son la raíz cuadrada de la varianza compartida entre los constructos y sus medidas (varianza media extraída). Fuera de la diagonal los elementos son las correlaciones entre constructos. Para la validez discriminante, los elementos diagonales deben ser mayores que los elementos fuera de la diagonal.

4.2 Análisis del modelo estructural

Una vez que la fiabilidad y la validez del modelo de medida ha sido establecido, varios pasos deben tomarse para evaluar las relaciones hipotéticas dentro del modelo estructural (Hair Jr *et al.*, 2014), el cual evalúa el peso y la magnitud de las relaciones entre los distintos constructos.

La evaluación de la calidad del modelo se basa en su capacidad para predecir los constructos endógenos (Hair Jr *et al.*, 2014). La bondad del ajuste del modelo es comprobada a través del análisis del estadístico de la t de Student, el nivel de significación de los parámetros path (β) y el valor R^2 para cada constructo dependiente y la prueba de Stone-Geisser (Q^2), que

consiste en una validación cruzada del modelo evaluando en qué medida los parámetros estimados son útiles para predecir las variables observadas correspondientes a estos constructos, es decir se utiliza para la relevancia predictiva lo que permite una evaluación del modelo estructural (Roldán & Sánchez-Franco, 2012).

Así en primer lugar, se aceptarán aquellos coeficientes path, y por extensión las hipótesis planteadas, que sean significativos según una distribución t de Student de una cola con n-1 grados de libertad (Roldán & Sánchez-Franco, 2012). Estos valores, según (Chin, 1998) deben ser al menos de 0,2 e idealmente superar el valor 0,3, por tanto si $\beta < 0,2$ no hay causalidad y la hipótesis se rechaza. De acuerdo con Hair *et al.* (2011), se utilizó un *bootstrapping* (5000 remuestras) para generar los estadísticos t-Student y sus errores estándar, esto nos permitió evaluar la significación estadística de los coeficientes *path* (Castro & Roldán, 2013) y aceptar o no el resto de hipótesis (ver tabla 3).

En segundo lugar, se analiza la varianza explicada. La bondad de un modelo se determina a través de la fortaleza de cada relación estructural y se analiza utilizando el valor de R^2 para cada constructo dependiente. Según Falk y Miller (1992), estos valores deben ser superiores a 0.1 para poder considerar que el modelo tiene suficiente capacidad predictiva. Considerando que el R^2 es una medida de la exactitud del modelo (Hair Jr *et al.*, 2014), y por tanto mide la cantidad de varianza del constructo que es explicada por el modelo (Serrano-Cinca, Fuertes-Callén, y Gutiérrez-Nieto, 2007) con los valores 0.75, 0.50, 0.25, respectivamente, se describen los niveles sustanciales, moderados o débiles de la exactitud de la predicción (Hair, Ringle, & Sarstedt, 2011), como se puede ver en la figura 2, todos los R^2 están entre el mínimo 0.1 y el 0.75, por lo que tienen una capacidad predictiva en diferente grado.

Tabla 3. Contraste de hipótesis planteadas

Hipótesis	Relaciones entre constructos	b	Standard Error	T Statistics
H1	Cooperación -> Innovación	0,468***	0,061	7,659
H2	Innovación -> Performance	0,420***	0,068	6,207
H3	Cooperación -> Performance	0,261***	0,078	3,348

Nota: $t(0.05, 4999) = 1,645158499$, $t(0.01, 4999) = 2,327094067$, $t(0.001, 4999) = 3,091863446$ * $p < 0,05$. ** $p < 0,01$. *** $p < 0,001$. ns. No significativo (basado en $t(4999)$, test de una cola).

Finalmente, el test de Stone-Giesser (Q^2) se usa como criterio para medir la relevancia predictiva de los constructos dependientes (Roldán & Sánchez-Franco, 2012) y por tanto es un medio para evaluar la relevancia predictiva del modelo estructural (Hair Jr *et al.*, 2014), esta medida permite examinar la pertinencia de predicción del modelo teórico y el modelo estructural. Para modelos reflexivos se utiliza el índice de redundancia de validez cruzada (Q^2) (Castro & Roldán, 2013). Si Q^2 es mayor que 0 esto implica que el modelo tiene relevancia predictiva (Hair Jr *et al.*, 2014 ; Castro & Roldán, 2013), en nuestro caso todos los Q^2 obtenidos tienen signo positivo y son mayores que 0, como se puede apreciar en la figura 2.

Figura 2: Contraste de hipótesis

Nota: * $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$; (basado en $t(4999)$, test de una cola), n.a= no aplicable

Los resultados resumidos en la figura 2, confirman que el modelo estructural tiene una relevancia predictiva satisfactoria para las dos variables dependientes: innovación y performance, pudiéndose por tanto afirmar que todas las hipótesis planteadas son aceptadas. Siguiendo a Bernal-Conesa, De Nieves-Nieto, y Briones-Peñalver, (2016) a structural equation model is presented in order to explain the motivations of implementing Corporate Social Responsibility (CSR se han de tener en cuenta los efectos totales (directos e indirectos), los cuales se reflejan en la tabla 4.

Tabla 4. Efectos totales

Relaciones entre constructos	β	Standard Error	T Statistics
Cooperación -> Innovación	0,468***	0,061	7,659
Innovación -> Performance	0,420***	0,068	6,207
Cooperación -> Performance	0,458***	0,070	6,504

Nota: $t(0.05, 4999) = 1,645158499$, $t(0.01, 4999) = 2,327094067$, $t(0.001, 4999) = 3,091863446$ * $p < 0,05$. ** $p < 0,01$. *** $p < 0,001$. ns. No significativo (basado en $t(4999)$, test de una cola).

Como se puede observar en la tabla 4, el efecto total de la Cooperación sobre el Performance es mucho mayor que el efecto directo y además es significativo ($\beta=0,458$ $p \leq 0,001$). El efecto total es obtenido mediante la siguiente expresión: Efecto total = Efecto directo + Efecto indirecto (Sarstedt, Ringle, Smith, Reams, & Hair, 2014). Por lo que puede existir un efecto moderador de la variable Innovación en la relación entre la Cooperación y el Performance. Esta moderación puede ser aceptada, si este potencial efecto mediador es significativo.

Para ello, se han de responder tres cuestiones (Hair, Hult, Ringle, & Sarstedt, 2013): (1) ¿es el efecto directo entre una variable y su dependiente significativo cuando la variable mediadora es excluida del modelo?, (2) analizar si el efecto indirecto vía variable mediadora es significativo después de que la variable mediadora haya sido incluida en el modelo y (3) cuanta es la influencia del efecto indirecto sobre el total.

Para responder a la primera cuestión en referencia al papel mediador de la Innovación se excluye a ésta del modelo y se ejecuta el *bootstrapping* con esta condición. Como resultado se obtiene que el efecto directo entre la Cooperación sobre el Performance adopta el valor de 0,466 siendo significativo ($p \leq 0,001$). Así pues, cuando se excluye a la variable mediadora, el efecto directo es significativo.

Responder la segunda cuestión requiere re-calcular el modelo completo (con la variable mediadora incluida) y probar la significancia de los efectos indirectos. Para la variable mediadora Innovación el *bootstrapping* correspondiente muestra que el valor del efecto indirecto es 0,196 y significativo al $p \leq 0,001$ (Vinzi *et al.*, 2010).

Finalmente, para estimar la magnitud del efecto indirecto (Sarstedt *et al.*, 2014) se calcula la varianza explicada por la variable mediadora (VAF), que representa el ratio del efecto indirecto sobre el efecto total (Vinzi *et al.*, 2010). El resultado de este paso final produce un valor de 0,429, lo que indica que un casi mitad del efecto total de la Cooperación sobre el Performance está explicado por los efectos indirectos de la Innovación. Esto sugiere que la Innovación media parcialmente en la relación entre la Cooperación y el Performance, ya que la condición de que tanto el efecto directo como el indirecto son significativos representan la mediación parcial (Nitzl, Roldan, & Cepeda, 2016). Por otra parte, una situación en la que el VAF es superior al 20% y menor del 80% podría caracterizarse como una mediación parcial típica (Hair Jr *et al.* 2013).

5. CONCLUSIONES

A la luz de los resultados obtenidos estos confirman las relaciones establecidas en el modelo de investigación, y todas las hipótesis planteadas son aceptadas. Así se puede observar una influencia significativa de la Cooperación sobre la Innovación de las empresas de agronegocios. Se observa además que la Cooperación influye en el Performance de la empresas y al mismo tiempo se producen unos efectos indirectos sobre el Performance a través de la Innovación (ver tabla 4) en línea con otros estudios. Teniendo en cuenta estos efectos indirectos, la relación entre Cooperación y Performance mejora pues b_3 pasa de 0,261 a 0,458.

A través del estudio realizado, se pretende cubrir el vacío detectado en la literatura sobre las empresas de agronegocios para la implantación de medidas de RSC, ya que si bien existen estudios previos sobre innovación y *performance* estos no contemplan la relación entre la Cooperación y la Innovación y su influencia sobre el *performance*. Así pues, la ausencia de trabajos empíricos previos que analicen dichas relaciones en el sector de los agronegocios en España y su integración en la empresa justificó su realización y se considera que viene a añadir un suplemento investigador a los estudios que relacionan la Cooperación y su integración en las empresas, pues dicha relación no se estudia con un efecto directo únicamente, sino que incorpora una relación indirecta a través de la Innovación sobre el Performance.

La integración de medidas de cooperación responsable no se traduce únicamente en un posicionamiento ético o moral por parte de las organizaciones, sino también en la generación de intangibles de elevado valor estratégico, tales como la cooperación externa y la innovación de la empresa.

La principal contribución de este trabajo ha sido demostrar la vinculación entre la innovación y la cooperación y su influencia sobre el performance en las empresas de agronegocios de manera empírica y fiable. Desde un punto de vista práctico las empresas pueden utilizar los resultados de este estudio como un punto de apoyo para potenciar la cooperación y la innovación en su organización, pues la integración de estas tiene una relación directa con el performance de la empresa.

RESUMEN

Los consumidores recurren cada vez más a los sitios webs y a los sistemas conversacionales, como la mensajería instantánea móvil (MIM) para recoger opiniones y críticas de otros a la hora de tomar decisiones sobre la compra de productos y servicios turísticos. Esto conlleva que este consumidor, a la hora de evaluar entre las distintas alternativas se encuentre ante un gran volumen de información. Bajo este contexto, los *chatbots* a través de MIM, se presentan como una solución para una toma de decisión acertada en función de sus preferencias gastronómicas permitiéndole filtrar la excesiva oferta de turismo gastronómico.

En este estudio se plantea abordar el uso y el comportamiento del consumidor turístico en la consulta de *chatbots* de recomendaciones gastronómicas. Para ello, se trabajará con la información obtenida a través de una encuesta online, con una muestra de 420 individuos en España aplicando técnicas de estadística descriptiva. Los resultados muestran que: (1) su uso está determinado por su instantaneidad, disponibilidad permanente y por el desconocimiento de la zona; y (2) sus recomendaciones gastronómicas son valoradas positivamente por el ajuste a las necesidades y preferencias de cada consumidor.

Keywords: Chatbots Gastronómicos, Consumidor, MIM (Mensajería Instantánea Móvil), Turismo.

1. INTRODUCCIÓN

Cada vez más los turistas usan Internet en sus viajes adquiriendo éste un papel muy importante (O'Connor, 2011). En este nuevo paradigma de la Web 2.0 los usuarios se convierten en las principales fuentes de difusión de la información online, generada a su vez por ellos mismos y permitiendo la divulgación boca a boca electrónica (*e-WOW*). A este tipo información se le denomina Contenido Generado por el Usuario (CGU) (Burgess *et al.*, 2009).

Las decisiones de compra de los turistas online están siendo influenciadas por las valoraciones y comentarios hechos por otros consumidores. Diversos autores (Borja *et al.*, 2002; Borja y Gomis, 2009; O'Connor, 2011) contemplan que específicamente este perfil de usuario turístico es influenciado durante la fase de pre-compra, la fase de la compra y la fase de la post compra, no sólo por las recomendaciones offline de amigos/familiares o canales tradicionales, sino mediante el entorno online: el *Word of mouth* (boca-oído) de los blogs, o sitios webs como *TripAdvisor* o las redes sociales como *Facebook*. De este modo, las recomendaciones extraídas de los medios sociales se convierten en un elemento clave de influencia para la evaluación de la información de los productos y servicios turísticos para la toma de decisión del usuario que desea su consumo (García, 2016; Cho y Fesenmayer, 2001; Buhalis, 2003; Buhalis y Law, 2008; Xiang y Gretzel, 2010; Hays *et al.*, 2012; Albacete, 2012; Burgess y Kerr, 2012; Roque y Raposo, 2013).

De esta manera, Internet ha posibilitado que los usuarios puedan transformarse en expertos o *influencers* sociales en un determinado asunto o producto en muy poco tiempo (Xiang y Gretzel, 2010). Asimismo, se manifiesta que el *e-Word Of Mouth* está cobrando cada vez más presencia en la toma de decisiones en el consumo turístico. El éxito de esta forma de comunicación se debe a que su información generada no persigue una finalidad comercial y, por tanto, ofrece mayor credibilidad para el turista potencial que está buscando información objetiva para evaluar sus alternativas.

El consumidor turístico, hoy en día, es consumidor y generador de recomendaciones a través de los medios sociales que permiten que dichos usuarios creen comentarios, intercambien experiencias, colaboren y ayuden a otros en su toma de decisión (Borja *et al.*, 2002; Xifra y Chias, 2008; Rosen, 2009). Estos medios basados en la participación y recomendaciones online convierten a un consumidor en *consumer* y *prosumer* al mismo tiempo ya que ofrecen mecanismos de participación directa. Se observa cómo el consumo turístico se está viendo influenciado por cómo estos consumidores están usando la tecnología móvil con consultas de información sobre el destino (Gasdia y Rheem, 2012; Salgado *et al.*, 2013; García, 2016).

Por otro lado, el uso en los últimos años de la mensajería instantánea móvil (MIM) como *WhatsApp*, *WeChat* o *Telegram*

está cambiando la forma de comunicación y mantenimiento de las relaciones con los demás, convirtiéndose estos sistemas conversacionales en la principal vía para la comunicación social. De hecho, se estima que llegue a convertirse en una plataforma de entretenimiento, comercio y trabajo (Wu y Lu, 2013). Su rápido crecimiento y alta adquisición convierten a la mensajería instantánea móvil en un medio idóneo para la difusión de información sobre productos y servicios turísticos.

Con esta investigación, se pretende conocer el uso y el comportamiento del consumidor turístico en el empleo de un chatbot gastronómico a través de un sistema conversacional por MIM, en concreto *WhatsApp* con el objetivo de identificar las razones principales de su utilización. Para ello se aborda, en primer lugar, una revisión de la literatura, se definen los objetivos y metodología. Finalmente se extraen los resultados y se concluye con las principales aportaciones de este trabajo científico.

2. MARCO TEÓRICO

La accesibilidad de los canales *Web 2.0* a través de cualquier dispositivo, y en particular a través del móvil, permiten una búsqueda directa e instantánea, eliminando las barreras geográficas y horarias en el momento de la necesidad. No obstante, en este contexto se echa en falta una respuesta inmediata ante cualquier consulta del consumidor relacionada con los productos y servicios turísticos. Actualmente la inmediatez de respuesta, que no de búsqueda, y la comunicación directa solo es posible a través de la mensajería instantánea móvil. De hecho, ya hay empresas turísticas que están adoptando estos sistemas conversacionales para relacionarse con sus clientes y atender sus cuestiones. Según la Asociación para la Investigación de Medios de Comunicación (AIMC, 2016), más del 57,5% de los usuarios utilizan de forma diaria aplicaciones móviles de mensajería instantánea, entre las que destacan *WhatsApp* con el 91,6% de cuota de mercado siguiéndole *Telegram* con un 16,8%. Estos estudios evidencian que los sistemas conversacionales a través de la MIM es una vía propicia para el recibo y envío de información turística.

2.1 Chatbots turísticos en sistemas conversacionales de MIM

Los sistemas conversacionales de mensajería instantánea móvil (MIM) como *WhatsApp* o *Facebook Messenger* permiten el envío de mensajes uno a uno a través de un *chat* como si estuvieras manteniendo una conversación frente a frente. Esta ventaja de mantener en tiempo real un diálogo con otra persona crea un nuevo escenario de comunicación para que las marcas interactúen con sus consumidores. La interfaz de estos canales a través de una conversación bidireccional admite interactuar de forma privada, personalizada y directa con cada cliente, bien a través de una comunicación hombre-máquina (Hill *et al.*, 2015), o bien persona a persona. La primera forma de comunicación consiste en implementar un *chatbot*, es decir, un software basado en inteligencia artificial que permite la comunicación con humanos, para que dé respuesta de manera automática a las peticiones de los consumidores (Shah *et al.*, 2016); mientras que la comunicación persona a persona (*peer to peer*), es aquella donde no existen procesos automáticos para dar respuestas a las necesidades del consumidor/cliente (AbuShawar y Atwell, 2016).

Las marcas pioneras que están empezando a implementar servicios para sus consumidores a través de sistemas conversacionales aplicaciones móviles de mensajería instantánea existentes o incluso están desarrollando aplicaciones móviles instantáneas conversacionales a través de un *chatbot* provienen del sector turístico cuyo objetivo es prestar mejor servicio a sus clientes.

En la tabla 1, se recogen los principales *chatbots* existentes que dan soporte al consumidor turístico en la mayoría de las etapas de la compra de los servicios gastronómicos.

Tabla 1 - Chatbots para consultas gastronómicas

Marca	Tipología MIM	Fase de consulta	Funcionalidad	Cobertura	Idioma
<i>Ask Vicente</i>	WhatsApp Facebook Messenger	Búsqueda Destino Posterior	Recomendación basada en: -Localización -Precio -Momento de consumo -Número de personas	Nacional (España)	Español Inglés
<i>Foursquare</i>	Slack Skype	Búsqueda Destino	Recomendación basada en: -Localización.	Internacional	Inglés
<i>E-8T</i>	Facebook Messenger	Búsqueda Destino	Recomendación basada en: -Localización. -Tipo de comida -Tipo de local -Tipo de cocina	Nacional (Singapur)	Inglés
<i>Kiki</i>	Facebook Messenger	Búsqueda Destino	Recomendación basada en: -Localización. -Sin localización Reserva en chat	Nacional (Japón)	Inglés Koreano Chino

<i>Milly</i>	Facebook Messenger	Búsqueda Destino	Recomendación basada en: -Opiniones de expertos -Tipo de comida -Eventos de la ciudad -reporte semanal	Local (Queens, Nueva York)	Inglés
<i>Paitbbar</i>	Facebook Messenger	Búsqueda Destino	Recomendación basada en: -Localización -Sin localización -Tipo de cocina Reservas en chat	Local (Lahore, Pakistán)	Inglés
<i>Surebot</i>	Facebook Messenger	Búsqueda Destino Posterior	Recomendación basada en: -Localización -Hashtags de comida de Instagram Redirige a la web site del restaurante para reservas.	Internacional	Inglés
Where bot	Facebook Messenger	Búsqueda	Recomendación basada en: -Localización	Internacional	Inglés

Fuente: elaboración propia a partir de www.botlist.com (2016)

Como se observa en la tabla 1, el 90% de este tipo de *chatbots* están implementados sobre Facebook Messenger. Dentro de este tipo de *chatbots* destaca *Ask Vicente*, por dos aspectos: (1) Su uso múltiple en sistemas conversacionales de MIM (*Facebook Messenger* y *WhatsApp*); y (2) la información que ofrece a los consumidores de turismo gastronómico en todas sus etapas para la toma de decisión en su ciclo de consumo turístico (búsqueda, destino y posterior).

2.2 Comportamiento del consumidor en el uso de sistemas de Contenido Generado por el Usuario

Los factores que influyen en el comportamiento de uso de plataformas que recogen Contenido Generado por el Usuario (CGU), como por ejemplo las redes sociales, son: actitud, confianza, entorno colaborativo, coste reducido, facilidad de uso, optimización de tiempo, atemporalidad, intención de uso, utilidad percibida.

Tabla 2 - Tipología de factores que influyen en el uso de sistemas de contenidos generados por el usuario

Tipología de factores de uso	Factores de Uso	Autores
<i>Confianza</i>	<i>Actitud</i>	(Casaló <i>et al.</i> , 2010).
	<i>Confianza</i>	(Chung y Buhalis, 2008; Bressler y Grantham, 2000; Filieri y Mcleay, 2013).
	<i>Entorno colaborativo</i>	(Wang y Fesenmaier, 2004b; Bressler y Grantham, 2000; Chung y Buhalis, 2008).
	<i>Intención de uso</i>	Wang <i>et al.</i> , 2002; Wang y Fesenmaier, 2004; Hsu y Lin, 2008; Parra <i>et al.</i> , 2011; Hsu y Huang, 2012.
<i>Relación calidad/precio</i>	<i>Coste reducido</i>	(Taño <i>et al.</i> , 2013; Binney <i>et al.</i> , 2003).
	<i>Optimización tiempo</i>	(Binney <i>et al.</i> , 2003).
	<i>Atemporalidad</i>	(Taño <i>et al.</i> , 2013).
<i>Aprendizaje</i>	<i>Facilidad de uso</i>	(Taño <i>et al.</i> , 2013; Meroño, 2005; Silva y Mendes, 2014).
	<i>Utilidad percibida</i>	(Huh <i>et al.</i> , 2009; Ryu <i>et al.</i> , 2009).

Fuente: Elaboración propia

Tal y como se observa en la tabla 2, se han agrupado la actitud, la confianza, el entorno colaborativo junto con la intención de uso dentro de la tipología general (1) confianza de la colectividad generada en cuanto a los contenidos generados, por otro lado, los factores de coste reducido, optimización de tiempo y atemporalidad se agrupan en (2) relación calidad/precio y el (3) aprendizaje, es decir, la mayor o menor dificultad que requiere usarlo, se encuentran los factores de facilidad de uso y utilidad percibida.

Analizada la literatura, no se encuentran autores que contemplen factores que influyen en el uso que realizan los consumidores turísticos de sistemas conversacionales en MIM como los *chatbots*. Por tanto, sería interesante observar si estos factores contemplados por los distintos autores para los sistemas conversacionales basados en CGU también son aplicables al comportamiento de los consumidores a la hora de usar los *chatbots* en la búsqueda de información turística gastronómica.

3. OBJETIVOS DE LA INVESTIGACIÓN

El objetivo general de esta investigación determinar el uso y comportamiento del consumidor turístico en la consulta de un *chatbot* a través de mensajería instantánea móvil, *WhatsApp*, para recibir recomendaciones gastronómicas. Para llevar a

cabo dicho objetivo general, se establecen los siguientes objetivos específicos:

- 1) Identificar las situaciones en las que el consumidor gastronómico acude al uso del *chatbot* de consultas de recomendaciones gastronómicas por el sistema conversacional *WhatsApp*.
- 2) Detectar la percepción que tienen estos consumidores de la información sobre las recomendaciones gastronómicas extraídas por el *chatbot* gastronómico.

4. METODOLOGÍA CIENTÍFICA

La metodología científica se aplica sobre el comportamiento del uso que los consumidores de turismo gastronómico hacen del *chatbot* denominado *Ask Vicente*, único sistema conversacional que está implementado en la MIM, *WhatsApp* (ver tabla 1). Los motivos que justifican el estudio sobre los consumidores de este *chatbot* gastronómico español son: (1) la penetración de *WhatsApp* en el mercado español ya que entre las aplicaciones móviles de mensajería instantáneas utilizadas por los españoles, *WhatsApp* supone el 92,8% según datos de AIMC, Marzo 2017; (2) la importancia del turismo gastronómico en España; y (3) porque es la único *chatbot* que contempla *WhatsApp* para abordar la tres fases de consulta de información por parte de los consumidores (antes, durante y posterior). Por dichas razones, nos centraremos en *Ask Vicente* y se analizarán cuáles son los factores que influyen en su uso.

Este estudio se aborda con una primera fase de consulta de fuentes secundarias que permite contextualizar los *chatbots* gastronómicos a nivel internacional y definir los principales factores de utilización de las plataformas de contenido generado por los usuarios. En una segunda fase, tal y como se muestra en la tabla 3, se aborda el trabajo de campo aplicando una encuesta online de preguntas cerradas y semicerradas sobre una muestra de 420 consumidores turísticos que utilizan el *chatbot* a través de *WhatsApp* para la consulta de recomendaciones gastronómicas en el territorio español, y que fueron tratadas con técnicas de estadística descriptiva. El ámbito de la investigación es España y el trabajo de campo fue realizado desde el 15 de Julio al 15 de octubre del 2016.

Tabla 3-Ficha técnica

Población de estudio	Usuarios de <i>WhatsApp</i> .
Ámbito geográfico	España.
Técnica de investigación	Encuesta online.
Tratamiento y análisis	Estadística Descriptiva.
Tipología de investigación	Cuantitativa.
Margen de Confianza	95%
Tamaño muestral	420 encuestados
Periodo de investigación	15 de Julio al 15 de Octubre de 2016.

Fuente: Elaboración Propia

5. RESULTADOS DE LA INVESTIGACIÓN

Las situaciones en las que el usuario utiliza los *chatbots*, para obtener recomendaciones sobre gastronomía tal y como se muestra en la figura 1, principalmente sucede en los siguientes casos: en primer lugar, para cuando no se conoce la zona donde se encuentra; en segundo lugar, para buscar recomendaciones de lugares gastronómicos dónde realizar celebraciones; y por último, para incluir dichas recomendaciones gastronómicas en actividades de fin de semana o para solicitar una recomendación específica relacionada con un plato típico. No son relevantes los casos relacionados con: circunstancia de trabajo o comida de empresas, ambas muy relacionadas entre sí, siendo la primera cuando el usuario se encuentra en su horario laboral y la segunda por compromisos laborales, pero no obligatoriamente dentro de su jornada de trabajo.

Por tanto, las situaciones en las que dichos consumidores recurren más al servicio de *chatbot* de recomendaciones gastronómicas por *WhatsApp*, están motivadas por las consultas sobre la zona en la que se encuentra y para planificar celebraciones con el fin obtener información necesaria para reducir su incertidumbre (ver figura 1).

Figura 1 - Uso del chatbot gastronómico a través de la MIM WhatsApp

Fuente: Elaboración Propia

Las principales percepciones que tienen los consumidores sobre las recomendaciones gastronómicas del *chatbot* son principalmente (ver figura 2): (1) Dicho sistema permite la planificación de la comida en cualquier momento y lugar; (2) se encuentra disponible siempre y cuando se necesita; (3) y es un sistema rápido en el suministro de la respuesta. Estas tres primeras percepciones se relacionan con atributos funcionales más que emocionales. Respecto a las otras tres percepciones con menor valoración (diversión, agradable y entretenimiento), van relacionadas con la empatía que genera la interacción del *chatbot* gastronómico a través de *WhatsApp*.

Figura 2 - Percepción del uso del chatbot gastronómico por WhatssApp

Fuente: Elaboración Propia

Como se observa en la figura 3, los factores que los consumidores valoran más para recibir recomendaciones gastronómicas por el sistema conversacional *Ask Vicente* son:

(1) La adaptación de la recomendación a sus preferencias (41%); (2) la cercanía al lugar donde los usuarios se encuentran a la hora de solicitar la recomendación gastronómica (34%). En menor porcentaje, se valoran los factores relacionados con la información extra del lugar gastronómico recomendado en relación a: (3) la accesibilidad al lugar recomendado (9%), (4) que posea terraza o no (7%), (5) y que tenga aparcamiento (*parking*) (6%). Esto indica que el factor más valorado por los consumidores a la hora de solicitar información al *chatbot* recomendador es la proximidad del establecimiento gastronómico.

Figura 3. Factores más valorados de las recomendaciones gastronómicas del chatbot

Fuente: Elaboración Propia

6. CONCLUSIONES Y DISCUSIONES

En esta investigación se observa cómo el comportamiento del uso que el consumidor de turismo gastronómico realiza de un *chatbot* gastronómico para las consultas sobre gastronomía está determinado por factores circunstanciales, por lo que se aprecia sobre todo las características funcionales de este sistema. Además de sus características relacionadas con casos de uso en momentos de ocio como son las celebraciones. Esto refleja que el consumidor que utiliza este tipo de sistema no solo es el turista, sino que también es aquel que sale a comer por ocio y su circunstancia condiciona el uso de este canal en momentos distendidos.

El consumidor de turismo gastronómico valora positivamente la disponibilidad permanente y su atemporalidad para cualquier consulta con la finalidad de planificar una comida a través del *chatbot*. Estos factores de uso en un sistema conversacional a través de un *chatbot* por *WhatsApp* coinciden con algunos de los factores del uso en plataformas de contenido generado por el usuario (CGU) para consultas de información turística. Además, este sistema conversacional por MIM es percibido como agradable, divertido y entretenido.

Este estudio revela el papel que juega para el consumidor su entorno cercano en la obtención de información y recomendaciones en este ámbito. Los resultados obtenidos evidencian que la posibilidad de diálogo y la inmediatez de respuesta que se genera a través de un sistema conversacional como es el de un *chatbot* por medio de *WhatsApp*, es una ventaja diferencial para ser utilizada en los próximos años en la consulta del turismo gastronómico.

Respecto a los tres aspectos más valorados por las consultas de recomendaciones gastronómicas a través del un *chatbot* por MIM son: (1) la adaptación a las preferencias del usuario, (2) la cercanía al lugar y (3) la accesibilidad. El comportamiento del consumidor en el uso de los *chatbots* gastronómicos se caracteriza en demandar recomendaciones según su geolocalización y para un momento puntual en el que desea cubrir su necesidad. Se vuelve a corroborar que un *chatbot* de recomendaciones gastronómicas a través del sistema conversacional de MIM ofrece la posibilidad no solo de la planificación para ir a un restaurante sino de cubrir el momento de la necesidad de inmediato y al instante a través de una conversación, sin tener que evaluar detenidamente la información generada por otros usuarios, como es el caso de los blogs, redes sociales o foros. (plataformas de CGU).

En esta investigación se observa que los factores que determinan el uso de un *chatbot* de recomendaciones turísticas por *WhatsApp* para la búsqueda de un restaurante cuando se realiza un viaje guarda relación con los factores que influyen en el uso de sistemas basados en el contenido generado por el usuario (CGU). Entre estos factores destacan la atemporalidad, es decir, la disponibilidad de consultar este tipo de canales sin limitaciones temporales o geográficas y la adaptación a las preferencias del consumidor para ofrecer recomendaciones según las indicaciones y necesidades.

Sin embargo, este estudio revela que existe un factor clave valorado por los consumidores en el uso *chatbot* gastronómico a la hora de recibir las recomendaciones gastronómicas que no aparece en la de los sistemas de CGU como es la inmediatez de respuesta. Esta ventaja, también permite que la implementación de un *chatbot* en sistemas conversacionales como la MIM sea una de las mejores opciones para la localización de una fuente inmediata de respuesta a la recomendación de interés solicitada por el consumidor de turismo gastronómico.

En esta investigación se infiere que el uso de un sistema conversacional como es el de un *chatbot* implementado en *WhatsApp* juega un factor decisivo en las recomendaciones gastronómicas.

En resumen, resulta relevante abordar nuevas investigaciones que estudien qué factores determinan el uso de *chatbots* en el turismo en general y estudiar su uso en las distintas etapas del ciclo de un viaje.

AGRADECIMIENTOS

Esta investigación ha sido posible gracias a la financiación de la Universidad de Málaga (UMA), Andalucía-Tech.

Esta investigación ha sido posible gracias a la colaboración de la empresa levelbots para el estudio de campo de *Ask Vicente*.

ABSTRACT

Women's entrepreneurship is one of the main challenges in economic growth. In this sense, within the context of creating new companies, it can be considered as one of the main mechanisms that contributes to achieve the desired wellbeing in society. Women's entrepreneurship reduces unemployment, increases innovation, improves competitiveness and favors economic growth significantly.

This article aims as analyzes the influence of the socioeconomic and psychosocial factors involved in female entrepreneurship. For this purpose, we used a sample of 101 women entrepreneurs in the municipality of León, Nicaragua. We applied Factor Analysis and Regression Analysis, in order to find out the relationship between the considered factors. Some results indicate that all variables considered have a significant influence on the probability of entrepreneurship. The capacity of entrepreneurial women increases when they have skills, knowledge and an early contact in the business world.

Keywords: Woman, Entrepreneurship, Socio-demographic and Psychosocial Factors.

1. INTRODUCTION AND OBJECTIVES

In recent years, there has been an increase of women participation in entrepreneurship within the business environment. A major challenge for any country is to be able to take the entrepreneurship to a higher development stage (Amorós, Guerra, Pizarro, & Poblete, 2006), this needs to be done in order to consolidate the activities, which imply a greater impact in terms of employment, greater possibilities to grow in innovation and transformation that contribute to greater economic growth, competitiveness, quality and increase in the scope of the enterprise (Acs & Amorós, 2008).

Undoubtedly, in Nicaragua, as in most developing countries, women entrepreneurs have undergone major changes in the last decades, such as their widespread incorporation in the workplace, the improvement in their education level and their participation in the different social and political fields.

In this context, the diversity of women entrepreneurs in the municipality of León, Nicaragua, is characterized mostly by informal enterprises. This situation forces women to explore new patterns of growth and economic development within their family nucleus and their communities, taking into account their regional differences. That is to say how cultural influences, ways of being and thinking as defined in the different regions of the country (at a general level and particularly in the municipality of León) shape different ways of understanding women entrepreneurship and entrepreneurial development.

Another aspect worth mentioning is the fact that women entrepreneurs lack the necessary knowledge to develop their businesses. For this reason, when they are affected by difficulties they face in the market, such as globalization challenges, the technological revolution, and localization; overcoming these challenges will allow them to achieve sustainable competitive advantages in order to surpass social inequality.

Governments and international economic organizations have promoted policies and programs aimed at encouraging initiatives led by women in business. Hence, the incentives provided often serve the purpose of recognizing entrepreneurial women as an important social phenomenon. In this sense, in the context of creating new companies, women entrepreneurship, can be considered as one of the main mechanisms that contributes to achieve the desired welfare for society in an important way (Carter & Shaw, 2006).

This study has a two-fold purpose. Firstly, to conduct a literature review of the different factors that explain the role of entrepreneurship to increase the dynamism in the economy from the women's point of view. Secondly, to analyze the attitudes toward entrepreneurship in the municipality of León and, to determine if these variables are encouraging the economic strengthening of the city and consolidating its investment initiative. Thus, the scientific interest of the present study is aimed at helping design more effective policies to promote entrepreneurship in cities and recommending ways of fostering favorable women entrepreneurs' attitudes and initiatives.

2. LITERATURE REVIEW AND CONCEPTUAL MODEL

During the last decades the role played by the entrepreneurial woman, has undergone a great transformation process in relation to the woman's social position. The magnitude of this change is reflected in significant areas including a series of practices related to learning, whether formal or informal. Such practices are adopted on an ongoing basis with the aim of improving knowledge, skills and competences (Cobo, 2012), key elements in stimulating the development of entrepreneurial activity to generate wealth and employment (Audretsch & Keilbach, 2004).

In order to understand the evolution and development of economy it is necessary to review the contributions that have been made in recent years regarding the concept of the entrepreneur. Nowadays, the focus of researchers is on the so-called entrepreneur or Schumpeterian entrepreneur, for his contribution to economic growth, both in social terms of employment generation and in social welfare (Rodríguez & Jiménez, 2005; Schumpeter, 1934), there is a broad spectrum of connotations in the field from different perspectives: economy, sociology and psychology. The creation of a sociological climate, for example, includes perceptions of what it is commonly understood or known as such, that it to say a socio-cultural environment that values and rewards entrepreneurship (Rodríguez, 1999). For instance, the presence of a woman's character, who constantly assumes the risk of success or failure in her daily life. This character gives her the ability to create innovative enterprises, without forgetting risk acceptance and stimulation of competition.

In the literature on business dynamics, there have been many studies that attempt to explain the approach associated with entrepreneurship to envision new business opportunities (Álvarez, Noguera, & Urbano, 2012; Brush & Gatewood, 2008), and the importance of knowledge to explain what knowledge is and how the success of female entrepreneurship is determined (Baron, 2006; Chen, Greene, & Crick, 1998). Based on this approach, entrepreneurship requires some personal variables that describe the particular perceptions of each individual, and how these have a significant impact on the competences and abilities to find different alternatives for solution and achievement of objectives (Arenius & Minniti, 2005), specifically, from a very general perspective, there is some consensus (in both developing and developed countries) that the need to seek greater compatibility between work and family is a predominant factor in women's entrepreneurial dynamics (Castiblanco, 2016; Shabbir & Di Gregorio, 1996).

This influence is also shown in the field of entrepreneurship highlighting the determining factors in the understanding of individual behavior differences (Brandstätter, 2011), as reflection of individual actions. Success depends on a set of conditions such as culture, education, information, available technology and social norms (Acs & Amorós, 2008; Carree, Van Stel, Thurik, & Wennekers, 2002), as well as other individual variables related to personality and ability (Wennekers, Stel, Thurik, & Reynolds, 2005). From the psychological approach, entrepreneurship depends largely on the disposition and willingness of individuals to initiate an independent business, the skills of women involved and the efforts for the necessary successful implementation (Kantis, 2004; Kantis, Angelelli, & Moori, 2004).

Among the individual variables, we find, in turn, the convergence of three basic elements of entrepreneurship (figure 1), those objective variables, **knowledge**, **skills** to know how to apply them, (aptitude) that can be acquired and developed and with another series of cognitive variables that relate to the way in which the female entrepreneur processes the information that comes from the environment **attitude (personal attributes)** and the perception she has of existing opportunities, her own abilities, and the risks inherent in the business.

Figure 1 represents the interrelation among the three factors:

Source: Own elaboration

One of the explanatory factors that try to measure business intentions is the attitude of the individual towards the behavior of the company. That is to say, personal evaluation positive or negative contributes to the intention to create a company is greater this behavior (Linan, 2008).

The capacity to pursue entrepreneurship is a concept little used in the psychological literature (Bird & Wennberg, 2016), however, the impact of the leader's intentions on skills and competencies is made up of the skills and aptitudes, knowledge and qualities of entrepreneurial women and result from the development of skills acquired throughout their lives from learning and experience (Bird, 1988).

Creativity is usually defined as “the ability” inherent to human beings. As defined by entrepreneurship, through creativity women are able to extract new forms of creativity and establish new relationships. This link to knowledge can be labeled as the capacity to create business knowledge (Lee, Florida, & Acs, 2004).

In this sense, Schumpeter (1934) considers that within economies that operate in a constant state of imbalance, the motivations of the individual act as drivers of business conduct, lies in technological, political, social, regulatory and other types that offer a continuous supply of new information about different ways of using resources to improve wealth (Shane & Venkataraman, 2000).

According to Drucker (1985), *creativity and innovation* are the specific instruments of entrepreneurs representing the way in which entrepreneurs exploit change as a previously non-existent opportunity (Verheul & Thurik, 2001), *creativity and innovation* involve an individual's intention of creating something new, the ideas to develop products / services, abilities to find solutions to their needs, and desires to continue to learn (Carter & Ram, 2003).

The successful entrepreneur, as Bandura (1986) explains, arises from a highly motivated person who believes he/she possesses skills, qualities and behavioral characteristics to perform his/her tasks, successfully (Amorós, 2011), important components associated with success are the initiative and optimism that usually emerge as a result of personal skills and creative and innovative abilities, which develop from the surrounding reality (Langowitz & Minniti, 2007).

The multifaceted and dynamic nature of entrepreneurial women has focused on different factors that explain their position in order to increase the dynamism in economy (De Bruin, Brush, & Welter, 2007), these factors can be distinguished. Firstly, the economic approach, aspects related to economic rationality (Álvarez & Urbano, 2013), roughly speaking it is argued that female entrepreneurship is due to their entrepreneurial capacity and is related to the performance of the company, sector or country (Anna, Chandler, Jansen, & Mero, 2000; Carter & Shaw, 2006), secondly, the psychological approach which states that the psychological traits are the determining factors of the entrepreneurial activity (Carter & Shaw, 2006). Finally, the sociological approach, which points out that the socio-cultural environment, conditions the decision to create a company (Alvarez, Urbano, & Amorós, 2012).

One of the entrepreneurship models to which more reference is made involves the entrepreneurial process, the entrepreneur's personality traits, and the environment in which the process is developed (Acs & Amorós, 2008; Alvarez, Urbano, & Amorós, 2012). Within the studies carried out, focused on the entrepreneur and her act of innovation, three main lines of research are recognized. These studies are based on the approaches that characterize female entrepreneurship, central object of this study:

2.1 Economic approach: Here we will consider among the demographic factors the variables age and education

From the point of view of the benefit to the entrepreneur (Veciana, 2007), indicates that this aspect has been object of study from its origins. The classic economic theories tend to incorporate aspects like “entrepreneur risk”, innovation, and leadership. The entrepreneurial nature, from the economic point of view, implies a unique continuous process that combines both the individual's internal factors (such as personality, values, objectives, etc) with the external factors such as resources allocation, and decision-making, (society, the government, economy, etc.). This combination helps some specific people (the entrepreneurs) to visualize opportunities that will eventually become projects likely to implement (Audretsch & Keilbach, 2004).

In the previous literature reviewed, socioeconomic factors, specifically the age variable, is a predictor commonly used to establish causes of success, (Castiblanco, 2016; Holienka, Jančovičová, & Kovačičová, 2016), asserting that the probability of pursuing entrepreneurship increases as the age of the person increases (Langowitz & Minniti, 2007), family and personal responsibilities increase the perception of business risk, implying that the probability of starting a new business peaks (Levesque & Minniti, 2006), as age increases and the number of women interested in starting a business decreases (Arenius & Minniti, 2005), there is no empirical evidence showing that age influences differently at the time of pursuing entrepreneurship (Holienska *et al.*, 2016).

Most research suggests that there should be a positive relationship in socio-demographic characteristics, since a society can benefit from women of all ages. In a business context, socio-demographic factors have been used in the characterization of entrepreneurial women (Castiblanco, 2016).

Based on these arguments, we propose the first hypothesis:

Hypothesis 1. The probability that a woman intends to pursue entrepreneurship: age has an effect on the intention to pursue entrepreneurship.

2.2 Education

Research on female entrepreneurship considers the educational level as a major human capital indicator. Given its nature, female entrepreneurship necessarily requires the development of certain capacities (Verheul & Thurik, 2001), and implies different knowledge base and information (Shane & Venkataraman, 2000), this difference, in turn, may explain that women with more training and experience are more likely to take advantage of their knowledge, contacts and capital saved (Bosma, Hessels, Schutjens, Van Praag, & Verheul, 2012), however, these same women are more reluctant to introduce innovations and technology into the market.

(Carter & Shaw, 2006), evidence this; in their review, they find that there is a great variety of ways to classify women's achievement, which involves the level of education and work experience. Veciana (1989), in turn, indicates in his study that

the entrepreneur's level of education is not decisive for the creation of companies. According to Bird & Wennberg (2016), the positive relationship between entrepreneurship and education, which has emerged in more developed countries, suggests that adopting a strategy would be a predominant factor in women's entrepreneurial dynamics (Arenius & Minniti, 2005).

On the other hand, the presence of women is almost a testimony in the construction of that activity where the skills required to establish a business are minimal and relatively easy to learn, focusing on trade and professional services (Pilková, Jančovičová, & Kovačičová, 2016).

Authors such as Angelelli & Llisterri (2003), Ejermo & Hansen (2015), Bills (2015), o Minniti & Naudé (2010), argue that structural problems in women's education also limit their access to technical training. This limitation may in turn affect their access to knowledge of new technologies, which can potentially benefit the development and growth of their enterprise. However, qualitative research carried out in Latin America show that most of the training courses offered are difficult to adapt to match women entrepreneurs' needs (Powers & Magnoni, 2010).

Hypothesis 2: Having an education exerts a positive effect on women who intend to pursue entrepreneurship

2.3 Psychological Approach. Among the factors, we will consider the variables related to perception of self-confidence (ability), family background, and knowledge of another entrepreneur

From a psychological perspective, some authors have attempted to understand the personality traits that define an entrepreneur and his/her decision-making processes (Robinson, Stimpson, Huefner, & Hunt, 1991), this approach implies a radical change from the economic approach, based on the methodological point of view (Veciana, 1999).

Empirical research that tries to determine the psychological characteristics in a regional or cultural scope evidences the existing differences between entrepreneurs and those who are not, and between those who succeed and those who do not, without exemption of uncertainty and risk and those who decide to develop their professional career (Veciana, 1999).

2.3.1. Abilities

According to Bandura and Walters (1977), the capacities and abilities arising from business practices largely explain their behavior and subjective character. This is based on the extent to which the entrepreneurial woman perceives the capacities she has herself, with the objective of achieving competitive advantage (Krueger, Reilly, & Carsrud, 2000).

(Anna *et al.*, 2000), consider that the perceived results of a woman's self-efficacy can improve when integrating into the local market, through a favorable environment in which she integrates that can be useful to differentiate her capacities. This new dimension implies for women the following capacities (1). Perceived capacity to recognize an opportunity, (2). Ability to generate ideas and (3). Ability to recognize, imagine and take advantage of the opportunity (this ability is referred to as competence). These abilities play an important role in the survival and growth of the company.

Hypothesis 3: The belief in having unique skills has a positive effect on women entrepreneurs

2.3.2. Family background

Family background plays a determining role in learning when making a decision to create a company where different effective components develop: solidarity, skills, habits and attitudes that are part of this conception, especially in business management (Gibb, 1987). The influence of an individual from the part of parents and/or people with a degree of closeness and affection is explained by mechanisms of social learning theory (Bandura & Walters, 1977), in many cases, more personal than operational support is required at the enterprise level (Noguera, Alvarez, Merigo, & Urbano, 2015).

In Latin America, evidence indicates that the educational system and family are not the most effective contexts for motivating and training entrepreneurs (Angelelli & Llisterri, 2003), researchers have not yet considered relevant how the family can trigger events that stimulate recognition of entrepreneurial opportunities (Aldrich & Cliff, 2003), although it is recognized that family members contribute to the formation of important values, such as the ability to work hard (Angelelli & Llisterri, 2003).

Hypothesis 4: Having a family background in entrepreneurship matters has a positive effect on the establishment of a company

2.4 Sociological approach

Among the factors, we will consider the variables related to perception of self-confidence (ability), family background, and knowledge of another entrepreneur.

The first studies under this approach appeared in the early twentieth century, and more systematically in the 1960s (Veciana, 1999), from a perspective that includes sociological and cultural elements. This approach starts from a broader analysis, considering that within creation of new enterprises the characteristics are acquired in terms of: personal experiences (family origin, education, previous occupational experience, lifestyle, class structure, etc.) and the environment in which the new enterprise will be developed (facilitator environment, corporate culture), (Graña, 2002).

2.4.1. Social Capital

A major number of businesses are aware that associativity might contribute as a way of spontaneous cooperation between small businesses. This constitutes a social capital in order to favor their economic growth and increase their competition.

In Latin America, (Mundial; & CEPAL, 2010), they analyzed in their empirical study the raise of women associations and how they play an important role in facilitating women's access to social capital. From literature to social capital, De Nieve and Briones (2009), distinguish three reasons that motivate the entrepreneurial activity: a) the economic, characterized by the exchange of resources or activities; b) the strategic, associated to the value produced in the networks, and, c). the social, based on the trust of the actors involved in the network.

On the other hand, the fact of understanding social capital as an entrepreneurial process (Aldrich, Zimmer, & Jones, 1986), might be a predicting variable in the probability of starting a business, as contact networks are important resources of knowledge and new ideas (Davidsson & Honig, 2003), as facilitators of female entrepreneurship, self-employed women examine their human and social capital (Langowitz & Minniti, 2007), this implies the existence of increased contacts to develop cooperation agreements in accordance with the discovery of opportunities (Ha & Bostjan, 2003) and may exert influence on the propensity to innovate and undertake entrepreneurial initiatives (Ortíz García & Millán Jiménez, 2015).

From another perspective, it has been pointed out that the usefulness of social contacts lies in information (Kim & Aldrich, 2005), as well as in networks as crucial elements to access financing, technology, commercial channels, as well as links with suppliers and investors (Aldrich *et al.*, 1986), at the same time, there is influence on women's self-confidence levels and, therefore, in their intention to be entrepreneurs (Ventura & Quero, 2013).

Empirical evidence indicates that women predominantly implement informal social networks (personal and close ties), (Ramos, Medina, Lorenzo, & Ruiz, 2010), both of which may be indicative of the existence of a network of entrepreneurial contacts that provides them with relevant social capital for the formation of their intention to pursue entrepreneurship. In their study, Ruiz & Cordura (2012), indicate that one of the factors that hinder women's initiative, are social networks. As an example, microenterprises, such as street vendors, often struggle to earn enough money, so that social networking and capital building are particularly important in developing new business contacts.

Hypothesis 5: Having agreements or alliances with companies of the industry, cause a positive effect on the interest to develop technology and innovation in the establishment of a company. Finally, it should be emphasized that the theoretical and empirical evidence show

Finally, it should be emphasized that the theoretical and empirical evidence show certain tendencies about the type of entrepreneurship that women choose, the attitudes and motivations that drive them to pursue entrepreneurship or not, and their level of education. These aspects are framed to some extent within the factors identified in Figure 2.

Figure 2. Factors that [+] contribute and [-] affect the creation and development of the female entrepreneurship

3. METHODOLOGY

3.1 Variables and Measurement

In order to measure our dependent variable, we focus on one item of the questionnaire applied through a personal survey in a field study. As support document, we used a self-administered questionnaire directed to businesses' owners. **Do you consider that lack of knowledge, lack of training, experience, and family responsibilities impose obstacles?** It is a dichotomous variable, which takes the value 1 for an affirmative answer and value 2 for a negative answer.

Regarding socio-demographic factors, to measure age we used a continuous variable that takes ages 25-34 in value 1, ages 35-44 in value 2 and ages 45-82 in value 3. For education, women with primary education are included in value 1, women who achieved secondary school level are included in value 2, and those who had higher education (bachelor degrees or graduate levels) are included in value 0.

Cognitive variables were measured through a Likert-type variable (values 1 to 7).

Regarding relational variables, they were also measured through a Likert-type variable (values 1 to 7)

4. EMPIRICAL STUDY

4.1 Sample

To test our model, the study population consists of entrepreneur women from the municipality of León, Nicaragua, with a sample of 101 women, with a confidence level of 95% and a standard error of 5%.

4.2 Analysis and Results

Before carrying out the relevant statistical analysis, it is necessary to ensure that adequate tools are being used to measure the concepts that we intend to measure. Therefore, we corroborated the reliability and validity of the scales used to measure each of the variables.

To measure reliability, Cronbach's alpha was used. In order to increase the values of the alpha coefficient, the criterion of item-total correlation was followed to determine if an item should be eliminated (Wang, 2003). The validity of each scale was checked by factorial analysis. With this analysis we tried to verify if each scale was measuring a single concept.

For all variables, Cronbach's alpha values were higher than the minimum recommended. All the items showed an item-total correlation higher than 0.3, so all the initial items were kept.

Before the factorial analysis, the suitability was determined using the Kaiser-Meyer-Olkin or KMO statistic and the Bartlett sphericity contrast. Satisfactory values were obtained for all variables, both for the KMO index and for the Bartlett test, so that the various factor analysis were carried out.

Table 1. Factor analysis for the variable Education. Rotated Components Matrix

	Factors					
	Education					
	Primary		Secondary		University	
	1	2	1	2	1	2
Primary and secondary education encourages creativity, self-sufficiency and personal initiative	,246	,804	,761	,201	,367	,695
The educational level in women entrepreneurs directly affects the degree of sophistication, the possibilities of innovation and the growth potential of the new enterprises	,897	,267	,285	,811	,703	,183
I believe that higher education has contributed to the strengthening and development of my leadership	,779	-,135	,583	,443	,784	,270
Universities and colleges provide quality preparation for the creation of new companies	-,688	,345	,718	-,024	,074	,890
Vocational training and continuing education systems provide quality preparation for new businesses establishments.	-,453	,762	,815	-,377	,677	,272
The educational level in women entrepreneurs affects the values transmitted by the family and social environment, and by entrepreneur models.	,126	-,632	,224	-,634	,727	,035
	KMO=0,460 $\chi^2=32,787$ p<0,005		KMO=0,582 $\chi^2=42,033$ p<0,000		KMO=0,803 $\chi^2=70,734$ p<0,000	

Source: SPSS development of the survey of female entrepreneurs

Extraction method: Principal component analysis. Rotation Method: Varimax Standardization with Kaiser.

In the case of the Education variable, using factorial analyzes, the results indicate that there are significant differences in the level of education; although it is important to note the differences in the level of education of primary women ($\chi^2=32,787$ p <0.005) ensures that the educational level directly affects the degree of sophistication. In those with secondary education ($\chi^2 = 42,033$ p <0,000), it affects the possibilities of innovation and the growth potential of the new enterprises. In the case of women with a higher formation ($\chi^2= 70,734$ p <0,000), their education has contributed to the strengthening and development of their leadership, which may be a disadvantage in relation to women who are not trained to pursue entrepreneurship in certain sectors (Brush, 1992). The first part of Table 1 clearly shows the predominance of female education related to their educational level, a fact that agrees with the arguments presented by the literature on this subject.

Table 2. Factor analysis for the variables Creativity and Innovation. Rotated Components Matrix

	Factors					
	Age					
	25 to 34		35 to 44		45 to 82	
	1	2	1	2	1	2
1. Women with the ability to generate ideas habitually are usually related to a greater creative talent.	,938	-,290	,559	,659	,728	,291
2. I have innovative ideas	,803	-,286	,772	-,418	,828	-,0.80

Extraction method: Principal component analysis. Rotation method: Varimax Standardization with Kaiser.

In terms of socio-economic factors, the average age is 49 years. Table 2 shows the factorial analysis of the variables. We deduce that all the proposed variables that make Model 1 have a significant relation with the probability that the woman with personal abilities and creative and innovative capacities is a potential entrepreneur. Thus, as age (45 to 82) increases, it exerts a negative effect and this probability decreases ($\chi^2 = 94.387$ p <0.000). The analysis show that, when the age of the

entrepreneurial woman is in the group (25 to 34), ($\chi^2 = 44.049$ $p < 0.000$) within the creativity and innovation scale; this is a predictor that prevails in the first five items with greater intensity on initiative taking to generate ideas related with the skill through creative processes. For the entrepreneurial women in group (35 to 44), ($\chi^2 = 52.775$ $p < 0.000$), the probability of implementing their skills prevails. It seems that there is an age range acting an inhibiting barrier when women start a business. However, for entrepreneurial women with few creative abilities this barrier occurs at older ages, while entrepreneurs with creative abilities would have a greater “timeframe” to carry out their initiatives. These results confirm partly the proposed hypothesis (Castiblanco, 2016; Holienka *et al.*, 2016), that women entrepreneurs with a high level of education frequently require to start their entrepreneurial activities later.

Table 3. Factor analysis for the variable Role Model in the social context

Follow example of successful businesses directed by women	,735
KMO=0,784 $\chi^2=295,49$ $p < 0,000$	

Source: SPSS development of the survey of female entrepreneurs

In order to determine the minimum number of factors, a confirmatory factorial analysis is carried out in order to evaluate the reliability and validity of the measurement scales used in this investigation Table 3 presents the Beta Standardized coefficients that constitute a measure of the contribution of each variable to the predictive model. The higher values indicate that any change in the predictor variable may have a significant effect on the criterion variable; since statistics take values very close to 0.8, therefore none of them will be excluded.

The significance of the Barlett test ($\chi^2 = 295.49$ $p < 0.000$) and the KMO (.784) showed an adequate correlation between the items and a good sample adequacy respectively. An initial estimation of the model indicates that two elements explain the experience scales of family in entrepreneurship and experience of family in entrepreneurship. They showed significant values in their influential role on the variable role model in the social context, which shows that women entrepreneurs do not come from business households and the vast majority, do not have an early contact in the business world. This characteristic allows us to verify statements (Gibb, 1987), that family history plays a determining role in learning when making a decision to start a business and in many cases entrepreneurs require more personal than operational support at the corporate level (Noguera, Alvarez, Merigo, & Urbano, 2015). Consequently, the H3 hypothesis is also accepted.

Table 4. Factor analysis for the variable Results Agreement or Alliances with Companies

	Factors
Agreements or alliances with industry companies	,805
Agreements with a variety of participant businesses	,894
Agreements or alliances with providers, distributors and clients	,632
Agreements or alliances with public and private universities	,767
Alliance for joint production	,890
KMO=0,766 $\chi^2=303,64$ $p < 0,000$	

Source: SPSS development of the survey of female entrepreneurs

From the Factor Analysis model for the variable Results Agreement or Alliances with Companies, referring to the informal factor of the contact networks, it is evident that the scales indicate a correct approach of the factorial structure, given that statistics take very close values; therefore, none will be excluded. Subsequently, a relationship between the level of analysis and agreements with entrepreneurs was explored. The results indicate a significance of the Barlett test ($\chi^2 = 303,64$ $p < 0.000$) and the KMO (0.766). An initial estimate of the model indicates that to pursue entrepreneurship it is necessary to be surrounded by a business ecosystem. In this case it negatively affects entrepreneurship in the municipality of León. The beta exponential indicates that there is a statistical association between the level of analysis and the social capital factor. In the case of the municipality of León, female entrepreneurs are observed to practice strategies with suppliers, distributors and customers. As a result, being surrounded by a business ecosystem is determined by the confidence of the actors who participate in the network and are likely to increase the effectiveness in their businesses. The presence of women in the municipality of León, Nicaragua, is almost a testimony in the construction of those activities where the skills required to

establish a business are minimal and relatively easy to learn, concentrating on trade and professional services (Pilková *et al.*, 2016)

The results show that having entrepreneurial families, (both in innovation, as highly qualified personnel), acquiring a production system, incorporating new products in the market, and accessing and specializing in the market segment; are all factors that influence the independent variable in a positive way

Table 5 shows the results for logistic regression in order to predict the influence of entrepreneurial relatives as a control variable based on cognitive and socio-personal factors. It is observed that coefficient B differs significantly from 0; therefore, it is understood that it produces changes on the dependent variable indicating the inexistence of a relationship. Although no hypothesis was proposed, in the case of some authors who used this variable, we found out that having family entrepreneurs does exert an influence (Gibb, 1987; Veciana, 1989).

Table 5. Regression analysis of the effect of the independent variables on the results

	Has an Entrepreneurial Family
Independent Variables	
Research and Develop key technology [I+D+I]	0,24**
Has high-qualified staff in technology	0,20**
Acquire specialized production systems	-0,299
Incorporates new products and services into the market.	0,470***
Access and specialize in market segments	-0,156
	R ² corrected= 0,024

Source: SPSS development of the survey of female entrepreneurs

*p<0,05 ** p < 0,01 *** p < 0,000

On the other hand, hypothesis 3 proposed that cooperation influences innovation positively. The relationship between the two variables was analyzed (see Table 6), showing that, in the case of Age, Education and Skill, they positively influence innovation. Consequently, hypothesis 3 is accepted. However, in the businesses of the municipality of León, only those cases, in which women have a higher education result in a greater innovation. Therefore, hypothesis 3 is partially accepted.

Table 6. Regression analysis of the effect of Innovation

	SPAIN
Age	0,108*
Education	- 0,385***
Ability	0,062
	R ² corrected= 0,146

Source: SPSS development of the survey of female entrepreneurs

*p<0,05** p < 0,01 *** p < 0,000

Finally, hypothesis 5 suggested that social capital, in relation to the informal factor, can foster cooperation. The analysis in Table 6 confirm that education positively influences cooperation with both direct and indirect agents. Therefore, hypothesis 5 is also accepted. No practice of social capital results in greater cooperation with competition. Therefore, hypothesis 5 can only be partially accepted.

5. CONCLUSIONS

The present study has analyzed with empirical evidence the different factors that explain the position of entrepreneurial women to increase their dynamism in the economy in the municipality of León, Nicaragua. We tried to prove the three-dimensional conception of the construct, based on the economic, psychological and sociological defended by (Álvarez & Urbano, 2013), this influence of the three-dimensional conception globally incorporates, aspects related to economic rationality and the action of entrepreneurial women in the light of change. Two basic premises support and guide the research conducted. Firstly, socio-economic variables try to test the possible influence of entrepreneurial women's ability (Anna *et al.*, 2000; Wennekers, Stel, Thurik, & Reynolds, 2005), on psychological factors. Such factors determine the understanding of the processes (Alvarez, Urbano, & Amorós, 2012), that give rise to success in the implantation of the entrepreneurial woman's personality. Secondly, the socio-cultural environment can condition the decision to create a company (Alvarez *et*

al., 2012). In this sense, the perceptions of entrepreneurial skills have a very significant effect on the three motivational constructs considered (aptitude, ability and training).

As has been shown by factor analysis, given the relationship among these three elements they are interrelated, so that some empower others maintaining a common goal: women's attitude towards business behavior and self-efficacy. Self-perceived entrepreneurial skills are closely linked to this variable. However, business skills are measured by a list of very specific skills. In contrast, positive or negative attitudes that contribute to the intention to pursue entrepreneurship have been measured as an added sense of capacity or control. Therefore, the perception that these skills are owned traits strengthens the link with knowledge, which can be labeled as the ability to create business knowledge.

This research provides a first radiograph of entrepreneur women, identifying the central peculiarities of women's entrepreneurial spirit in the municipality of León, Nicaragua and in its companies.

From the results obtained, the average age is 49 years. In the factorial analysis, the variable age presented a highly significant effect with negative coefficient β in older women. This relationship increases as soon as it is introduced in the model of Creativity and Innovation, which leads us to interpret how age acts as an inhibiting barrier when starting a business.

If we take into consideration, the influence that education has according to our results, a high level of education requires social self-evaluation of entrepreneurship and it has a positive effect on the perception of skills. This finding may also be important for business policy in general, and specifically for education.

The direct influence of values on the antecedents of relatives in the intention to pursue entrepreneurship indicates aspects linked to the influence of a closer environment. Such environment comprises models of parents or friends, and follows examples of successful companies, affective elements that are influential on the assessment of entrepreneurship. This shows that entrepreneur women do not come from business households and the vast majority do not have an early contact in the business world. This characteristic makes it possible to verify that, due to the need to seek greater personal and family compatibility, ranging from genetics to education. It is a predominant factor in the entrepreneurial dynamic and there is no significant effect on the Role Model assessment.

Regarding the informal factor of the contact networks, it is evident that the lack of affiliation to mentors linked to business success and the cultural aspect indicates that entrepreneur women from León tend to build businesses "imitating" business models where the required skills to establish themselves are minimal and relatively easy to learn, concentrating on trade and professional services. This proves the statements by (Pilková *et al.*, 2016) therefore the development of skills such as opportunity, recognition, creativity, leadership, communication and innovation, are necessary for business success.

Finally, we believe that it should be analyzed the inclusion of specific contents in Education as well as the compatibility between work and family for the entrepreneurial spirit that explain the decline of its nature. The abilities of entrepreneur women are essential for understanding business processes. These contents would be a very important complement to visualize new business opportunities.

ABSTRACT

In the contemporaneous society, the development of public politics that reach significant results and contribute with actions that promote quality of life turn out to be relevant. Thus, the aim of this study was to identify the results of social management applied to the quality of life in Brazilian environmental public politics. This literature review involves a qualitative approach, in descriptive nature, considering the Social Management elements: practices, democracy and citizenship formation, taking on account the confrontations against the social issue and the guarantee of universal human rights as possible promoters of quality of life. The results pointed the presuppositions of social management and the elements that promote quality of life are inseparable of the establishment and the application of environment politics, as exemplified in the Brazilian National Politics of Solid Wastes. Nevertheless, it can't be affirmed that this Politic represents the purpose of promoting an amplified quality of life for the concerned people, which affects the expected results for this public politic. Based on the presented results, it is questioned the relevance of the elements of social managements as promoters of quality of life and still need to be observed and considered for the improvement of the Brazilian politics.

Keywords: Social Management, Quality of life, Public Politics, Solid Wastes.

JEL Classification: D78

1. INTRODUCTION

According to Machado and Quaresma (2014), social management still crosses through its conceptual and methodological phase, nevertheless, it is evident the continuous search for the effective answers to the challenges such as the support for job opportunities and generation of employment, social participation and income distribution. It can be affirmed that these challenges maximize when confronted to the necessity of mediate the participation of different individuals interested in the “development”. It is in this context of reflection of subjects or of those presupposed in social management, taking on account the ones especially related to quality of life, that this study stands in order to realize a critical analyses of the National Politics of Solid Wastes (NPSW), instituted by the Law nº 12.305, from August 2, 2010.

This analyses justifies meanly when observing that one of the indissociable pillars of the sustainable development is the social one, and with its attributes and constructs capable of constructing new paradigms of analyses, reflection and actuation that, integrated to the rest of the pillars such as environmental, economic, political, and cultural the sustainability can really be developed.

For the development of this study, it was realized a review of literature using books and scientific periodicals with the aim of clarifying the concepts related to social management currently recognized, as well as how to identify the basic elements related to the constructs of quality of life. With the stratification of the elements that contribute to the analyses of social management in the NPSW, by the way of initiatives that promote quality of life, it will be analyzed the NPSW, instituted by the law nº 12.305, from August 2, 2010 and regulated by the decree nº 7.404, from December 23, 2010, looking for the identification of those requirements that establish initiatives or relative controls to the quality of life of the social actors highlighted on it. After realized this mentioned review of literature, the final considerations will be directed to the discussion about the relation between the attributes of the social managements focusing the aspects concerned to the quality of life and the requirements established in NPSW, checking if the policy considered these constructs of social managements and also raising a discussion about what are the possible unfolding of the analyzes realized in this study, that could feed new researches.

2. LITERATURE REVIEW

In the face of the diversity of discussions concerning to the concept of social management and their assumptions, it was verified the need to capture the perceptions of the authors of the subject, and in this case, Maia (2005) was highlighted whose concept of social management aligns in a consistent form with the elements of quality of life to be discussed.

Therefore, as an indicative concept of social management, Maia brings the followed approach.

We comprehend social management as a group of social processes with viable potential of emancipatory and transformer corporate development. It is supported by values, practices and democracy and citizenship formation, in the view of the confrontation of expressions of social matters, of the guarantee of universal human rights and the affirmation of the interests and public spaces as patterns of a new civilization. Construction rose in democratic pacts, in the local, national and worldwide fields; among the agents of the sphere of civil society, political and economic society, with the effective participation of citizens historically excluded of the processes of distribution of wealth and power (Maia, 2005, p. 15-16).

Considering this concept of social management presented above and its relation to the guarantee of the rights and the citizenship, this literature review proposed for this study will direct to debates concerning to the quality of life, highlighting approaches that add consistency to the perception of the quality of life with one of the elements of the initiatives that seeks to promote social management.

Herculano (2000), after approaching the considerations related to other authors, like Allard, Erikson, Sen and also contemplating in analyses the premises used in Scandinavian social indicators, he consolidates the convergence between the references that the wellbeing has as basic elements: the possibility of influence on decisions related to the collectivity and participate in the community life under a political perspective, and benefit from the past and the present collectivity community actions, which is relevant when analyzing an environmental policy, as it is shown in this article.

Herculano (2000) still contextualize quality of life joining the environmental issue to the other items measured by IDH (life expectation, literacy rate, years of schooling and Gross Domestic Product *per capita* - GDP/capita), proposing that quality of life represents:

The sum of the economic, environmental, scientific-cultural and political conditions collectively built and made available for that the individuals can realize their potentialities: include accessibility to the production and consumption to the means in order to produce culture, science and art, as well as presupposing the existence of mechanisms of communication, information, participation and affecting the collective destination through territorial management that guarantees cleaned water and air, environmental hygiene, collective urban facilities, healthy food and accessibility to urban natural mild areas, as well the preservation of natural ecosystems (Herculano, 2000, p. 22).

In addition, complementing the theoretic elements related to the conceptual debate of quality of life, it is possible to link it to the citizens basic need attendance in a reasonable political conception of justice, referred by Weber (2013, p. 207) as primary assets necessary for exercising the rights of citizens, the author underlines “the rights and fundamental freedoms”, “freedom of moving and free choice of occupation”, “the powers and prerogatives of occupation and liability positions”, “income and wealth” and “the social basis of self-respect”. It is important to highlight that the author develops the concept of justice as equity, and discusses about the concept of the dignity of the human person linked to the minimal goods satisfaction for that the individual would indeed be able to exercise citizenship. Therefore, the elements presented in this study can contribute to the analyzes of quality of life applied to the NPSW, taking on account that the quality of life is an insoluble condition to attend the citizens basic needs as the actors who really cooperate with the society they live in.

The delimitation of quality of life presented by Herculano (2000) and their relation with the ones presupposed by Weber maximize the dialogue between the elements of social management, quality of life and environmental management, enabling the advancing of this literature review with the purpose of analyze the essential legal requirements essential to the comprehension of the NPSW.

In progress to the theoretical dialogue up to here realized and starting with a legal contextualization needed for the introduction to the NPSW, respecting the requirements proposed in the Brazilian Federal Constitution of 1988 – FC/88, it is verified the outlining of the Brazilian Citizens social rights and that, for this study, turn out to be relevant some details that will be discussed as follow. Thus, objectively, the FC/88 defines its fundamental principles of citizenship, the dignity of the human person and de social values of work and of the free initiative among others, and also stablishing as one of the basic purposes of the Federative Republic of Brazil the eradication of poverty and marginality and the reduction of social and regional inequalities. This purpose mentioned is totally related to the purpose of this study.

On realizing other clippings that can also contribute for the elaboration of this study, the art. 5.º, subsection XIII of FC/88 presents the right of freedom to exercise any job, profession or craft, once attending the professional qualifications established by the law, condition related to the requirements that will be presented on NPSW.

The FC/88 also highlights in its art. 6.º that “education, health, food, job, home, transport, leisure, security, social security, protection to maternity and infancy, helpless assistance, on the constitution form are social rights”. Then, the art. 7.º the FC/88 presents the relation of rural and urban workers wrights, besides others that focus on the improvement of social conditions as the social rights to be guaranteed.

On proceeding, it was underlined the relation between environment and quality of life established by FC/88, art. 225.º in its referred chapter of environment, pointing out that, “everyone has the right to an ecologically balanced environment, which is an asset for common use by people and essential for a healthy quality of life, imposing to the Public Power and to the collectivity the duty of defend and preserve them for the present and future generations”, and in the §1.º, subsection V from the same article, it attributes to the Public Power the control of production, commercialization and employment of technics, methods and substances that bring risk to life, to the quality of life and to the environment.

This relation between environment and quality of life presented in the lines of FC/88 is exploited by a group of environmental politics, defined on federal sphere, that has as purpose operationalize the application of the rights and deeds established and defined in the Federal Constitution. However, among various environmental policies the purpose of this article is the NPSW instituted by the law 12.305/2010, and when realizing a review of the established requirements in its contempt it can't let be apart its principles and objectives, once they guide the main line of politics, so, according to the art. 6.º of the law, they are principles of NPSW.

- I the prevention and precaution;
- II the polluted payer and the protector recipient;
- III the systemic vision, in generation of solid wastes, that consider the environmental varieties, social, cultural, economic, technological and of public health;
- IV sustainable development;
- V the eco-efficiency through the compatibility between the supply, at competitive prices, of goods and qualified services which satisfy the human necessities, bring quality of life and reduce the environmental impact and consumption of natural resources at a level, at least, equivalent to the capacity of sustainability estimated for the planet;
- VI the cooperation between different spheres of Public Power, the business sector and the other segments of society;
- VII the responsibility shared by the products cycle of life;
- VIII the recognition of reusable and recyclable solid waste as an economic good and of social value that generates job and income and promotes citizenship;
- IX the respect for local and regional diversities;
- X the society right to information and social control;
- XI the reasonability and the proportionality. (BRASIL, 2010)

In the art. 7.º of the law 12.350/2010 are presented the objectives of NPSW in which are highlighted those that present a more effective connection with the constructors of social management previously discussed, and quoted as follows:

- a) "protection of the public health and of the environmental quality", considering that public health is a society right;
- b) "encouragement to the recycling industry, in the view of fomenting the use of raw material and input derived from recyclable and recycled materials", which can offer opportunities to individuals and groups involved in this subject.
- c) "integrated management of solid wastes" that could promote a favorable environment to the participation and raise more discussions about the process.
- d) "articulation between the spheres of the public power, together with the business sector, with the view of financial and technical cooperation for an integrated management of solid wastes."
- e) "continuous technical capacitation in the fields of solid wastes", also allowing qualification for job and social inclusion.
- f) "integration of collectors of reusable and recycled materials in actions that involve the shared responsibility for the products cycle of life", which directly represents and an objective strictly related to the concepts of social management presented in this study.

Once going deeper into the requirements of NPSW as public policy, it is possible to identify the emancipation of stated and cities to the action and guided development concerning to solve the matter of managing the solid wastes. The law 12.305/2010 also foresee how one of its instruments, the social control, defined in its art. 3.º, subsection VI as the "set of mechanisms and procedures that guarantee information and participation to society in processes of formulation, implementation and evaluation of public politics related to solid wastes", and it is also defined by the law that the integrated management of solid waste may consider the social, political, economic, environmental and cultural dimension, besides defining the reversible logistic as an instrument of economic and social development.

Other points that can be attributed to social management and the quality of life applied to the NPSW are in the clipping of its art. 6.º in which it highlights the systemic vision principle in waste management considering the environmental, social, cultural, economic, technological and of public health variations, and still the recognition of the reusable and recyclable solid waste as a good of social value, job and income generator and citizen promoter.

In the operationalization of NPSW it can be foreseen that the Ministry of Environment (ME) will elaborate one NPSW with the horizons of 20 years that should minimally contemplate, among other contents, according to art. 15.º of NPSW, subsection V, the "targets to eliminate and recover dumping trash, associated to social inclusion and to the economic emancipation of the collectors of reusable and recyclable materials", which is also contemplated in the minimal content previewed for the States Plans of Solid Waste (SPSW). Still referring the NPSW, this one proposes the use of the mobilization process and the social emancipation, by means of public audiences and consults, to its elaboration.

Face to the social elements treated in the NPSW, it turns out interesting, to enrich the proposal discussion, the presentation of one extract of the Universal Declaration of Human Rights of 1948 that in its art. 25.º establishes that:

Everyone has the right to a standard of living adequate for the health and wellbeing of himself and of his family, including food, clothing, housing, medical care and essential social services, and also the right to security in event

of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control (UNESCO, 1998, p. 5).

In the perspective presented by the Universal Declaration of Human Rights it is verified the Brazilian alignment, as a country committed with this cause, and it can be stated in the art. 79.º of FC/88, where it is instituted the Fund to Combat and Eradicate Poverty (FCEP), with the objective of enabling the access to dignified levels of subsistence to all Brazilians, by the implementation of “supplementary actions of nutrition, home, habitation, education, health, family income reinforcement, and other programs of relevant social interest directed to increase the quality of life”.

However, besides NPSW searches for the involvement and establishment of premises concerning to social include, for example, by the means of social control and considering the collectors in its objectives and the constructs of the plains in the NPSW and SPSW, it can't be affirmed that, objectively, the instruments proposed by NPSW establish, in a solid way, actions that promote the social emancipation of the people interested in the results of this policy, considering that social emancipation, according to Lima and Pereira (2015), would be one of the main targets of social management, that this year it searches for observing its application in a systemic environmental politics. So, the presented clippings up to now, have as the major target, underline efficiently, the evidences related to social management considered in PNSW, with no intention of exhaust the subject nor to identify all the presence points of the social manage included in the law or to establish a paradigm affirming that social management, in fact, has being promoted by NPSW.

The purpose of presentation and interrelationship of this group of clippings is to search for a more effective delimitation of the minimum parameters of quality of life that the legal framework, corroborated with the approaches of the referred authors, could make social management tangible, under the perspective of quality of life related to the guarantee of the basic rights, the human rights and of the minimal consumption goods needed to support the rights of citizenship.

3. FINAL CONSIDERATIONS

Considering that the constructors of social management and the promoter element of citizens quality of life used as references in this study, it is possible to affirm that in NPSW are presented the presuppositions of social management and the elements that search for promoting quality of life, as promoting the participation of the interested groups by the means of social control and the systemic vision in wastes management, considering the social variance in integrated form with environmental variances, socials, cultural, economics, technological and of public health. However, it can't be affirmed that this one has, in an objective and structural manner, the purpose of promote quality of life extended to its various holders, because the policy limits to underline the social actor, “the collector”, front his exposition to a group of social vulnerabilities that has relevant role to effect the application of principals and objectives of policy, which turns out to be one important actor to be considered in the instruments that were instituted by policy, as the state and municipal plans of solid wastes and the development of cooperatives and collectors associations.

In order to reach the objective proposed by this study, two lines of analyzes were necessary, being the first of them the verification of the constructors of social management described in this literature review that were presented in the NPSW, considering that the social management is a process that needs to be developed by public policies. The other line of analyses the intends to verify whether in the requirements, instruments and tools proposed by the NPSW and the legal requirements correlated are considered as the necessary elements for that the social management develops in integrated form together with the others purposes of the law, as the environment, the economic and the political.

However, when analyzing the law 12.305/2010 it is possible to find elements directly related to the constructors of social management and, among these elements, it can be pointed the social control as a form of participation of the interested parts, as the law considers as the principle of systemic vision in the manage of wastes the environmental, socials, economics, technologic, and public health varieties. The law still recognizes reusable and recyclable solid wastes as a good of social value, job and income generator and citizenship promoter, which is objectively an element that represents the necessary goods to promote the quality of life of the referred group, for its vulnerability, nevertheless it is immature to affirm that the assumptions of a social management, under the perspective of quality of life, be strongly integrated and present to the NPSW and its instruments.

The performed analyses, even incomplete, of the main elements of social management and of the quality of life in the NPSW, evidences that it can be considered that the constructors of social management are present as relevant elements for the success of an application as a legal instrument. It is valid to affirm that this study did not intent to make an evaluation of the unfoldings and of the application of the instruments defined by NPSW so, this study represents a test for targeting more further studies related to the comprehension of the proceedings related to the promotion of quality of life as how an insoluble element of social management is, in fact, being promoted by the instruments established in the environmental policy allowing this integration to contribute, by significant means, to the parts interested in this instruments.

Finally, besides the presented limitation, it generates a great challenge and expectation that the instruments defined in the art. 8.º of PNSW be capable of develop and operate as the necessary conditions to directly or indirectly guarantee the quality of life to the citizens involve to the proposal themes in NPSW, those who are not explicitly highlighted in politics, as the street cleaners, the communities placed around dumps and landfills, the employers of recyclable industries, the ones that live in regions devoid of waste collection and others, searching for the guarantee of human dignity, their basic rights and the necessary goods for their citizenship. Therefore, the tutoring and monitoring of the effectivity of the referred instruments can constitute opportunities for new studies.

ABSTRACT

This paper aims to contribute to the study of the role of Azorean-Madeiran (i)migration in the socio-spatial formation process of the Santa Catarina island, southern coast of Brazil. In order to approach the study of the marks and cultural traits of Portuguese origin, inscribed in the insular landscape, the focus was understand your influence on the settlement, the urban and rural habitat, and military and traditional architecture. It was within the scope of Portuguese colonial expansion in South America that the geostrategic importance of the Santa Catarina Island determined its effective occupation, fortification and settlement. The historical process of (trans)formation of its landscape was marked in an expressive way by the culture of the Azorean and Madeiran settlers, and their descendants, from the middle of the eighteenth century. In methodological terms, the research crossed the written and documentary information, with the cartographic analysis and the data obtained in the field work, in the sense of creating bases to support (re) interpretation of the Portuguese heritage in that territory. This study revealed that the circumstances of the environment and the influence of Portuguese culture determined the idiosyncrasy of insular society, giving them characteristics that help to better understand certain aspects of their territorial and architectural culture.

Keywords: Santa Catarina Island, Azorean-Madeiran (i)migration, Socio-spatial Formation, Urbanism.

JEL Classification: R580

1. INTRODUCTION

The main objective of this paper is to present the first conclusions of the preliminary study on the influence of Azorean - Madeira (i)migration of middle of the 18th century on the historical process of occupation and spatial organization of the Santa Catarina island, southern Brazil. This study is based on the integrated reading of settlement, urbanism and architecture and aims to contribute to the recognition of the marks of Portuguese culture in the process of socio-spatial formation of the Island, and in the different expressions of built heritage: military architecture, Religious architecture, domestic architecture and “industrial” architecture in its landscape context.

In methodological terms, the research combined the interpretation of cartography and ancient iconography with historical and documentary sources, and its crossing with the fieldwork developed in the last quarter of 2016, such as the financial support of the Foundation for Science and Technology (SFRH/BSAB/114620/2016), in the scope of prospecting of the Portuguese heritage on the Island.

Was used a research methodology based on an interdisciplinary and multi-scalar approach that crossing the written and documentary information, with the cartographic analysis and the data obtained in the field work, in the sense of creating bases to support the (re) interpretation of the Azorean legacy in the island. Although in the context of the Portuguese colonial world, the Santa Catarina island was only later of interest object and permanent occupation, its strategic location between Rio de Janeiro and Rio de la Plata would determine the role and importance it had in the delimitation and defense of this region, in the inventory and exploitation of its resources in favor of the Portuguese Crown. It will be essentially within this framework of intentions and in establishing support points for the exploration of the southern region of Brazil up to the present border between Argentina and Uruguay, which is inscribed the historical process of construction and transformation of the landscape of Santa Catarina Island.

The colonization of the Island and the mainland frontier territory is strongly marked by the cultural traces of populations of Portuguese origin. At first, still in the seventeenth century, it was based on contingents of Portuguese residents and/or their descendants, from the village of S. Vicente, on the São Paulo coast, which retained ancient cultural features of mainland Portugal (Furlan, 2015). And, in the second period, the complete occupation of the Island, between 1748 and 1756, counted on the (i) migration of about 6,000 Portuguese North Atlantic islanders (Piazza, 1988), with strong cultural peculiarities. The Portuguese occupation of the southern Brazilian territory up to the *Rio de la Plata* highlights the tendency towards the litoralisation of settlement and the establishment of a placement based on a system of agro-marine activities directly supported by maritime commerce at a distance. This study aims to identify and characterize the historical territorial matrix associated with (i) the migration of Azorean and Madeiran settlers as basis of the occupation and spatial organization of the Brazilian Island.

2. THE ROYAL EDICT OF THE MIDDLE OF 18TH CENTURY AND THE SCHEDULED COLONIZATION PROCESS

The process of occupation and organization of the island territory followed the instructions and guidelines defined by the Royal Provision of August 9, 1747 and publicized by the Edict. This document, also known as “Silva Paes Regiment” (1st Governor of the Santa Catarina Captaincy), framed the displacement and accommodation of Azorean and Madeiran couples on the Island, based on the *usucapio* law through the registration of concessions of lands to those who live and work (Oliveira and Salomon, 2010). The colonization and settlement of the Island was marked out and regulated by the aforementioned document, the rules of which constitute a veritable landscape planning manifesto, contemplating premises concerning the configuration of both urban and rural space.

The Royal Provision comprises the integrated conception of the island territory contemplating the definition of the characteristics of the site of the settlements implantation, their dimensioning and “norms for their urban design”, and uses *sesmaria* and *baldio* [waste ground] as fundamental mechanisms in the scope of the process of space occupation and land exploitation. The territorial structure that supports it is based on an orthogonal mesh with a *quarto de legoa em quadro* [quarter of a league in square] (Cabral, 1950) assuming the public space or collective lands as common good associated with each village and the “small property” as essential socio-spatial criterion in the division and distribution of land by Azorean owners. This set of rules and its spatialization, with appropriate adaptations to the geography and the ecology of the place, establish a model of territorial occupation that is the origin of a historical territorial structure that, associated with urban and rural space, still exists today (Reis, 2012).

The island’s planned settlement was thus based on the deeply intricate relationships between the villages, the sea and the countryside, and their location is preferentially situated along the small coastal plains near sheltered sites, namely in the north and south bays, and in Lagoa da Conceição. This option is directly related to the possibility of developing a socio-economy based on a system of complementary activities associated with the exploitation of land and sea resources supported by the trade of the surplus in relations with the vast region where it is integrated.

The beginning of the occupation and territorial organization of the Island precedes the date of the said Royal Provision in the context of the coastal colonization of the Brazilian extreme south, which comprised from the north to the south the phased foundation of different settlements along the coast. In a first time, the towns of Nossa Senhora da Graça do Rio de S. Francisco do Sul, in 1645; Nossa Senhora do Desterro (on the Santa Catarina Island) in 1651; Santo António dos Anjos da Laguna, in 1676 (Piazza, 1970) and Colónia do Sacramento (on the left bank of the River Plate) in 1680.

Figure 1. The coastal colonization of the Brazilian extreme south

Secondly, in the 1740s and 1750s, the occupation and strategic organization of the space, both on the continental and island lines, consolidated with the implantation “... of one of the most expressive defensive systems ever built in Brazil” (Tonera and Oliveira, 2015) through the construction of four fortresses and the densification of the urban network. The royal document framed the founding of the villages of Nossa Senhora do Rosário de Enseada de Brito in 1750, S. Miguel da Terra Firme and S. José da Terra Firme, both in 1751, on the continent front the Island, and in the Island the foundation of Nossa Senhora da Conceição da Lagoa, in 1750, Nossa Senhora das Necessidades e de Santo António, in 1755, and Santa Ana da Armação, in 1772. A strategy that, at a later time, coinciding with the first decades of the nineteenth century, included the foundation, in insular territory, of the settlements of Nossa Senhora da Lapa do Ribeirão, in 1809, or S. João do Rio Vermelho and S. Francisco de Paula Of Canasvieiras, in 1834 and 1835, respectively, in addition to the urban expansion of the settlements previously founded.

342

From its reading it is understood that the ecological structure of the landscape constituted by the great diversity of natural ecosystems (mountainous system, water system, dune system, lagoon system, etc.) overlapped the cultural structure constituted by the human settlements and the different buildings, and also by the agricultural production spaces. To the ecological and cultural structures of the landscape were added the mobility structure that joined the sea route (between points of the continent and the Island and between points of this) the terrestrial route through a network of dirt roads, conforming a unique historical landscape with strong character and pronounced identity (Batista, 2017).

To the general cartography of the Island is added as essential element for the reading and analysis of the process of socio-spatial formation, considering the marks and the Portuguese cultural traces that are inscribed in it, the plans and drawings of *Villa Capital de Santa Catharina*, 1774, of the marshal Diogo Funk, and of the fortifications and respective surroundings, by different Portuguese military engineers, dating from the last decades of the eighteenth century and beginning of the nineteenth century.

Figure 4. Planta da Villa Capital de Santa Catharina, 1774

Source: Veiga, Eliane V. 2010. Florianópolis: Memória Urbana. Florianópolis: FFC Publicações, 159, mapa 3

The urban reading using the Plant of the old Vila do Desterro (present Historical Center of Florianópolis) confirms a regular mesh polarized either by the wide and sloping square marked by the presence of the church, as by the port that determines the orientation of the orthogonal and tight chess of the streets (Peluso, 1953, 1981), associated with an urban model of Hispano-Portuguese origin that is adopted from the 16th century in colonial America and became a rule in the process of scheduled settlement of the Santa Catarina Island (Filho, 1997). The rational model that underlies it is also common either to the spatial pattern of military buildings and communication routes, and to the implantation of both structures through perfect adaptation to the geography and ecology of the place.

To this set of essential cartographic elements is added another one associated to the iconographic representation of the Island landscape, fundamentally of the said village in its territorial context, developed in the same period, by artist-travelers.

Figure 5. Panoramic view of the ancient Vila do Desterro, de 1827, by Debret

From its analysis, and as a main contribution to the reading of the Island landscape transformation (Makowiecky, 2010), namely of its capital, we consider the existence of a model of occupation and territorial organization based on the specific understanding of the coastal landscape, and was, as it was mentioned, on the basis of the process of settlement, exploration and defense of the insular territory and the continental territory. From the present cartographic and iconographic analysis, and from the field work carried out in view of the integrated and systemic understanding of the historical process of colonization of the Island, we are make the mapping and characterization of the main foundational settlements, of the built structures and associated complementary elements with socio-economic and political-military functions as fundamental bases for the development of the island territory.

4. THE HISTORICAL PROCESS OF SOCIO-SPATIAL FORMATION OF THE ISLAND: SETTLEMENT, URBANISM AND ARCHITECTURE

The mapping of the historical-geographical synthesis associated with the urban and rural heritage of Azorean and Madeiran origin constitutes a primordial register for the understanding of the permanencies, absences and changes registered in the landscape within the evolutionary process of organization of the Island territory. In this sense, it was considered the study, although a summary, of the different themes associated to the distribution and organization of the defensive system and the foundational urban system in its relationship with the road system, both terrestrial and maritime; and to the characterization of the domestic architecture and “industrial” architecture in its interdependence with the agricultural parceling and the traditional agro-marine economy.

Prior to the arrival of the Portuguese settlers a defensive system was installed with the objective of protecting the island territory, the populations that would come to inhabit it, and the navigation routes. The fortifications built in a rational spatial pattern, merge architecture and landscape through the careful selection of the site of implantation, strict adaptation to top-morphological characteristics, and the use of building materials from the site. From this resulted different typological solutions (Tonera and Oliveira, 2015) that, through the specific understanding of the landscape, have enhanced it, enhancing its singularities and attributes, constituting, today, as a whole, a landscape and patrimonial reference in the scope of the Portuguese heritage in the Island. The techniques and constructive systems used include the predominance of stone and lime masonry (from shells), both on the walls of fortifications and on the walls of buildings, complemented by other local materials such as wood spans, roofs and floor) and clay (in the production of half-cane roofing tiles).

Figure 6. Blueprints and aerial photography of S. Joze fortress

Source: Tonera, R.; Oliveira, M.M. 2015

As part of the process of occupation and organization of the island area, based on the (i)migration of thousands of Azorean and Madeiran people, the urban and socioeconomic development of the island expresses the organized implantation of settlements as centers of civil and religious power (Várzea, 1985; Reis, 2012) with the aim of promoting the social and territorial cohesion. The different settlements of Azorean origin associated to the programmed concentrated settlement show in their configuration an urban model (whose bases are defined by the Royal Provision, although its pre-existence) marked by the presence of a large outer space corresponding to the Square or Public Garden, that relates spatially and visually the church, located in a dominant point and oriented mainly to the west, with the sea and the fishing port, replicating, some variables of the historical Portuguese urban matrix.

Figure 7. Schematic diagram of the Edict Royal norms, 1747. A-Church; B-Square; C-Houses; D-Ocean; E-Collective area

Figure 8. Application of the Edict Royal urban model to the urban plan of Ribeirão da Ilha. A-Church; B-Square; C-Houses; D-Ocean; E-Collective area

On the other hand, there is a scattered occupation associated with land parceling, the small and long plots of land, supported by a network of secondary roads with which the agricultural houses are related, still perceptible in different areas of the Island. In one case, as in another case, the more or less diffuse disposition of the houses seems to make it difficult to recognize the limits of the settlements, since there is no in the local vocabulary, as in the Azores, the term village, replacing it by parish (administrative district) as a territorial constituency polarized by the church, although in the Santa Catarina Island this arises linked to the clearly identifiable foundational nucleus.

To the deeply intricate relationships of the foundational settlement with the land but also the sea, is added the deep religiosity of Portuguese (i)migrants that is materialized in the presence of churches, chapels and “altars”, marking indelibly the Santa Catarina landscape like da Azorean and Madeiran landscape. It is, in this sense, that the two main types of settlement identified are associated with the urban habitat and the rural habitat respectively, evidencing both the Portuguese (Azorean-Madeiran) origin of the architectures: religious, domestic and “industrial”, important material expressions of the North-Atlantic island culture that are at the base of the strong identity of the South American Island landscape.

Figure 9. Examples of different architectural expressions

In the approach to the study of the Island architecture we considered the scarce existing bibliography and the fieldwork that privileged themes associated with the interrelationship between architecture and landscape such as implantation, volumes and construction processes and materials. It is not intended to elaborate a typological system for framing the traditional architecture of Santa Catarina Island, but rather a systemic reading of the “Luso-Macaronesian culture” influence from the analysis and characterization of issues that seem to highlight the similarities constructive, typological and formal between the islands of the North and South Atlantic (Batista, 2017). In this sense, from a constructive point of view, the domestic architecture of the Santa Catarina Island is broadly in the tradition of the Portuguese continental and insular house. Stone houses and wooden houses synthesize, to a certain extent, essential aspects of the architectures of the lands of origin, denoting the contribution and influence of all those who crossed the Atlantic towards Brazil, although with reinterpretations adjusted to the circumstances of the environment.

As for stone masonry houses, three fundamental “types” (without excluding the possibility of others) were identified, with volumes of one and two stories, and inclined roofs of two and four-water roofs: the linear house, the square house and the complex two-story house.

The linear house, generally of a single floor and predominantly asymmetrical gable roof, presents, similarly to its Azorean congener, dimensions that vary in lengthwise direction as a function of the number of compartments, while maintaining a constant width. On the other hand, the square house or “*casarão*” (common designation in the Brazilian Island), of a floor and four waters, denotes the more wealthy origin of its owner and it forms a domestic space of unequal facades but all with great profusion of spans in which the facade parallel to the street / road often does not have a door, appearing implanted on an expressive base that raises the entry level on one of the side facades, accessing the house through a small outside staircase. In both cases, the rhythm of the façades, the predominantly lining the walls with lime, the use of colors such as ocher, blue or gray around doors and windows and the double hung windows, denounce the influence of the Portuguese architectural culture. This is also felt in formal and compositional details such as the traditional roofs with half-cane tile and the double eaves. Finally, complex two-story houses, such as in the Azores, associated to medium-sized rural properties or a more wealthy urban population, are less frequent but undeniably expressive and notorious in the landscape. They correspond to dwellings of greater dimension and structural complexity and internal organization.

Figure 10. Fundamental typologies of domestic architecture

If in the stone houses the use of wood is complementary, and can appear in the structure, although in a rudimentary way, as in the interior of the roof or in partition walls, in wooden houses, this locally abundant material is associated with an architectural expression equally characteristic of the Lusitanian presence on the Island, with strong influence of the popular architecture of the Madeira Island.

On the other hand, among the presence and variety of constructions related to Azorean-Madeiran productive activities, flour and spirits mills houses (*atafona* or *engenho*) stand out because of their importance to a recent past in the local economy, or because they constitute an inestimable brand of Portuguese inheritance and a trace of the collective identity of the Santa Catarina Island. The production of cassava flour merges the indigenous tradition with the Azorean-Madeiran in an adaptation of the *atafona* to the milling process of the animal traction “mill” (ox or cow), also associated by Madeiran influence to the production of molasses and sugar cane brandy or *cachaça* from the distillation of sugar cane, completed with the use of the traditional alembic (Batista, 2017).

5. CONCLUSION

The study revealed that the cultural landscape of the Santa Catarina Island, with “Luso-Brazilian feature,” is the result of a process of spatial organization resulting from the policy of the Portuguese Crown in the exploration and defense of the South American territory by the effort of some thousands of islanders of Azorean-Madeiran origin.

The programmed foundational settlement associated with simultaneous work on land (agro-livestock, horticulture) and at sea (artisanal fishing, “whales industrial fishing”), and the religiosity of Portuguese (i)migrants materialized in the expressive presence of churches, marks indelibly the Santa Catarina landscape, with similarities to the Portuguese islands landscape.

The urban habitat and the rural habitat show, in spite of recent changes, the Portuguese-Azorean-Madeiran origin of the domestic architecture (stone houses and wooden houses) and the “industrial” architecture (*engenhos* of flour and sugar cane), which with adaptations to the matrix landscape are at the base of the landscape identity of the Santa Catarina Island. Will be in the permanence of this material cultural heritage in its relation with the immaterial dimension and in the perpetuation of the singularity of places that, from the history of an inherited reinterpreted in the present landscape, we can will be (re) constructed a landscape for the future.

THE DIFFERENT DIMENSIONS OF URBAN PUBLIC SPACE AND ITS INFLUENCE ON DESIGNING PLANS AND PROJECTS OF URBAN RESTRUCTURING

Elsa Duarte

Centro de História da Arte e Investigação Artística
(eduarte@live.com.pt)

ABSTRACT

The present paper is related with the current investigation on the influence of the different public space dimensions on designing plans and projects of urban restructuring. The relevance of this study is due to, the need of creation and development of sustainable and resilient urban spaces, mainly when it comes to intervention in pre-existing run-down urban areas or in process of degradation, for which ought to consider rehabilitation, requalification and urban restructuring. Within this approach, should be adopted planning models focused on revitalization of these areas, considering in a more integrating way the four public space dimensions:

- The sociological dimension, which includes as disciplinary subjects, sociology, anthropology and psychology;
- The economic and political dimensions;
- The urban and architectural dimension, which is made up from disciplinary areas of architecture and urbanism;
- The ecological and environmental dimension, that integrates as disciplinary areas, ecology and landscape architecture.

In this perspective, it is essential to adopt an inclusive and global view on the system of collective spaces in the city, that connect fundamental aspects of each knowledge area, with the aim to design urban plans that embrace an interdisciplinary principle, based on the identity of the place and in the idiosyncrasy of the population that inhabits it.

Keywords: City, Public Space, Dimensions, Intervention, Holistic View.

JEL Classification: R580

1. INTRODUCTION

Currently the majority of the population lives on big metropolitan areas and a large percentage of those lives in social, clandestine or illegal genesis districts, which shows up unmistakable signs of degradation both social and structural, as demonstrate through an ONU reports referring to 2016.

In the face of this reality, becomes urgent the action and intervention towards rehabilitation, requalification and restructuring, improving the quality of the urban environment and the population quality of life.

Therefore, the new urban planning models should focus on revitalization of those areas, considering in an integrated way all four urban public space dimensions: sociological dimension, economic e political dimension, urban and architectural dimension, ecological and environmental dimension.

In order to that to be possible, is necessary de adoption of integrated intervention strategies, which through a global and comprehensive view over the city collective space systems, could articulate and connect the fundamental aspects of each one of the different knowledge areas, associated with those different dimensions, based on the principle of the interdisciplinary.

The present paper aims to contribute for the study of the different urban public space dimensions considering the influence that those different disciplinary fields might to exert into the design of plans and projects of urban restructuring. The integrative and interdisciplinary production of the urban and metropolitan design for both social and environmental run-down residential areas, assume the urban restructuring project not only as “a form of intervention in the existing urban tissue that aims to introduce new structural elements of an urban settlement or of an urban area” (Decreto-regulamentar n.º9/2009), but as an holistic and inclusive form of intervention within the city, that connect and combines in a more effectively way the different dimensions that characterizes it. For that reason firstly, it is necessary to identify the different urban public space dimensions in its interrelation with socio-economics, anthropology, urbanism and ecology, among others. As a result of this, it is presented in this paper a brief study, which integrates and sums up the contribution of those different disciplinary fields as a base for the definition of an alternative urban planning model associated to the establishment of multifunctional and resilient urban spaces enhancers of a better quality of urban life.

2. THE DIFFERENT DIMENSIONS OF URBAN PUBLIC SPACE AND THE FOUR DISCIPLINARY FIELDS

The different dimensions of urban public space are disciplinary related to knowledge areas that have it as a study object and intervention. The public space system is characterized by being fundamentally sociological, political, urban and environmental. Thus is justified in the context of urban intervention the study of such dimensions allowing to a

multidisciplinary work team in a rational and conscious way, the design of different plans and projects through the analysis and understanding of the historical processes of construction and transformation of the site, delivering future scenarios generating identify and sustainable urban spaces, that promotes social and territorial cohesion.

The public space, as “the total area, in principle exterior and not edified, of free access and collective use” (Brandão, 2002), has been influenced by several factors that influence its morphology and consequently its design. Such factors are inherent to the dimensions of the public space which are presented in four major groups since it is understood that collective use spaces correspond not only to “places of passage, distraction and of ephemeral and fleeting sociability”, but most of all to “territories were a substantial part of the meetings and interactions between subjects take place, as well as their symbolic relationship with the city” (Fortuna *et al.*, 1998/1999). It is considered four essential dimensions of to the urban public space, with which distinct knowledge areas are related in a profoundly intricate way:

- The sociological dimension, which includes as disciplinary subjects, sociology, anthropology and psychology;
- The economic and political dimensions;
- The urban and architectural dimension, which is made up from disciplinary areas of architecture and urbanism;
- The ecological and environmental dimension, that integrates as disciplinary areas, ecology and landscape architecture.

Currently, the contemporary paradigm is related to the recognition and awareness of the existence of different disciplinary fields such as Urban Ecology and with the increasing concern to promote sustainable areas (both environmental, social and economically) within our cities. So it is a priority to “achieve sustainable development by establishing a balanced and harmonious relationship between social needs, economic activities and the environment” (Convenção Europeia da Paisagem, 2004). Therefore it is fundamental to identify, characterize and understand in a comprehensive and relational way, the processes that caused damaged urban areas and consequently damaged collective use spaces, so that through the adoption of a global and inclusive vision on the aspects and procedures that operate and intervene on the city, could take place as a principle of intervention, the interdisciplinary approach, based on the identity of the place and the idiosyncrasy of the population that inhabits it.

Such as various authors stands to, (Serdoura, 2007; Cordeiro *et al.*, 2008; Jackson, 2011), the different typologies of public spaces are distinguished by the sort of relationship that they establish with the edified tissue and the urban mesh, as well as, by the sort of utilization that they provide or the way in which their appropriation is made, considering the interpersonal relations established by them.

2.1 Sociology, Anthropology and Psychology

The social dimension of the urban public space is related to the disciplinary scope of Sociology, Anthropology and Psychology in a profound and intricate way. In these subjects, it is important to know beside some other factors, the connections that the habitant or the visitant/citizen establishes with the public spaces, how (re)act and the importance that whole public space represents for him. Considering the collective space as a privileged space for the exercise of citizenship, it is essential to analyse the concepts of place and “non-place”, through the way how populations relate to each other and how they appropriate and relate to the collective space. So according to this, the identification and understanding of psychological and sociocultural factors among others, must be considered in the urban planning process, based on the assumption that this process must be guided by the respect for the collective identity and character of the place.

The place is assumed as the set of physical and social characteristics with which are established special and social relations, such as feelings of belonging to the place (Schulz, 1979; Augé, 1994; Magalhães, 2001; Speller, 2005). If the public space is the reflexion of all past actions and those change the relation citizen-space, is the identity and idiosyncrasy of the population that inhabits it that must be studied and considered in the process of the urban plan and project design, as a key element for the reestablishment of urbanity and cohesion and social inclusion. On the opposite side, the concept of “non-place” refers to a space without identity, although it does not cease to be a “practiced space”, because it ends up fulfilling a certain function, even though it does not stimulate feelings of belonging, nor it is a historical space and/or have an (id) entity of its own (Augé, 1994).

It is the physical and social characteristics of space that represents its *genius loci*, being the place identity that causes feelings of appropriation and bound to it (Schulz, 1979; Rossi, 2001; Speller, 2005; Silvano, 2001). Those feelings of belonging and bind to the place, might be expressed in the most varied ways which reinforces the need to be considered the user-space relationship in the process of spatial production, namely in its application to urban restructuring plans that focus on spaces with highly marked characteristics. As Filomena Silvano (2001) refer on her study, “according to Lefebvre’s perspective; conceive the space presuppose representing it from a certain system of signs”. In this sense, it is fundamental in the context of that process, to map the very relation that the human being establishes with the urban environment, knowing that it is altered according to the time of the day and the cognitive-emotional and sensorial stimuli that are produced (Duarte, 2013).

Cities suffer processes of urban diffusion, fragmentation and privatization, leading to uses, functions and social segregation. They are also the reflexion of changes both cultural and social, which lead to the morphological modification of public spaces in cities (Borja *et al.*, 2003; Innerarity, 2006). The public space systems thus as a fundamental role as a structuring element of the urban tissue and as a promoter of “urbanity”, shall adapt to what are the real needs of social groups in the intervention areas, improving their organization and health conditions (Machado, 2005; Menezes, 2005; Cordeiro *et al.*, 2005).

Regarding to the public space typologies and to its social and cultural requirements for its design, it should be considered that the “public space defines the quality of the city because it is an indicator of the urban life quality and the quality of citizenship of its inhabitants (Duarte, 2013). So ought to be designed multifunctional areas related with environmental and patrimonial protection (green corridors, urban woods, botanical gardens, cultural parks), to food production (urban orchards,

urban agriculture), and recreation and leisure (sports parks, parks and gardens), socially useful and safe, economically viable and ecologically sustainable. For that reason, it is fundamental to consider that “the urban design should be thought as a whole and not as separated parts in which the edification is part of a project and the public space part of another, without creating an union between the edified and non-edified space” (Aragonés *et al.*, 1998; Duarte, 2013).

The present dimension of the public space system, demands on the scope of the planning process the integration of several functions and users (groups and social classes, age groups, ethnic group, etc.) in order to instil feelings of security and belonging, considering it, as a motivator of different social and cultural encounters and interactions, which is a crucial aspect for an inclusive and socially just contemporary city (Duarte, 2013).

2.2 Politics and Economy

Changes in economics paradigms and urban policies oblige to the city design model and its public space, to recognize the project of urban and landscaping requalification as activating elements of the improvement of socioeconomic quality of the urban region. The adopted urban policies over time are connected to planning options that affected the relations established between society and territory, reflecting its consecutive economic and environmental conditions. For instance, the economic pressure exerted on industrial areas which in turn directly influence demography in a given urban context. On the one hand, there is a significant increase of the under-privileged social classes, which is the basis of the creation of illegal genesis residential quarters in an attempt to deal with the high housing demand. On the other hand, when there is a decline and abandonment of a certain industrial activity, is experimented the abandonment of urban districts which were once urban centres are now authentic *brownfields* that punctuate our cities.

As Nuno Portas (2003) refer, “in the same way that the economy underlines the growth and spatial and social order transformations, it is also related to the environmental values, which in a certain way contemplate the spatial and social order in the same sphere of action, as it happens in public space, through which it is intended that cities start to assume good urban environment and quality of life features. Therefore, starts to be adopted new intervention policies in public space, providing in addition to the characteristics that promote recreational and leisure activities, characteristics associated with production, thus helping to convert unused yet adequate spaces for agricultural production into horticultural parks in urban centres”. The political-economic dynamics have a great influence on the forms of occupation of the public urban space. For instance, the road and transport systems that have been influencing the design and progress of cities, leads to overvaluation of this use, serving as an excuse to the abandon of small commerce due to lack of parking spaces. However, this element cannot be neglected because they are the ones who linked different spaces of the city and support the population movements. For that reason, mobility has an important role in the construction of new landscapes (Portas *et al.*, 2002; Brandão, 2008).

Portas, N. *et al.* (2013), consider that the “established city is a palimpsest of overlapping (layered) memories that limit the possibilities of transforming their obsolete areas or fill urban voids, giving the current consensus on preservation of patrimonial and/or environmental values, that are no longer limited to classified perimeters, expanding to the impacts nature on functional (tertiary) or social (gentrification) modifications”. Although, it is considered that the refereed conditions, according to a new standard of urban policies and space design should be taken into consideration as opportunities and/or as support of new intervention plans to combine these factors with the characteristics of the intervention areas, within a comprehensive and dynamic space view.

The public space as a common good is associated “to the usufruct of which area we are all entitled” (Brandão, 2005), so that new urban and socioeconomic policies for projects and plans of urban restructuring might have as their main purpose, the revitalization of rundown areas, allowing the improvement of quality and urban image, promoting processes of humanization and social well-being. In order to that, such policies should be based on the following parameters (Duarte, 2013):

- Avoid phenomena of gentrification and social exclusion and acknowledge that “conventional responses do not work”. In this sense, Miguel Lashayas (2015) refer that “a typology of more contextualized intervention should be adopted more and more, connecting the local people and using the available community resources”(Lashayas, 2015);
- Rethink the revitalization of historical centres, reinforced by the trend of patrimonialisation of the identity and economic sectors expansion in the areas of tourism as a monoculture;
- The commercial urbanism and intervention on void and/or rundown residential parks, in the attempt to reverse the crises of small commerce, the escape of the resident population or the physical and social damage of critical districts;
- The revitalization of building and assemblies made obsolete, particularly on water fronts and other places of strong symbolic value, adjustable to “projects of excellence”, with a strong visibility and social impact;
- The sudden attention given to “public space”, after the changes induced by the car and the new urban experiences, etc. That seems to have “positive effects (in addition to the functionality itself) on the self-esteem and the calculation of the advantages by the present “actors”, the street-to-street economic revive and the image of the Local Administration” (Portas *et al.*, 2003). The core of this assumption is the recognition shared by several authors of the most varied areas of knowledge that the public space acts as a structuring element and of support to buildings, public equipment, the road system, etc.

2.3 Architecture and Urbanism

The urbanistic dimension is related with the disciplinary fields of architectures and urbanism. It is in this group that the analysis carried out will allow to evaluate the physical conditions of the space, looking for urban planning parameters that the public space system should contemplate.

In order to analyse the importance of public space for the present dimension, it is important to know and identify the

main city problems associated with urban transformations, envisioning new urban principles to adopt in the process of designing urban restructuring project plans.

The urbanisation process had suffered some major modifications over the years, highlighting the XIX century, in which “the distinction between public and private was formalized, in order to guarantee the existence of collective spaces and the diversity of functions and shared uses that could be developed there” (Borja *et al.*, 2003). During the XX century is witnessed the setback of what was established in XIX century, public space is no longer recognized as an element that gives “shape and sense to the whole city as a key linking element between the edified system and the public spaces system, losing its fundamental functions” (Borja *et al.*, 2003). Finally, it is now recognized the importance of public space, its multiple functions and capabilities. The city a place of communication, goods transition, services, information and emotions is a highly changeable element (Choay, 2004; Lynch, 2009). It is possible to identify different cities (Gehl *et al.*, 2002): the “traditional city” corresponding to historical and vernacular places, in which spaces of encounter, commerce and circulation continue to coexist in balance; the “invaded city”, where individual uses such as traffic appropriate the territory in detriment of other urban space uses; the “abandoned city” were the anthropological place and sociability disappeared; and finally the “recovered city”, where great efforts are made to find a new balance between uses of the city as a place of encounter, commerce and circulation”.

It is on this last city “typologies” that is focused the present study, since it is considered urgent to adopt a new planning model that includes the different typologies of collective use spaces and recognizes the system of public spaces as a structural element that gives sense to the urban mesh, responding to the needs of the population that uses it and respecting the memory of the place, but looking into the future. Recognizing the lack of quality public spaces and its intended the “recover the culture of the public space” (Borja *et al.*, 2003) looking for reverse, the urban standardization and homogenization processes in force recognized by Rem Koolhaas (2002), as a “generic city”, in other words, the “city recognized only with a functional purpose, according to the present needs, losing the connection to the memory and identity of the space and its population”.

The present city is the result of mutations resulting from the alteration of organizational models that came across according to the architectural principles, intentions and needs of each time line. As well as to the changed notion of time and distance, which lead to the progressive displacement of the population from the city centres to the periphery. However, this change of the city occupation and the importance given to the public space is due to multiple factors. Yet in the course of urban transformation, new urban challenges arises which are materialize essentially in the design of the public space, understood as a meeting space between people, and of representation of the city (Santos, 2015; Arroyo, 2011; Pérez-Gomez, 1996; Brandão, 2002; Portas, 2005) meaning that is transversal to all areas of knowledge considered.

In view of the above considerations it is proposed that the main guidelines to be adopted in the scope of public space design have to include the following premises:

- “The current public space has to be thought out and built for who inhabits it and has to produce balanced functions between public and private places. Is the public space that decides the density and design and the private that develops it, cede ground and builds” (Duarte, 2013);
- Facing the current urban challenges its key the adoption of a perspective that defends the need of “produce city, regenerating the old centres and creating new centres at the metropolitan scale, ensuring mobility, accessibility, visibility of each one of the city areas keeping and building a multipurpose urban mesh by its uses and population in which the public space is the structural element” (Brandão *et al.*, 2000);
- It is up to the coordinator of the project/urban plan, to understand that the challenge ahead, does not correspond only to a conceptual and formal question, but goes beyond this, and also concerns the interpretation of factors of different order, for which should be adopt competent and innovative strategies and programmatic considerations that includes, both urbanization and landscape, the individual with the society, patrimony with the contemporary, “establishing the *continuum natural* into the urban environment, valuing the reunion of men with nature and with themselves (Pérez-Gomez, 1996; Brandão, 2003; Fadigas, 2007);
- As an intervention strategy, “the urban planning and intervention projects in the public space should be open to public participation by all stakeholders, contributing to the adoption of mended solutions and options for the democratization of urban life” (Duarte, 2013). This process might be directed in various ways, but must to be taken in consideration that the target audience to inquirer has to inhabit it and or, uses it daily, because they are ones that will potentially give to the designer a greater knowledge of the area to intervene, assessing their problems and potentialities (Quick *et al.*, 2012);
- It is important to experience spaces, similar to the user experience, walking through them and to know them, allowing the designer to make more informed decisions regarding the intervention strategies to be developed (Careri, 2002);
- The urban plan/project must include “the built and public space connection, carefully defining areas of housing and public utilities integrated in a consistent way with the collective space design, valuing the human scale. Thus it is possible to provide more humanized spaces, which provide neighbourhood relations, spaces that induce feelings of security and of vigilance and care by the user in relation to the space” (Duarte, 2013);
- A careful social, physical and environmental integration must be developed, ensuring mobility and accessibility for all, through a good system of pedestrian, clickable and, or road courses, associated with a public transportation network ensuring connections between planned spaces and the remaining urban system” (Duarte, 2013).

2.4 Landscape architecture and Ecology

The Landscape Architecture as an integrative formation and synthesis of knowledge and eminently practical profession, bases its intervention on the global, relational and interdisciplinary evaluation of space, taking into consideration all the

approaches mentioned, its principles, concepts and intervention strategies” (Duarte, 2013), with the aim of generating socially cohesive, economically dynamic and environmentally balanced public spaces that contribute to guarantee urban sustainability at a global level.

Whereas the need to revitalize degraded urban areas, is based on the articulation of the concepts and strategies associated with the different dimensions identified, it is considered in the present investigation the “need to formulate a new model of landscape intervention, based on the reconciliation between society and nature” (Batista *et al.*, 2015), in which the “landscape project arises from the meeting between the recognition of the sites and their natural and cultural values and the social, cultural and technical energies that can be added to the historical memory of communities and places. The same would be saying that, in the context of urban and landscaping (re)design, the first requirement in order to maintain and enhance the identity and character of a landscape as a presupposition of contemporary intervention, will be not enforce functional and formal logics (in the socio-economic, cultural, symbolic, ecological contexts), exogenous and strange models and development rhythms averse to the natural and cultural spirit of the place, grounding the reasons for the cultural and landscape identity that should guide the project process” (Batista *et al.*, 2013).

Today the main challenge is to change “from a system that exploits technological development for pure profit to another that aims to make sustainable cities. And that demands fundamental changes to the human behaviour towards the public power exercise, in commerce, architecture and urban planning” (Haughton *et al.*, 1994). Since the urban landscape is the result of pressures exerted of the most varied order and dimension, it is important to consider that the “landscape is for that reason, faced as a multifaceted, complex and dynamic in permanent mutability reality, as a result of the interaction between natural and cultural systems” (Batista *et al.*, 2015). It should be understood that the territory integrates varied landscapes, be they urban, rural and industrial, among others and that the cities themselves enclose representative fragments of these distinct sorts of landscape, gifting spaces with great potential in the promotion of urban life quality and sustainable urban development, reaching the urban environmental balance (Magalhães, 2001).

The importance of nature in urban areas is linked to the idea of *continuum natural* as a coherent and continuous system of green spaces throughout the city (Cabral, 1993). This key idea to urban ecological structures assumes public green spaces as being “the most important, because through them people find in the city a natural environment at the man’s scale” (Cabral, 1993). In this sense, public spaces such as streets, roads, squares, parks, among other typologies, reflect the process of adapting culture to the environment (Serdoura, 2007; Jackson, 2011). Reason why they are considered fundamental structural elements, through those the urban system ought to be organized, as a reflexion of history and culture of a population, enclosing in itself meanings concerned to each user and social group.

However, the urban public spaces system is associated with a multiplicity of functions (Telles *et al.*, 1996; Magalhães, 2001): the biodiversity growth in the city and they are responsible for a range of ecosystem services essential to the biological balance and bioclimatic comfort; as an urban infrastructure they are support of recreational and leisure activities contributing to the promotion of social welfare, both physical and psychological. They are elements of interest and aesthetic value, that gave priority to the human scale and to the proportion of the built volumes and the pleasantness of the urban environment. Therefore, due to the different functions and benefits associated with vegetation and green spaces, it is considered fundamental that the Portuguese municipalities promote the elaboration of green structure plans provided in the existing legislation.

The approach to urban restructuring plans should envision a global vision of the territory that considers the urban areas, just like the landscape in which is inserted, undertakes processes of morphological alteration and occupation. So the public space should be drawing and thought-out according to the requirements imposed by the inclusion of urban ecology information, by the conversion of recreational and leisure spaces into production spaces, for instance, as it is the case of urban gardens, with the intention of the restoration of the *continuum natural* in the city.

The conquest of empty spaces for the practice of urban agriculture, for all classes, has a unifying element of contemporary society, responds to a paradigm shift at the socio-economic level, where there is a search for a healthy and sustainable food, based on the ransom of the urban-rural interrelation, introducing sustainable and resilient spaces in urban areas, paying contribute to the improvement of the quality of life in the city (Reynolds *et al.*, 2016; Haughton *et al.*, 1994; Hough, 1998). The new agricultural areas in urban context are one of the best uses to be implemented in empty or featureless unstructured spaces, once they immediately improve the urban image and constitute a mean of promoting territorial cohesion and social interaction. Within the new plans and projects of urban restructuring, the urban public space must be perceived considering its capacity of mutability and adaptation to the new realities and requirements of the different dimensions that characterizes it, and of the deeply intricate relationships established between them.

3. FINAL CONSIDERATIONS

In the contemporary city, social housing districts or illegal genesis neighbourhoods set the habitat of a high percentage of urban population. In this context, the improved quality of the urban environment and urban life is connected to the requalification of public spaces. The multidimensionality and multifunctionality of these spaces requires as principle of intervention the principle of interdisciplinarity, within the framework of plans and/or projects of urban restructuring. The summed up study of the different dimensions of the urban public space, considering the concepts and strategies adopted by the different disciplinary fields, revealed the need for a new planning model and urban design, which through a holistic and integrated view, connect and embodies them establishing resilient landscapes and spaces. This is why, the urban reconstruction of those spaces ought to be based on an intervention sustainable plan in all its dimensions and adjusted to the local reality, with the giving respect to the history of the place as well as the idiosyncrasy of the population that inhabits it. The new plans must provide urbanity, multifunctional spaces able to deliver security, and feelings of neighbourhood and

belonging. Although, the network of urban public spaces should be integrated and value the municipal ecological structure by re-establishing the *continuum natural*. The urban public spaces design must be thought from the user's point of view, for that reason the participation of the population throughout the project process is fundamental in the sense that is through the local community that it is possible to know the local reality in its different dimensions: economic, sociocultural, urban, environmental.

The structure of urban public space have to serve as a matrix for the built structure, with which must harmonize trying whenever possible to privilege the human scale, contribute to increasing the culture diversity and biodiversity and privilege types of spaces that promote urban living and quality of life to favour territorial cohesion and social inclusion.

A PAISAGEM SONORA DE ÉVORA NO SÉCULO XVII: PERSPECTIVAS A PARTIR DA ACTIVIDADE MUSICAL DAS INSTITUIÇÕES RELIGIOSAS DA CIDADE

Luís Henriques
CESEM/Universidade de Évora
(luiscfhenriques@gmail.com)

RESUMO

A ideia de uma paisagem sonora do espaço urbano foi uma das várias áreas que se desenvolveram a partir de uma ideia mais alargada do que hoje é chamada paisagem cultural. Esta ideia de cartografar sons urbanos a partir de uma perspectiva histórica foi desenvolvida na Península Ibérica com um projecto que envolveu as cidades andaluzas de Sevilha e Granada. Os objectivos principais por detrás destes projectos são, para além da cartografia do maior número possível de eventos, a organização destes eventos através de várias plataformas interactivas (websites, aplicações, etc.) que permitem ao utilizador seguir várias experiências musicais que já não existem ou que foram transformadas durante o tempo. Em Évora, um projecto deste tipo encontra-se em desenvolvimento, que foca os arquivos musicais da cidade, nomeadamente a Catedral e a Biblioteca Pública, que albergam as fontes musicais da cidade e dos conventos e mosteiros dos arredores. Esta comunicação analisa a paisagem sonora histórica de Évora no século XVII, com uma visão geral das instituições religiosas da cidade a partir da perspectiva da sua actividade musical, que eram de longe os mais numerosos centros musicais da cidade neste período. Esta paisagem sonora inclui os sinos das igrejas, instrumentos musicais (nomeadamente os órgãos) e o canto das Horas nestas instituições.

Palavras-chave: Évora, Paisagem Sonora, Século XVII, Música Sacra.

1. INTRODUCTION

A ideia de uma paisagem sonora, geralmente circunscrita a determinado espaço urbano partindo de uma perspectiva histórica, é algo que tem despertado a atenção da Musicologia nos últimos anos. Este estudo tem-se desenvolvido a partir da noção generalizada de paisagem cultural, nomeadamente, da associação e relação entre vários elementos implantados em determinado espaço, tendencialmente urbano, onde relações deste tipo são mais facilmente detectáveis e estão mais documentadas. A paisagem cultural é estudada quase maioritariamente de um ponto de vista antropológico, uma vez que advém da acção humana. Porém, não afastando a componente antropológica, que está na sua essência, o conceito de paisagem sonora parte, não só do Homem em si, mas também num percurso inverso; do ambiente acústico em que o som é ouvido para o indivíduo que o produziu.

O conceito de paisagem sonora desenvolveu-se sobretudo a partir dos escritos do compositor canadiano Raymond Murray Schafer na década de setenta (Schafer, 1977). Este autor referiu vários elementos fundamentais presentes na paisagem sonora, dividindo-os em dois grandes grupos: por um lado os sons naturais, incluindo os vocalizos animais, o som dos efeitos atmosféricos e outros elementos naturais e, por outro, os sons decorrentes da acção humana através da composição musical, *sound design* ou outras actividades do quotidiano como a conversação, trabalho, e sons produzidos de forma mecânica resultantes da tecnologia industrial (Schafer, 1993: 9-10). Para o presente estudo interessam os sons decorrentes da acção humana, tendo a composição e a interpretação musical (quer por meio da voz, o instrumento natural por excelência, ou através do uso de instrumentos musicais) como os meios produtores e a sua integração na paisagem sonora sacra de Évora no século XVII.

No caso concreto da Península Ibérica, o conceito de paisagem sonora foi abordado a partir de uma perspectiva histórica através do projecto que envolveu as cidades de Sevilha e Granada como casos completos enquanto centros de actividade musical, estando o trabalho realizado nas duas cidades disponível no sítio *Paisajes sonoros históricos de Andalucía (c.1200-c.1800)* (<http://www.historicalsoundscapes.com>). Neste campo destacam-se os estudos realizados por Juan Ruiz Jiménez para Granada e Sevilha, focando a vivência musical urbana de ambas as cidades durante o século XVI. A cidade de Sevilha tem sido o foco de outros estudos relativamente à sua paisagem sonora nos séculos XVI e XVII. Estes têm incidido não só sobre a actividade de instituições religiosas, como é o caso da Sé, mas também sobre as redes de relações entre as várias instituições aí instaladas. Aqui é importante salientar os trabalhos sobre a presença da música nas procissões realizadas pela cidade, nomeadamente no dia dos defuntos (2 de Novembro) na Sé de Sevilha (Jiménez, 2014) e também na festa do Corpo de Deus – conhecida em Espanha como *El Corpus* – uma das procissões de maior importância na vida cívica da cidade (Pellicer, 2016). Foi ainda realizado um estudo sobre a paisagem sonora nesta cidade no tempo de Miguel de Cervantes, tendo como elementos centrais o a actividade do compositor Francisco Guerrero, abrangendo-a numa perspectiva global e estabelecendo um roteiro sonoro ilustrando o percurso do escritor pela urbe espanhola (Jiménez, 2016).

No caso do projecto das cidades andaluzas foi traçada uma metodologia assente em bases cartográficas musicais, ou seja, um levantamento do maior número de eventos musicais que ocorreram dentro do perímetro urbano de cada cidade entre os séculos XIII e XIX. Estes eventos foram seguidamente agrupados por temas de forma a formarem roteiros, incluídos numa base de dados online e uma aplicação para dispositivos móveis, recursos claramente vocacionados para o turismo cultural. A

produção de recursos interactivos, embora primeiramente direccionada para a utilização turística, possui ao mesmo tempo a abrangência e profundidade suficientes para constituir um importante ponto de partida para o estudo de carácter científico, sobretudo no que diz respeito à análise do desenvolvimento e relação entre os vários centros de actividade musical dentro de um determinado perímetro urbano e as relações destas instituições com centros de outras cidades.

No caso de Évora, esta cidade tornou-se num importante centro musical durante o século XVI, devendo muita dessa primazia à actividade das instituições religiosas fundadas no perímetro urbano desde a Idade Média. Nas primeiras décadas do século XVI, durante o bispado do Cardeal D. Afonso e, sobretudo, durante o primeiro período do arcebispado do Cardeal D. Henrique, Évora consolidou-se como um dos principais centros produtores de música, não só devido à actividade das instituições musicais da cidade, mas também enquanto centro de ensino e preparação de músicos para outras instituições portuguesas e estrangeiras, nomeadamente espanholas e das colónias do Novo Mundo.

Desta forma, a Sé constituiu-se como a instituição central da cidade no que à actividade musical diz respeito. A sua centralidade deveu-se sobretudo à Capela e à Clastra (local do ensino da música) e também ao Colégio dos Moços do Coro. Aqui, percebe-se que para além da existência da Capela, instituição de prática musical por excelência, encontrava-se também organizado um sistema para o ensino da música, produzindo músicos, não só para o serviço da Catedral, como também para assumirem semelhantes cargos em outras instituições (Alegria, 1973: 4-5). É este sistema, herdado do século XVI, que se observa durante os séculos XVII e XVIII.

A Capela da Sé como irá ser conhecida no século XVII, encontra-se presente na documentação da Catedral a partir da segunda década do século XVI. É sobretudo durante o bispado do Cardeal D. Afonso e a presença do compositor e teórico de origem espanhola Mateus d'Aranda que, tanto a actividade musical da capela, como o ensino da música irão incorporar-se na estrutura organizativa da Sé. Todavia, isto não quer dizer que esta estrutura já não estivesse montada na Sé (como seria natural) desde a Idade Média. Porém, tal não constituiu um factor de tal forma determinante que proporcionasse a preocupação no seu registo escrito em qualquer documento da Catedral. Ocuparam o cargo de mestre de capela da Sé ao longo do século XVII Manuel Rebelo (1590s-1647), António Rodrigues Vilalva (1647-1678) e Diogo Dias Melgaz (1678-1700). Destes mestres apenas sobrevivem algumas obras de Manuel Rebelo e largo número de obras de Diogo Dias Melgaz, na sua maioria copiadas no século XVIII (Alegria 1973: 127).

No caso da Clastra (referente ao ensino da música), este nome advém do primeiro local onde os moços do coro eram ensinados, mais concretamente, na Capela do Fundador do Claustro. Em 1552 foi criado o Colégio dos Moços do Coro enquanto instituição de ensino da música, funcionando primeiramente no edifício da antiga Sé que tinha também servido como casa do Senado da cidade, e, ameaçando ruína, mudaram-se para os antigos celeiros do Arcebispo, atrás da casa do Cabido, onde hoje se localiza a Biblioteca Pública de Évora (Alegria, 1973: 54). O Colégio manteve-se nestas instalações até pelo menos ao início do século XVIII, altura em que foi construído o edifício anexo à Sé, sendo a instituição para aí transferida no tempo do Arcebispo D. Simão da Gama (Alegria, 1973: 89-90). Vários foram os músicos que ocuparam o cargo de mestre da Clastra durante o século XVII, geralmente durante curtos espaços de tempo. O primeiro que surge é António Pinheiro (1604-1608), seguindo-se Domingos Martins e Diogo Dias de Vilhena até à década de vinte. Por essa altura, Manuel Rebelo assumiu estas funções (1620s-1633), que acumulava com o cargo de mestre de capela, assim como o seu sucessor, António Rodrigues Vilalva (1633-1642). Bento Nunes Pegado ocupou o cargo em meados do século (1642-1663) e Diogo Dias Melgaz assumiu-o a partir de 1663, conjuntamente com o cargo de mestre de capela (Alegria, 1973: 127).

Desde a primeira metade do século XVI que os moços do coro, após completarem os estudos musicais no Colégio, eram mandados estudar no Colégio do Espírito Santo. Esta instituição Jesuíta, fundada pelo Cardeal D. Henrique em 1559, tinha como principal função o ensino humanístico, remetendo para um plano secundário qualquer prática musical, nomeadamente o canto dos ofícios diários, tarefa da qual a Ordem estava isenta. Todavia, o Colégio do Espírito Santo desempenhou um papel central na educação dos músicos do Colégio dos Moços do Coro, proporcionando-lhes uma sólida formação humanística que, conjugada com um superior ensino do cantochão, polifonia e composição, não só os transformou em artistas de alta qualidade, como também em teólogos e filósofos. Porém, a relação entre os dois colégios não se desenvolveu sem incidentes, como é referido através do queixume enviado pelo Cabido da Sé ao Reitor do Colégio do Espírito Santo a 5 de Julho de 1611. Neste, o Reitor é alertado para o comportamento indisciplinar dos estudantes do Colégio, que se haviam introduzido na Clastra da Sé, perturbando as aulas dos moços do coro. Ordenava ainda o queixume que se trouxesse um livro de cantochão para fora da capela (do Fundador do Claustro) para que os estudantes pudessem cantar e que alguns, conhecidos, ficassem dentro da capela, porém, afastados dos moços. A advertência final alerta para o aprisionamento no Aljube dos estudantes que continuassem o comportamento indisciplinar (Alegria, 1997: 100).

À Sé de Évora, segue-se a Igreja de Santo Antão no respeitante à importância da sua actividade musical. Situada na actual Praça do Giraldo, local central da cidade, foi mandada construir em meados do século XVI pelo Cardeal D. Henrique. Esta igreja manteve uma importante actividade musical devido à sua colegiada e também por ser igreja anexa à Sé no respeitante a benefícios. Encontra-se aqui como mestre de capela nas últimas duas décadas do século XVI o antigo mestre da capela privativa do Cardeal D. Henrique, Manuel Mendes, que também ocupava o cargo de mestre da Clastra da Sé (Alegria, 1973: 41). Esta igreja possuía desde 1380 um vigário e seis beneficiados com obrigação de coro, ou seja, tinham obrigação de cantar os vários ofícios do Dia Litúrgico e as Missas (Fonseca, 1728, 218). No início do século XVIII possuía dez beneficiados e um reitor, todos com obrigação de coro (Costa, 1708: 423).

A Igreja de São Tiago data do tempo do Rei D. Manuel estando implantada na freguesia do mesmo nome, a qual sofreu obras profundas durante o século XVII. No final de seiscentos era servida por um prior, um cura e oito beneficiados com obrigação de coro (Fonseca, 1728: 217). Apesar de possuir uma comunidade eclesiástica mais numerosa que a Igreja de Santo Antão, não se conhecem relações musicais significativas com a Sé ou de igual importância ao templo da Praça do Giraldo. O mesmo ocorre com a Igreja de São Mamede, na respectiva freguesia, de fundação medieval e fachada quinhentista mas que, tal como a de São Tiago, também sofreu profundas intervenções artísticas durante o século XVII. Esta igreja possuía

em meados do século XVI (e, possivelmente também durante o século seguinte) um prior, dois beneficiados simples, dois beneficiados com “a cura das almas” e um capelão, todos com obrigação de coro (Fonseca, 1728: 219), mantendo este número de clérigos ainda no início do século XVIII (Costa, 1708: 422).

O grupo de igrejas associadas às freguesias de Évora encerra com a Igreja de São Pedro, uma das freguesias mais antigas da cidade. Esta igreja localizava-se na actual Rua Diogo Cão. Em 1840, após a extinção das ordens religiosas, foi transferida para o Convento de S. Francisco, sendo demolido o edifício por estar arruinado, do qual actualmente apenas sobrevive o pórtico de estilo gótico (Beirante, 1995: 97). De acordo com o Padre Francisco da Fonseca (1728: 217) a igreja teria um prior que sustentaria um capelão cura. Refere ainda o padre Jesuíta os vários priores da igreja desde 1330 que, pelos títulos (Cardeais, Bispos, Cônegos), terá constituído um cargo de prestígio e influência dentro da hierarquia eclesiástica da cidade, uma vez que o Priorado era colação do Arcebispo de Évora, sucedendo-se “muytos outros Priores de grande gradação, e literatura” (Fonseca, 1728: 217). Nesta igreja tinham sido instituídos seis benefícios pelo Bispo D. Giraldo Domingues no tempo do Rei D. Dinis, os quais, “à imitação das Collegiadas rezaõ devotamente no Coro” (Fonseca, 1728: 217). Esta situação em termos do número de clérigos aparece confirmada no início do século XVIII pelo Padre António Costa, que refere ainda a reedificação da Igreja em 1702 pelo Arcebispo D. Fr. Luís da Silva (Costa, 1708: 423).

Encontram-se ainda espalhadas praticamente por toda a cidade igrejas de menor dimensão e inúmeras ermidas de cuja actividade musical pouco ou nada se conhece. Estas manteriam uma celebração irregular dos vários ofícios, destacando-se certamente com maior importância musical as festividades dos santos a que estavam dedicadas ou outros santos de particular devoção. Este é o caso da Igreja de S. Vicente, dedicada aos irmãos mártires Vicente, Sabina e Cristeta, onde a festa da celebração do seu martírio, realizada a 27 de Outubro, certamente estaria revestida de um carácter mais nobre, uma vez que era paga a expensas da Câmara da cidade. Também pode ser encontrado nesta igreja um altar lateral dedicado a Nossa Senhora da Vitória mandado construir pela Confraria do mesmo nome, instituída após a Batalha do Salado. Extinta no tempo de Filipe II, foi restaurada durante o arcebispado de D. Alexandre de Bragança que, certamente, também reavivou todo o cerimonial musical em torno desta festa (Fonseca 1728: 223-224).

A outra grande tipologia de instituições religiosas diz respeito aos conventos. Partindo da quantidade e diversidade de instituições deste tipo que se instalaram dentro das muralhas da cidade desde a Idade Média, albergando comunidades masculinas e femininas, consegue-se traçar uma série de relações, quer ao nível das suas orientações litúrgico-musicais, como também nas zonas envolventes à sua localização. Algumas zonas da cidade possuíam uma forte concentração de instituições religiosas, como é o caso da área envolvente ao Colégio do Espírito Santo, com o Colégio de Nossa Senhora da Purificação, o Convento de Santa Mónica, a Igreja de S. Mamede e o Convento de S. João Evangelista nas proximidades. O efeito sonoro gerado pela actividade musical quotidiana destas instituições nas ruas circundantes teria certamente algum impacto em quem se deslocasse através desta zona da cidade.

Estas comunidades mantinham uma actividade musical regular, sobretudo, através do cantochão para as várias horas do Ofício Divino e para as várias missas celebradas durante o dia. Apesar da escassez de documentação musical, assim como de referências nas fontes históricas, é de assumir que nos conventos fosse também interpretada polifonia, embora em menor escala quando comparada com as igrejas seculares da cidade, uma vez que na natureza destas comunidades estaria o cantochão. O estudo da prática polifónica nos conventos intramuros é praticamente inexistente na actualidade. Porém, no estudo realizado a partir das fontes do Mosteiro de S. Bento de Cástris, uma comunidade feminina cisterciense nos arredores da cidade, verificou-se que o termo canto d'órgão (como é designada a polifonia nas fontes da época) começa a ser referido no início do século XVIII (Conde 2009: 382), encontrando-se obras polifónicas, embora em reduzido número, da primeira metade do século XVI. Trata-se do motete *Adjuna nos Deus* e de duas secções de um Credo a quatro vozes do compositor e mestre de capela da Sé Mateus d'Aranda (P-EVp Cód. CLI/1-9d e P-EVad Mús. Lit. n.º 32).

No interior das muralhas predominaram as casas do ramo masculino e feminino das ordens Franciscana, Agostiniana, Dominicana e do Carmo. No século XVII, os ritos destas ordens encontravam-se já muito próximos do Rito Romano praticado nas igrejas seculares da cidade, mais breve que os das ordens monásticas (geralmente comunidades retiradas para locais isolados, como é o caso da Ordem de Cister), o que lhes permitiu uma fácil implantação nos centros urbanos. Encontram-se, assim, numerosas casas franciscanas na cidade. Para além do Convento de São Francisco, de fundação medieval, existem ainda os conventos femininos de freiras clarissas fundados durante o século XVI de Nossa Senhora da Graça, de Santa Helena do Monte Calvário e do Salvador do Mundo, fundado na primeira década do século XVII. A Ordem Agostiniana estava representada no centro urbano com o Convento de Nossa Senhora da Graça e o convento feminino de Santa Mónica, aos quais se juntará no século XVII o Convento de Nossa Senhora das Mercês de frades agostinhos descalços (também conhecidos como frades grilos). O Convento de São Domingos de Évora foi uma das primeiras casas desta ordem a ser fundada em Portugal e uma das primeiras instituições conventuais de Évora. Para além deste convento ainda existiam os conventos femininos de Nossa Senhora do Paraíso, fundado em 1430, e o de Santa Catarina de Sena, da primeira metade do século XVI (Fonseca, 1728: 348-399). De acordo com o inventário realizado após a sua extinção em 1897, o Convento de Nossa Senhora do Paraíso possuía uma importante colecção de livros de coro iluminados desde o século XV (conservados actualmente no Arquivo Nacional – Torre do Tombo), o que pressupõe ter existido uma intensa e regular actividade musical nesta instituição (Frazão, 1998). O Convento do Paraíso, destruído no início do século XX, localizava-se na actual Rua de Mendo Estevens, muito próximo do Convento de Nossa Senhora do Carmo.

Este convento de frades carmelitas calçados, localizado junto à Porta de Moura, teve uma história atribulada durante o século XVII. A Ordem do Carmo chegou a Évora por volta de 1531, durante o bispado do Cardeal D. Afonso, estabelecendo-se primeiramente numa zona extramuros entre a Porta de Avis e a Porta da Lagoa na Ermida de São Tomé. O Convento fundado em torno desta ermida floresceu durante o século XVI e primeira metade do XVII através de importantes legados, entre os quais se destaca o de Rui Dias Cotrim, que permitiu a sua construção a partir de 1532 (Fonseca, 1728: 357). Foi este um dos conventos que se viram no centro das acções militares durante o cerco de Évora pelas tropas de D. João de

Áustria em 1663, durante a Guerra da Restauração, que havia sido ocupado pelos sitiados não resistindo, porém ao assédio dos espanhóis (Menezes, 1698: 518). Os frades abandonaram o respectivo convento, refugiando-se em casas que possuíam na Praça do peixe (actual Praça de Sertório), recusando a oferta feita por D. João de Áustria do Palácio dos Condes de Santa Cruz para sua residência (Fonseca, 1728: 358). Em 1666 D. Afonso VI ofereceu-lhes o Palácio dos Duques de Bragança para residência, tendo lançado a primeira pedra do convento da Porta de Moura a 6 de Janeiro de 1670. Em 1691 foi sagrada a Igreja do convento, onde terá sido cantado o extenso ofício da Dedicção da Igreja (Fonseca, 1728: 358).

Outra comunidade religiosa que foi também alvo de incursões por parte das tropas de D. João de Áustria, sendo palco dos assédios às muralhas da cidade, foi o Convento de Nossa Senhora dos Remédios, de frades Carmelitas Descalços, localizado imediatamente à saída da Porta de Alconchel. As tropas espanholas alojaram-se no convento e, entre este, o da Cartuxa e o do Carmo prepararam-se para assediar as muralhas da cidade com artilharia (Menezes, 1698: 518). De acordo com o Padre Francisco da Fonseca, o então prior Fr. José do Espírito Santo recusou-se a abandonar o convento na iminência da sua ocupação pelas tropas espanholas. Assim, deixou-se ficar com o resto da comunidade que os espanhóis “entrando no Convento achou o Prior, e Religiosos em oração no Coro com tanta paz, e serenidade, que assombrou” os invasores (Fonseca, 1728: 380). Por esta descrição se depreende que a comunidade terá mantido a sua rotina diária perante o perigo eminente, estando muito provavelmente a cantar alguma das Horas do Ofício a quando do arrombamento das portas do convento.

Este convento de carmelitas descalços foi uma das instituições fundadas em Évora no início do século XVII, apesar haver referência à presença deste ramo reformado da Ordem do Carmo na cidade nas duas últimas décadas do século XVI. Aqui viveu durante pelo menos duas décadas (c.1606-162?), Fr. Simão dos Anjos, músico e compositor do qual muito pouco se sabe em termos biográficos. Ainda está por confirmar a afirmação de que terá estudado com Manuel Mendes na Clastra da Sé de Évora, assim como parece também duvidosa a afirmação da sua profissão na Ordem de S. João Evangelista (Stevenson, 2017). No fundo musical da Biblioteca Pública de Évora existe um pequeno motete para o Domingo de Ramos, *Pueri Hebraeorum vestimenta* (P-EVp Cód. CLI/1-3), que possivelmente poderá datar do período em que permaneceu neste convento. Também neste convento foi sepultado a 12 de Março de 1700 o compositor e mestre de capela da Sé de Évora, Diogo Dias Melgaz, que falecera na sua casa da Rua do Espírito Santo (Alegria, 1973: 86).

Para além da prática de música vocal referida até este momento, encontra-se ainda na Évora do século XVII música instrumental realizada nas instituições religiosas da cidade, como prática autónoma ou integrada na prática vocal. Os primeiros instrumentos musicais que têm maior impacto na paisagem sonora de Évora no século XVII são os sinos. Tendo em conta que cada igreja teria pelo menos dois sinos – um maior e outro mais pequeno – é possível perceber o impacto sonoro que estes instrumentos teriam em certas zonas da cidade de maior concentração de igrejas. É esse o caso do espaço envolvente entre o Convento de S. Francisco e a actual Praça do Giraldo. Este é um local de grande concentração de igrejas, com o Convento de Nossa Senhora da Graça, Igreja de São Vicente, Igreja de Santo Antão e Igreja de São Tiago e, mais afastados os Conventos do Salvador, de Santa Clara e Nossa Senhora das Mercês. Nas torres sineiras destas instituições, apesar de em alguns casos terem ocorrido transformações profundas na sua configuração, encontram-se espaços para três ou mais sinos. O tipo de toques e utilização destes instrumentos surge regulado nos regimentos e ordinários de cada uma das comunidades religiosas. Em geral, o sino maior seria tocado para as cerimónias mais importantes do Dia Litúrgico, nomeadamente a Missa de Terça ou o ofício de Matinas.

O sino menor seria destinado a ocasiões de menor importância. Porém, ocasiões como a celebração de funerais ou festividades importantes na vida litúrgica de cada comunidade exigindo que os sinos dobrassem, quase certamente existiriam mais que dois desses instrumentos em utilização. Actualmente poder observar-se, a título de exemplo, o caso dos conventos agostinianos de Nossa Senhora das Mercês e Nossa Senhora da Graça que, embora já desprovidos dos respectivos instrumentos, podem lançar pistas importantes relativamente ao número de instrumentos. No primeiro caso, a torre sineira possui apenas dois espaços, o que pressupõe que nela apenas existissem dois instrumentos. No segundo caso, a torre sineira possui três espaços, o que aponta para a existência de um terceiro instrumento. Em ambos os casos as torres sineiras estão destacadas do corpo da igreja, apenas fornecendo suporte para os instrumentos, o que também pressupõe que estes não fossem de grande dimensão dada falta de robustez da respectiva torre. Pelo contrário, no caso da Sé – o edifício religioso mais importante da cidade – encontram-se duas torres perfeitamente integradas na fachada da igreja. Para além de possuírem vários espaços para pelo menos meia dúzia de instrumentos, a sua robustez estrutural permitia também a instalação de instrumentos de grande dimensão, proporcionais à importância do templo no contexto urbano.

A Sé surge novamente como instituição central no respeitante à prática instrumental na cidade. Ao longo do século XVII são numerosos os músicos instrumentistas ao serviço da Catedral. Em 1651, encontra-se uma folha de pagamento a 19 músicos na Sé. Entre estes contam-se o mestre de capela, António Rodrigues Vilalva, o mestre da Clastra, Bento Nunes Pegado, e o reitor do Colégio, Manuel Cid, assim como dois organistas, sete cantores, dois sacabuxas, um charamela, um harpista, e ainda dois músicos que tocavam baixão e charamela e corneta, fagote e charamela respectivamente (Alegria, 1973: 74-75). Durante o período em que Diogo Dias Melgaz ocupou o cargo de mestre de capela esta instituição era composta por seis cantores, um sacabuxa, um harpista, dois organistas e, novamente, dois músicos que tocavam baixão e fagote e um músico que tocava baixão e charamela (Alegria, 1973: 78).

Apesar de numerosas, estas folhas de pagamento parecem não reflectir a totalidade dos músicos ao serviço da Catedral. Os oito moços do Coro não surgem representados, assim como os restantes clérigos ao serviço da Catedral e com obrigação de coro, que não seriam remunerados através do serviço da Capela. Também não surge muito provavelmente a contratação de músicos para serviços pontuais, como é o caso particular de Diogo Rodrigues de Mesas. Este músico era cantor na Capela da Sé, mercador na Praça do peixe e Procurador-Geral do Assento colocou três filhas no Mosteiro de S. Bento de Cástris, Isabel Maria da Silva, Luísa Helena e, mais tarde, Catarina Francisca. Em 1657, as três filhas de Diogo de Mesas foram alvo de processo inquisitorial, possivelmente no seguimento de processo levantado contra o pai, sendo que também alguns dos

sete filhos morreram no cárcere da Inquisição ou em autos-de-fé (Projecto Orfeus, 2015).

Relativamente aos órgãos, estes instrumentos possuem uma importância particular devido às suas características únicas. Estas assentam sobretudo no facto de grande parte destes instrumentos, dado o seu tamanho, estarem fixos nos locais para onde foram construídos, apesar de circular em números instrumentos de pequena dimensão (chamados positivos ou portativos), que seriam transportados nos espaços interiores de cada instituição e, muito possivelmente, também entre várias igrejas da cidade. O primeiro órgão que se destaca é, evidentemente, o órgão quinhentista da Sé de Évora pela sua antiguidade, uma vez que terá sido construído em meados do século XVI pelo organeiro e organista Heitor Lobo, a mando do Cardeal D. Henrique. O órgão da Sé constitui, de longe, o mais bem estudado instrumento deste tipo da cidade. Os instrumentos que existiram nas outras instituições religiosas de Évora durante o século XVII ainda carecem de um estudo aprofundado que possa revelar, quer pontos de confluência entre estilos de construção, estabelecendo redes de influência organológica entre estas instituições, como também factores de ordem interpretativa, relacionando os instrumentos com determinados eventos histórico-musicais. Uma consequência para o facto de ainda hoje não se conhecer muito sobre os órgãos seiscentistas de Évora foi a intensa construção e alteração de instrumentos deste tipo durante o século XVIII. Para isso contribuiu certamente a presença em Évora do organeiro italiano Pascoal Caetano Oldovino que instalou uma oficina na cidade, realizando obras profundas em praticamente todos os instrumentos que hoje se conhece e nos quais também se inclui o órgão quinhentista da Sé.

Apesar dos dados documentais não transmitirem informação detalhada sobre a actividade musical das instituições religiosas de Évora, consegue-se perceber, embora de forma incompleta, que estas igrejas e conventos foram centros de produção regular de música. Tendo como base a prática do cantochão, comum e em uso nestas instituições, este repertório seria cantado diariamente nas várias horas do Ofício e no próprio e ordinário das Missas celebradas durante o Dia Litúrgico. Seguidamente, encontram-se algumas instituições, como a Sé e a Igreja de Santo Antão, com um volume de prática musical bastante assinalável onde, para além do cantochão, encontram-se numerosas referências relativamente a uma actividade musical polifónica e a permanência nestas instituições de músicos e compositores que assegurariam essa mesma prática, através do canto, do órgão e outros instrumentos, o que tornou a cidade de Évora num dos importantes centros musicais portugueses entre os séculos XVI e finais do século XVIII.

ABSTRACT

The importance of the retail industry for the Portuguese economy coupled with the criticality of the retailing market for its growth and the relationship between service quality and effectiveness of business deliver the motivation for this study. The aims of this research focus on the intend to develop a methodology for assessing the impact of service quality in hypermarkets of Bragança city on customer satisfaction and behavioural intentions and to specifically comprehend a conceptual model to analyse if (1) the national culture directly influences the perceived service quality (in the five dimensions of SERVQUAL) and indirectly contributes to customer satisfaction and (2) this impacts directly on the intent to return and recommend services and if the intention to return directly influences the recommendation of services. This research is of particular importance to the literature retailing and practitioners, once there are few studies in this field applied to the Portuguese hypermarkets retailing.

Keywords: Customer Satisfaction, Modern Retail Industry, Service Quality, National Culture.

JEL Classification: M10, M31

1. INTRODUCTION

Globalisation, strong competition, instable consumer demands and changes both in economic, technological and political systems force enterprises to learn faster and to adopt themselves to environmental changes (Ginevičius and Gudačiauskas, 2004). Some of the fastest growing sectors of the global economy are related to the focus on customer satisfaction. In a period of economic recession, remarkable performance will depend on those retailers who are able to create customer loyalty by answering to consumer demand (Ghosh, Tripathi and Kumar, 2010). Furthermore, customer needs and buying patterns have altered enormously. To meet several needs, enterprises to adopt customer-oriented marketing strategies and differentiated to rise a competitive advantage in the market, which allows them to stand out in the competition (Ko, Kim, Kim, and Woo, 2007). Additionally Ko *et al.* (2007) advocate that improved relationships with consumers can main to better customer loyalty, retention, effectiveness and profitability. Consequently, it is central to make a durable, strong and consistent relationship with customers in today's competitive society. Presently, providing quality of service is seen as the way to remain competitive in markets where global competition and technology have turned products and services into commodities (Nadiri and Gunay, 2013).

The retail industry is not indifferent to customer loyalty and satisfaction with the service. Although most customers do not immediately associate a commercial surface with a service, the service is one of the main tools in obtaining consumer satisfaction and loyalty (Yuen and Chan, 2010). Continued aggressive promotion based in price, such as the creation of coupons, temporary discounts, and others, while widely used, often have a minimalist effect on company results, as they tend to attract the wrong customers, and this does not always mean profit (Sirohi, McLaughlin and Wittink, 1998). Somewhat, the retail store must find a way to differentiate itself so it can stand apart from other retailers and drive more consumers to its store. Service quality is one way to accomplish this. Retailers need an efficient way to assess the service quality of their store (Simmers and Keith, 2015). However, the focus on customer retention in this area of business is one of the right strategies to generate profits (Sirohi, McLaughlin and Wittink, 1998). Loyalty is an important step in ensuring that consumers perform something that is beneficial to the firm, whether through purchase or simple word of mouth (WOM). It is believed that satisfaction is a consequence of the quality of the service, and guaranteeing it, increases the likelihood of involving the customer and loyalty. Several studies have shown that there is a positive relationship between quality of service and consumer loyalty (Yuen and Chan, 2010).

In a highly competitive industry, as is the retailing sector, it is critical that organizations have a good knowledge of the

business aspects that are important to their customers (Yuen and Chan, 2010). Only with a deep understanding, is it possible to respond positively to the expectations of customers regarding the services offered. To this extent, the strategy for creating competitive advantage resides in providing a high quality of service which results in satisfied customers (Shemwell, Yavas and Bilgin, 1998) and customer retention (Callan and Kyndt, 2001), dimensions which are essential for the survival of the retail industry.

Nevertheless, various authors have evaluated the relation between culture and service quality, in other words, how cultural dimensions influence perceived service quality and customer satisfaction (Furrer, Liu and Sudharshan, 2000; Nguyen, Cao and Phan, 2015; Tanvir, Hussain and Janjua, 2011; Veloso and Monteiro, 2013). This is so because customers of different nationalities perceive service quality in different ways, due to cultural and environmental differences (Wen, Qin and Blankson, 2012). For this reason, cultural differences have to be considered in a study which evaluates service quality (Laroche, Ueltsch, Abe, Cleveland and Yannopoulos, 2004).

From the review of literature on quality, it has been found that research efforts are concentrated on defining and measuring quality in the manufacturing sector. Since service quality is an elusive concept, there is considerable debate in relevant literature concerning which is the best way to conceptualize this phenomenon. Although an all embracing definition of service quality is not yet possible, definitions of service quality proposed by researchers revolve around the idea that it is the result of the comparison customers make between their expectations about service and their perceptions of the way the service has been performed (Grönroos, 1984; Parasuraman, Zeithaml and Berry, 1985, 1988). If service quality is to be improved, it must be reliably assessed and measured. According to the SERVQUAL model (Parasuraman, Zeithaml and Berry, 1988), service quality can be measured by identifying the gaps between customers' expectations of the service to be rendered and their perceptions of the actual performance of the service.

Several authors have studied the relationship between perceived service quality and customer satisfaction (Al Khattab and Aldehayyat, 2012; Chiou, Droge and Hanvanich, 2002; Cronin and Taylor, 1992; Ekinci, Dawes and Massey, 2006; Jamal and Naser, 2002; Mohsin and Locker, 2009; Zaibaf, Taherikia and Fakharian, 2013; Zhang and Prybutok, 2005), confirming that service quality is an important antecedent of satisfaction. In this regard, Dabholkar, Thorpe and Shepherd (2000) argue that traditionally, most researchers conclude that customer satisfaction resulting from a particular experience of consumption, leads to an evaluation/attitude about the quality of service over a period of time. However, the reverse situation has stood out as the most relevant.

According to a recent meta-analysis, only a few outcomes of satisfaction have been investigated in the satisfaction literature (Szymanski and Henard, 2001). These outcomes are reflected in customer behaviour, the intention to return and WOM recommendation (Word-of-Mouth communication intention). Several researchers suggest that behavioural loyalty is the most powerful outcome of consumer satisfaction (Ekinci, 2001). Additionally, Oh (1999) confirms that customer satisfaction positively and significantly influences the return intention and WOM recommendation. As customers are nowadays more concerned with service quality received, it is of value to study the effect of service quality on customer loyalty (Yuen and Chan, 2010).

In the Portuguese retail industry, few research has been undertaken to directly evaluate the relationship between service quality, customer satisfaction and behavioural intentions. In this context, the main objective of this paper is to propose a methodology that allows for the examination of the antecedents and consequences of customer satisfaction, in retailing sector of Bragança. We specifically intend to present a conceptual model which aims to assess whether the national culture and perceived service quality promote customer satisfaction, intention to return and recommendation of services.

Although the quality of service in the retail industry has been extensively researched internationally (Dabholkar *et al.*, 2001; Das *et al.*, 2010; Durvasula and Lysonski, 2010; Khare *et al.*, 2010; Martinelli and Balboni, 2012; Mahfooz, 2014; Minh and Huu, 2016; Nadiri and Gunay, 2013; Simmers and Keith, 2015; Tang *et al.*, 2015; Yuen and Chan, 2010; Yu and Ramanathan, 2012), there has been little research done in Portugal to examine service quality as an antecedent of satisfaction and behavioural intention of customers in the Portuguese retail industry. The choice of this topic is due to the need for retailers to properly understand whether the service meets customer perceptions in the different dimensions of SERVQUAL, contribute to their satisfaction and behavioural intention (intention to return and recommend services), since they are determinant variables in maximizing profit, market share, and return on investment (Hackl and Westlund, 2000).

This research is particularly important for retail managers (survival and growth of retail companies), politicians (wealth creation, economic growth, etc.) and for the development of the literature in the Portuguese retail industry. In this paper, after this present introduction, a review of the main literature on customer satisfaction and their behavioural intention is made, then we propose the conceptual model and research hypotheses, ending with the presentation of the methodology and the contribution of the research.

2. THEORETICAL BACKGROUND

2.1 National Culture, Service Quality, Consumer Satisfaction and Behavioural Intentions

Hofstede (1990a) defined national culture as a system of values and beliefs learned during childhood. National culture is defined by Laroche *et al.* (2004, p. 62) as “patterns of thinking, feeling, and acting that are rooted in common values and societal conventions”. Hofstede (1990b) suggests five dimensions of national culture: power distance, individualism, masculinity, uncertainty avoidance and long-term orientation. Various authors have verified that cultural dimension is related to the way customers perceive the service provided (Furrer *et al.*, 2000; Mattila, 1999; Nguyen, Cao and Phan, 2015; Tanvir *et al.*, 2011; Veloso and Monteiro, 2013). Moreover, according to Tanvir *et al.* (2011, p. 1242) “cultural dimensions and service quality dimensions are interrelated”.

Service quality has assumed a major role both in public and private institutions, as an indispensable requirement to the costumers' satisfaction. There are two basic ways to define quality: one from the viewpoint of the service provider and the other from the costumers' perspective. The quality from the customer's perspective is the main objective of this study because it reorients the retail managers to the customer's needs. Firstly, it should be noted that the measurement of service quality is an important area of academic and scientific interest, which has assumed special prominence after the contribution of various authors (Parasuraman *et al.*, 1985). These authors, who represent the American school, have designed an instrument for measuring quality of service, called SERVQUAL. Initially, the proposed model incorporated 10 dimensions of quality (tangibility, reliability, responsiveness, professionalism, courtesy, credibility, security, access, communication and customer understanding). However, these dimensions were revised and subsequently reduced to five (Parasuraman *et al.*, 1988). The dimensions of courtesy, credibility, security, competence and communication have led to a new dimension: assurance, while the dimensions of understanding/knowing customers generated the dimension of empathy. A Parasuraman *et al.* (1988) suggested the following definitions for the five dimensions:

- Tangibles: Physical facilities, equipment and appearance of personnel;
- Reliability: Ability to perform the promised service dependably and accurately;
- Responsiveness: Willingness to help customers and provide prompt service;
- Assurance: Knowledge and courtesy of employees and their ability to inspire trust and confidence;
- Empathy: Caring, individualized attention the firm provides its customers.

SERVQUAL measures service quality from the customer's perspective of customer perceptions, through the amplitude of the discrepancy that exists between the expectations and perceptions of customers. Cronin and Taylor (1992) view that the validity of the use of expectations in the SERVQUAL model was called into question when consumers had no well-formed expectations and developed the SERVPERF scale which consists of the same 22 "items" of SERVQUAL, although centered only in measuring consumer perceptions regarding the quality of service. Despite the criticisms of SERVQUAL (Buttle, 1996; Cronin and Taylor, 1992), it remains the most widely used theoretical framework for measuring the quality of services so that, in the literature there are numerous studies that apply the SERVQUAL scale to assess quality of services across physical (Donnelly, Hull and Will, 2000; Mukherjee and Nath, 2005) and in digital environments (Wang and Tang, 2003; Kuo, 2003). Despite the diversity of studies in many fields, this study will be applied to the physical environments of hypermarkets in Bragança, city of Portugal.

Customer satisfaction is the outcome of the customer's perception of the value received in a transaction or relationships, where value equals perceived service quality, compared to the value expected from transactions or relationships with competing vendors (Blanchard and Galloway, 1994; Heskett, Sasser and Hart, 1990; Zeithaml, Parasuraman and Berry 1990). According to Gundersen, Heide and Olsson (1996), the crucial point of customer satisfaction is to identify the important attributes, considered by customers as their needs and expectations. As Valdani (2009) points out, enterprises exist because they have a customer to serve. The key to customer satisfaction lies in identifying and anticipating customer needs and especially in being able to satisfy them. Enterprises which are able to rapidly understand and to satisfy customers' needs, make greater profits than those which fail to understand and satisfy them (Barsky and Nash, 2003; Dominici and Guzzo, 2010). In order to be successful, especially in the service industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing ones (Dominici and Guzzo, 2010). On the other hand Bennett and Rundle-Thiele (2002) argued that for customers to escalate their loyalty, their perceived value of the good or service presented need be at par with reality, forming an integral part of the corporate aims of the organization. Additionally Sirdeshmukh *et al.* (2002) reported that customers' satisfaction has close relationship to brand loyalty as well as service quality. Analogous claim is presented by Hoq and Amin (2010), who postulated that customer satisfaction is the emotional tendency of a customer towards repurchase of products and services offered by a retail store. In order to be successful, especially in the retail industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing ones (Dominici and Guzzo, 2010).

The literature suggests behavioural intentions as a construct which permits the evaluation of customer loyalty (Yang and Peterson, 2004). These are behaviours related to the intention to repurchase and even to the intention of recommending the product/service (Clemes *et al.*, 2008; Lai and Chen, 2011; Sumaedi *et al.*, 2012; Yuen and Chan, 2010; Zeithaml *et al.*, 1990). Some studies developed in service industry have found the positive relationship between perceived service quality and loyalty (De Ruyter and Van Birgelen, 1998; Wong *et al.*, 1999). Customers frequently develop an attitude toward purchasing based on a prior service experience or, still, this attitude can also be influenced by previous information, based on the image of the retail in the market and even by word of mouth (WOM recommendation). With reference to the previous conception, customer loyalty has been usually defined as occurring when customers repetitively buying goods or services over time and retain positive attitudes towards the enterprise delivering the goods or services (Yuen and Chan, 2010). Service providers are increasingly developing loyalty, as they consider that it helps to rise income, and leads to largest market share, effectiveness and profitability (Al-Wugayan, Pleshko, and Baqer, 2008). In this sense, behavioural intentions can be define as the customer's judgment about the likeliness to repurchase in this firm or the willingness to recommend the firm to others. We conceptualize behavioural intentions as a higher-order construct consisting of (1) positive word of mouth (Boulding, Kalra, Staelin, & Zeithaml, 1993), (2) willingness to recommend (Parasuraman *et al.*, 1991), and (3) intentions to continue buying from a particular service provider (Bowen and Shoemaker, 1998). Based on previous definition, behavioural intention in this study may be described as a stated likelihood to repurchase in the hypermarkets in the North of Portugal and to recommend the hypermarkets to family, friends and others in the future. Research has established the many benefits of behavioural intention, such as making it a tendency for retailers to follow, as well as developing and maintaining a loyal

customer base (Yuen and Chan, 2010). There is also ample evidence of the influence of service quality on behavioural intentions, a huge body of research has demonstrated the significant relationship between service quality and customers' behavioural intentions (Parasuraman *et al.*, 2005; Sousa and Voss, 2010). According to Chaudhuri and Holbrook (2001), behavioural intentions, and not attitudinal intentions, can be related to increased market share. Zeithaml *et al.* (1996), compiled a list of specific positive behavioural intentions, included loyalty, switching intentions, willingness to pay more, external response, and internal response. In a multi-industry study, the authors later provided evidence of the significant effect of perceived service quality on customers' favourable behavioural intentions, such as repurchase, tendency to say positive things and recommend the company (Zeithaml, Berry and Parasurama, 1996). In addition, Cronin and Taylor (1992), find a favourable association between service quality and repurchase intentions. Also, Zeithaml *et al.*, (1996) and Fullerton (2005), find a positive relationship between service quality and behavioural intentions. Moreover, preceding research has demonstrated associations between service quality and particular dimensions of behavioural intentions, like as Parasuraman *et al.* (1988), find a favourable relationship between service quality and willingness to recommend the firm, and Boulding *et al.* (1993), find a positive correlation between service quality and repurchase intentions, saying positive things, and willingness to recommend. Several authors point out that customers may not necessarily buy the greater quality service and that there may be other factors that define consumer choice, such as satisfaction (Wang *et al.*, 2004; Ryu and Han, 2010). Therefore, we expect customers who perceive the quality of the service as high to be more likely to demonstrate intentions, and we again believe that this relationship will hold regardless of the buyers' collectivist orientation. Loyal customers are main assets to firms, they make proportionally more purchases at their 'first choice' store than customers who shift (Knox and Denison, 2000). Usually, great service quality leads to customer loyalty, as it increases customer confidence towards and satisfaction with the company. It is supposed that positive perceptions of service quality enhances the possibility of customers being dedicated in supporting the company and developing and strengthening loyalty behaviour (Yuen and Chan, 2010).

3. CONCEPTUAL RESEARCH MODEL AND HYPOTHESES

In according this theoretical background, the aim of this study can see in Figure 1, propose a model that consists of five major constructs: National Culture, Service Quality, Customer Satisfaction and two Levels of Behavioural Intentions (Intention to return and WOM recommendation).

Figure 1. Conceptual model

The hypermarkets managers should focus their attention on customer service quality evaluation as they must have actual knowledge that the service quality perceived by the client meets their expectations, as contended by Parasuraman *et al.* (1985, 1988). Based on these assumptions the purpose of this study is to examine whether the perception of the services provided in the different dimensions of SERVQUAL, exceeds the customer expectations.

However, the main objective of this study is to test the conceptual model shown in Figure 1, which includes four research hypotheses, as explained below.

The literature suggests that national culture constitutes an important construct in the study of service quality since it influences the perception of the quality of the service provided (Tanvir *et al.*, 2011; Furrer *et al.*, 2000). In this study we intend to, as have Furrer *et al.* (2000), who evaluated the impact of national culture on perceived service quality, test the following hypotheses:

H₁: The customers' national culture influences the perceived service quality

H_{1.1} – The customers' national culture influences the perception of the tangibles service

H_{1.2} – The customers' national culture influences the perception of the reliability service

H_{1.3} – The customers' national culture influences the perception of the assurance service

H_{1.4} – The customers' national culture influences the perception of the responsiveness service

H_{1.5} – The customers' national culture influences the perception of the empathy service

The relationship between service quality and satisfaction has not been consensual in the literature as several authors argue that, on the one hand, both concepts are identical, while others consider them as distinct (Dabholkar, 1995; Dabholkar *et al.*, 2000; Oliver, 1993). According with Dabholkar (1995), while evaluation of service quality is essentially cognitive, for its part, satisfaction integrates both cognitive and affective components. This author claims that these two concepts are distinct for recent consumers of a product. However, in the long run, the affective dimension tends to be blurred and to that extent, the concepts tend to overlap. Meanwhile, Ngobo (1999) also reinforces the distinction between perceived quality and satisfaction level of the three dimensions. Assuming that these two concepts are distinct, a question that immediately arises relates to the order of their occurrence in the mind of the consumer and as such, the causal relationship between them. In this regard Dabholkar *et al.* (2000) argues that, most investigators traditionally hold that consumer satisfaction results from a particular consumer's experience of a service which leads to an evaluation/attitude on the overall quality of service over a given period of time (Parasuraman *et al.*, 1988). Recently, however, the reverse situation has stood out as the most relevant. This position is particularly evidenced by Oliver (1993) who suggested that the quality of service should be an antecedent of consumer satisfaction irrespective, of the experiential or the time factor. Similarly, Cronin and Taylor (1992) analysed the effect of these concepts in both directions and concluded that the quality of service perceived exerts a greater impact on customer satisfaction than otherwise. Recently, several authors have considered service quality as an important antecedent of satisfaction (Ekinici *et al.*, 2008; Zhang and Prybutok, 2005; Chiou *et al.*, 2002; Saleh and Ryan, 1991). Most studies assessing the relationship of service quality on customer satisfaction demonstrate the existence of a statistically significant level in studies of the retail industry. In line with this, and based on SERVQUAL, the following hypotheses are proposed in the present study.

H₂: The quality perceived by the customers has a positive influence on their satisfaction.

H_{2.1} – The higher the tangibility, the greater the degree of the customers' satisfaction.

H_{2.2} – The higher the reliability, the greater the degree of the customers' satisfaction.

H_{2.3} – The higher the assurance, the greater the degree of the customers' satisfaction.

H_{2.4} – The higher the responsiveness, the greater the degree of the customers' satisfaction.

H_{2.5} – The higher the empathy, the greater the degree of the customers' satisfaction.

In reviewing the literature, we have found that marketing services have extensively researched behavioural attitudes (e.g. Andreassen and Lindestad, 1997; Bobbitt and Dabholkar, 2001; Dabholkar, 1996; Zeithaml, Parasuraman and Berry, 1996). Several concepts have been examined as antecedent factors of behavioural intentions, such as service quality (Brown, Churchill and Peter, 1993; Zeithaml *et al.*, 1996) and satisfaction (Andreassen and Lindestad, 1997; Oliver, 1999). According to Liang and Zhang (2011, p. 156), "*it is generally believed that satisfaction leads to repeat purchases and positive WOM recommendations*", assuming that if customers are satisfied with a product/service, they are more likely to continue to purchase it, and are more willing to spread positive WOM. Thus, we propose our third and fourth hypotheses:

H₃: Customer satisfaction positively influences intentions to return.

H₄: Customer satisfaction positively influences WOM recommendations.

According to Nadiri and Hussain (2005, p. 471), "service quality promotes customer satisfaction, stimulates intention to return, and encourages recommendations". Oh (1999) found a positive and significant relationship between intention to return and WOM recommendations. In this study we intend to also propose this relationship and the following hypothesis:

H₅: Intentions to return positively influences WOM recommendations.

4. METHODOLOGY

A questionnaire was designed as the survey instrument, which were included all the constructs of the proposed model. The questions in the questionnaire were based on a review of the literature in the area of the retail industry, described above in the theoretical background. This study was applied to customers from of hypermarkets of Bragança during the months of February and March 2017. It was used a non-probabilistic sampling using convenience technique. The questionnaires were distributed online and the answers came from several cities of the district of Bragança. Also some questionnaires were distributed in the near the exit of the hypermarkets of Bragança. In this study, respondents were required to fill out a three-page three sections. The first section consisted of a standard demographic profile of respondents. The second section contained the characterization of purchase process. The last section includes the statements of dimensions and

their sub dimensions. The measurement items to measure primary and sub-dimensions of service quality were adapted from several researchers (Chen *et al.*, 2011; Cronin and Taylor, 1992; Dabholkar *et al.*, 1996; Wu *et al.*, 2011) and a series of items focusing on the behavioural intentions, customer satisfaction and national culture, which were adapted on the basis of several researchers' results (Furrer *et al.*, 2000; Mattila, 1999; Nguyen, Cao and Phan, 2015; Tanvir *et al.*, 2011; Wu, 2013; Yu and Ramanathan, 2012; Yuen and Chan, 2010; Zeithaml *et al.*, 1996). Respondents were asked to use a five-point Likert-type scale (where 1 = "strongly disagree" and 5 = "strongly agree") to record their perceptions. Construct reliability will be assessed by using the Cronbach's alpha coefficient.

For the descriptive analysis it will use absolute and relative frequency tables. The Spearman correlation coefficient will be used to measure the intensity of the linear correlation between variables. Multiple linear regression will be used in order to estimate models that could identify the determinants of the behaviour of the variables under analysis. The significance level of 5% will be assumed. Additionally, to test the causal relationship between different constructs, we will use the structural equation model, given that the theoretical model includes the complex relationships between latent variables measured with different items that are presented simultaneously as independent and dependent variables.

5. FINDINGS AND CONTRIBUTION OF RESEARCH

The customer satisfaction and the customer loyalty process allows for significantly increased revenue from hypermarkets by obtaining sales growth and a better return of investments. With this in mind, the manager retail needs to know the real customer service needs and expectations, so that the service is tailored to the customer's satisfaction, in order to retain them and attract potential new customers.

Thus, this study proposes to develop and analyse a conceptual model that aims to explain the relationship between national culture, perceived service quality, customer satisfaction and behavioural intentions (intentions to return and WOM recommendation).

Based on research conducted in bibliographic data bases, we have identified a gap in the literature about the hypermarkets in Portugal, which relates to the knowledge of the factors affecting customer satisfaction and behavioural intention. It is hoped that this research will contribute to the development of the literature, politicians (wealth creation, economic growth, etc.) and managers of hypermarkets (the survival and growth of hypermarkets retailing). From a practitioners' point of view, the understanding of the factors that influence customers' satisfaction and behavioural intentions, on the one hand, may contribute to the retail manager's development when establishing strategies and contribute to the improvement of services provided by the hypermarkets and consequently increase profit, market share, and improve return on investment (Hackl and Westlund, 2000).

Findings are expected to report high levels of perceived quality and significant relationship between retail service quality dimensions and customer satisfaction and yet we expected to prove that the cultural dimensions and service quality dimensions are interrelated (Tanvir *et al.*, 2011; Furrer *et al.*, 2000). Furthermore we will try to show like as Furrer *et al.* (2000) also have demonstrated, that the relationships between cultural dimensions and the relative importance of the dimensions of service quality can provide useful insights for how firms should allocate resources in different cultural groups. We have shown that the relative importance of the service quality dimensions varies from one culture to another. Retail service providers need to recognize the importance of service quality dimensions in order of their significance, and implement appropriate strategy for competitive advantage over domestic and international players competing for share of an expanding consumer base (Mahfooz, 2014).

This present study will enrich the literature about cultural influences on service quality to measure individual-level cultural dimensions and by focusing on overall service quality expectations in the context of the retailing industry of Portugal which receives little attention from scholars. We will hope that the culture values show a quite good match with Hofstede's national culture scores. Furthermore, this study similar the research developed by Nguyen *et al.* (2015) will extend prior research by identifying the most influential factor within four cultural orientations that predict service quality expectations.

Furthermore to the theoretical contributions, the research findings will have practical implications for retailing modern, namely: the modern retail store should carefully segment their targeted customers given that service quality expectations differ across individuals in a country; moreover, in order to reduce customers' uncertainty about services and supermarkets should be implemented informational interventions. Also, it is believed that customer relationship management should be considered as this helps to reinforce customers' belief that they and retail modern stores are carefully linked as a group, at the same time the employees should deal with customers' complaints and solve their problems in an effective manner to enhance hypermarkets' power. These contributions could increase customers' satisfaction and their loyalty to hypermarkets (Nguyen *et al.*, 2015).

The study results will help retail stores owners and managers to recognize and prioritize the primary and sub-dimensions of service quality. Retailing management should realize that the significance customers accentuate is based on each of the primary and sub-dimension of service quality. Moreover, retail management should structure their infrastructure, processes, operations and resource allocation in terms of the relative importance of the service quality dimensions to their target at specific customers. Simultaneously, the retail managers should dedicate special attention to the national culture, because we will expect that study will show such as several studies have verified that cultural dimension is related to the way customers perceive the service provided is related.

ABSTRACT

In Norway, with its long coast, the fishing industry is a powerful engine in the economy. One of Norway's main fish resources is the Atlantic cod (*Gadus morhua*), which is in the top-10 list of the most harvested wild species in the world. The Norwegian people have traded cod since the time of the Vikings and the products are still important in fish exports. Adequate management of cod is very important to ensure future sustainability. On the other hand, in Portugal documented interest in dried and salted cod dates back to the 15th century, i.e., since the discoveries. At that time, cod was an important source of protein, easy to preserve if dried or/and salted and Portugal is still a cod consuming nation. However, as a coastal country, with high biodiversity, but no cod, Portugal needs to import this product, as traditional dried and salted cod remains an important commodity. Yearly consumption of cod per capita (over 60kg) and is the most demanded seafood product in Portugal. This raises questions: why are these eating habits still maintained? What does Norway gain by fuelling the demand for cod? What are the mutual benefits?

Keywords: Atlantic Cod, Import-export, Norway, Portugal.

JEL Classification: Q21, Q22

1. INTRODUCTION

The importance of cod as a commodity lies not only in historical roots, but also in the particular features that can be found in this fish species (Perdikaris and McGovern, 2007). The capacity to acquire and store protein safely during long and arduous voyages in rough seas was not easy, but was facilitated by cod (Fagan, 2008).

In 1000AD Leif Erikson discovered territories in North America giving them the name Vinland (land of vineyards) and there is evidence for a Norse settlement in L'Anse aux Meadows located in the Northern tip of Newfoundland (Canada) (Ingstad and Ingstad, 2000). It is generally believed that the discovery was enabled by early navigators remaining close to the coast where there was an abundance of Atlantic cod that was easy to catch. This fish species had another useful characteristic; it was easy to preserve using open air drying methods (Outram, 2003). Around five centuries later (in 1497), John Cabot in the service of King Henry VII sailed in a caravel named Matthew from Bristol (England) to North America (Morison, 1986). There is evidence that Matthew's crew were astonished by the proliferation of cod, which could even be caught using with fishing baskets (Pringle, 1997). A few years later other groups such as the Basques (Kurlansky, 2000) and the Portuguese (Cole, 1990) were able to reach those fish rich waters and use first salt as a means of preservation and later drying (Andrieux, 2009). Support for the latter comes from evidence of a Portuguese settlement in the Azores islands who were fishing towards the north and may by chance have reached the coast of Newfoundland (Abreu-Ferreira, 1998).

The historical evidence described above demonstrates that cod fisheries have been in existence since those times and this activity that has enabled trade between countries (O'Rourke and Williamson, 2002). Cod has been a sought after commodity that is highly imperishable and flexible in terms of provisioning (Pálsson, 1998). Atlantic cod (*Gadus morhua*) is confined to only the northern hemisphere and can be found in the relatively shallow waters of the Atlantic Ocean (Fig. 1) (Neat *et al.*, 2006); it is nonetheless, an important trade commodity for several countries (Anderson, 2003). Northern countries such as Iceland, Denmark, the UK, Norway and Russia among others have specialised fleets dedicated to cod fishing (Parker and Tyedmers, 2015).

The present study aims to use relevant literature to explore the reasons for the expansion of cod as a commodity with particular reference to Norway as a producer, Portugal as a consumer and more recently also as a processor. It is our objective to investigate the cultural reasons associated with trade in salted and dried cod commodities. Other issues will also be explored, such as the reasons for this trade to reach large markets such as Brazil.

2. MATERIAL AND METHODS

In the present study, a twofold approach was used, following data collection methods described by Robson (2002). First, the position of Atlantic cod in terms of catches was investigated, using either European or domestic databases (Norway and Portugal) and data concerning the general term “cod” and the relationship between the two countries. Second, additional supporting information came from scientific literature concerned with a socio-economic perspective on “cod” and the trade or other relationship between Norway and Portugal.

The second approach involved a search for information in the literature for relevant terms: the method used was based on a search of scientific databases for “Atlantic cod”. The tool Google Scholar was used for this to search for articles published in English in peer-reviewed journals within five of the most important scientific editorial groups: (1) Elsevier, (2) Springer, (3) Wiley-Blackwell, (4) Taylor & Francis and (5) SAGE Publications. These groups have together published more than half of all academic papers in worldwide peer-reviewed literature.

In addition, a further 9 additional key-terms related to “Atlantic cod” were also chosen in conjunction with the main search term. A wild-card character was used – asterisk (*) – to substitute one or more characters in each of the key-terms. The following key-terms were used with the wild-card (Table 1).

Table 1 – Key-terms searched in the scientific literature

Key-term	Searched and excluded items
Norw*	for Norway, Norwegian
Port*	for Portugal, Portuguese, excluding all other words
Expor*	for export, exports, export-import
Impor*	for import, imports, import-export, excluding importance and important
Cod*	for cod, except code and related words such as: codify, codified, codification
Gad*	for <i>Gadus morhua</i> , gadoid fish, gadoids
Klip*	for klipfish, klipfish or Klippfisk (a term used to designate cod)
Trad*	for trade, trading, excluding all other words such as traditional, or derived
Seaf*	for seafood, sea-food

A decision was made to limit the number of key search terms in order to provide focus for the study. Several other terms could have been used, but this would be at the expense of going on a more subjective track. Instead, it was used the addition of terms in order to refine the search in each of the editorial group engines (e.g. key-term 1 + key-term 2 + key-term 3).

Apart from peer reviewed scientific literature, recent grey literature was also used. This choice can be justified as such literature is relevant for the subject of cod trade between Norway and Portugal.

3. RESULTS

The results concerning the position of cod fisheries worldwide can be seen in Figure 2. Atlantic cod (*Gadus morhua*) is in the top-10 list of the most harvested wild species in the world attesting to the importance of this fish resource.

Figure 2 – Top ten of the world's largest wild harvested fish species

Source: FAO (2017)

In terms of the key search terms for the main editorial groups, these turned up much relevant literature for the purpose of this study. This can be seen when the search is narrowed to include six terms at a time: “Norway” + “Portugal” + “Export” + “Import” + “cod” + “trade” (Table 2). Within the five editorial groups, the range of the combined terms varied between 14 and 92.

Table 2 – Results of the key-terms searched in scientific literature published by five of the main editorial groups.

Editorial group	Elsevier	Springer	Wiley	T&F	Sage
Total articles	5,500,000	4,980,000	3,860,000	2,310,000	1,830,000
“Norway” “Portugal”	24,100	29,700	14,600	13,000	5,100
“Norwegian” “Portuguese”	2,980	3,850	2,410	2,320	851
“Norway” “Portugal” “Export” “Import”	2,310	3,180	1,450	1,190	470
“Norwegian” “Portuguese” “Export” “Import”	166	320	146	145	58

Based on the literature, cod imports for the last two decades or so have increased in Lusophone countries such as Brazil (Fig. 3) and more recently to Angola.

4. DISCUSSION

4.1 Main reasons for cod consumption in Portugal

By the late 1400s, some European fishermen adopted the salt-based curing methods developed by the Basques. In Portugal, salted cod became a staple food that was affordable for all levels of society (Arvela, 2013). The literature shows that in southern European countries, with particular focus on Portugal, Atlantic cod became an important commodity for several reasons mainly related to the cultural context and has become part of everyday eating habits (Albala, 2003). Probably the most relevant reason that dates back several centuries until today (with some evolutionary changes), is that in Catholic countries, particularly during fasting periods that preceded Christmas (Advent) and Easter (Lent), cod was viewed as an alternative to red meat (Dickie, 2008). Even today, during holy-days, such as Christmas Eve dinner and Easter Sunday lunch, when the extended family meets, dishes using cod are compulsory for most (Delamont, 2002). For the Portuguese, cod became an essential trading commodity within the former Empire reaching all continents (Lessa, 2008).

4.2 Cod: context changes in supply and steady demand

4.2.1 The main changes

In Portugal during the *Estado Novo* dictatorship cod fisheries were an activity that involved several people, particularly men, that worked in the long distance fisheries. Soon after the Carnation Revolution the cod fleet positioned over the offshore waters of Newfoundland began to be dismantled (Coelho *et al.*, 2011). This was due internal changes, but also to international conjunctures such as a reduction in access to long distance fisheries. In a volte-face, Portugal joined in 1986 the then European Economic Community (EEC) and gained some extra access to Canadian waters as a result of a third party agreement (Hutchings and Myers, 1995). This renewed access to cod waters lasted only a few years, and by 1992 the cod stocks off Canadian Atlantic waters started to collapse (Myers *et al.*, 1997). A moratorium was put in place for an unspecified time until stocks recovered (Bundy and Fanning, 2005). As a result, the price of cod increased dramatically (Bjørndal *et al.*, 2016). This put some pressure on cod stocks, but other trade opportunities appeared (Lynghjem and Breivik, 2015). Cod resources have been since subjected to great pressure and research including stock assessments to help with their preservation has been effectively carried out (e.g. Eide *et al.*, 2003; Arnason *et al.*, 2004; Kjesbu *et al.*, 2014).

4.2.2 Norway as the alternative cod supplier

By late 1990s, Norway was able to manage sustainable cod management stocks in its waters. It also increased its cod aquaculture from experimental pilots to an attempt at industrial level production, although this was not very successful (Brown *et al.*, 2003; Rosenlund and Halldórsson, 2007). By the year 2000, Portugal started to import not only dried and salted cod, but also fresh cod from Norway. The cod processing industry in Portugal began to process not only for the domestic market, but also to overseas as a result of a higher demand particularly in Brazil and to some extent also in Angola. In Brazil, this was a result of better economic prospects and in Angola, this was due to a combined set of factors such as increased purchasing power for the people and the large number of Portuguese immigrants arriving in Angola as a result of deteriorating economic conditions in Portugal (Lorentzen *et al.*, 2016).

4.3 Cod supply

4.3.1 Cod distribution

Cod has specific characteristics: it can only be found in cold waters, it is relatively large and is easy to catch (Hardie *et al.*, 2008). All these characteristics are important factors for the success of this species as a trade commodity.

Norway pursues an 820,000 km² EEZ with plenty of large areas of cold and shallow waters on the continental shelf. As a result, it is one of the countries where Atlantic cod (*Gadus morhua*) has a higher probability of being found. Catches from this species have been subjected to international quota agreements (Jakobsen, 1987). On the other hand, Portugal pursues a 1,730,000 km² EEZ, located in comparatively milder water temperatures and a deeper continental shelf. The consequence of these features is that the probability of finding Atlantic cod is very low (Dulvy *et al.*, 2005).

4.3.2 Comparative importance of exports

The bulk of Norwegian exports is composed of few sectors. Fish, either fresh, chilled or frozen is the raw material related to the third most important economic activity sector in Norway and accounts for circa 7% of its exports, being only surpassed by machinery (second place reaching 9%) and the main activity sector which is related to the oil and gas industry (Nystrand, 2011; Eurostat, 2017). Fishing and aquaculture are among the main and most important economic activities in Norway.

In comparison, Portugal has no highly dominating economic activity sector in export, but electric and cabling is slightly ahead accounting for around 15% of all exports. It is followed closely by machinery (13.1%) and forestry related products such as pulp, paper and cork (13%). The most important sector where seafood products are included is in the canning and other processed seafood products, accounting for less than 1% of all exports (Eurostat, 2017). Fishing and aquaculture are not among the main economic activities in Portugal (*op. cit.*).

4.4 Cod trade between Norway and Portugal

4.4.1 Norway

Norway is among the largest fish and seafood producer worldwide (Anderson, 2003). Fish catches reached 2,135 thousand tonnes in 2014. In addition, 1,332 thousand tonnes were produced through aquaculture in 2014, roughly 10% more than the total EU production. In terms of consumption, each Norwegian consumes around 44kg/fish per year. In total, the domestic market for Norway reaches around 220 thousand tonnes of seafood consumption per year (Eurostat, 2017).

With its long coast, the fishing industry in Norway is a powerful engine of the economy (Soma *et al.*, 2014). Notwithstanding, due to its relatively high latitudinal position, the Norwegian coast is not very diversified in terms of fish species. One of the main fish resources is Atlantic cod (*Gadus morhua*), which is in the top-10 list of the most harvested wild species in the world (Higgins *et al.*, 2010). The Norwegians have traded dried and salted cod since the Vikings and fish products are still important exports.

4.4.2 Portugal

In comparison, in terms of production, Portugal catches reached 177 thousand tonnes in 2014. Fish and other seafood reared in aquaculture settings amounted to 11 thousand tonnes in 2014. These figures are roughly half of production in the Czech Republic and two-thirds of that of Hungary where both countries have no coast and low fish consumption (Eurostat, 2017). Thus, the Portuguese are avid seafood consumers. Each Portuguese consumes in a year over 62kg/fish, putting them at the top of the world's consumer list. As a result of high domestic demand of around 700 thousand tonnes of seafood consumption per year, the country has to rely heavily on imports (*op. cit.*).

Being a coastal country, with high biodiversity, but no cod, Portugal needs to import this product as traditional dried and salted cod. This staple food remains an important commodity and Portugal is still a cod consuming nation (Bjørndal *et al.*, 2016). Cod represents a significant part of yearly consumption per capita (over 60kg), being the most demanded seafood product in Portugal (Bjørndal *et al.*, 2015). As a result, and due to the EU tariff regime, a fish processing industry dedicated to these products is protected and encouraged.

4.4.3 Comparative trade

Gadoids are part of the fishing sector that alone accounts for \$1.08 billion (2015). This is one of the major economic sectors in Norway where cod, saithe, haddock and other groundfish species are marketed as clipfish (dried and salted), being part of an important sub-sector of the fishing and processing industry (Haugnes, 2010). Around 41% of these clipfish goes to the Portuguese market. In terms of fish and other seafood production and consumption, Norway has a positive balance of trade of around 3,247 tonnes/year. In comparison, Portugal presents a negative balance of trade of 512 tonnes/year. The most consumed seafood in Portugal is cod or similar gadoids (Almeida *et al.*, 2015). Salted cod and clipfish are imported mainly from Norway (Fjørtoft and Nystrand, 2016). Both salted and frozen cod imported to Portugal are used in the processing industry for clipfish production.

Fjørtoft and Nystrand (2016) pinpoint an important aspect related to Norwegian clipfish, which still is as an attractive commodity to the Portuguese. However, importers tend to choose salted cod instead of clipfish. This may jeopardize the successfully traded brand *Bacalhan da Noruega* from a consumer perspective.

4.5 Reasons for the Portuguese ‘cod addiction’

The question that arises is why are the Portuguese eating habits so reliant on cod. In the literature, a large number of reasons are cited, which can be broadly split into two groups: 1) the preservation process, and 2) appealing texture with low rate of waste.

4.5.1 Cod preservation process

An important characteristic of cod is the ease with which individual fish can be preserved through drying and salting, enabling it to be kept long term in good condition. These techniques not only preserve cod, but also improve the taste. The low fat content means effective preservation, preventing bacteria developing and contamination of the edible parts. These facts help explain why cod has been a staple food throughout history (Wicklund and Lekang, 2016). Later, refrigeration and freezing techniques were developed and used in the preserving of cod (Evans, 2015). While consumption in Portugal may eventually be considered idiosyncratic (Cardoso *et al.*, 2013), the reasons above help explain why cod is the main seafood product to be consumed there.

4.5.2 Cod texture and low waste

Cod has an appealing texture and little is wasted as after gutting most of the body and head are used in human consumption (Næss and Haneckzo, 2013). In Portuguese cuisine, the process of curing cod is important as after this process the whole cod can be cut into three or eventually four main parts: the steak (prepared by boiling or grilling); the loin (which is the thickest part and is oven baked or boiled); the scraps (usually shredded) and the tail (used in a similar way to the scraps). The faces, cheeks and tongues from the heads are used in by-products. (Fjørtoft and Nystrand, 2016), (these are colloquialisms and do not correspond exactly to their common meaning). Thus, cod contains a high percentage of edible parts and little waste is produced (Anderson and Dalley, 2000; Hardie *et al.*, 2008). These are the main reasons why cod has become a staple food in Portuguese cuisine, even being known as *Fiel amigo* - a faithful or loyal friend (Sobral and Rodrigues, 2013).

Texture in clipfish is so important that in Portugal it is common to sell cod as a generic product, without a brand, only labelling it as being cured using traditional Portuguese methods. These traditional methods are used not only for cod, but also for other gadoids, creating a large range of colours, sizes, smells and tastes. Consumers are allowed to touch and smell clipfish before they buy it.

4.5.3 A flexible and multicultural cuisine with endless recipes

A large number of dishes can be prepared using the different cuts from salted and dried cod (Sobral, 2012). In traditional Portuguese cuisine there is a common claim that there are 1,001 recipes that use salted and dried cod. These often feature other common ingredients such as onion, olive oil and potatoes, which are tantamount to compulsory in Portuguese cuisine. Even with these common ingredients, the way of slicing or mashing potatoes or onions and the harvest of the olive oil are sufficient to differentiate some recipes (*op. cit.*). There are also ingredients that appear in other individual recipes. Among these are coconut milk, lard and saffron which are used to make cod chutney. Battered cod is used for some recipes with shredded cod (Sobral, 2008) and some dishes are named after the person who created it (e.g., *Bacalhau à Brás*, *Bacalhau à Gomes de Sá*, *Bacalhau à Zé do Pipo*). Many cod dishes were created in the Northern coastal part of Portugal, and among them the *Bacalhau à Gomes de Sá* has been popularized in Brazil, particularly due to the large number of inhabitants of Northern Portuguese descent (Coelho, 2004). Cod chutney is quite common in certain parts of Asia, particularly Goa, Daman and Diu in India and Macau in China, influenced by Indo-Portuguese gastronomy (Ansaldó, 2010). More recently, the *Bacalhau à Brás* - a cod dish originally created in a very typical Lisbon quarter, the *Bairro Alto* - has been in high demand among tourists. Its success has resulted in a Spanish version and it can also be found in Macau (Kammen, 2009).

4.6 An expanding ‘cod addition’

4.6.1 Multiple consumers

Due to cultural links with Portugal, particularly in Christmas and Easter Catholic traditions, Brazil has become also a cod loving nation (Maranho, 2010). Consumption has increased during recent decades, as have imports (Simonard-Loureiro and da Costa, 2016).

A similar demand has occurred in Angola, where this rose during the late 2000's as a alongside increased purchasing power (Egeness and Pleym, 2015). One of the main reasons for the rise in demand may be related to the recent emigration of Portuguese people to Angola (Queirós, 2010).

4.6.2 Fuelling cod consumption

Norway gains from encouraging regular cod consumption, particularly through the generic name of salted and dried ‘cod’ – clipfish, including not only *Gadus morhua*, but also other gadoid species. This phenomenon may have resulted from the collapse that occurred in 1992, and the need to increase consumption of other gadoid species (Link *et al.*, 2009).

There is a surplus of cod production in Norway, and the increasing demand for cod in Portuguese speaking countries, benefits its trade. Portugal also benefits; although it needs to import the raw material (cod) from Norway, it has a specialised processing industry that transforms cod into products required elsewhere (Pettersen and Myrland, 2016). Tightening mutual trade agreements between Norway and Portugal seems beneficial for both countries. Mutual trust is important because Norway is seen to be a high quality cod producer, and Portugal has demonstrated that it is not only a highly demanding

consumer, but also an efficient processor capable of supplying the extended Lusophone gastronomic culture associated with nostalgia and memorabilia, i.e., knowledge from past generations that is maintained in the present (Bourdain, 2010).

5. CONCLUSIONS

We found that the Portuguese are not only avid consumers of seafood both in the past and now, but also that they are 'addicted to cod' and that the flexibility and history apparent in the curing process of this fish species as well as a widespread and rich cuisine are major factors in the expansion of demand for cod. The label Norwegian cod together with Portuguese traditional curing methods create a high standard of food quality much appreciated by consumers. The close cultural connections between Brazil and Portugal has influenced the former when it comes to the consumption of cod, not only at Christmas and Easter, but also on other occasions. Norway as a strategic cod supplier, being particularly active after the collapse of Newfoundland cod stocks, may gain economic advantage from other, newer markets such as Brazil and Angola. There are without doubt mutual benefits to be had from trading Atlantic cod as a commodity.

GENDER RELATIONS WITHIN THE SOCIAL STRATIFICATION IN FEMALE EMPLOYMENT IN RURAL INDIA

Sanghamitra Kanjilal-Bhaduri

Department of Economics, University of Calcutta, India

(bhaduri.sanghamitra@gmail.com)

ABSTRACT

The paper has presented an empirical picture of labour market inequalities for women and the inequalities outside, within the framework of overlapping social stratification in rural India. Analysis is based on secondary data, where the emphasis is not only on measurement of quantitative variables, but also on the interactions between various qualitative, socio-economic and socio-cultural variables. Main finding of the present study is that the participation of women in labour force varies across economic classes, social groups, religions, regions and the rural urban divide. Factors determining labour supply decisions of women are different from those of men. Interconnectedness of female employment with other social parameters which are outside the realm of the standard labour market analysis gets highlighted in the study.

Keywords: Gender Relation, Female Labour Force/Work Force Participation, Social Hierarchy.

JEL Classification: J16, J21

1. INTRODUCTION

The notion of 'work' and 'employment' for women is complex. While economic factors predominantly determine a man's participation in employment, the reasons why women work, or do not work or whether they work part-time or full-time can be diverse and are often rooted in a complex interplay of economic, social, cultural and personal factors.

In India, as in other parts of the world, fewer women participate in employment as compared to men both in urban and rural areas. But more women work as compared to men. This is the backdrop against which this paper analyses issues, such as, what gender relations emerge in employment under overlapping class, caste and community identity (religious groups) and finally how such gendering of work has many significant and related consequences.

Rural women have less access than men to productive resources, services and opportunities, such as land, livestock, financial services and education. Numerous studies underscore the social costs of rural women's lack of education and assets, linking it directly to high economic costs: wasted human capital and low labour productivity that stifle rural development and progress. To understand women's work status in India's rural areas and to examine the nature of women's employment, data from large scale National Employment-Unemployment Surveys is analysed in the present study.

Theoretically, female labour supply is often modelled using the framework of the time allocation model (Becker, 1965), which states that women make their labour supply decisions not only considering leisure and labour trade-offs, but also home-based production of goods and services (including caring for children)¹. Seminal work done by Goldin (1995) explored the U-shaped relationship between female labour supply and the level of economic development across countries. Initially, when the income level is low and the agricultural sector dominates the economy, women's participation in the labour force is high, due to the necessity of working to provide for consumption of goods and services. As incomes rise, women's labour force participation falls, only to rise again when female education levels improve and consequently the value of women's time in the labour market increases. This process suggests that, at low levels of development, the income effect of providing additional labour dominates a small substitution effect, while as incomes increase; the substitution effect starts dominating².

The key contribution of this paper is that it explores the dimensions of women's participation; both within the labour market and outside, across socio-religious and socio-economic groups. The interface of class, caste and religion (community identity) with labour market outcomes of women has been explored and it is seen how specific attention to social and cultural variables has relevance for discussions on women's employment (Neetha, 2013). The importance of explicitly drawing distinctions between class, religious and caste categories in the analysis of female employment pattern is highlighted in the paper. The novelty of this study is that it uses a detailed and very large Indian household survey dataset conducted by the National Sample Survey Office (NSSO). Stylised facts from the data are presented in a later section.

1.1 A History of Gender Relationships

There are two levels at which women and men interact with each other: there are large-scale, more impersonal gender relations and intimate gendered relationships (Holmes, 2008). At the large-scale level women as a social group are compared to men as a social group. Concerns at that level are with general patterns in how the two groups are positioned in relation

¹ Hence the need to consider participation of women workers in activities which are outside the production boundary and officially considered as being 'out of labour force'.

² The income effect is the change of hours of work of an individual with respect to a change in family income. The own-substitution effect is the change in hours of work of an individual with respect to change in their wage, holding income constant.

to each other within society. The usual framework employed to understand gender relations is the common sociological framework of social stratification and the associated inequalities.

'Social Stratification' refers to the different layers within a society, the hierarchies organised around different groups. The major forms of stratification occur around class, caste, ethnicity or religion and gender. Women's social position has historically been and continues to be one of disadvantage. A lot of research has been done on gender inequalities which mention that women typically have worse jobs, get less pay and are likely to be poorer. Continuity of women's relative disadvantage has been the focus of much research particularly through the 1980s and 1990s. There has also been a growing emphasis on complexity and diversity. Much of empirical research demonstrates that major continuities of inequality still confront women in the labour market (Arber & Ginn 1995; Hakim 1996; Rubery *et al.* 1999). Gender relations which operate at a large-scale level (studied in the paper) impact gendered relations which are at a more personalised and intimate level.

1.2 Conceptualising Continuities and Changes of Gender Relations in Employment

Research regarding gender relations in work and family has been evolving over recent decades (Irwin, 2005). Initially continuities in inequalities were focused but this has given way to recent concern with complexity and diversity. Researchers are now trying to understand how change in gendered employment patterns connects to change in social organisation more widely. There has been a shift in the system of gender relations over the twentieth century, resulting in a change of the pattern of inequality between men and women. Hence a need to develop and apply an intersectional approach to gender analysis has been emphasised by the International Labour Organisation (ILO). Recent research thus focuses more on issues of diversity, complexity and contextual specificities in the reshaping of gender relations within the hierarchies of class, caste, social and religious groups.

1.3 The Challenge

Women constitute 40 per cent of the global workforce. Their active engagement in productive employment contributes to faster economic growth and its long-term sustainability. Despite the breakthrough made in advancing towards gender equality in the world of work during the last few decades, women continue to be over-represented in more precarious, informal, less remunerated and unpaid work than men. This is largely due to the slow progress in social change in many societies (like in India), burden of unpaid care work that mostly women continue to undertake, and gender blindness of macroeconomic and development policies.

Understanding women's work is a complex issue in India and the world over, as the determinants relating to women's work and employment are qualitatively different from those of male workers (Beneria, 1982). Women's labour force participation is determined by class, caste, religion, marital status and other socio-cultural norms which operate at multiple levels in society. These norms restrict women's mobility and access to formal employment. They push women to take up non-wage employment or remain out of labour force (Thomas, 2012; Das, 2006; Sethuraman, 1998; Ghosh, 2009; Desai and Jain, 1994).

Women are primarily responsible for household duties and reproductive activities. Due to the unpaid nature of women's work and the definition of economic activity, women's labour force participation remains statistically under-reported (Chaudhary and Verick, 2014). The decline in women's economic activity is a cause for concern as women are valuable resources and as it implies a decline in their well-being. Women's employment is a critical factor in their progression towards economic independence and is also considered as an indicator of their overall status in society (Mammen and Paxson 2008). The gender gap in employment has macroeconomic implications as well.

2. RESEARCH OBJECTIVE

A major gap in the existing literature is the limited attention paid to the representation of class (as proxied by Landownership) and of Caste. Class considerations have been represented in the form of technological change in agricultural methods (Da Costa & Venkateshwarlu, 1999) or in the form of income classes of the household as represented by monthly per capita expenditure. But the idea that land ownership is a form of wealth which decides the economic class of the household has yet to be exploited in studies. Land holding size from National Sample Survey (NSS) data has been used as one of the many determinants of female labour force participation in studies before but the stratification of social hierarchy in terms of land ownership has been attempted³ few and far between. Ownership of land being a historically important indicator of wealth of the households and hence a socio-economic determinant, especially in rural India, warrants a detailed study of its effects on the labour supply decisions of women workers, i.e on female employment. To try to fill in the existent gaps in the literature this paper has the following objectives:

- a) To present a disaggregated analysis of female employment across class, caste and religious identities in rural India
- b) Investigate the causal relationship between socio-economic and socio-religious determinants of female work force participation.
- c) Establish the effectiveness of intersectionality in determining female work force participation.

The social stratification of class has been done by considering 'economic class' which in rural areas is well delineated by the land ownership of the respective households. Greater amounts of land imply higher social positioning and hence a privileged position. Amount of land owned is a strong class stratifier in rural India. Hence the idea of taking up land as one of the causal variable. As female labour is not decided by any single factor but rather by an interplay of various

³ A study by Gita Sen and Chiranjib Sen (1985) has studied the female employment pattern with respect to unpaid work within the land holding sizes of the households.

factors so the concept of intersectionality has been utilised. Introduction of the interaction terms brings in the concept of 'Intersectionality' (Grenshaw, 1989). It enables the present study to consider three dimensional axes at one point of time.

The axes of observation are;

- 1) landownership class
- 2) socio-religious group (interaction terms of social groups and religions), and
- 3) interaction terms (of land ownership and socio-religious groups)

The extent of female participation in the labour market is determined in India by a nexus of class/caste hierarchy and norms of patriarchal ideology. In a hierarchical society based on patrilineal-patrilocal families, the location of the family in the caste/class hierarchy would determine the level and forms of female work participation (Bardhan, 1985). This observation encouraged a look into the behaviour of female work-participation of the different socio-religious groups in India. These groups have been constructed from NSS data, which gives the position of the household in the socio-religious ladder. Interaction of these socio-religious groups and land ownership has given the position of the household in the class or socio-economic ladder. Econometric estimation and analysis of the impact of these interaction terms on the work participation of female workers has enabled the study to make certain conclusions about the behaviour of female labour supply. It has provided an insight into the employment aspects of women workers belonging to various land ownership classes of the different socio-religious groups. The need for such a study was felt as there are differences in inheritance and asset ownership legislations among the various social and religious groups in India.

3. DATA AND METHODS

The data used for analysis in this paper were collected as part of the all India quinquennial survey on Employment-Unemployment by National Sample Survey Office (NSSO). The NSSO carries out all India household survey programme about Employment and Unemployment every 5 years called the quinquennial rounds of Employment and Unemployment Survey (EUS). A nationwide enquiry is conducted to generate estimates of various characteristics pertaining to employment and unemployment and Labour Force characteristics at the National and State levels. Information on various facets of employment and unemployment are collected through a schedule of enquiry (Schedule 10) adopting established concepts, definitions and procedures. Based on the data collected during the entire period of survey, estimates pertaining to employment-unemployment in India along with various characteristics associated with them are presented in the reports.

NSSO employs three different methods of determining the activity status of the persons. The first method identifies the Usual Principal Activity Status (called 'Usual Principal Status', UPS) of a person by using a reference period of 365 days preceding the date of survey. A person is considered as being in the Work Force⁴ if he/she is gainfully employed for a major part of the preceding 365 days. The second method considers a reference period of one week (current weekly status) and the third method considers each day of the week (current daily status)⁵. Our study is based on Usual Principal Status (UPS). In the usual status approach, the broad activity status of a person viz. employed, unemployed and 'not in labour force' is decided by major time criterion.

Using employment data from the quinquennial rounds of the National Sample Survey (NSS), several papers/reports have examined the employment situation in India (Dev, 2002; Ghose, 2004; Masood and Ahmad, 2009; Srivastava and Srivastava, 2010; Majumder, 2011; Mehrotra *et al.*, 2012; Shaw, 2013). A major conclusion from these studies is the fact that there has been a marked slowdown in employment growth in the year 2011-12 and that this slowdown is more marked for female employment, both in urban as well as rural areas. These studies provide an insight into a neglected area – the female labour supply process in India (Dasgupta and Goldar, 2005).

While mainly economic factors determine a man's participation in employment, the forces that influence a woman's participation are many and diverse and include demographic, reproductive, social, religious and cultural factors. Hence, the decision to participate in the labour force is influenced by women's individual preferences and/or those of her household, family circumstances. The probability of participating in the labour force is thus modelled as a function of several explanatory variables split into categories: individual characteristics, household characteristics, social characteristics and regional characteristics. The existing literature (e.g. Klasen and Pieters, 2012; World Bank, 2012) suggest that important determinants of participation in India can be education (human capital endowment), family income, socio-economic and cultural factors, access to resources (skills and capital), labour market regulations, and infrastructure. The paper has thus tried to estimate the proximate determinants of the probability of labour force participation for women in rural areas, in section 3.1. The impact of the significant variables is explored. Stratification is done based on class and hence sub group regressions have been performed for the land ownership classes separately, in section 4. An effort has been made to highlight the significant determinants of the different economic classes. The varying importance of the determinants throws light on the interconnected nature of female employment. It is clearly established that only economic variables are not the deciding factors for female labour force participation. A host of other factors work in unison, as is seen in figure 3.1 below.

⁴ (i) WORK FORCE PARTICIPATION RATE (WFPR) or WORKER POPULATION RATIO (WPR) is defined as the number of persons/person-days employed per thousand persons/person-days.

(ii) LABOUR FORCE PARTICIPATION RATE (LFPR) is defined as the number of person/person days in the labour force per 1000 persons/person days. It is the economically active population which supplies labour for production and hence includes both 'employed' and 'unemployed' persons.

⁵ The NSSO has, over time, developed and standardised measures of employment and unemployment. Four different estimates of the Labour Force and Work Force are obtained based on the 3 approaches adopted in the survey for classification of the population by activity status viz: Usual Status, Current Weekly Status And Current Daily Status. These Are:

(i) Number of persons in the labour/work force according to the 'Usual Status' (ps) i.e by considering usual principal activity only.

(ii) Number of persons in the labour/work force according to the 'Usual Status' (ps+ss) i.e. by considering usual principal and subsidiary activity together.

(iii) Number of persons in the labour/work force according to the 'Current Weekly Status' approach &

(iv) Number of persons in the labour/work force according to the 'Current Daily Status' approach

Figure 3.1 : Flowchart showing the determinants of female labour force participation for the year 2011-12 (68th Round) at a glance

3.1 Data arrangement in the paper and methods used

The main data set used in the study is Unit Level Data from the NSSO 68th Round for the year 2011-12, extracted from Schedule 10. Logistic regressions have been performed as the dependent variable takes up a binary value. Independent variables are either categorical or continuous. All the statistical work has been done using the software Stata, version 12. Central Sample has been used throughout the study. Data arrangement being very specific to the sections which deal with the various aspects of the analysis of female employment issues have been explained in detail in the respective sections.

Exact definitions of the variables used for the analysis in this section and the descriptive statistics are presented in Table 3.1 and the logistic regression results are given in Table 3.2. A snapshot of the determinants used in the regression analysis has been provided by the flow chart (figure 3.1).

Table 1: Descriptive Statistics of the Independent Variables

Independent Variables	Description	Proportional Representation

3.2 Dependent Variable

The dependent variable in logistic regression analysis, participation in labour force, is a dummy variable with value=1 if 'in the labour force' and value=0 if 'not in the labour force'

It is important to note that the data on women's labour force participation in developing countries have been highly criticized as resulting in serious omission of women's work due to undercounting (Jain and Banerjee, 1985; Hirway, 2002). Much of this criticism has come from Indian feminists who have worked extensively with the National Sample Survey Office to develop more nuanced measures of women's work including questions on non-remunerative activities that are often encompassed under domestic chores such as farm work and looking after livestock (Das and Desai, 2003).

3.3 Independent Variables

The independent variables of importance and interest are:

- 1) Land ownership [coded as three dummies indicating marginal land owners (0.001-0.40 hectares), small land owners (0.40-2.00 hectares) and large landowners (>2.00 hectares) with landless households being the reference category],
- 2) Caste (coded as three dummies for Schedule Castes, OBCs, Others with Schedule Tribe being the reference category)
- 3) Religion (coded as two dummies for Muslims and Other-Religions with Hindus as the reference categories).
- 4) Several important control variables indicating demographic characteristics of the individual (age, educational level, marital status) and the household (dependence level, income level⁶), regional dummies have been incorporated in the model.

⁶ As NSSO does not provide data on income of the households hence, following normal standard the data on monthly per capita consumption level of the household has been considered.

Table 2: Logit Estimates (Odds-Ratio) of the determinants of labour-force participation of women workers, 15-59 years, Usual Principal Status

3.3.1 Observations

Regression results from table 3.2 can be interpreted in the following manner:

- 1) Older women in the age group of 30 to 59 years have greater probability of participating in the labour force (with women in the age group 30 to 44 being more probable than the ones in the age group 45 to 59) than women in the

age group of 15 to 29 years. This is because after 30s women generally have reduced reproductive responsibilities. In many households, the elder kids take care of the younger ones when the mother goes out to work.

- 2) Care work is always the responsibility of the female hence it is seen that if the household has children less than five years' age or elders above the age of 65 years then the probability of labour force participation lowers significantly.
- 3) For marital status, with 'never married' status being the reference category it is noticed that there is a significantly higher probability of female workers participating in the labour force. Odds ratios are the highest for 'divorced separated' category, highlighting the distress push that such women face which forces them in the labour market⁷.
- 4) Education level of the individual has a significant positive impact on labour force participation. An increase in the education level of the woman causes a higher probability of labour force participation.
- 5) Economic class of the household can either be proxied by the land-ownership or by the monthly per capita expenditure⁸.
 - As the land-ownership of the household increases the probability of labour force participation increases but results are not significant. If the amount of land owned is an indication of the wealthiness of the household then our hypothesis is that with an increasing ownership of land, probability of participation should be less⁹. But results show that there is an increasing probability of participation. This proves that there is some other element which is influencing the labour supply decision of female workers. It will be brought to light in a later section where the participatory process has been explored under the overlap of socio-economic and socio-religious factors influencing female labour supply decision.
 - With an increase in the income of the household the probability of labour force participation of the female worker lowers¹⁰.
- 6) Social groups and religion have a significant effect and results show that there is a lower probability of participation among SCs, OBCs, Others and Muslims.
- 7) Regions present a varied picture with West, North and South showing a higher probability of participation compared to Central and North-East.

Our study seeks to bring forth the gender relations in employment under the social hierarchies. As such a process works under the social stratification of class, caste, gender and religion so in the next section sub group regressions for the different land-ownership classes have been performed to see the determinants which are affecting participation of women in labour force.

4. ECONOMIC CLASS AS A DETERMINANT OF RURAL FEMALE EMPLOYMENT

In this section an effort has been made to elucidate the factors which play an important role in female labour supply decisions in the 68th round, 2011-12. Such an exercise has been performed within the stratification of the economic class. Separate sub group regressions have been run for each land-ownership class to verify if the deciding factors are different for each of the class. For each land-owning class, it seen that a host of varying factors are significant in determining the probability of participation for the women workers. What has also been endeavoured is to check if there is a uni-dimensionality in these factors. The results have established the significant role of multi-dimensionality through the interplay of social, cultural and demographic factors.

45-59	2.80(0.48)***	4.23(0.07)***	3.45(0.09)***	3.29(0.09)***
Marital Status (Ref: Never Married)				
Currently Married	6.15(1.02)***	7.06(0.12)***	12.15(0.35)***	10.07(0.30)***
Widowed	8.47(2.58)***	9.95(0.31)***	10.22(0.51)***	10.74(0.60)***
Divorced/ Separated	5.43(0.05)**	18.59(1.64)***	18.07(2.99)***	42.34(6.22)***

⁷ Similar regressions have been carried out for urban area and the odds-ratio for Divorced and Separated women is positive but not so high. It is 6.40(0.52)***. The results have not been published to economise on space.

⁸ The study considers land ownership only, as it is in the rural backdrop and because of the fact that the stratification according to class has been defined in terms of land ownership. Sub group Regressions have been run for mpee classes in rural and urban areas though, but the results have not been published.

⁹ It maybe due to the 'stigma effect' as mentioned by Goldin (1995) in the U-Hypothesis.

¹⁰ 'Income Effect' as mentioned by Neff *et al.* (2012) and Rangarajan *et al.* (2014)

4.1 Snapshot of the important determinants

Below, a summary of the determinants which are significant in female labour force participation for women belonging to the four categorised land-ownership classes has been provided

Figure 4.1: Significant determinants of female labour force participation for the different land-ownership classes

From Figure 4.1 it is evident that the interconnectedness of social and economic factors play a very important role in determining female labour supply. Gender relations being created in the employment process are not in favour of women. While employment issues in India centrally focus around the category of gender, by mentioning quantitative levels of female employment, the issues of patriarchy, domestic subordination, biological determinism, reproductive norms etc. are not taken into consideration¹¹. These are often informed by the cross-linkages with identities of class and caste. These categories often overlap with gender. The importance of intersectionality has been established which leads us to our next econometric specification.

5. FEMALE WORK FORCE PARTICIPATION UNDER THE OVERLAP OF CLASS, CASTE AND RELIGION

A lot has been studied about the different determinants of female labour supply process in the Indian Economy along a single axis. Studies on female employment need to delve more into the overlap (McBride *et al.*, 2014) of the axes of class, caste and religious identities and the cross linkage of the variables in influencing the decision of female labour supply. This section has tried to focus on this aspect. Economic class has been proxied by land-ownership, caste and religious identities have been proxied by creating socio-religious groups from NSS data¹². Wealth being a stock concept, its availability with the households should affect the decision of the family to send their women folk to work. This would be applicable not only for the current generation but for future as well as the past generations also. So, there would be an intergenerational aspect to this particular determinant of female labour supply. The present section, however, has focussed only at the effect on the present generation of women workers in the 68th Round for the year 2011-12.

5.1 Model and Variables

5.1.1 Total no. of observations in the 68th Round= 4,56,999 individuals

This includes both males and females in rural as well as urban areas. For this specific study only females have been considered and then the data set reduces to 2,23,195 persons. An attempt is made to analyse the employment behaviour of female workers, so the data set consists of working age females in the age group 15-59 years. Now the data set consists of 1,42,776 persons. After adjusting for work-force participation of female workers in rural areas the final data-set is 90,230 persons.

5.1.2 Dependent Variable : $\{P(1,0)\}$ is a categorical one, with binary outcome, where participation is either in workforce or not.

For considering Work-Participation of Female Workers (in the age group of 15-59 years) in the Usual Principal Activity Status the data has been arranged in the following manner:

- 1) Usual Principal Activity Status code 81¹³ (as per NSSO schedule) has not been taken into consideration as that will give us the Labour Force estimate but we are considering Work-Force participation only.

¹¹ <http://vle.du.ac.in/mod/book/print.php?id=13454&chapterid=29812>

¹² Appendix A

¹³ Did not work but was seeking and/or available for work-Upa81

- 2) Usual Principal Activity Status code 91¹⁴(attending educational institutions) has been considered 'out of labour force'(as per NSSO directive),
- 3) Usual Principal Activity Status codes [(92¹⁵,93¹⁶), (94,95,97¹⁷)] have not been taken into consideration as they do not enable us to define work-participation as gainful employment. {These codes describe activities which are not remunerable or done for gainful purposes}
- 4) An observation needs to be made here: Although Upa21¹⁸ defines unpaid family worker yet we have considered it in Work Participation because as landownership increases there is a greater representation of working age women in the family who work as unpaid family labour. Most of the unpaid agricultural (on owned farms) or non-agricultural (in own household enterprise) work is done by female workers of the household. Taking Upa21 into consideration or leaving it out of the definition of Work Participation changes the econometric results for the different socio-religious groups.

Work-Participation= Usual Principal Activity Status [(11¹⁹+12²⁰)+21]+31²¹+[(41²²+51²³)]

Final size of the dataset= 90230(observations). Over this data set describing and testing of the hypotheses is done using the Binary Logit framework.

5.1.3 Independent Variables:

1) Land Ownership:

Is a categorical variable where the classes considered are:

- Land1 = Landless Households (landownership 0.000 hectares), (yes=1; no=0)
- Land2 = Marginal Landowners (ownership 0.001-0.40 hectares), (yes=1; no=0)
- Land3 = Small Landowners (ownership 0.41-2.00 hectares), (yes=1; no=0)
- Land4 = Large Landowners (ownership >2.00 hectares), (yes=1; no=0)

This concept of creating land-ownership categories has also been used by the following researchers in their papers:

- a) P.K. Bardhan (1979); where he has considered three main classes viz, Landless labourers, Small farmers (holdings<2.5 acres) and Large farmers (holding>2.5 acres)
- b) Supriya Garikipati (2006); where she has classified men and women labourers using 'labour class ranks' developed by Bardhan (1979) and DaCorta & Venkateshwarlu (1999). It is based on Roemer's (1982) system and gives three labour classes: Pure Labourers, Labour Plus and Small Farmers.

2) Socio-Religious Groups²⁴ :

NSSO disaggregates data on the basis of social groups and religions. The following socio-religious groups have been created to get a detailed picture of the behaviour of workforce participation.

- Hindu-Others(H-O), (yes=1; no=0)
- Hindu-SC(H-SC), (yes=1; no=0)
- Hindu-ST(H-ST), (yes=1; no=0)
- Muslims(M), (yes=1; no=0)

Other-Religions(Othr-Relgns), (yes=1; no=0) [Includes Christianity-3,Sikhism-4, Jainism-5, Buddhism-6, Zoroastrianism-7, Others-9]²⁵

(3) Interaction Terms:

To get a further disaggregated picture of the work-force participation behaviour of the socio-religious groups, interaction terms of landownership and the socio religious groups have been created in the following manner:

- Lasrg11= Hindu-Others who are landless, (yes=1; no=0)
- Lasrg12= Hindu-SCs who are landless, (yes=1; no=0)
- Lasrg13= Hindu-STs who are landless, (yes=1; no=0)
- Lasrg14= Muslims who are landless, (yes=1; no=0)
- Lasrg15= Other-Religions who are landless, (yes=1; no=0)

¹⁴ Attended educational institution-Upa91

¹⁵ Attended domestic duties only-Upa92

¹⁶ Attended domestic duties and was also engaged in free collection of goods(vegetables, roots, firewood, cattle-feed, etc.), sewing, tailoring, weaving, etc. for household use-Upa-93

¹⁷ Rentiers, Pensioners, Remittance recipients etc.-Upa94, Not able to work due to disability-Upa95, Others(including begging, prostitution, etc.)-Upa97

¹⁸ Worked as helper in h.h enterprise (unpaid family worker)-Upa-21

¹⁹ Worked in h.h. enterprise (self-employed): own account worker -Upa11

²⁰ Employer-Upa12

²¹ Worked as regular salaried/ wage employee -Upa31

²² Worked as casual wage labour: in public works -Upa41

²³ Worked as a casual wage labour In other types of work -Upa51.

²⁴ Refer Appendix A.

²⁵ The steps involved in creating the socio-religious groups have been detailed out in Appendix A.

Lasrg21= Hindu-Others who are marginal landowners, (yes=1; no=0)
 Lasrg22= Hindu-SCs who are marginal landowners, (yes=1; no=0)
 Lasrg23= Hindu-STs who are marginal landowners, (yes=1; no=0)
 Lasrg24= Muslims who are marginal landowners, (yes=1; no=0)
 Lasrg25= Other-Religions who are marginal landowners, (yes=1; no=0)
 Lasrg31= Hindu-Others who are small landowners, (yes=1; no=0)
 Lasrg32= Hindu-SCs who are small landowners, (yes=1; no=0)
 Lasrg33= Hindu-STs who are small landowners, (yes=1; no=0)
 Lasrg34= Muslims who are small landowners, (yes=1; no=0)
 Lasrg35= Other-religions who are small landowners, (yes=1; no=0)
 Lasrg41= Hindu-Others who are large landowners, (yes=1; no=0)
 Lasrg42= Hindu-SCs who are large landowners, (yes=1; no=0)
 Lasrg43= Hindu-STs who are large landowners, (yes=1; no=0)
 Lasrg44= Muslims who are large landowners, (yes=1; no=0)
 Lasrg45= Other-Religions who are large landowners²⁶, (yes=1; no=0)

The Model can be expressed as follows:

Logit x = +

Where x is the probability that an individual participates in workforce;

Logit x= ln

(i=1,2,...,k) are the predictor variables, is the intercept and s are the regression co-efficients.

Table 1: Odds ratios explaining female participation (68th Round)

5.2 Observations

The results of the micro decision making process (table 5.1) as evident from the binary choice model are explored. The model uses land (categorised as marginal, small and large), socio-religious groups (categorised as Hindu-Others, Hindu-SC, Hindu-ST, Muslims and Other Religions), interaction terms of land and socio-religious groups and sector (categorised as rural and urban) as the causal variables.

5.2.1 Model 1

Economic class is not a significant variable in determining whether the women worker will take part in work-force or not.

- 1) Women workers belonging to marginal landowning households have a lower probability of working.
- 2) Those from small and large landowning have a greater probability of taking part in work force.
- 3) There is no inverse relationship between land-ownership classes and female work-force participation implying that the 'income effect' is not at work in the year 2011-12.
- 4) This is mainly due to the presence of Unpaid home based work (Upa21) because when binary logit without including this kind of work in the definition of work participation is performed then results show that there is an inverse relation between the two variables. The tables showing both the regression results have been presented.
- 5) As the ownership of land increases there is a lower probability of women workers working when the 'unpaid work'(Upa21) done by women workers is not considered, but once this work is taken into consideration the work force participation increases with increase in land ownership size.
- 6) This is a representation of the fact that for female workers the decision to participate in work force is not a simple function of economic or social or demographic or cultural factors. There are elements beyond these determinants which must be factored in to get the actual scenario.
- 7) The forces at play in determining whether a women worker will provide labour supply are varying in both the rounds. This proves the fact that unlike for male, female labour force participation is an interplay of a myriad factors. The interconnectedness of female labour is clearly brought out from the results.

Asset ownership laws are varied among the different socio-religious groups in India. To study the impact of such differences we have studied female work-participation behaviour among the various socio-religious groups.

5.2.2 Model 2

We consider Hindu-STs (Schedule tribes who are Hindus) as the reference category for the next section of study involving socio-religious groups as they are least represented in the sample.

- 1) Women workers from Hindu-Others, Hindu-SCs, Muslims (considering Mus-STs, Mus-SCs, Mus-Others and Mus-OBCs) and Other-Religions have a significantly lower probability of taking part in work-force participation, irrespective of the presence or absence of non-remunerative work done on own farm or household enterprise (Upa21) in both the rounds. This proves the importance of caste as a variable in determining the trend of female labour supply. We notice similar results for both the rounds.
- 2) Thus, in the social stratification of class and caste, in the 68th round, class loses its significance and the composition of work done by the women worker gains more importance.

5.2.3 Model 3

The overlap of economic class, caste, religion and gender is studied with the concept of intersectionality by looking at the impact of the interaction of land and socio-religious groups on female work participation. Results are as follows:

- 1) The logistic regression results for Hindu-Others show that women workers belonging to marginal, small and large landownership households have a greater probability of working. Presence of land as a productive asset, which is a form of wealth, is not affecting work participation favourably, i.e. there is no inverse relationship between landownership and Female Work Force Participation Rate among this socio-religious group. This is again due to the presence of 'unpaid work (Upa21)' in the definition of work participation. Although we are not clear yet, about the ownership rights of the available land with the households so we have assumed that the women workers have the same right to ownership as their male counterparts.
- 2) For Hindu-SCs and Hindu-STs, the results show that women workers from marginal, small and large landowning households have a greater probability of working. This is irrespective of whether we are considering Upa21 or not. So the overlap of class, caste and religion determine the employment relations for women workers. An increase in wealth is not affecting the work participation decision favourably.
- 3) For Muslims and Other-Religions too the lower probability of work force participation by women workers, both in case of the presence or absence of Upa21 again reiterates the fact that the Overlap plays an important role in decision making.
- 4) Thus, interconnectedness of economic and social variables play a strong role in determining female work force participation whereas economic variables are stronger in determining male work force participation²⁷.

6. CONCLUSION

Main finding of the present study is that the participation of women in labour force varies across economic classes, social groups, religions, regions and the rural urban divide. Labour force participation is the outcome of both the supply-side factors and the demand for labour. Factors determining labour supply decisions of women are different from those of men. Interconnectedness of female employment with other social parameters which are outside the realm of the standard labour market analysis gets highlighted in the study. This is responsible for creating puzzling trends and patterns in employment data. It is also responsible for the gender gap in labour force and workforce levels. Social and religious background is an important determinant of labour market participation for both men and women. Relative influence of social and religious background is much higher for females (Neetha, 2013). The differences in male and female participation rates, controlling for demographic variables and education is partly explained by this peculiarity of female employment. In fact, women belonging to different social, cultural and religious backgrounds exhibit varying participation rates in the activity statuses enumerated by NSS data. This fact has been corroborated in the paper, where econometric analyses have revealed that women belonging to different socio-economic and socio-religious groups have varying participation rates in the workforce. Large anecdotal evidence suggests that female behaviour in labour market is dramatically affected by their and their household's religious beliefs (Pastore and Tenaglia, 2013). Results of this study depict that socio-religious groups are significant determining factors for work force participation. So, the determinants which are significant for female employment are not on a single axis of consideration, they are always intertwined and manifest themselves along multiple axes. Hence, the gender relations emerging in the employment process are not always in favour of women. It is evident that majority of women in rural areas are subjugate to such relations, i.e. they cannot participate in the labour/work force independent of the relations. Women must decide to participate in the labour/work force within the boundaries of the gender relations which are created in the households or the work place.

Multiple layers of the society are referred to as 'Social Stratification'. The paper has presented an empirical picture of labour market inequalities for women and the inequalities outside, within the framework of such overlapping stratification in rural India. Analysis is based on secondary data, where the emphasis is not only on measurement of quantitative variables, but also on the interactions between various qualitative, socio-economic and socio-cultural dimensions which have an implication on female participation in the labour force. Clear and significant results are obtained when the interaction between landownership categories and socio-religious groups are taken into consideration. The multi dimensionality of the data provides a definite pattern of the employment of women workers within the gender relations created thereof.

²⁷ As a robustness check similar exercises have been performed for male workers (15-59 years). It has been found that class plays an important role in the decision-making process of male labour supply. Caste and composition of work do not have a significance. Overlap does not bring about any changes in the decision-making process. Results have not been published to economise on space.

APPENDIX A

Creation of the Variable 'Socio-religious group'

National Sample Survey (NSS) provides data for

- 1) Social Groups, Codes for which are as follows: ST=1, SC=2, OBC=3, Others=9
- 2) Religion, Codes for which are as follows: Hindu=1, Muslims=2, Others=3

Socio-religious groups created in the thesis:

Hindu-Others (including OBC): This group consists of individuals who are Hindus and belong to Others (non SC, ST and OBCs i.e the upper castes) and OBC social category. This group may be classified as elite because the representation of Others outweighs that of OBCs in this sample. The very small sample size of OBCs among Hindus has encouraged this step of considering them with the Others group, to avoid the problem of micro-numerosity.

Hindu-SC: This group of individuals are Hindu Scheduled Castes

Hindu-ST: They are Hindu Scheduled Tribes. Their representation is the least in the sample and hence this group has been considered as the reference categories in econometric estimations.

Muslims (including Muslim-ST, Muslim-SC, Muslim others and Muslim-OBC): The entire Muslim sample with respect to the different social groups (SC, ST, OBC and Others) is included in this group.

Other-Religion (including Christianity, Sikhism, Jainism, Buddhism, Zoroastrianism, Others): We have clubbed the Other-Religions and considered them as a single group to avoid problems of micro-numerosity.

Proceeding through trial and error final coding in the thesis is;

Religion	Hindu (H)	Muslim (M)	Others
	5	8	9

Social-Groups	ST	SC	Others+OBC
	1	2	3,9

Author's Calculation

Socio-Religious Groups= religion*socio-religious group

=> Hindu-Others (including OBC) = (5*3), (5*9) =15, 45

=> Hindu-SC=10

=> Hindu-ST=5

=>Muslims (Mus-ST, Mus-SC, Mus-Others, Mus-OBCs)= 8, 16, 24, 72

=> Other-Religions (Others-ST, Others-SC, Others-Others, Others-OBC)= 9, 18, 27, 81

APPENDIX B

Interaction term=land-ownership class*socio-religious group

Dummy variables for land classes:

Land1 = Landless Households (landownership 0.000 hectares), (yes=1; no=0)

Land2 = Marginal Landowners (ownership 0.001-0.40 hectares), (yes=1; no=0)

Land3 = Small Landowners (ownership 0.41-2.00 hectares), (yes=1; no=0)

Land4 = Large Landowners (ownership >2.00 hectares), (yes=1; no=0)

Dummy variables for socio religious groups:

Socrg1= Hindu-Others (H-O) , (yes=1; no=0)

Socrg2= Hindu-SC (H-SC), (yes=1; no=0)

Socrg3= Hindu-ST (H-ST), (yes=1; no=0)

Socrg4= Muslims (M), (yes=1; no=0)

Socrg5= Other-Religions (Othr-Relgns), (yes=1; no=0)

Creation of the interaction terms

Lasrg11=land1*socrg1= Hindu-Others who are landless

Lasrg12=land1*socrg2= Hindu-SCs who are landless

Lasrg13= land1*socrg3= Hindu-STs who are landless

Lasrg14=land1*socrg4= Muslims who are landless

Lasrg15=land1*socrg5= Other-Religions who are landless

Lasrg21=land2*socrg1= Hindu-Others who are marginal landowners

Lasrg22= land2*socrg2= Hindu-SCs who are marginal landowners

Lasrg23= land2*socrg3= Hindu-STs who are marginal landowners

Lasrg24= land2*socrg4= Muslims who are marginal landowners

Lasrg25=land2*socrg5= Other-Religions who are marginal landowners

Lasrg31= land3*socrg1= Hindu-Others who are small landowners

Lasrg32= land3*socrg2= Hindu-SCs who are small landowners

Lasrg33=land3*socrg3= Hindu-STs who are small landowners

Lasrg34=land3*socrg4= Muslims who are small landowners

Lasrg35= land3*socrg5= Other-religions who are small landowners

Lasrg41= land4*socrg1= Hindu-Others who are large landowners

Lasrg42= land4*socrg2= Hindu-SCs who are large landowners

Lasrg43= land4*socrg4= Hindu-STs who are large landowners

Lasrg44=land4*socrg4=land4*socrg4 Muslims who are large landowners

Lasrg45=land4*socrg5= Other-Religions who are large landowners.

TRABAJAR POR PROYECTOS EN EDUCACIÓN PRIMARIA: UNA EXPERIENCIA DESDE CIENCIAS

ABSTRACT

Nuestra intervención describe una experiencia sobre el trabajo por proyectos en Educación Primaria y detalla el proceso de enseñanza-aprendizaje realizado en el aula de manera integrada. En este estudio describiremos los principios que justifican el trabajo por proyectos, sus características, las fases de desarrollo y los tipos de actividades que hemos realizado en el tercer Ciclo de Ed. Primaria.

El proyecto –ecosistemas– abarca diferentes contenidos: Los elementos de estos espacios –bióticos / abióticos–, los climas, los animales en peligro de extinción, acciones beneficiosas y perjudiciales y paisajes e, incluso, los textos descriptivos.

Los contenidos se trabajan en grupos cooperativos donde el alumnado (protagonista de su propio aprendizaje) parte de sus intereses individuales y los comparte grupalmente, todo ello, desde una actitud investigadora: Detección y análisis del conocimiento previo, desarrollo de competencias en la realización de actividades que se relacionan con un problema/pregunta motivadora y una producción final donde el estudiante expone los aprendizajes adquiridos.

Finalmente, reflexionaremos sobre los resultados de esta práctica innovadora, mostrando imágenes del proceso y de las exposiciones del alumnado donde el papel de la familia es activo.

Valoraremos tanto las limitaciones y desventajas de llevar este enfoque al aula como las oportunidades y ventajas que nos aporta.

1. INTRODUCCIÓN

“Project Work is a learning experience which aims to provide students with the opportunity to synthesize knowledge from various areas of learning, and critically and creatively apply it to real life situations. This process, which enhances students’ knowledge and enables them to acquire skills like collaboration, communication and independent learning, prepares them for lifelong learning and the challenges ahead”.¹

En un mundo cada vez más globalizado es necesario que nos planteemos que el acceso a la información y la comunicación es cada vez, siguiendo este planteamiento, igualmente globalizado. La información científica, que antes se encontraba en manos de las instituciones, se compartimentaba en las diferentes disciplinas académicas y se almacenaba en soportes tradicionales –como los libros–, ahora se ha transformado sustancialmente, sobre todo tras la aparición de internet y, más recientemente, de las redes sociales que comparten el conocimiento. La escuela ha sido la encargada de transmitir el conocimiento científico a las jóvenes generaciones y, en cierta forma, ha mantenido –adaptada en mayor o menor medida a las edades de los niños–, la tradición de la compartimentación del conocimiento y la forma tradicional de acceder a él.

Los tiempos han cambiado y desde hace mucho tiempo “hacia finales de los años sesenta del siglo XX, se cristalizó un movimiento de científicos y académicos europeos a favor de la interdisciplinariedad como modo de superar la excesiva especialización del conocimiento, en busca de un abordaje de los problemas complejos y en pro de la integración del saber”. (Uribe Mallarino, 2012) Esta situación descrita para el ámbito científico no puede ser obviada por la escuela, sobre todo cuando la educación que se pretende está fundamentada en competencias y no tanto en disciplinas. La irrupción de la teoría de las inteligencias múltiples ha hecho que la visión tradicional de inteligencia adoptada por la escuela esté siendo cambiada, ya que “el mismo currículum para todos los alumnos en el cual todas las personas aprendían de la misma manera y el que no aprendía acorde con lo programado fracasaba en el sistema o era expulsado de éste” (Castro Solano, 2002) no puede ser un referente en la actual sociedad.

¹ Ministry of Education of Singapore. Recuperado el 12/04/17 de: <https://www.moe.gov.sg/education/programmes/project-work>

Desde la incorporación de las competencias básicas en educación, tras la aparición del informe sobre el proyecto liderado por la OCDE denominado DeSeCo (Definición y Selección de Competencias)², allá por 2003, la forma de enseñar y aprender en la escuela ya no debe responder a la manera tradicional. En otras palabras “saber sumar, restar, multiplicar y dividir ya no es suficiente para que un alumno de primaria supere con éxito una evaluación matemática. Si este alumno no es capaz de aplicar estas operaciones a un contexto real de la vida cotidiana, no habrá conseguido desarrollar una de las competencias básicas a las que se orienta el aprendizaje de esta área de formación y por tanto no habrá alcanzado los objetivos de aprendizaje de la asignatura”. (Mateo Villodres, 2010)

Por los motivos expuestos, en el trabajo por proyectos “los alumnos llevan a cabo un amplio proceso de investigación para responder a una pregunta compleja, a un problema o a un cambio. Los alumnos tienen autonomía y capacidad de decisión en el desarrollo de los proyectos. Al mismo tiempo, estos tienen que ser planeados, diseñados y elaborados para conseguir que los alumnos aprendan los contenidos básicos, trabajen las competencias del siglo XXI (como por ejemplo la colaboración, la comunicación y el pensamiento crítico) y creen productos y presentaciones de calidad. En el aprendizaje por proyectos lo más importante no es el producto o resultado final sino el proceso de aprendizaje y profundización que llevan a cabo los estudiantes”. (Pereira Baz, 2014)

El motivo que generó el trabajo por proyectos, en esta ocasión, fue una visita que realizamos a un ecosistema con motivo del Día Mundial de los Humedales (2 de febrero), a propuesta de las actividades para centros educativos que organiza la Consejería de Medio Ambiente y Ordenación del Territorio de la Junta de Andalucía llamadas “Mi marisma, mi escuela”. Previa a la visita, técnicos en Medio Ambiente de la Consejería llevaron a cabo una charla informativa sobre el tema en nuestro colegio, de tal manera que a través de diferentes actividades y juegos, los alumnos pudieron convertirse en exploradores de los espacios naturales para llevar a cabo, al día siguiente, una visita a un ecosistema de marisma cercano a la ciudad de Huelva. Tras la visita, en muchos de los alumnos surgieron preguntas e intereses sobre cómo profundizar en lo que habían visto y continuar investigando algo más.

Nosotros, con esta experiencia, hemos querido llevar a cabo una combinación de estrategias de aprendizaje que facilitaran el desarrollo de competencias, al mismo tiempo que fomentaran la autonomía de los alumnos y la atención a los diferentes ritmos de aprendizaje, a la vez que respondíamos a los intereses de la mayoría de los estudiantes que mostraron su interés en profundizar algo más en estos temas.

2. EL TRABAJO POR PROYECTOS

Importantes autores como Beane (2005)³ o Tann (1991) han definido el trabajo por proyectos o tópicos como “Enfoque centrado en las preocupaciones de los niños, que los involucra de manera activa en la planificación, presentación y evaluación de una experiencia dialogada de aprendizaje”. (Tann, 1991, p. 16)

Sergio Tobón, por su parte, considera que un proyecto es “un conjunto de actividades sistemáticas y elaboradas que se ejecutan para resolver un problema que puede ser una pregunta, una necesidad de aplicar un método para solucionar una dificultad, crear un producto, valorar una metodología de trabajo o el probar una hipótesis”. (Tobón, 2006, p. 1)⁴

Aunque también puede definirse como un “conjunto de diversas actividades relacionadas entre sí que sirven a una serie de intenciones u objetivos educativos. En un sentido amplio, se trata de proponer a los niños/as que se impliquen en la realización de proyectos que respondan a su interés y que tengan sentido para ellos”. (Benítez Sillero, 2008) Para ello, debe ser el profesorado el que busque proyectos que respondan a los contenidos y objetivos deseados en relación con lo que los alumnos propongan y estén en consonancia con los contenidos que se pretenden tratar a lo largo del curso. Situaciones cotidianas o experiencias de los alumnos individualmente o como grupo, pueden servir de motivo generador del trabajo por proyectos.

Así, el trabajo por proyectos “aplicado en los cursos, proporciona una experiencia de aprendizaje que involucra al estudiante en un proyecto complejo y significativo, mediante el cual desarrolla integralmente sus capacidades, habilidades, actitudes y valores. Se acerca a una realidad concreta en un ambiente académico, por medio de la realización de un proyecto de trabajo. Estimula en los estudiantes el desarrollo de habilidades para resolver situaciones reales, con lo cual se motivan a aprender; los estudiantes se entusiasman con la investigación, la discusión y proponen y comprueban sus hipótesis, poniendo en práctica sus habilidades en una situación real. En esta experiencia, el estudiante aplica el conocimiento adquirido en un producto dirigido a satisfacer una necesidad social, lo cual refuerza sus valores y su compromiso con el entorno, utilizando además recursos modernos e innovadores”.

Para nosotros, el trabajo por proyectos es un método que eleva toda la esencia del significado de la didáctica escolar.

2.1 ¿Cuál es su fundamentación?

Francisco Pozuelos (2007, p. 23ss) nos responde a la pregunta ¿Por qué trabajar con proyectos de trabajo? de manera concisa y clara a raíz del contexto, de los recursos, la diversidad, la teoría/práctica, el currículum integrado, la democracia y la fundamentación resumida del beneficio tanto a estudiantes como a docentes: El trabajo por proyectos «abre la escuela al entorno», «incorpora materiales y fuentes de información diversos», «integra diversidad cultural y personal», se aprende y se hace un proceso y un producto, «se trabaja con variados tipos de conocimientos y saberes», permite «una enseñanza como diálogo», «presenta el currículum con sentido y significado» para los alumnos y «promueve el desarrollo y capacitación profesional» para el maestro. Además, el trabajo por proyectos “contribuye a convertir la clase en un espacio de comprensión

y conocimiento compartido”. (Ramos García, 1999, p. 57)

Este tipo de metodología revela una mejora en el aula y su productividad, potenciando aspectos relevantes del proceso de enseñanza-aprendizaje [Tomado de: (Blumberg & Michael, 1992); (Norman & Schmidt, 1992) y otros] como los siguientes:

- El desarrollo de habilidades de autoaprendizaje.
- La adquisición de estrategias generales de solución de problemas mediante la solución de problemas concretos dentro de una disciplina.
- Una mejor selección y uso más frecuente de los materiales de aprendizaje (libros, fotocopias, internet, etc.), con mayor autonomía.
- Aprendizaje de habilidades sociales y personales mediante el trabajo en pequeños grupos. (Robinson, 1993)
- Permite aprendizajes en profundidad y en especial, una mejor comprensión, integración y uso de lo aprendido.
- Ayuda a desarrollar no sólo aptitudes intelectuales, sino también sociales, personales y afectivas que inciden positivamente sobre el rendimiento.
- Familiariza e implica al alumno en situaciones de su práctica profesional.
- Se da tanta importancia a los conocimientos como a los procesos de adquisición.
- Promueve un procesamiento más estratégico y recuerdo de la información a medio y largo plazo.
- A través de la práctica en la resolución de problemas, fomenta la capacidad de solución de problemas de distintos tipos y, sobre todo, estimula una actitud activa hacia la exploración y la indagación.
- Por su carácter multidisciplinar, permite la integración de conocimientos de diferentes campos disciplinares.
- El trabajo habitual, que el estudiante debe realizar de forma autónoma desde el principio (aunque debidamente apoyado y guiado por sus tutores y profesores) le lleva a aprender a aprender, resaltando el papel activo del aprendiz. (Glaser, 1990)
- Autonomía del estudiante. (Barrows & Tamblyn, 1980)
- Aumenta la motivación de los estudiantes.

2.2 ¿Cuáles son sus características?

Benítez Sillero (2008, p. 4) destaca seis características:

- 1) Los temas parten de propuestas o intereses. No se provocan si no que surgen. No tiene por qué elegirlo el niño.
- 2) Se tiene en cuenta tanto lo que sabe cómo lo que quiere saber el alumnado.
- 3) La programación debe ser abierta e ir modificándose en función de cómo evolucione.
- 4) Los tiempos son flexibles y aproximados.
- 5) Los errores se valoran positivamente para que los vivan y aprendan de ellos.
- 6) El proyecto es un fin en sí mismo y no una excusa para impartir contenidos.

Por su parte, Francisco Pozuelos (2007, p. 32) afirma que el Proyecto de trabajo tiene un proceso organizado a través de una tradición innovadora que aborda el currículum partiendo de temáticas relevantes. Considera que está abierto a la participación, a la vez que integra conocimientos diversos y permite una evaluación formativa. Además, añade otras particularidades como las raíces (el legado) bien asentado, lo interesante que resulta para el alumnado y lo significativo que es culturalmente, lo flexible que puede llegar a ser, la oportunidad de conseguir un protagonismo compartido que se apoya a su vez en el proceso y busca resultados dando respuestas fundamentadas a cuestiones importantes.

2.3 ¿Cómo llevarlo a cabo? 5 fases de desarrollo de un proyecto

Cuando se implanta el trabajo cooperativo, debemos tener en consideración que hay, según Guzmán Casas (2009, p. 43s) y Bottoms & Webb (1998)⁵ distintas fases o etapas que deben seguirse para garantizar dicho proceso:

- 1) “*Elección del tema* por parte de los alumnos a partir de las propuestas del docente o de las propuestas de los propios alumnos. En esta metodología es especialmente importante la elección del tema por parte de los alumnos ya que de esta forma podrán elegir problemáticas o inquietudes que les interesen y que conlleven un significado para ellos por lo que su motivación y su interés hacia el trabajo será mayor. Es importante definir un listado con los participantes de cada grupo y su rol dentro del mismo dando la misma importancia y peso a todos los miembros por igual. Resumiendo con Pozuelos Estrada (2007, p. 36) el tema debe ser interesante para el alumnado, relevante a nivel social y pertinente en cuanto al currículum básico.
- 2) *Detección de ideas previas* para conocer lo que los alumnos saben realmente del tema en cuestión. De esta forma el docente se hace una idea del nivel de conocimiento de los alumnos y los propios alumnos realizan su autoevaluación inicial y se dan cuenta del punto del que parten.
- 3) El docente trabaja con los alumnos para *definir los objetivos y el desarrollo del trabajo* en sí mismo que se espera conseguir. Los alumnos deben conocer estos objetivos así como la forma en la que van a ser evaluados por parte del docente y los estándares de calidad y los criterios que debe cumplir el proyecto realizado. También debe existir una descripción y un propósito del proyecto, el docente debe dejar claro de qué manera deben desarrollar los alumnos el problema planteado, proporcionarles técnicas y herramientas para ello. Se deben presentar también una serie de reglas e instrucciones para desarrollar el proyecto como los tiempos y las metas a corto plazo. Básicamente encontramos estas subtareas en la Elaboración del Plan de Trabajo:
 - a) Finalidades y objetivos didácticos.

⁵ Citados en ScolaTIC: Metodología trabajo por proyectos cooperativos. Recuperado el 15/IV/17 de: https://www.scolartic.com/liferaylms-portlet/scorm/10154/10180/8c8bc533-8bdd-4a33-bf59-a43358474609/contenidos/recursos/Metodologia_trabajo_por_proyectos_cooperativos.pdf

- b) Selección y organización de los contenidos.
 - c) Organización del tiempo, el espacio y los recursos.
 - d) Relación de actividades.
 - e) Confección de guías de observación.
 - f) Colaboración con las familias o difusión al resto de la comunidad educativa.
- 1) En la fase de *investigación* los alumnos desarrollan su trabajo, han de tenerse en cuenta los recursos, los tiempos y los espacios empleados donde es especialmente interesante y útil el uso de nuevas tecnologías, por ejemplo.
 - 2) En la última fase se desarrolla la *evaluación* que debe ser continua pero también tangible y tener en cuenta los resultados. También es importante que el trabajo realizado se exponga y sea conocido por todos los alumnos, a la vez que permanezca accesible en todo momento.”

2.4 ¿Cuál es el papel del maestro?

En el trabajo por proyectos es interesante analizar el rol del maestro. Romera Morón y Martínez Cárdenas (2009) no dudan en afirmar que “el docente, cuando trabaja por proyectos, ocupa un papel de escucha activa hacia el alumnado, observando, a través de lo que dice y de lo que hace, qué es lo que le interesa y así alimentar su deseo de aprender y sin desaprovechar las ocasiones que se presenten dentro y fuera de la escuela”.

Vemos que el rol del profesor cambia, no solo en su actividad y su rutina, también en su actitud, su manera de actuar en clase, su forma de evaluar y de planificar. La toma de decisiones ya no solo depende de lo que viene en los programas oficiales o cómo organizan los contenidos los diferentes libros de texto o recursos. Antes bien, los materiales curriculares se ponen al servicio de lo que los alumnos desean aprender. Actualmente, con las nuevas tecnologías, esta labor es mucho más interesante ya que “el docente:

- Debe actuar como facilitador, proporcionando a los alumnos recursos y asesoría a medida que realizan sus investigaciones, dejando que los alumnos recopilen y analicen la información, hagan descubrimientos e informen sobre sus resultados.
 - Está a cargo de la clase. Posee la autoridad y tiene la responsabilidad final por el currículo, la instrucción y la evaluación.
 - Busca reunir toda la clase para aprender y discutir una situación específica (tal vez inesperada) que un alumno o un equipo de alumnos ha encontrado.
 - Utiliza las herramientas y la metodología de la evaluación, y debe enfrentar y superar el reto que impone el que cada alumno construya un nuevo conocimiento en lugar de estar estudiando el mismo contenido de los demás alumnos”.
- (Coria Arreola, 2011, p. 6s)

Las metas, por lo tanto, también muestran un cambio significativo: “El docente ya no tiene como objetivo único o principal estimular la adquisición de contenidos de su disciplina, sino promover el desarrollo de habilidades como el pensamiento complejo y crítico, la cooperación, el liderazgo, la comunicación, la creatividad, el trabajo pluridisciplinar y la toma de decisiones”. (Font Ribas, 2004)⁶

González Gil (2008) trata las funciones del tutor en el aprendizaje basado en proyectos —que aunque para varios autores⁷ no es igual que el trabajo por proyectos, podemos usar algunas de sus características porque son comunes—, diciendo que éstas “van a depender básicamente de dos factores, por un lado, la experiencia del grupo en el trabajo ABP y por otro, de la fase ABP en la que se esté trabajando”.

Lógicamente, cuando el grupo de trabajo sea «novato» o se encuentre en las primeras sesiones del trabajo por proyectos, la función del tutor será más directiva y presencial que cuando dicho grupo ya esté habituado a trabajar con esta metodología (Iglesias, 2002, p. 9).⁸ Progresivamente, el tutor ejercerá una labor menos directiva y dejará que sea el alumno quien adopte un rol más activo. En los últimos cursos de la Educación Primaria, por ejemplo, los alumnos gozarán de materiales de apoyo y control de su trabajo que les servirán para organizarse y autorregularse.

El segundo factor que determinará las funciones del tutor será la fase de la dinámica del trabajo por proyectos que se esté desarrollando. Si bien “no existe una única forma para implementar un proyecto, las experiencias, los materiales, la información, el contexto, son los elementos que delimitan el desarrollo y conclusión que presentarán; sin embargo, es muy importante que se tenga claro el objetivo que se desea cumplir, para que el proyecto se planee y se complete de manera efectiva. Tanto los profesores como los alumnos deben hacer un planteamiento que explique los elementos esenciales del proyecto y las expectativas que se persiguen”. (Coria Arreola, 2011, p. 3)

Además, Sola Ayape (2005)⁹ asume que en el trabajo por proyectos los profesores pueden actuar también como expertos, proporcionando información especializada. Sin embargo, no hay que olvidar que su papel en el proceso es el de modelador y guía pero “sin decir demasiado a los alumnos” ni alentar o imponer soluciones.

Las recomendaciones que propone el Instituto Tecnológico y Estudios Superiores de Monterrey (2003, p. 23) para lograr un buen desempeño en la función del tutor del trabajo por proyectos o el ABP son las siguientes:

- “Sentirse y comportarse como un miembro más del grupo.
- No llevar la dirección del grupo con base en sus propias opiniones, por el contrario, facilitar la dinámica del mismo.
- Asegurarse de que los temas y objetivos de aprendizaje analizados y discutidos queden claros para todos los alumnos.

⁹ Citado en: Open courseware. Equipo Docente en ABP. Facultad de Psicología. Universidad de Murcia. Recuperado el 4/III/17 de: <http://ocw.um.es/cc-sociales/la-metodologia-de-aprendizaje-basado-en-problemas/material-de-clase-1/tema-5.pdf>

- En el momento de hacer cualquier intervención se debe considerar si el comentario ayuda a los alumnos a aprender por sí mismos.
- Ayudar a los alumnos a enfocar los temas centrales de su discusión en lugar de tratar todo tipo de temas al mismo tiempo.
- Recordar a los alumnos de forma periódica lo que se está aprendiendo de tal manera que valoren la experiencia, se recomienda que la intervención sea específica y con ejemplos”.

En definitiva, ser un director o guía del aprendizaje de sus alumnos para que ellos, a la vez que aprenden contenidos, adquieran destrezas que les permiten adquirir competencias y capacidades.

2.5 ¿Cómo es el aprendizaje de los alumnos?

Para Vergara Ramírez (2016, p. 37) “el aprendizaje es una herramienta que permite situarnos en un contexto determinado, dentro de una comunidad específica, y se inserta en un momento preciso –se sitúa en un momento concreto de nuestra historia personal-. Nada que incumpla estas condiciones tiene demasiada oportunidad de permanecer en nuestra memoria. Sin embargo, la enseñanza tradicional parece obstinarse en experimentar modelos que incluyen estos elementos y sigue basada en la transmisión de contenidos estáticos, descontextualizados y ajenos a las personas que aprenden”.

En el trabajo por proyectos partimos de la base de que el contenido que se pretende trabajar está generado desde los propios intereses de los alumnos. De tal manera, al partir de esta situación inicial, como hemos visto antes, los alumnos se sitúan en un momento concreto y en un contexto favorable a adquirir inconscientemente los contenidos, en los que los aspectos emocionales contribuyen a que se adquieran de una forma permanente.

El fin principal es que los alumnos estructuren los conocimientos de forma significativa y de manera autónoma, es decir, como hemos visto con la menor intervención del adulto posible y.

Con esta estrategia de trabajo por proyectos, Trabucco, Benhayón, Fridzon y Weisleder (2006, p. 6) buscan que “los estudiantes no sólo obtengan conocimientos de la materia, sino que también se conviertan en aprendices auto-dirigidos que desarrollen habilidades para la resolución de problemas, las mismas que podrán aplicar en cursos futuros y en sus carreras profesionales”.

2.6 ¿Qué objetivos se buscan?

H. S. Barrows (1986) estableció una serie de objetivos para cualquier versión de ABP o trabajo por proyectos:

- 1) “Estructurar el conocimiento para utilizarlo en contextos clínicos. A pesar de esta formulación clínica, no resulta difícil entender que se trata de orientar el trabajo a construir el conocimiento que hay que poner en práctica, es decir, el conocimiento funcional (en la acepción de Biggs, 1999) característico de cada profesión.
- 2) Desarrollar procesos eficaces de razonamiento clínico. De nuevo enunciado en términos médicos, se refiere a las actividades cognitivas necesarias en el campo profesional de referencia (resolución de problemas, toma de decisiones, generación de hipótesis, etc.).
- 3) Desarrollar destrezas de aprendizaje autodirigido. Nos estaríamos refiriendo a estrategias de aprendizaje, y, de forma especial, de naturaleza metacognitivas o de autodirección, centradas en lo que hace el aprendiz en contextos nuevos (Biggs, 2005)
- 4) Motivación para el aprendizaje. El hecho de que la propuesta de trabajo sitúe a los estudiantes en el contexto de un problema desafiante, que requiere su participación inmediata y que debe explorar de forma auto-dirigida aumenta de forma sustancial la motivación de los estudiantes, que superan la actitud pasiva característica de las aulas tradicionales.
- 5) Desarrollar la capacidad para trabajar en grupo con los compañeros (Biggs, 2005), lo que implica también otras capacidades como la comunicación, la confrontación constructiva de ideas y puntos de vista o la atención a los procesos del propio grupo.”

2.7 ¿Cómo es la evaluación del trabajo por proyecto?

Como se ha adelantado al hablar de las fases del trabajo por proyectos, en la quinta fase de su desarrollo, la evaluación es procesual, continua pero valorando a su vez los resultados y productos finales. Para ello, las exposiciones son una tarea que permite no calificar, si no evaluar lo aprendido, dando accesibilidad, si es posible a todos los alumnos.

Según Dochy, Segers y Sluijsmans (1999), la evaluación debe ir más allá de la medida de la reproducción del conocimiento, ya que las pruebas tradicionales no son apropiadas para formas de aprendizaje que se refieren a la resolución de problemas, la construcción de significados por parte del estudiante y el desarrollo de estrategias para abordar nuevos problemas y tareas de aprendizaje. Es necesario, por tanto, que la evaluación incremente el uso de diversos tipos de elementos para cuya solución los estudiantes tengan que interpretar, analizar, evaluar problemas y explicar sus argumentos.

Por su parte, García Sevilla (2008) da respuesta a cómo evaluar el ABP o el trabajo por proyectos: “Los múltiples propósitos del ABP traen como consecuencia la necesidad de una variedad de procedimientos de evaluación que reflejen los objetivos perseguidos en su totalidad. Por lo tanto, se recurre, por supuesto, a exámenes escritos, pero también prácticos, mapas conceptuales, evaluación de pares, evaluación del tutor, presentaciones orales e informes escritos”.

Considerando que todos deben estar implicados en la evaluación, esta puede “convertirse en una herramienta fundamental para el tutor en el proceso de aprendizaje por varios motivos. Por un lado, puede ayudarle a fomentar el espíritu de equipo para que todos los miembros del grupo funcionen como un todo con un único objetivo, alcanzar el éxito. Por otro lado, la evaluación individual permite a los alumnos reconocer las áreas de conocimiento o las habilidades en las que muestra mayor

deficiencia y les ofrece la posibilidad de corregirlas y mejorarlas (Parikh, McReelis, & Hodges, 2001) así como estimular el crecimiento profesional desde el principio de sus estudios hasta su vida laboral (Dolmans, Van Lwijk, Wolfhagen y Scherpbier, 2006)".¹⁰

A lo largo de las experiencias de trabajo por proyectos se implementan diferentes documentos de autoevaluación, coevaluación, heteroevaluación, desde un punto de vista sumativo y procesual.

3. EXPERIENCIA DE AULA: PROYECTO “ECOSYSTEMS”

3.1 ¿Qué hemos hecho en clase?

Los alumnos de 5º de Educación Primaria del Colegio Santo Ángel de la Guarda (Huelva) han llevado a cabo un proyecto de trabajo multidisciplinar en el que “Los Ecosistemas” han sido el tema de partida.

Para situarnos en el contexto, diremos que en este colegio de Educación Infantil, Primaria y Secundaria, se llevan realizando experiencias relacionadas con el trabajo cooperativo, las inteligencias múltiples y el desarrollo de estrategias y rutinas de pensamiento desde hace aproximadamente nueve cursos escolares. Se comenzó con la formación del profesorado en competencias después de haber hecho un sondeo por parte del equipo directivo. Posteriormente y dada la inquietud de la mayoría de los miembros del claustro, se empezaron a implementar actividades encaminadas al trabajo competencial que incluían metodologías y propuestas didácticas distintas a las tradicionales. En los últimos cinco cursos, se han empezado a poner de manifiesto el diseño de actividades desde las inteligencias múltiples, asociadas al trabajo por competencias y las estrategias y rutinas de pensamiento, así como la organización del colegio en grupos cooperativos.

En el proyecto que vamos a describir, cada grupo cooperativo de clase (4-5 alumnos por grupo), que ya llevan tiempo trabajando, con ligeras modificaciones, desde principio de curso, creó un equipo para trabajar este tópico y decidieron llamarse para esta ocasión de formas originales y relacionadas –en la mayoría de los casos- con el tema principal de estudio (“Los exploradores de los ecosistemas”, “Los 4 del bosque”, “Los naturalistas”...).

Se asignaron, también, los siguientes roles: coordinador, secretario, portavoz y encargado de los materiales. Además de lo anterior, se propuso en la clase un “decálogo del trabajo cooperativo” para que cada grupo tuviera en consideración cuáles eran las pautas a seguir en un trabajo cooperativo, para el que ya habían ido siendo entrenados desde los cursos anteriores con proyectos de menor envergadura y complejidad.

Los roles asumidos son los siguientes:

COORDINADOR/A (Centrado en la tarea) 	• Coordina el trabajo del equipo. Tiene visión general de qué tal vamos • Anima a los miembros del grupo a avanzar en su aprendizaje. • Tiene claro lo que el profesorado quiere que aprendan. • Determina quién debe hacerse cargo de las tareas de los miembros ausentes. Flexibiliza las tareas según necesidades.
SECRETARIO/A (Centrado en el proceso y las relaciones) 	• Procura que no se pierda el tiempo. • Toma nota de las conclusiones del trabajo, las decisiones tomadas,... • Recuerda de vez en cuando, a cada uno, los compromisos personales y, a todo el equipo, los objetivos del grupo. • Rellena los documentos de evaluación del equipo.
PORTAVOZ (Centrado en las relaciones) 	• Habla en nombre del equipo cuando el profesorado requiere su opinión. • Controla el tono de voz. • Se asegura de que todos participan y son tenidos en cuenta.

¹⁰ Open courseware. Equipo Docente en ABP Facultad de Psicología. Universidad de Murcia. Recuperado el 4/III/17 de: <http://ocw.um.es/cc.-sociales/la-metodologia-de-aprendizaje-basado-en-problemas/material-de-clase-1/tema-5.pdf>

MATERIAL (Centrado en el proceso y la tarea) 	• Organiza y custodia los materiales del equipo. • Regula los tiempos. • Se asegura de que los miembros del equipo mantengan limpia y ordenada su zona de trabajo. • Se encarga de la presentación de los resultados.

De los doce grupos con que contaba la clase, diez grupos escogieron un ecosistema distinto (la selva, la taiga, el desierto cálido, los ecosistemas humanizados, bosque mediterráneo, desiertos fríos, la sabana, ecosistema de agua salada, ecosistemas de agua dulce y Doñana –como un ecosistema cercano-) y dos de los grupos eligieron acciones perjudiciales y acciones beneficiosas para el medio ambiente.

Para comenzar el trabajo se formularon, tanto individualmente como grupalmente, una serie de preguntas motivadoras relacionadas con su espacio a estudiar.

Para detectar sus ideas, los alumnos respondieron a dos de las tres preguntas de la rutina de pensamiento K-W-L (¿Qué sé? ¿Qué quiero aprender? ¿Qué he aprendido?): ¿Qué sé? ¿Qué quiero saber?, dejando la tercera para el final del trabajo a modo de resumen que incorporarán al portafolio de cada grupo.

La trama de asignaturas y temas implicados en el proyecto queda recogido en el siguiente cuadro:

Ilustración 1. Asignaturas, objetivos y contenidos implicados en el proyecto

ÁREAS IMPLICADAS Y TEMAS: LOS ECOSISTEMAS				
SCIENCE	SOCIAL SCIENCE	ENGLISH	SPANISH	ART
TEMA: Ecosystems	TEMA: El clima	TEMA: Awesome animals	TEMA: La descripción	TEMA : Los paisajes
OBJETIVO: Saber los elementos de un ecosistema y cómo estudiarlo	OBJETIVO: Conocer el concepto de clima y tiempo atmosférico y su influencia en el medio ambiente	OBJETIVO: Saber describir los animales (características físicas y psicológicas)	OBJETIVO: Reconocer y usar los textos descriptivos	OBJETIVO: Representar las características de los paisajes del natural.
CONTENIDOS: Diferentes tipos de ecosistemas: Terrestres / acuáticos	CONTENIDOS: Influencias del clima en los ecosistemas	CONTENIDOS: Endangered animals / Comparison	CONTENIDOS: Redacción de cuentos sobre animales	CONTENIDOS: Elementos naturales y animales en movimiento

Partiendo de las Ciencias Naturales (Science), los alumnos investigaron sobre sus ecosistemas con total libertad y, con la ayuda de la biblioteca del centro y el aula de informática, encontraron libros y documentos en la web que les ayudaron a tener más información sobre su objeto de estudio que la que podían encontrar en sus libros de texto: cómo era la vegetación, la población animal y otros elementos. Además, por ellos mismos, empezaron a traer información impresa desde casa. El esquema básico de la información que tenían que aportar fue:

Ilustración 2. Imagen tomada del libro de texto. Science 5 -editorial SM-

La información aportada debía ser expuesta en un mural con el siguiente aspecto (ilustraciones 3, 4 y 5):

Ilustración 3. Modelo de mural con la información

POSTER DE TRABAJO ECOSYSTEMS					
ECOSYSTEM		COLD DESERT	HOT DESERT	TIGA	RAIN FOREST
PLACE					
BIOLOGICAL COMPONENTS	ANIMALS				
	PLANTS				
ABiotic COMPONENTS					
WEATHER					
OTHER ELEMENTS					

Ilustración 4. Alumnos trabajando en el mural

Ilustración 5. Otro aspecto del mural. Acciones beneficiosas y perjudiciales para el medio ambiente

Como complemento a lo anterior, desde la asignatura de Ciencias Sociales se aportó la información sobre el clima como uno de los elementos que va a condicionar y a su vez condiciona, cada ecosistema. Para ello se explicaron conceptos básicos sobre el clima y el tiempo atmosférico y se realizaron actividades que se añadieron a la carpeta de aprendizaje. Cada grupo investigó el clima típico de su ecosistema, haciendo su climograma correspondiente y estudiando las características de cada lugar, el tiempo y sus ubicaciones exactas.

Ilustración 6. Alumnas trabajando en el mural

Los contenidos se han tratado en inglés y español debido a que la asignatura de Ciencias Naturales se imparte en inglés –debido a un proyecto de anticipación del bilingüismo– y se han complementado con el tema de la asignatura de Lengua Inglesa. Por este motivo, dentro de cada ecosistema los alumnos investigaron los animales en peligro de extinción, tema que se corresponde con la asignatura de Inglés, dentro del tema que se organizó y programó para que coincidiera con el proyecto. En el tema los alumnos aprendieron a describir animales –recordando lo tratado en 3º EP sobre este mismo tópico– y tuvieron que aplicarlo a lo que estaban tratando en el proyecto. Para ello, cada alumno seleccionó un animal en concreto y describió sus características en esta segunda lengua completando la siguiente ficha:

Ilustración 7. Modelo de ficha para describir el animal en peligro de extinción

My endangered animal	
Where do they live?	
Appearance (physical description)	
What do they eat?	
Character	
Why are they in danger?	
How do they compare with another animal?	
How many are there today?	

En la asignatura de Lengua Castellana y Literatura se trataron los textos descriptivos (paisajes o animales), que sirvieron para confeccionar los textos que debían aportar a la gran presentación final del trabajo. Esta presentación final incluye dos sesiones para que los grupos de 5ºA y B presenten su proyecto al resto de los compañeros y, también, para que los alumnos presenten sus trabajos a las familias, a través de una tarde de encuentro en la que tendrán la oportunidad de compartir todo lo que han hecho a lo largo del proyecto.

En cuanto a la competencia artística, cada alumno dibujó una representación de su ecosistema, haciendo un acuerdo previo con su grupo, de forma que, entre todos lograron plasmar diferentes imágenes y paisajes de su objeto de estudio. El alumnado contó de nuevo con libertad de actuación (ilustraciones 8, 9 y 10). Para este tema pudieron buscar imágenes de los ecosistemas y plasmarlas de la mejor manera posible siguiendo las indicaciones del profesorado. La mayor parte de los alumnos optó por los dibujos coloreados con lápices de colores o ceras, aunque la técnica se propuso como libre, a elección de cada grupo.

Ilustración 8. Dibujo de un ecosistema humanizado

Ilustración 9. Dibujo de un ecosistema: taiga**Ilustración 10. Dibujo de un ecosistema: desierto cálido**

Aunque no fue objetivo de este proyecto incluir contenidos en lengua francesa —que se ha incorporado por primera vez al currículum de Educación Primaria en este curso—, los alumnos tuvieron la inquietud de preguntar al profesor de Francés sobre cómo se decían los diferentes ecosistemas en dicha lengua y lo aportaron a sus portafolios de grupo.

Hay que mencionar el esfuerzo de dos grupos que no seleccionaron un ecosistema en sí. Estos optaron por “Las acciones beneficiosas” y “Las acciones perjudiciales” para los ecosistemas, ya que tuvieron que adaptar algunos de los contenidos que debían trabajar y también la forma en la que van a presentar los contenidos.

En estos dos grupos, los alumnos centraron su atención en las acciones negativas o positivas y sus consecuencias. Ambos investigaron de manera distinta al resto. En lugar de estudiar los animales en extinción de un ecosistema en concreto, estos grupos aportaron información sobre la población animal que beneficia o perjudica al medio ambiente y al ser humano, dando una perspectiva diferente, al igual que lo hicieron respecto al clima, tratando el calentamiento global. A través de los ojos de los niños y sus capacidades artísticas, lograron poner de manifiesto muchas de las consecuencias de la sociedad consumista, de los pequeños gestos que cambian al mundo, plasmado en diferentes dibujos e incluso en una maqueta que hizo el grupo de las acciones perjudiciales para el medio ambiente.

Toda la información que han ido recogiendo y elaborando de las diferentes áreas, se incluyeron en una sola carpeta llamada “Our project: Ecosystems”, en las cuales los alumnos fueron controlando su propio conocimiento y descubrimientos y donde pudieron evaluar el proceso de las tareas e investigaciones. Además de esto, han plasmado la información en los dibujos y en el mural donde cada grupo pudo ver qué había hecho y cómo lo habían hecho los demás grupos.

Llegados a este punto, nos planteamos el porqué de una carpeta de trabajo o portafolio. El profesor Pozuelos Estrada (2007, p. 39) lo considera un elemento básico y útil para la evaluación, tanto del profesorado como del alumnado porque “consiste en un instrumento práctico destinado a compilar las variadas producciones y actividades que se efectúan a lo largo de la experiencia. Es por naturaleza bastante flexible y abierta a progresivas mejoras como consecuencia de las interacciones vividas y sugerencias expuestas. Reúne, por tanto, las aportaciones y evidencias inicialmente en versión provisional hasta que, al final, se exponen en su composición definitiva”.

Como ya hemos comentado anteriormente, como productos finales cabe reseñar las dos actividades realizadas como síntesis de este proceso. La primera de ellas, la creación de un resumen-mural (ver ilustraciones 3, 4 y 5), donde los alumnos reflejaron una síntesis de sus trabajos, para ello, completaron varios puntos: Clima y lugar, plantas y animales (componentes bióticos), componentes abióticos, y otros elementos (en donde los alumnos añadieron informaciones que consideraron relevante).

El mural ocupó una pared del pasillo existente entre ambos 5º, de manera que cualquier alumno pudo leer y conocer los puntos claves de los ecosistemas que habían estudiado sus compañeros, no solamente de clase, si no de curso. Este mural

sirvió también para detectar lo aprendido. Para las exposiciones orales, el mural se trasladó a la sala donde se realizaron, acompañando de la exposición de dibujos sobre los ecosistemas que habían hecho en las clases de Ed. Plástica.

La segunda actividad a destacar es la tarea de antes y durante la exposición final, en la cual los alumnos presentaron su ecosistema frente a los demás compañeros y profesorado y bajo la mirada de los padres (la presentación a las familias se desarrolló por la tarde, para facilitar la asistencia de los padres). Para su realización, los alumnos decidieron optar por crear una presentación en Impress (Openoffice) (ver ilustración 11) -aunque algunos grupos lo complementaron con carteles y maquetas-, dándole un mayor toque visual y explicativo a lo que narraron por grupos.

Para realizarla, los alumnos tuvieron que poner en práctica la Competencia Digital con la que, en principio, no contaban, ya que no todos sabían manejar programas para hacer presentaciones de diapositivas. Gracias a la colaboración de dos alumnas de prácticas¹¹, los alumnos pudieron llevar a cabo esta actividad en la que se adentraron en el mundo de las diapositivas. Guiados por sus propios intereses y por la forma de organización que decidieron en el grupo, fueron añadiendo la información que querían transmitir oralmente. Durante la exposición, el alumnado puso en marcha la competencia en comunicación lingüística desarrollando de la expresión oral y escrita, su capacidad de transmisores de conocimientos y fueron capaces de responder preguntas lanzadas por los compañeros y por los padres, creando una interacción con agentes que normalmente no están dentro del aula.

Otro elemento a destacar de la exposición y comunicación oral de los estudiantes, trabajando por proyectos, ha sido la capacidad de organización realizada por ellos mismos, mediando las diferentes intervenciones y logrando que todos los miembros del grupo hablasen por igual.

3.2 ¿Cómo han trabajado los alumnos?

Partimos de la pregunta ¿por qué hacer que los alumnos investiguen? La respuesta idónea la tiene Tonucci (2010) el cual considera que la investigación es la actividad natural en el niño para aprender. “La simple observación nos muestra cómo el niño empieza a conocer con la técnica de la investigación, a través de la experimentación, del tanteo y del error, etc. De hecho es el método de la ciencia; se trata de reelaborar creativamente la información que se posee, probar, intentar, verificar, comparar... Esto lo hace el niño desde que nace, hasta que la escuela interrumpe ese modo de conocer imponiéndole otro, ajeno y clasista y determinado por opciones políticas de clases dominantes que imponen un modelo escolar literario y verbalista. En ese modelo incluyo una cierta moda de la investigación, que traduce todo lo positivo de ésta en mera retórica literaria”.¹²

Mediante los proyectos de trabajo, los alumnos son los encargados de gestionar los materiales con los que trabajan y qué les es interesante y qué no para conseguir sus fines. El trabajo por proyecto en grupos cooperativos invitó de manera implícita, a un reparto de las tareas y temas a investigar, es decir, además de aprender contenidos, los alumnos también aprendieron a autorregularse y planificar las tareas, de tal manera que se promocionó la distribución y ordenación de trabajo de aula. De esta forma, consideramos que las competencias para aprender a aprender y sentido de la iniciativa y espíritu emprendedor se pusieron de manifiesto, así como las inteligencias intrapersonal e interpersonal.

Para ayudarles en la organización del proyecto, entregamos a los alumnos diferentes fichas en las que ellos tuvieron que detallar la labor de cada miembro del grupo: quién haría los resúmenes, quién traería fotos, quién escribiría los documentos para el póster, quién haría la presentación en el ordenador, etc.

Debemos resaltar que los alumnos fueron descubriendo que, de lo que se planea a lo que se llega a hacer realmente, hay una gran distancia. Ya que el propio proyecto fue sugiriendo nuevas tareas y funciones que, de primera mano, los estudiantes desconocían y que tuvieron que ir negociando a medida que el proyecto iba tomando forma.

Creemos que la palabra que mejor define el papel del alumnado es «libertad». A pesar de realizar tareas guiadas, los alumnos han manejado su propia información y han plasmado lo que ellos mismos querían resaltar, aspecto que se ve reflejado en las dos tareas mencionadas como actividades destacadas. Este punto es interesante discutirlo porque los alumnos, aunque han tenido una trayectoria de trabajo en grupos cooperativos y han sido entrenados en miniproyectos, suelen estar acostumbrados a actividades guiadas y donde tenían poco margen de actuación. Ahora han tenido que gestionar las tareas y también han tenido que negociar entre ellos cómo debían realizarlas. Esto ha servido, además, como ya hemos planteado, para que surgieran iniciativas y nuevas tareas que –a manera de retos- ellos han ido generando.

Se podría afirmar que los alumnos, en esta ocasión, han sido los mayores encargados de construir sus propios conocimientos, ya que no han tenido solo tareas en las que las respuestas podían ser buscadas en su propio libro de texto, sino que han tenido que manejar diferentes fuentes documentales e, incluso, han solicitado la ayuda de expertos para poder finalizar algunas actividades.

Al tratarse de un trabajo por proyectos cooperativo, los intereses individuales se han adaptado a los continuos consensos grupales, planteando metas de manera conjunta e intentando contentar y realizar todas las ideas que se iban aportando.

Además, el ritmo de trabajo y los distintos estilos de aprendizaje también marcaron la diferencia entre unos grupos y otros. Algunos, no se conformaron con realizar su comunicación oral apoyándose en el recurso de Impress (Openoffice) sino que crearon otros materiales, trabajando más pero logrando una mejor explicación, presentación y exposición.

En definitiva, el papel del alumno ha sido activo y protagonista durante todo el proceso.

¹¹ Una de Magisterio en Educación Primaria –que ha participado desde el principio en la elaboración del proyecto- y otra del Máster en Comunicación y Educación audiovisual –que se incorporó más tarde-.

¹² Fragmento de una entrevista realizada a Francesco Tonucci en 2010. Recuperado el 3/III/17 de: <https://colectivoeducadores.files.wordpress.com/2010/02/francesco-tonucci-investigar-en-la-escuela.pdf>

Ilustración 11. Alumnas realizando la presentación en Impress (Openoffice)

Además de lo anterior, consideramos que el trabajo por proyectos respeta los diversos ritmos de trabajo de los alumnos y facilita que ellos se sientan parte del equipo y que puedan contribuir al producto final, cada uno desde sus propias capacidades, entendiendo que es el resultado final lo que importa y que este depende del compromiso personal con la tarea.

3.3 ¿Cuál ha sido el papel del maestro?

La labor del docente en esta experiencia ha sido principalmente la de observar y guiar, aunque el papel del maestro como ayudante organizativo también ha sido esencial.

Este proyecto ha sido liderado por los dos profesores de Ciencias Naturales y Sociales (uno en 5º A y otra en 5º B), contando con la colaboración de los demás profesores de las demás áreas de la siguiente forma:

- Profesor de Lengua Extranjera (Inglés): imparte en los dos grupos y también CCNN, CCSS y Plástica en 5ºA.
- Profesor de Plástica y Lengua Española en 5ºB.
- Profesora de Lengua Española en 5ºA.
- Alumnas de Prácticas que han colaborado en los dos grupos, ejerciendo –a veces- de enlace entre las diferentes actividades.

Los profesores, trabajando en equipo, han sido los encargados de controlar las tareas, de marcar límites de tiempos, de elaborar y entregar fichas que ayudaban a la organización grupal de los estudiantes, así como la difícil tarea de corregir y valorar todo lo que el alumno produce y recoge en su carpeta de trabajo, además de evaluar los productos finales.

Aunque el alumno haya sido el protagonista de esta experiencia, los maestros, por su parte, han sido piezas fundamentales de este puzle educativo, destacando sobre todo la guía y la ayuda que ha aportado al aprendizaje del niño. Esto no hubiera sido posible sin la coordinación del equipo docente.

3.4 ¿Y el rol desempeñado por la familia?

Desde el primer día, los familiares han contribuido aportando informaciones impresas e imágenes a sus hijos. Durante esta experiencia, el papel de este agente externo ha sido clave por contribuir mediante libros, información oral, etc., pero es al final del proceso cuando su labor ha sido más activa, gracias a la asistencia a la exposición final.

Dicha exposición se convirtió en una interacción de alumnos-padres, en la que en algunos momentos, rozando casi el debate, las familias pudieron ver lo que sus hijos habían aprendido con la realización de este proyecto.

Esto último es interesante porque cuando las familias se enfrentan a situaciones de aprendizaje de sus hijos en las que ellos no pueden monitorizar –en la mayoría de los casos- qué están realizando estos en clase, porque no son las actividades que tradicionalmente han venido realizando, o porque no hay lecciones que memorizar y luego demostrar que se saben mediante un examen, se generan incertidumbres. Por este motivo, decidimos hacer este encuentro con los padres, para que pudieran ver que los niños están aprendiendo y que es momento de dejar ciertos espacios de libertad a los niños para que gestionen su propio aprendizaje.

Cabe destacar que los padres también contribuyeron a la evaluación de la experiencia ya que dispusieron de una ficha para evaluar las exposiciones que sirvió para la retroalimentación y contribuirán para mejorar algunos aspectos para próximas actividades o proyectos.

4. REFLEXIÓN DE LA PRÁCTICA INNOVADORA

4.1 ¿Cuáles han sido las limitaciones o desventajas encontradas?

Implementar nuevas formas de enseñanza-aprendizaje siempre es complejo. A pesar de la coordinación e implicación de los docentes y la predisposición de los alumnos, siempre hay discrepancias entre lo que se programa y lo que en realidad se

obtiene. A lo largo de este camino nos hemos encontrado con la complejidad para planificar y llevar, en cierta medida, un ritmo similar entre ambas clases, a pesar de la buena coordinación y contacto continuo entre los dos maestros implicados. De la misma forma, no todos los grupos de alumnos han aprovechado el tiempo de la misma forma o se han coordinado para conseguir resultados similares al final.

Según el Instituto Tecnológico y de Estudios Superiores de Monterrey (2003, p. 31),¹³ las principales dificultades y barreras para poner en práctica el el trabajo por proyectos o el ABP son las siguientes:

- Es una transición difícil: esta técnica didáctica no puede implementarse rápidamente y es necesario un estudio previo de las condiciones y ver qué situaciones pueden ser planteadas así y cuáles no.
- Requiere una modificación curricular: es necesario que los contenidos puedan abordarse de una forma distinta, desde muchos ángulos, con mayor profundidad, desde diferentes disciplinas. Para ello hay que contar con un equipo docente abierto a hacer estas modificaciones.
- Se requiere más tiempo: en el ABP no es posible transferir información de manera rápida como en métodos convencionales. Al trabajar con ABP se requiere más tiempo para lograr los aprendizajes y para planificar la enseñanza.
- El trabajo por proyectos o el ABP es más costoso: en la medida en que se requiere mayor capacitación y tiempo para lograr los objetivos de aprendizaje.
- Los profesores carecen de la habilidad de facilitar: la inercia hacia continuar siendo el centro de la clase y exponer la información es muy fuerte. Las competencias para hacer de guía en lugar de ser el transmisor del conocimiento son difíciles de conseguir porque, en la mayoría de las ocasiones, hemos aprendido así y en la formación inicial de los docentes se mantienen estas formas.

En nuestro caso, la formación inicial del profesorado no ha sido obstáculo porque ya se ha participado en acciones de educación permanente en las que ha estado implicado todo el claustro. No obstante, algo muy notorio ha sido la dificultad a la hora de controlar y manejar el tiempo de cada tarea y su realización. Por una parte, los niños están acostumbrados, aunque hayan hecho otros trabajos de grupo o cooperativos, a que los tiempos los organicen los profesores y sean ellos quienes programan qué tarea y en qué tiempo debe ejecutarse. Por otra parte, quizás las más notable, han sido las dificultades e inconvenientes de trabajar en grupos cooperativos. Por ejemplo, cuando hay tareas motivadoras a repartir, se generan enfrentamientos (manejo de las TICs para la presentación en Impress –Openoffice–) para ver quién la realiza y cuando existe alguna tarea menos emocionante o más tediosa, el alumnado tiende a evitarla, llegando, en algunas ocasiones a una peor ejecución de dicha tarea.

Dejar fluir todos los intereses de los alumnos al completo puede conllevar desorganización, y de esto al caos, por lo que hay que ofrecer el apoyo suficiente y también algunos instrumentos que favorezcan la organización de los grupos.

Otras dificultades que hemos observado en el trabajo de los alumnos son:

- Poca implicación personal en el trabajo en equipo porque prefieren el trabajo individual.
- La participación y aporte de recursos/trabajo no es homogénea –de ahí que es importante la coevaluación y la heteroevaluación–.
- Algunos alumnos están demasiado acostumbrados al trabajo tradicional y tienen dificultad para manejar el reto que les supone tener que organizarse con iguales.
- Abundancia de información a la que se puede acceder en la actualidad (uso de las TICs), que les dificulta el proceso de selección de la información relevante para cubrir aspectos del proyecto a realizar.
- Discrepancias entre la tarea a realizar y lo que realmente se pide. Algunos estudiantes consideran que hacer la actividad supone una evaluación positiva, independientemente de que esté bien realizada o que realmente responda a lo que se pide. Por este motivo hemos introducido la autoevaluación en el proceso.

4.2 ¿Qué ventajas y oportunidades de aprendizaje hemos encontrado durante la experiencia?

El trabajo por proyectos ha permitido abordar temas importantes que no se adhieren a una materia concreta, como por ejemplo, el tema de la contaminación de Huelva, la acción humana de la fábrica que han trabajado los alumnos de los dos grupos que no escogieron un determinado ecosistema.

Ha favorecido el alejamiento del libro de texto como única fuente de información, incorporando actividades no habituales y motivadoras como la creación de una presentación en Impress (Openoffice) o tener que comunicar sus resultados a otros compañeros y a los padres.

Ha fomentado el trabajo en grupo y todo lo que eso conlleva, los estudiantes se han sentido parte de un equipo que debía cumplir ciertas metas, y pusieron en funcionamiento una serie de estrategias cognitivas complejas de manera conjunta, como planificar, consultar, concluir, informar... Todo ello apoyado en la realización de tareas que les han permitido pensar en cómo aprenden. Los alumnos han contado con estrategias y rutinas de pensamiento, así como un cuadro con la taxonomía de Bloom y una caja de herramientas de las inteligencias múltiples (ilustración 12) donde han podido ir analizando qué hacían y qué estaban desarrollando en cada momento –todo ello monitorizado por el profesorado.

¹³ Tomado parcialmente de: <http://www2.uca.es/ordenacion/formacion/docs/jifpev4-documentacion.pdf>

Ilustración 12. Caja de herramientas de las inteligencias múltiples

La relación familia-escuela se ha potenciado fácilmente con esta metodología, y ha permitido acercar a los padres el conocimiento que adquieren sus hijos en el entorno escolar, estimulándoles a la hora de demostrar lo aprendido en clase.

Ha ofrecido un enfoque más personalizado y adaptado a los intereses de los alumnos, logrando también autonomía y responsabilidad durante todo el proceso.

Ha conseguido que el alumno sea dueño de su propio conocimiento a la vez que ha fortalecido su actitud investigadora.

Ha logrado unir diferentes materias del currículum oficial en un mismo compromiso.

Ha permitido atender a la diversidad partiendo del autoconocimiento –cada alumno ha sido consciente de qué podía aportar al grupo y ha trabajado en la medida de sus posibilidades y adecuando el trabajo a su propio ritmo-. El trabajo por proyectos “no sólo representa una opción eficaz para la adquisición de conocimientos sino también para la socialización del alumnado, para la integración del currículum y para la atención a la diversidad en contextos complejos”. (Trujillo Sáez, s/f, p. 15)

4.3 ¿Cómo valoramos este proceso de enseñanza y aprendizaje?

Trabajar por proyectos el aprendizaje es algo más que acumular información y salir victorioso de los típicos rituales académicos, y es que, de esta forma, los alumnos aprenden porque quieren y lo que quieren.

La competencia en Comunicación lingüística se ha visto reflejada en todo momento, especialmente en las dos áreas de la lengua (primera y segunda) donde los alumnos aprendieron a redactar textos descriptivos y formas verbales adecuadas tanto en inglés, como en español. Además, aprendieron el nombre de sus ecosistemas en francés. De esta, destacamos la tarea de la exposición final, donde los alumnos, a través de la inteligencia lingüística-verbal, pusieron todo su esfuerzo en el acto de la comunicación oral.

Las competencias a destacar del trabajo por proyectos, además de las mencionadas anteriormente, son la competencia de Aprender a aprender y la competencia de Sentido de iniciativa y espíritu emprendedor, por motivos nombrados anteriormente. Por su parte, se ha contribuido, además, al desarrollo de las inteligencias lingüístico-verbal, la intrapersonal –para tareas organizativas y reflexivas-, interpersonal –a la hora del trabajo grupal-, la visual-espacial –a la hora de representar gráficamente los ecosistemas y de presentar la información en el mural y en las diapositivas- y, por último, la lógico-matemática –a la hora de secuenciar las actividades, organizar los materiales,...

Finalmente consideramos que la competencia de Conciencia y Expresiones Culturales ha resaltado en los grupos de trabajos que tenían como objeto de estudio las acciones positivas o negativas para el medio ambiente, aunque todos los grupos han desarrollado su inteligencia más naturalista, demostrando también Competencias Sociales y Cívicas en la forma de organizarse y llevar el proyecto adelante mediante la planificación y la negociación.

A pesar de la dificultad a la hora de planificar acorde a los intereses de todos los alumnos, esta experiencia ha servido para desconectar de la rutina y ofrecer una manera distinta de enseñar y aprender a todos y cada uno, gracias también, a la asunción y adaptación de roles, la cual ha venido de la mano con el sentido de la responsabilidad. En general ha sido valorada positivamente por los alumnos que han manifestado, en sus evaluaciones, volver a repetir esta forma de trabajar. También, cómo no, ha servido para que el profesorado ponga de manifiesto otras competencias docentes.

Para próximos cursos volveremos a repetir el Proyecto «Ecosystems/Ecosistemas» porque ha logrado un aprendizaje significativo y ha desarrollado todas las competencias establecidas para Educación Primaria, incluida la Competencia digital, -aunque más específicamente se trata en una asignatura que los alumnos no tienen hasta llegar a 6º curso de EP- y ha desarrollado las inteligencias múltiples.

BIBLIOGRAFÍA

INFORME DE TRABAJO DE UNA TAREA EN GRUPO
ECOSYSTEMS

Tarea _____

Nombre y nº de los alumnos _____

Nombre del grupo: _____

NORMAS PARA ELABORARLO: Este documento tiene como objetivo que expliquemos por escrito todo el trabajo que hemos hecho durante el desarrollo de una tarea. Será redactado por el secretario, pero todos deberemos revisar el resultado final. Este documento será parte del trabajo de la tarea. El profesor decidirá cómo recogerlo y evaluarlo. Se puede usar la parte de atrás.

Puntos del informe:

Planificación de la tarea (Contenido, formatos, distribución de tareas dentro del grupo ...).

I

Búsqueda de Información (Contenidos investigados, fuentes de información consultadas, información extraída).

Elaboración del producto o proceso (Explicación de la creación que se ha hecho contenidos, formato ...).

Presentación pública (Medio elegido para su difusión. Si se lleva a cabo una exposición oral o la creación de un recurso, debe incluirse un guión o estructura de los aspectos que se van a informar).

Valoración (Evaluación del producto o proceso final a partir de los puntos de la rúbrica de evaluación).

DOCUMENTO DEL ALUMNO AL INICIAR UNA TAREA - 2

ECOSYSTEMS

PRODUCTO FINAL:	ALUMNO:	FECHA:
¿Qué producto quiero/quremos construir?		
¿Qué pasos tengo/tenemos que dar?		
¿Qué espero/esperamos aprender al elaborar este producto?		
¿Hago/hacemos revisiones de lo que estamos aprendiendo?, ¿utilizamos alguna forma de recoger lo que vamos haciendo?		
Necesito/necesitamos demostrar lo que hemos aprendido haciendo:		

EVALUO LA EXPERIENCIA DE AULA ECOSYSTEMS

Nombre del alumno: _____ nº: _____

GRUPO: _____

- 1.- ¿Te ha gustado trabajar en este proyecto?, ¿Por qué?

- 2.- ¿Crees que has aprendido a través de las actividades y tareas que has ido realizando?
Razona la respuesta.

- 3.- ¿Cómo te has sentido? (contigo mismo, con tus compañeras, con el profesorado)

- 4.- ¿Volverías a trabajar de esta manera en el aula? ¿Por qué?

- 5.- ¿Qué es lo que más te ha gustado? ¿Por qué?

- 6.- y... ¿lo que menos? ¿Por qué?

- 7.- ¿Cuáles son los problemas u obstáculos que habéis encontrado para el logro de los resultados previstos en el proyecto?

- 8.- ¿Has trabajado bien en tu grupo?

- 9.- ¿Has participado en todas las decisiones adoptadas por tu grupo?

- 10.- ¿Qué cambiarías para mejorar?

GUÍA PARA LA AUTOEVALUACIÓN

ECOSYSTEMS

Nombre: _____ N°: _____

GRUPO: _____

Ahora se trata de que nosotros mismos evaluemos el trabajo que hemos realizado durante este proyecto.

1. Rellena la siguiente autoevaluación:

ASPECTOS A TENER EN CUENTA	Siempre	La mayoría de las veces	Ocasional-mente	Pocas veces
Participé responsablemente				
Cumplí los plazos				
Aporté ideas, fuentes de consulta, otros...				
Cuidé los materiales de trabajo				
Contribuí a que otros participaran				
Escuché y valore el trabajo de mis compañeros				
Lleve todos los trabajos al día				

2. Señala tres cosas que has aprendido al trabajar este tema y que antes no sabías:

1. _____

2. _____

3. _____

3. Señala las actividades que más te sirvieron para poder aprender.

1. _____

2. _____

3. _____

OTROS ASPECTOS QUE QUIERAS APORTAR Y QUE NO HAYAS SENALADO YA:

TABLA DE EVALUACIÓN GRUPAL (miembros del grupo)

ECOSYSTEMS

NOMBRE DEL GRUPO: _____
¿QUÉN EVALÚA? _____

	NOMBRE DE LOS COMPONENTES			
Acepta el reparto de tareas				
Es responsable con la parte de trabajo asignada				
Participa en las discusiones de grupo aportando ideas, clarificando...				
Escucha activamente a los demás				
Acepta las opiniones de los miembros del grupo				
Muestra respeto a todos/as				
No entorpece el trabajo del grupo				
Alimenta, apoya y felicita al resto de compañeros y compañeras				
Dificulta el trabajo porque no aporta los materiales				
Pone pegas al trabajo/tarea asignada				
Entiende lo que hay que hacer y aporta soluciones				

FORMA DE EVALUAR: 3 (TOTALMENTE DE ACUERDO), 2 (DE ACUERDO), 1 (PARCIALMENTE DE ACUERDO), 0 (EN DESACUERDO)

RESUMEN

La presente comunicación desarrolla una experiencia de innovación docente en el 4º curso del Grado de Educación Primaria en la asignatura Didáctica de las Ciencias Sociales II. Esta experiencia tiene como objetivo desarrollar los contenidos teórico-prácticos relacionados con las metodologías didácticas activas para enseñar actividades económicas en la Educación Primaria. Para ello, se ha llevado a cabo una experiencia en el laboratorio didáctico “Ciudad Arcoíris” el cual se distribuye en diferentes rincones que simulan una ciudad. Los resultados muestran una alta satisfacción por parte de los estudiantes del Grado de Educación Primaria y de los maestros y maestras que han colaborado en dicha experiencia. Además, los estudiantes han valorado positivamente la construcción y aplicación del conocimiento teórico a través de una experiencia práctica. Concluimos que el uso de metodologías didácticas activas en la enseñanza de las Ciencias Sociales contribuye a la construcción del conocimiento del alumnado en dicha área.

Palabras clave: Actividades Económicas, Educación Primaria, Educación Superior, Metodologías Activa.

1. INTRODUCCIÓN

El desarrollo de los contenidos relacionados con actividades económicas en la Educación Primaria ayuda al alumnado a adquirir las competencias necesarias para desenvolverse como ciudadanos y consumidores críticos en su vida diaria. Las actividades económicas son un campo fundamental a trabajar en el área de Ciencias Sociales. La necesidad de que el alumnado de Educación Primaria conozca los aspectos más elementales del sistema económico es incuestionable. No obstante, la escuela no ha asumido esta cuestión posiblemente por dos motivos: porque existe una economía básica que se aprende en la calle o bien porque hay conceptos muy complejos que es mejor trabajarlo en niveles posteriores (Travé, 2006).

Esto hace fundamental la educación económica para una alfabetización económica que promueva y proporcione las herramientas necesarias para comprender el mundo económico y poder tomar decisiones personales y sociales sobre los problemas económicos que encontramos cada día en nuestro día a día (Denegri, 2006).

La población infantil y juvenil forma parte la ciudadanía económica la cual consume y es objetivo principal del sector publicitario, el cual a través de los medios de comunicación invita y crea expectativas en esta población. Por tanto, es relevante que la educación económica no interese ya que son las condiciones económicas las que condicionan el futuro, los estudios y el trabajo (Santesteban, 2008). Kemmis, Cole y Sugget (2007) citados por este autor consideran que es importante trabajar contenidos tales como el desempleo, el cambio tecnológico, los cambios en la estructura de la fuerza de trabajo y las modificaciones en las ocupaciones de la juventud.

Con la crisis económica, la educación económica, como dice Pagés y González (2010), se hace más necesaria en la educación obligatoria, ya que ayudará al alumnado a comprender situaciones como el desempleo en su familia, el desahucio de un vecino de su casa o que ya no pueda tener todos los caprichos que antes su familia le concedía.

La alfabetización económica de la ciudadanía, dice Santesteban (2013, p. 28), *tiene sentido si la dirigimos hacia la comprensión de esta realidad tan tozuda y compleja, para comprender cómo afecta la economía a nuestra vida y a nuestras expectativas, y si después levantamos la cabeza y enseñamos a mirar la perspectiva del cambio económico, social y político en el futuro, algo que puede comenzar hoy mismo.*

Los resultados obtenidos por Travé y Pozuelos (2007) en su investigación relacionada con la formación del profesorado en cuanto a contenidos económicos están ausentes e incide en el desinterés por la enseñanza de la economía en las etapas obligatorias. Estas carencias en el profesorado fomentan el analfabetismo económico del alumnado.

Es por este motivo que se hace necesario introducir en la formación inicial de maestros cuestiones relacionadas con las actividades económicas. De esta forma, en el Grado de Educación Primaria de nuestra universidad se desarrollan los contenidos básicos en la asignatura Didáctica de las Ciencias Sociales II de 4º.

Para el desarrollo de los contenidos de la asignatura, nos basamos en el Proyecto Investigando nuestro mundo: Investigando las actividades Económicas (Travé, 2006). Este proyecto se trata de una propuesta curricular basada en un currículum integrado en el cual se presenta el conocimiento científico de la temática, el conocimiento escolar, las concepciones del alumnado y tipos de actividades que se pueden desarrollar en el aula.

En el caso de Investigando Actividades Económicas, Travé (2006) explica que el estudio de esta temática en primaria facilita el desarrollo de la dimensión vital y social de la persona que aprende y propicia estructuras que permiten la interacción

con el medio uniendo la problemática económica con el resto de los ámbitos de investigación. De esta forma, la alfabetización económica contribuye a la alfabetización científica proporcionando las habilidades y valores necesarios para el desarrollo social y personal. Como explica Travé (2006), conocemos que las concepciones relacionadas con la economía se forman tanto en la vida, como en la vida cotidiana, a través de los medios de comunicación y también en la escuela. Por ello, es importante que la escuela no sea la única que propicie la organización del conocimiento económico necesario para desenvolverse como ciudadanos. Cualquier proyecto de aula, está relacionado con aspectos económicos.

Este proyecto es una propuesta para que el profesorado de Educación Primaria lo desarrolle en sus aulas y se basa en una metodología investigadora teniendo como principios básicos la globalización del conocimiento a través de un currículum integrado. Dicha propuesta, es estudiada por los estudiantes de formación inicial del Grado de Educación Primaria. Para su estudio, partimos de una metodología coherente que parte también de la investigación escolar donde es el propio estudiante el que va construyendo su conocimiento a partir de lecturas, seminarios, exposiciones, talleres, rincones, etc.

El uso de metodologías activas desde un enfoque investigador provoca la adquisición de un conocimiento teórico-práctico por parte del alumnado. De esta forma, estudios como Bigg (2003), Contreras y otros (2005), De Miguel (2006), Fonseca y Aguaded, (2007), Fry y otros (2003), García-Varcácel (2001), Ponsa y otros (2009), Rué (2007), Sánchez (2008), Ubieto y otros (2008), Zabalza (2002), Zabalza y Zabalza (2010) muestran que la docencia en la Universidad necesita un cambio hacia metodologías activas de enseñanza-aprendizaje que permitan el desarrollo de los contenidos y el aprendizaje de los mismos por parte del alumnado.

De acuerdo con Rekalde y otros (2014), consideramos que la enseñanza en la universidad no debe limitarse al conocimiento exclusivo de las disciplinas y de los contenidos científicos conceptuales de la misma sino que debe haber una preocupación por parte del docente de cómo trabajar en el aula las competencias y habilidades necesarias para desarrollar los procedimientos y actitudes en los estudiantes que le permitan conectar el conocimiento teórico con el práctico. Por esto, es fundamental reflexionar y buscar mecanismos sobre el cómo enseñar, qué estrategias, actividades y recursos son necesarios para atender a la diversidad de todo nuestro alumnado universitario.

Desde este punto de vista, y dadas las inquietudes de la docente por mejorar su práctica en el área de la Didáctica de las Ciencias Sociales, partiendo del Proyecto Investigando a nuestro Mundo, hemos desarrollado una experiencia innovadora dentro de la materia la cual desarrollaremos en los siguientes apartados.

2. LA EXPERIENCIA

La ciudad Arco Iris es un proyecto de innovación docente que surgió en el ámbito de la Educación Infantil y se ha ampliado a lo largo de los años a Educación Primaria y las distintas menciones de este grado, adaptando las actividades en cada uno de los casos. Este proyecto se lleva a cabo en la Facultad de Ciencias de la Educación de la Universidad de Huelva. El espacio donde se ubica recrea una ciudad donde alrededor de una plaza se disponen los espacios más comunes donde se desenvuelven la vida de los ciudadanos: cafetería, floristería, farmacia, centro de salud, casita, veterinario, ayuntamiento, banco, etc. Todo este espacio está pensado para que los niños y niñas aprendan jugando y para que los maestros y maestras de las escuelas, el alumnado y el profesorado de la universidad trabajen construyendo redes de colaboración que contribuyan al desarrollo de mejoras que transformen las escuelas.

Esta experiencia surgió en el curso académico 2000/2001, con el diseño de un aula experimental de infantil cuyo objetivo en aquel momento era que el alumnado de esta titulación tuviera la posibilidad de desenvolver en situaciones simuladas, conocieran los distintos espacios y elaboran materiales didácticos para su posible aplicación (González, Romero y Vidal, 2003).

2.1 Contexto y participantes

La experiencia se ha llevado a cabo en la Universidad de Huelva, en la Facultad de Ciencias de la Educación, concretamente en la titulación del Grado de Educación Primaria. En ella ha participado una docente, implicando un total de 120 estudiantes distribuidos en 2 grupos de 65-70 alumnos y alumnas cada uno. Esta innovación docente se ha desarrollado en los dos grupos ya que la docente ha impartido una misma asignatura en ellos.

Estos grupos son muy variados en sus características teniendo cada uno de ellos una serie de necesidades concretas que han hecho que se desarrollen las actuaciones de éxito en mayor o menor medida, considerando la flexibilidad y apertura pertinente en la planificación didáctica de una materia siendo uno de los objetivos prioritarios de la docente atender a la diversidad de su alumnado desarrollando prácticas que le permitan dar una respuesta lo más individualizada posible que parta de las demandas del alumnado.

El proceso de creación y desarrollo del proyecto se describe en González, Romero y Vidal, 2003; González y Romero, 2008; y González, Gómez y Álvarez, 2016¹. Basándonos en los principios didácticos con los cuales se comenzó el proyecto hemos desarrollado una actividad práctica dentro de la asignatura Didáctica de las Ciencias Sociales II, con un grupo de alumnos y alumnas de 65.

En esta asignatura, trabajamos a través de carpetas de investigación, dentro de esta carpeta, la experiencia que vamos a describir constaba de una actividad concreta transversal que se iba desarrollando a lo largo de todo el cuatrimestre. Una parte de la actividad era obligatoria y otra optativa, más adelante lo explicaremos

¹ En estas referencias se puede encontrar más información sobre el Proyecto "Ciudad Arcoíris".

2.2 Fases de la experiencia

Fase Inicial con el alumnado de la universidad:

- 1) En primer lugar, los estudiantes de grado en una clase teórica analizaron dos artículos que describían el Proyecto Ciudad Arcoíris. De esta forma, analizaron cuáles eran los objetivos, cómo se desarrollaban las visitas con el alumnado de infantil, etc. Posteriormente, en pequeños grupos, realizaron una reflexión sobre cómo relacionar las actividades económicas con el Proyecto Ciudad Arcoíris. En gran grupo, expusieron las ideas que tenían, debatieron la posibilidad de realizar una visita con alumnado de Educación Primaria y reflexionaron sobre la posibilidad de trabajar actividades económicas en el espacio de la Ciudad del Arcoíris. Para finalizar, la profesora explicó cómo surgió el proyecto y por qué lo estaban trabajando en la asignatura.
- 2) En segundo lugar, el alumnado visitó en una clase práctica, la Ciudad del Arcoíris. Una vez en el lugar, la profesora junto con otros miembros del equipo del Proyecto de Innovación, explica al alumnado algunos aspectos relevantes del proyecto que tienen que tener en cuenta a la hora de decidir si quieren participar en él. El alumnado observa y analiza cada uno de los rincones de los cuales está compuesto el espacio y cada pequeño grupo elige uno de ellos. Una vez elegido el rincón, el alumnado debe realizar un análisis de los recursos existentes, elaborar un listado con los mismos y ver cuáles deben ser restaurados, sustituidos o son útiles para su práctica.

Fase de desarrollo del Proyecto con el alumnado, las escuelas y el equipo del proyecto:

- 1) La docente, junto con la coordinadora del proyecto, elige los centros educativos, de un listado de solicitudes que se han realizado durante el año, que visitarán la ciudad para el desarrollo de las actividades que el alumnado planificará.
- 2) Durante cuatro semanas, el alumnado elabora una planificación didáctica con varias actividades que trabajen objetivos, contenidos y competencias relacionadas con las actividades económicas para alumnado de 1º y 2º de Educación Primaria. Esta planificación es orientada y supervisada por la docente en todo momento. A su vez, realiza varias sesiones en la ciudad de evaluación, reconstrucción y construcción de recursos, restauración del rincón y limpieza del mismo. La planificación se nutrirá de los contenidos teóricos que se están estudiando en otras actividades teóricas de la carpeta relacionadas con el conocimiento científico, las concepciones, el conocimiento escolar y el tipo de actividades que se utiliza para trabajar actividades económicas.
- 3) Una vez que se han elegido los centros educativos participantes, en este caso 2 centros de titularidad pública (3 unidades de 1º y una unidad de 2º con un total de 60 niños y niñas), el profesorado de la universidad se pone en contacto con las maestras y maestros implicados y tienen una reunión preparatoria en la cual se les explica el proyecto en profundidad, y se visita la Ciudad Arcoíris para que ellos la conozcan. En esta reunión, se consensuó una actividad previa a la visita en el aula planificada por el profesorado de la universidad y el alumnado para ser llevada a cabo en las aulas que visitarán la Ciudad del Arcoíris. En esta fase, se le da la siguiente información a los maestros y maestras:

“Antes de la visita es conveniente que, además de informar a los niños y niñas de qué es la ciudad y cómo va a transcurrir el día, repaséis con ellos las normas de comportamiento y tengáis en cuenta lo siguiente:

- **Autorización de las familias:** En la notificación que enviaréis a los padres y madres para que autoricen la asistencia de sus hijos/as a la Ciudad, debéis especificar que se realizarán fotografías y grabaciones de la visita para que puedan ser analizadas por los estudiantes de Magisterio y tengamos un recuerdo de la experiencia. Este material se puede distribuir gratuitamente a aquellos centros que lo soliciten.
- **Distribución previa:** *Debe haber una asignación y distribución previa de los rincones en los que van a participar los niños y niñas. Durante la primera parte de la jornada permanecerán en uno de ellos y después del descanso podrán rotar si así lo desean. Adjuntamos un cuadro resumen con datos sobre el número de alumnos y edades recomendadas en cada rincón. En dicho cuadro el número de niños es ilustrativo y se aumentaría si fuera necesario en aquellos rincones donde sólo se hayan ubicado 2 niños/as. Los niños/as deben distribuirse uniformemente por todos los rincones, sin dejar ninguno vacío.*
- **Identificación:** *Para la visita es conveniente que todos los niños/as traigan colgadas identificaciones con su nombre y el rincón que se les ha asignado para la primera parte de la sesión. Así mismo se indicará si el niño/a tiene algún tipo de alergia o intolerancia.*
- **Desayuno:** ¡No olvidéis traer algo para comer en el descanso, porque gastamos muchas energías!”

- 1) El profesorado de la Universidad se coordinó con las escuelas para recibir dicha información y transmitirla al alumnado. Cada grupo en diferentes tutorías, expuso su planificación didáctica a la profesora y consensua, analiza y da recomendaciones al alumnado para que la mejore.
- 2) La semana previa a la visita se desarrolló la actividad previa en las aulas del alumnado que va a realizar la visita a la Ciudad Arcoíris. La actividad llevada a cabo fue elaborada por un grupo de alumnos y alumnas y corregida por la profesora. Después se llevó a cabo por cuatro grupos de alumnado en las diferentes aulas de niños y niñas que vinieron.
- 3) La semana de la visita se realizó una limpieza profunda de la ciudad. Tanto alumnado como profesorado decidieron la colocación final del rincón, estructuraron los recursos en el espacio y revisaron que estuviera todo el material necesario para llevar a cabo las actividades que planificaron. En el aula, se hizo una última supervisión de las actividades y se controló que todo el alumnado tuviera los materiales pertinentes y la propuesta terminada además de tener claro los nombres de los niños y niñas y sus características.
- 4) Desarrollo de la visita. A la llegada hubo una asamblea inicial tras la cual los niños se distribuyeron por los rincones. La docente nombró a los niños y niñas que iban a cada rincón, que fueron previamente enviados por los maestros y maestras tras la elección de los niños y niñas en las aulas. Cada grupo de alumnos y alumnas del Grado cogió a

los niños y niñas de su rincón. Realizaron un recorrido general por todos los rincones y se colocan al final en su rincón para comenzar la actividad. Los maestros y maestras se quedaron fuera del laboratorio. Es conveniente que permanezcan en el recinto o sus cercanías para evitar cualquier percance. En la primera parte, se desarrollaron las actividades y el alumnado observará y registrará con una plantilla los criterios que han consensuado con la profesora sobre las actividades económicas. En la segunda parte, los maestros y maestras entraron para que la visita sea útil para todos y que, con su experiencia, colaboren en la buena marcha de la misma, apoyando, observando, preguntando y respondiendo las cuestiones de nuestros alumnos. Ellos pueden aprender mucho de los maestros y maestras y viceversa. Además, esta experiencia facilita a los maestros y maestras la oportunidad de observar a sus alumnos y alumnas en otros contextos de enseñanza y aprendizaje y permite evaluar la adquisición y desarrollo de muchos de los contenidos que se trabajan en el aula fuera de la misma.

Fase posterior a la visita: en el aula

- 1) El profesorado de la universidad entregará un cuestionario de valoración al profesorado de las escuelas y pedirá que la actividad posterior sobre la Ciudad que realicen en el aula nos la transmitan vía email o correo ordinario. En muchos casos, incluso envían las producciones elaboradas por los niños y niñas.
- 2) Por otro lado, el alumnado de la universidad junto con la profesora analizarán en gran grupo cómo se han trabajado las actividades económicas, que actividades deberían mejorarse y cuáles han funcionado, qué recursos han causado mayor impacto... La profesora, con sus anotaciones de la visita, debatirá que cuestiones han sido satisfactorias y cuáles se podrían mejorar. Se realizará una reflexión final de cómo nos ha servido la teoría para trabajar las actividades económicas en la práctica.

En esta primera experiencia con alumnado del Grado de Educación Primaria y niños y niñas de Educación Primaria se ha trabajado en torno a la enseñanza de las Ciencias Sociales, concretamente, el valor del dinero.

Al igual que en las experiencias llevadas a cabo anteriormente en el Grado de Educación Infantil (González, Gómez y Álvarez, 2016), el alumnado universitario y los niños y niñas de primaria han sido los principales protagonistas del proyecto. El papel del alumnado universitario ha sido muy relevante en todas las fases del proyecto, puesto que son ellos los responsables de las diferentes tareas que se han ido desarrollando en la Ciudad: selección, montaje y decoración del rincón, planificación de las actividades a realizar, elaboración de los distintos recursos y materiales, aplicación y evaluación de las actividades llevadas a cabo; observación e interacción con niños y niñas; intercambio con maestros/as y profesores/as; reflexión y mejora de la actuación docente... Ellos adquieren la responsabilidad de los niños y las niñas durante la visita a la Ciudad del Arcoíris, atendiendo a las características de cada uno de ellos y dando respuesta a sus demandas en cada momento.

Es importante reconocer la labor realizada por los maestros y maestras en la experiencia, ya que ellos facilitan la información necesaria al profesorado universitario, abren sus aulas para que el alumnado pueda trabajar con sus niños y niñas y están a la disposición de los docentes universitarios para cualquier cuestión relacionada con la visita e incluso se establecen, posteriormente, redes de colaboración para otras actividades.

La coordinación entre el profesorado universitario en el proyecto también es de gran relevancia dado que la Ciudad abre las puertas a diferentes materias y, también ahora, a diferentes titulaciones. Tanto los maestros y maestras como el profesorado universitario adquieren un rol de guía, orientación y coordinación de sus respectivos alumnos y alumnas pero también forman parte de los participantes activos de la experiencia.

De esta forma, se establece un gran entramado de relaciones entre todos y todas las participantes que ayudan a encajar las piezas del puzle de la teoría y la práctica nutriéndonos mutuamente para contribuir a una formación inicial completa del alumnado del Grado de Educación Primaria.

3. RESULTADOS

Una vez llevada a cabo la experiencia, hemos hecho un cuestionario abierto al alumnado del Grado de Educación Primaria para la evaluación de la asignatura. En él se dedicaba una cuestión a la metodología didáctica utilizada por la docente y, dentro del mismo, se hacía referencia a la valoración del proyecto. Además, posteriormente, se ha pedido a cinco alumnos que realice una valoración escrita de la actividad desarrollada. En el análisis, el alumnado describió aspectos positivos y a mejorar de la experiencia.

Comenzando por los aspectos que han contribuido de forma óptima a la formación, destacan la posibilidad de trabajar con los niños y niñas en un contexto de exploración y análisis de la práctica que se ha elaborado desde la teoría. Valoran considerablemente que es una oportunidad para ver cómo la teoría es aplicable a la práctica y remarcan la posibilidad de llevar una actividad a la realidad y después analizarla de nuevo en las clases teóricas teniendo la perspectiva del grupo aula y de la profesora.

Por otro lado, el alumnado remarca el valor positivo de trabajar con la diversidad del alumnado y muestran, en las clases preparatorias de la visita, su preocupación e interés por dar respuesta a las características del alumnado. Se observa que se desarrollan habilidades relacionadas con emociones como la empatía, el amor y el respeto al otro.

El alumnado valora positivamente la coordinación y atención por parte del equipo de profesorado y alumnado que participa en el proyecto destacando sus funciones en el proceso de decoración, limpieza, planificación y estructuración de la visita, consideran que facilitan el desarrollo del proyecto y el proceso de enseñanza-aprendizaje del alumnado.

Otra de las ventajas que enumeran es la utilización de diferentes materiales y recursos para el desarrollo de la planificación señalando la importancia de ver la importancia de la elaboración y restauración de los mismos para el aprendizaje del

alumnado. Resaltan que les ayuda a aumentar su creatividad y explorar diferentes vías didácticas para conseguir los objetivos de su planificación.

Es relevante la alta valoración del espacio de la Ciudad como laboratorio didáctico. El alumnado explica como ventaja el cuidado del espacio donde se desarrollan las visitas destacando la implicación de todo el equipo del proyecto y de ellos mismos en el mantenimiento de la belleza y la amplitud de la Ciudad que genera la motivación del alumnado.

Como aspectos a mejorar, en primer lugar, el alumnado considera en relación a la última ventaja, que debería cuidarse más algunos aspectos relacionados con el mantenimiento del espacio como la humedad en paredes, limpieza general, etc. Como propuesta, consideran que se deben dar más apoyos económicos y de recursos humanos a la Ciudad.

La dificultad de aplicar los contenidos teóricos y adaptar la planificación elaborada a las circunstancias que surgen durante la visita considerando que se debería desarrollar en un mayor número de horas.

En esta experiencia concreta, el alumnado percibió que los niños y niñas de primero y segundo de Educación Primaria tienen dificultades para entender los conceptos económicos de tal forma que corroboraron lo estudiado en la teoría.

Para finalizar, la valoración general de la visita ha sido muy positiva considerándolo como una oportunidad única que debería ser más común en la titulación ya que pueden llevar la teoría a la práctica y analizarla para después mejorarla.

4. CONCLUSIONES

Este proyecto de innovación docente, “La Ciudad del Arcoíris”, ampliado en esta experiencia a la Educación Primaria, ha tenido una repercusión mediática muy importante en los últimos años, obteniendo la mención de calidad en el curso 2003/2004 por la Unidad para la Calidad de las Universidades Andaluzas. Además, recientemente, en 2014, se le ha concedido el Premio de Innovación Docente de Excelencia de la Universidad de Huelva. Esta difusión en los medios, ha permitido que dicho proyecto haya sido la inspiración de otras experiencias similares como las desarrolladas en la Universidad de Córdoba, la Universidad de Almería o el Instituto de Educación Secundaria “La Orden”.

Los resultados se han obtenido en todos estos años permite concluir que

“este laboratorio no sólo fomenta prácticas alternativas de enseñanza en la educación superior, sino que también favorece la innovación, investigación didáctica y la actualización docente. El profesorado universitario tiene más oportunidades para contactar con la realidad y nutrirse de la experiencia práctica de los maestros/as y de las distintas situaciones de aprendizaje que se generan en la Ciudad. Los maestros y maestras cuentan con otro escenario en el que observar las reacciones e intereses de los escolares, relacionar contenidos y fundamentar sus propuestas didácticas y organizativas. El alumnado universitario, por su parte, mejora su conocimiento práctico; reforzando las competencias profesionales que Zabalza y Zabalza (2011) consideran básicas en Educación Infantil: crear ambientes de aprendizaje ricos y estimulantes; desarrollar relaciones constructivas con los colegas, las familias y el entorno; diseñar y desarrollar actividades de aprendizaje adaptadas a los niños/as pequeños y que cubran adecuadamente el currículo de la etapa; dominar las técnicas de la documentación y la observación y asumir los compromisos propios de un maestro/a de Educación Infantil. A las que nosotras añadimos: saber interpretar la realidad con ojos de niño y niña; fomentar la pedagogía del asombro; saber utilizar la cabeza, el corazón y las manos, y saber utilizar el juego como herramienta didáctica. Gracias a la interacción con los niños y niñas, el interés, motivación, implicación y compromiso del alumnado universitario aumenta, repercutiendo gratamente en sus resultados académicos (Romero y González, 2010; González, Álvarez y Báez, 2014). Los niños y niñas, finalmente, ven favorecidos sus procesos de enseñanza/aprendizaje por las acciones implementadas por todos los agentes anteriores. “(González, Gómez y Álvarez, 2016, p. 47)

Las redes de colaboración que se constituyen en torno a esta experiencia de trabajar juntos y en el mismo espacio alumnado del Grado de Educación Primaria, niños y niñas de Educación Primaria y profesorado de los distintos niveles educativos hacen que se den procesos de interacción que tienen gran potencialidad en los procesos de enseñanza-aprendizaje.

La ampliación del proyecto al Grado de Educación Primaria suponía un reto, sin embargo, se han cumplido la mayoría de los objetivos que se habían planificado ya que es una experiencia que permite reflexionar e indagar y realizar un proyecto de aprendizaje servicio e investigación-acción que mejora la teoría y práctica para poder seguir avanzado en la elaboración de recursos y creación de nuevos espacios abogando por metodologías activas basadas en la colaboración y en la atención a todo el alumnado.

Las repercusiones más importantes que observamos es la oportunidad que genera el proyecto de trabajar con maestras y maestros de Educación Primaria, con las cuales intercambiamos posturas didácticas y nos nutrimos de sus situaciones reales de aprendizaje desarrollando así el enriquecimiento de todos los implicados en el proyecto.

Se percibe que la valoración más importante del alumnado es la posibilidad de poder unir los contenidos teóricos y prácticos de una misma asignatura, observando y analizando cómo se lleva a cabo la teoría a la práctica y si es posible.

La coordinación entre el profesorado implicado, las becarias y el alumnado participante se desarrolla. Cabe reseñar las relaciones de interacción fuertes que se han ido construyendo entre las personas que participan en el proyecto considerando a estas como un valor enriquecedor del proceso de enseñanza-aprendizaje.

Por último, los miembros del equipo de este proyecto hemos observado y analizado los aspectos que se podrían mejorar para transformar la organización del mismo en lo que se refiere a gestión de recursos humanos y materiales y para insistir en la difusión de esta experiencia, condición ésta muy importante en cualquier proyecto de innovación.

PARALLEL SESSION IV

PREDICTION OF IRREGULAR SOCIO-ECONOMIC DATA

José Luis Carmo
University of Algarve and CEDMES
(jlcarmo@ualg.pt)

ABSTRACT

Irregular data are observable in the context of many different fields. Along with the irregular occurrence of observations, these series can exhibit other characteristics, such as trends and seasonality, which may make more difficult to predict. In this work, are discussed several methods to handle with irregularly spaced time series, based on exponential smoothing, as well the application of normalized basis function networks, a supervised learning model. Furthermore, relatively simple modifications are proposed to some of these methods, and their adequacy is shown in dealing with these processes. Some experimental comparisons with real time series are made.

Keywords: Forecasting, Non-stationary Data, Exponential Smoothing, Neural Networks.

JEL Classification: C32, C45, C53

1. INTRODUÇÃO

Uma série temporal consiste num conjunto ordenado de observações de uma ou mais variáveis, registadas frequentemente a intervalos de tempo de igual amplitude. Mas, nem sempre as manifestações ou os registos de um fenómeno se apresentam regularmente espaçados no tempo e, nesse caso, a série temporal é *irregularmente espaçada*. Naturalmente, pode ser construída uma série de registos com os valores totais observados em períodos de tempo de igual amplitude. Contudo, tal acarreta uma perda de informação mais ou menos importante, pelo que pode ser crítico realizar a sua análise e modelação. Diferente é o caso de uma série *incompleta*, onde o processo de ocorrências é regular, mas por um qualquer motivo não são conhecidas todas as observações – por exemplo, devido a falhas pontuais no processo de registo das observações.

Fenómenos observados de forma irregular no tempo podem ser encontrados em áreas bastante díspares (Figura 1).

Figura 1 – (a) Número diário de manchas solares (*sunspot numbers*); (b) Variações “intraday” nas taxas de câmbio entre o Franco Suíço e o Dólar Americano; (c) Avaliação imobiliária no mercado português; (d) Procura de peças de reposição na indústria aeroespacial

Como já referidas atrás, o estudo de séries temporais inclui duas vertentes fundamentais: a *análise* e a *modelação*. Na primeira, pretende-se estudar e caracterizar as principais propriedades da série, o que poderá ser feito tanto no domínio temporal como no domínio das frequências. Poderá assim servir de fase preliminar à escolha de um modelo adequado. Na modelação de séries, tem-se como objectivo principal possibilitar a realização de *previsões* de valores futuros da série. Poderá também pretender-se uma descrição da série em termos das suas componentes de interesse, por exemplo, para examinar o comportamento sazonal da série. Assim que o modelo esteja completamente definido/identificado e estimado, a sua adequabilidade poderá ser aferida, não só através da realização de testes de diagnóstico, mas também através de algum tipo de conhecimento que eventualmente já exista sobre o fenómeno observado.

Para a modelação de séries temporais procura-se descobrir regularidades empíricas fortes na sequência de valores conhecidos da série. Desta forma, é necessário encontrar um modelo adequado, descrito através de uma função parametrizada – *linear* ou *não linear* –, e, depois, um método para a estimação dos parâmetros do modelo. Frequentemente, supõe-se que o processo dinâmico desconhecido gerador de uma série temporal é descrito através de um modelo de tipo auto-regressivo. Como nas abordagens que irão consideradas neste trabalho, supõe-se, então, que qualquer valor de uma série temporal pode ser aproximado como função de um certo número de observações anteriores.

Para a determinação completa de um modelo, além da estimação dos parâmetros correspondentes, é muitas vezes indispensável a identificação de outro tipo de quantidades. Por exemplo, o factor de esquecimento do método de alisamento exponencial simples para a estimação do nível de uma série estacionária, ou a localização de funções para um modelo definido através da combinação linear de funções gaussianas. Estes parâmetros especiais, designados por *hiperparâmetros* (ou metaparâmetros), condicionam a estimação dos restantes parâmetros do modelo. O processo completo de determinação do modelo será desta forma constituído por duas fases: uma fase preliminar de identificação dos hiperparâmetros, e uma segunda fase, onde se procede à estimação final dos parâmetros do modelo. A identificação dos hiperparâmetros pode ser tratado como um problema de optimização (não linear), envolvendo repetidas experiências provisórias de estimação dos parâmetros.

Na previsão de processos conhecidos genericamente como *procura intermitente* (originada pela indústria de aviação e a sua necessidade de previsão do consumo de peças ou itens de reposição) assumem-se sequências de valores de procura regularmente espaçados no tempo, mas exibindo uma percentagem relativamente alta de valores nulos de procura. Esta é a assunção básica feita no Método de Croston (Croston, 1972) e as suas variantes, e seguida por vários autores – vide, por exemplo, Teunter e Duncan (2009). No entanto, em muitos casos, será preferível registar ou converter os dados em duas sequências de variáveis,

$$\{(X_i, y_i)\}_{i=1, \dots, N},$$

instantes e observações, como se mostra na Figura 1. Deste modo, a série pode ser assumida explicitamente como bivariada, e outras variáveis de interesse serão facilmente definidas:

- $x_k = X_k - X_{k-1}$: intervalo de tempo entre duas observações consecutivas;

- $Y_k = \sum_{i=1, \dots, k} y_i$: valor total observado até ao instante k ;
- $d_k = y_k / x_k$: valor médio observado por período de tempo (“taxa de procura”).

A definição destas variáveis será instrumental, nomeadamente, para a resolução das seguintes questões:

- Quanto é que se espera para a próxima observação?
- Quando é que se espera que a próxima observação ocorra?
- Quanto é que se espera que seja o total observado num dado horizonte temporal?

A partir de um modelo completamente estimado, pode então ser calculada uma previsão do valor futuro da série, para um horizonte temporal adequado. Assim que o valor efectivamente observado se encontre disponível, estes dois valores podem ser comparados. Denotando por

$$\hat{y}_{k|k-p}$$

uma previsão para y_k , utilizando a informação disponível até ao instante $k - p$, o erro de predição p -passos-à-frente é definido por:

$$e_{k|k-p} = y_k - \hat{y}_{k|k-p}$$

Para aferir a qualidade do modelo, comparando-o com outros, ou mesmo com variantes do mesmo modelo, é necessária uma medida de desempenho apropriada. O seu valor será determinado por uma sequência de erros de previsão, produzida através de um conjunto de observações conhecidas da série. Será conveniente, na utilização de métodos de estimação recursiva, ignorar os primeiros erros cometidos no cálculo das medidas de desempenho, visto a inicialização destes métodos ser habitualmente feita de forma heurística e simples, produzindo assim enviesamento significativo nas primeiras estimativas obtidas. Podem ser referidas, entre as mais conhecidas, as medidas MAD (*Mean Absolute Deviation*), RMSE (*Root Mean Squared Error*), e MAPE (*Mean Absolute Percentage Error*). No entanto, mais recentemente, Hyndman (2006) propôs como padrão uma medida que pode ser interpretada como o rácio de duas MAD: a obtida pelo procedimento que está sendo avaliado sobre a resultante da aplicação do método conhecido como *Naïve* (cada previsão é simplesmente o valor registado na ocorrência anterior). O resultado produzido por esta medida – denominada de MASE (*Mean Absolute Scaled Error*) – é independente da escala original dos dados, e tem uma interpretação directa: um valor menor que um significa que as previsões obtidas são melhores que o método “ingénuo”.

2. PREVISÃO DE DADOS (QUASI-)ESTACIONÁRIOS

Um conceito importante na análise de séries temporais é o conceito de estacionariedade. De forma intuitiva, pode-se dizer que uma série é *estacionária* quando as suas propriedades distribucionais são invariantes ao longo do tempo. Em particular, o valor médio e a variância da série deverão ser constantes ao longo do tempo. Uma série será *não estacionária* se, por exemplo, exibir tendência, efeitos periódicos, heteroscedasticidade, entre outros efeitos. A simples observação do gráfico dos valores da série pode ajudar a diagnosticar se a série é ou não estacionária. Se os valores apresentarem uma certa flutuação com variação constante em torno de uma média constante, será razoável pensar que se trata de uma série estacionária.

2.1 Alisamento exponencial simples

Os métodos vulgarmente designados de *métodos de alisamento exponencial* são bastante utilizados para a previsão de séries temporais. São definidos por fórmulas de actualização recursiva, onde se empregam pesos para diferenciar a importância das várias observações. Em cada método, a estimação dos vários parâmetros baseia-se na aplicação de esquemas recursivos do tipo:

$$\text{nova estimativa} = \text{coeficiente de alisamento} \times \text{nova informação} + \left(1 - \text{coeficiente de alisamento} \right) \times \text{anterior estimativa}$$

Deste modo, perante a presença de novas observações, o método facilmente procede à actualização do modelo de previsão. O *coeficiente de alisamento*, que poderá também variar com o tempo, descreve o grau de importância relativa entre a nova informação e a anterior estimativa.

No *alisamento exponencial simples* o que se procura é a estimação apenas do nível (local) da série, através de uma sequência de estimativas “alisadas” do valor médio, que variam com o tempo. O esquema atrás apresentado é assim aplicado directamente para a estimação do parâmetro de nível, ficando disponível no final do processo uma previsão para o valor futuro da série. Mesmo nalgumas situações em que se presume que o parâmetro de nível varia no tempo de forma lenta ou até moderada, o alisamento exponencial simples poderá produzir previsões suficientemente satisfatórias.

Alguns dos métodos de alisamento exponencial são adaptados para séries irregularmente espaçadas. O mais conhecido e usado para esse fim foi proposto por Croston (1972) – e “recuperado” mais tarde por Willemain *et al.* (1994) –, estando inclusivamente disponível em algum *software* comercial de previsão. Consiste meramente na aplicação do método de alisamento exponencial simples, quer à série das observações, quer à série dos intervalos de tempo, mas com coeficiente de alisamento de valor comum às duas sequências de valores. Estas estimativas são então usadas para estimar a taxa de procura futura:

$$\hat{d}_k = \frac{\hat{y}_{k|k-1}}{\hat{x}_{k|k-1}}$$

Este método será designado por CRT#1. O método de Croston pode apresentar estimativas enviesadas, pelo que Syntetos e Boylan (2001) propuseram uma fórmula correctiva:

$$\left(1 - \frac{\alpha}{2}\right) \hat{d}_k$$

sendo α o coeficiente de alisamento (CRT#2).

2.2 Alterações ao método de Croston

Com recurso a procedimentos bastante simples, podem ser efectuadas alterações básicas ao método de Croston original, por forma a torná-lo mais versátil e assim poder apresentar um acréscimo no seu desempenho.

A optimização de um coeficiente de alisamento comum para ambas as séries, intervalos de tempo e observações, pode ser demasiado restritivo e levar, em alguns casos, a resultados notoriamente mais pobres. A primeira dessas propostas consiste, portanto, em permitir que as duas sequências de valores possuam coeficientes de alisamento diferentes, ou seja, aplicar separadamente o método de alisamento exponencial simples. Esta alteração será designada por CRT#3.

Mesmo depois de uma optimização cuidada dos dois coeficientes de alisamento, a sequência de estimativas da taxa de procura pode não ser suficientemente alisada. Como tal, propõe-se incluir no processo a realização de um alisamento adicional a essas estimativas, de forma a possibilitar a obtenção de melhores resultados. Assim, a segunda proposta, CRT#4, modifica um pouco mais o método original, onde se aplica o alisamento exponencial simples a uma terceira série, a sequência de estimativas da taxa de procura. Deste modo, existirão no total três coeficientes de alisamento diferentes para optimizar.

2.3 Redes de funções de base normalizadas

Os modelos conhecidos por *redes neuronais artificiais*, e em particular as *redes neuronais supervisionadas*, utilizando determinados procedimentos de pesquisa ou de estimação paramétrica, procuram “aprender” com base em exemplos, ou *padrões de treino*. O modelo, uma vez estimado, deverá ter a capacidade de “generalizar” convenientemente o conhecimento adquirido para novas situações. Essa generalização pode ser entendida como *previsão*, se os padrões forem construídos a partir de séries temporais.

As redes neuronais artificiais são modelos paramétricos que incluem componentes não lineares. Alguns modelos neuronais têm a capacidade de aproximar, arbitrariamente bem, qualquer função contínua não linear, conhecido apenas um conjunto de pontos. Em particular, as *redes de funções de base* apresentam-se como um dos modelos mais atractivos. O facto de poderem ser heurísticamente interpretadas como modelos lineares relativamente aos parâmetros, permite a utilização de métodos eficientes de estimação, como os métodos baseados no critério de mínimos quadrados. É uma clara vantagem em relação a outros modelos mais conhecidos, e complexos, como o *perceptrão multicamada*. Entre outras contribuições importantes para a teoria e metodologia subjacentes à construção e aplicação de redes de funções de base, deve-se referir os trabalhos de Powell (1987), Broomhead e Lowe (1988), e Moody e Darken (1989).

As redes neuronais artificiais podem ser representadas de forma gráfica, através de estruturas organizadas em *camadas de neurónios*, mas, naturalmente, resumem-se a expressões matemáticas. A resposta de uma rede de funções de base, com uma saída, é definida por uma função contínua parametrizada, não linear em relação às variáveis de entrada mas linear nos parâmetros:

$$f_w(\mathbf{x}) = w_0 + \sum_{i=1}^m w_i \phi_i(\mathbf{x})$$

onde $\mathbf{x}$ é um padrão de entrada genérico, w_i é o peso associado à função de base φ_i (w_0 representa um termo independente), e m é o número de funções de base consideradas. Cada função de base é localizada num ponto $\mathbf{c}_i$, designado de *centro*, e o seu valor depende da distância euclidiana entre o padrão de entrada e o seu centro. Várias expressões são admissíveis, mas habitualmente consideram-se funções gaussianas para as funções de base:

$$\phi_i(\mathbf{x}) = \phi(\|\mathbf{x} - \mathbf{c}_i\|) = \exp\left(-\frac{\|\mathbf{x} - \mathbf{c}_i\|^2}{2\sigma_i^2}\right)$$

em que σ_i é um hiperparâmetro de dispersão, designado por *raio*. O modelo é assim entendido como uma mistura (combinação linear) de gaussianas multidimensionais, que depende dos parâmetros $\{w_i\}$ e dos hiperparâmetros de localização e dispersão $\{(\mathbf{c}_i, \sigma_i)\}$.

Cada neurónio artificial representado por uma função de base gaussiana foca, portanto, uma certa região do espaço de entrada, caracterizada pelo centro e pelo raio dessa função, e, ao se considerar como raio um escalar, atribuindo igual importância às diferentes dimensões desse espaço. Mas, em certos problemas, as propriedades intrínsecas ao modelo podem levar, nomeadamente, a um número relativamente elevado de funções de base, aumentando assim o número de parâmetros e hiperparâmetros presentes. Uma forma natural de obviar alguns destes efeitos é considerar para o raio, não um escalar, mas um vector. Contudo, também assim se aumenta a complexidade do modelo, além de que, em estudos experimentais realizados anteriormente, os resultados obtidos não foram especialmente prometedores (Carmo e Rodrigues, 2009). Mais interessante, e uma opção mais simples, é utilizar *funções de base normalizadas* (RFBN), onde cada valor obtido por uma função de base é dividido pelo total obtido por todas as funções de base, para o mesmo padrão de entrada. Uma formulação especial para este tipo de redes, bem como a discussão sobre a sua identificação e estimação, pode ser encontrada no trabalho referido acima.

Assim, no caso de séries irregularmente espaçadas, o que procura é, através de um esquema auto-regressivo não linear, dado pela função f , a previsão de uma das variáveis supondo a outra conhecida, ou, mais geralmente, a estimação simultânea das duas variáveis:

$$\begin{aligned} & \bullet \{(x_{k-p}, y_{k-p}), \dots, (x_{k-1}, y_{k-1}), x_k\} \longrightarrow \hat{y}_k \\ & \bullet \{(x_{k-p}, y_{k-p}), \dots, (x_{k-1}, y_{k-1})\} \longrightarrow (\hat{x}_k, \hat{y}_k) \end{aligned}$$

2.4 Comparação experimental

Com a finalidade de avaliar o desempenho preditivo das abordagens atrás referidas, realizou-se um pequeno estudo experimental, através de cinco séries representativas de processos de procura irregular de uma empresa portuguesa da indústria papelreira. Como medida de avaliação considerou-se o RMSE, baseado nos erros de previsão um passo à frente da série de valores da taxa de procura, e ignorando os 20 primeiros erros. Os respectivos hiperparâmetros foram otimizados por uma pesquisa apropriada em grelha. O treino de RFBN – com duas saídas, intervalos de tempo e observações – foi realizado através da versão recursiva do conhecido método dos mínimos quadrados (RLS), e com a contínua adaptação de centros e raios (Carmo e Rodrigues, 2009).

Tabela 1 – Valores de RMSE produzidos pelos métodos em análise na previsão da taxa de procura

Série (N)	Naïve	CRT#1	CRT#2	CRT#3	CRT#4	RFBN
A1 (168)	65.61	47.77	47.78	47.77	46.95	39.51
A2 (177)	64.66	46.22	46.23	46.12	45.24	37.51
A3 (163)	61.37	44.70	44.70	44.51	44.29	37.68
A4 (182)	54.58	39.08	39.08	39.08	38.80	21.15
A5 (179)	40.58	29.27	29.33	29.09	28.84	25.53

Os resultados obtidos encontram-se na Tabela 1, onde se incluiu igualmente, como termo de comparação relativo aos métodos em estudo, o método *Naïve*. Como seria expectável, sendo um modelo muito mais robusto, a rede de funções de base apresentou um domínio claro sobre as várias versões do método de Croston. Estas não apresentaram diferenças significativas, comparativamente, no entanto, a versão que considera o alisamento adicional das estimativas da taxa de procura obteve sempre um menor erro. É igualmente de assinalar o ganho manifesto de todos os métodos relativamente à forma básica que utiliza como previsão a ocorrência anterior.

3. PREVISÃO DE DADOS COM TENDÊNCIA

Tendências ou periodicidades podem estar presentes nos dados, e os métodos anteriores podem se revelar insuficientes para lidar com estes casos. Em particular, foram desenvolvidas várias extensões do método de alisamento exponencial simples para atender a diferentes aspectos de não estacionariedade que podem estar presentes numa série temporal. Nomeadamente, Holt (1957) apresentou um esquema, através da introdução de um ajustamento localmente linear, para reconhecer a presença de tendência na série de observações.

3.1 Método IDUHO

O método de alisamento exponencial IDUHO (*Irregular Data Using Holt's method*), variante do método de Holt proposta por Wright (1985), é uma abordagem indicada para a previsão de séries irregularmente espaçadas. A série em causa deverá apresentar uma tendência local de tipo linear, não poderá demonstrar efeitos de sazonalidade significativos e deverá apresentar um número suficientemente grande de observações. Note-se que, mesmo admitindo-se a estacionariedade, é possível a sua aplicação, através da série dos valores acumulados. Contudo, embora a série acumulada seja estritamente crescente, o método pode excepcionalmente produzir previsões de valor negativo, pelo que são necessários esquemas correctivos (Carmo e Rodrigues, 2004).

Os dois coeficientes de alisamento, um para o parâmetro de *nível* e o outro para o de *declive*, são no IDUHO também variáveis com o tempo. Encontram-se dependentes do respectivo hiperparâmetro, que, portanto, terão que estar definidos antes do início do processo de estimação. No final ficará definida uma função de previsão, que, dado um qualquer horizonte temporal futuro, fornecerá a estimativa da ocorrência respectiva.

3.2 Comparação experimental

No contexto da avaliação imobiliária do mercado português, foram consideradas três séries, relativas a apartamentos de igual tipologia e para o mesmo período de tempo, em três diferentes localidades. Apresentando uma tendência crescente evidente, de tipo linear, o desempenho do método IDUHO foi analisado para a sua previsão. Foi igualmente considerado, apesar da sua limitação em lidar com este tipo de dados, inerente ao próprio modelo, o modelo RFBN, agora apenas com uma saída.

Tabela 2 – Valores de RMSE produzidos pelos métodos em análise na previsão da taxa de procura

Série (N)	Naïve	IDUHO	RFBN
B1 (141)	1.62	1.26	1.32
B2 (229)	2.23	1.25	1.31
B3 (233)	2.32	2.11	2.22

Como no caso anterior, a série otimizada, através da medida RMSE, foi a relativa aos valores da taxa de procura, com os hiperparâmetros definidos por pesquisa em grelha.

Os resultados obtidos (Tabela 2) mostram a maior capacidade do método IDUHO na estimação das séries. As redes de funções de base, não sendo especialmente indicadas para séries não estacionárias, obtiveram valores para a medida de erro apenas ligeiramente superiores. Inesperado, apenas numa primeira análise, foi o comportamento do método *Naïve*, em que, apesar da sua natureza simplista, consegue na prática acompanhar o crescimento da série. Na Figura 2 apresentam-se graficamente os resultados obtidos para a série B2.

Figura 2 – Resultados obtidos pelo método IDUHO para a série B2: (a) série da taxa de procura, a série otimizada, e as respectivas estimativas ('+'); (b) série dos valores originais, e as respectivas estimativas (traço contínuo)

4. PREVISÃO DE DADOS COM SAZONALIDADE

O problema da previsão de processos irregularmente espaçados com efeitos sazonais tem merecido pouca atenção na literatura, apesar de sua importância em várias áreas, incluindo na gestão de inventários e cadeias de abastecimento. Como extensão directa do método de Holt, Winters (1960) desenvolveu um processo para lidar com séries que apresentem igualmente sazonalidade, que viria a ser conhecido como método de Holt-Winters.

4.1 Método de Cipra, Trujillo e Rubio

Para séries irregularmente espaçadas que apresentem efeitos sazonais, pode-se recorrer ao método de alisamento exponencial proposto por Cipra, Trujillo e Rubio (1995) – que aqui será designado por CTR#1 –, que combina as formulações do método IDUHO e do método de Holt-Winters.

Neste método, o nível, a tendência e os índices *sazonais* são actualizados sempre que uma nova observação fique disponível, usando esquemas recursivos do mesmo tipo do método IDUHO, mas agora com três hiperparâmetros, e levando em consideração a possível ausência de dados entre duas ocorrências consecutivas. Ou seja, o método não pressupõe que a série seja irregular. Pelo contrário, é dirigido para séries regularmente espaçadas, mas admitindo que algumas observações podem estar em falta. Em particular, a inicialização do método é consideravelmente rígida, pois exige, na parte inicial da série, a presença de pelo menos uma observação para cada instante do ciclo sazonal (por exemplo, para uma série mensal com ciclo anual, é necessário que nos primeiros anos haja uma observação para Janeiro, uma para Fevereiro, etc., até ao mês de Dezembro). Portanto, para muitas séries, que pela sua própria natureza são irregularmente espaçadas, não será possível a aplicação deste método, pelo menos, com esta inicialização.

4.2 Alteração ao método de Cipra, Trujillo e Rubio

Tendo em conta a limitação apontada na secção anterior, foi estudada uma alternativa à inicialização do método, permitindo, ou pelo menos, não invalidando à partida, a sua aplicação a qualquer série irregular. Esta inicialização envolve a utilização do próprio método IDUHO, aplicado em primeiro lugar à série revertida (considerando a série do fim para o início) para a definição do valor inicial do nível e do declive, e depois à série original, para, a partir dos respectivos *erros filtrados*, a inicialização dos índices sazonais. Concretamente, o procedimento pode ser esquematizado através dos passos do seguinte quadro:

Inicialização do nível, a_0 , declive, b_0 , e índices sazonais, $\mathbf{c}_0$
1. Aplicar IDUHO à série revertida, e obter
$\tilde{a}_N$
$\tilde{b}_N$
2. Aplicar IDUHO à série original, com
$a_0 = \tilde{a}_N + \tilde{b}_N$
$b_0 = -\tilde{b}_N$
3. Obter $\mathbf{c}_0$, através dos erros filtrados
$y_k - \hat{y}_{k k}$

O método original, mas com a inicialização apresentada, será denominado por CTR#2.

4.3 Comparação experimental

Com o objetivo de verificar o desempenho da abordagem descrita na secção anterior, comparando com o método original, foi considerado um novo conjunto de séries reais. São sete séries relativas à procura (venda) diária de gasolina de uma grande companhia do mercado português, com efeitos sazonais semanais. Apresentam uma percentagem relativamente baixa de valores “em falta”, pelo que é possível aplicar o método CTR#1. Optou-se, mais uma vez, em utilizar também o modelo RFBN, aplicando-o a séries não estacionárias. Como nas experiências anteriores, foi otimizada a série da taxa de procura, mas agora através da medida MASE, e os hiperparâmetros das diferentes abordagens determinados por pesquisa em grelha.

Os resultados obtidos (Tabela 3) mostram, desde logo, que qualquer das três abordagens apresenta ganhos muito consideráveis relativamente ao método *Naïve*. Depois, não sendo uma diferença muito grande, é um facto que CTR#2 melhorou sempre CTR#1. Ou seja, além de agora o método ter aplicação universal, é também de supor que a sua forma “mais inteligente” de inicialização permitirá que apresente um aumento de desempenho. É igualmente de realçar o comportamento das redes face a dados sazonais, ao se mostrarem, em geral, bastante competitivas, e terem mesmo alcançado resultados de destaque para algumas séries.

Tabela 3 – Valores de MASE produzidos pelos métodos em análise na previsão da taxa de procura

Série (N)	CTR#1	CTR#2	RFBN
C1 (230)	0.48	0.46	0.45
C2 (236)	0.45	0.44	0.43
C3 (249)	0.51	0.48	0.30
C4 (261)	0.42	0.40	0.52
C5 (268)	0.50	0.48	0.50
C6 (270)	0.37	0.34	0.52
C7 (275)	0.48	0.47	0.54

5. CONCLUSÕES

É bem conhecida a utilização dos métodos de alisamento exponencial para a previsão de séries temporais. Menos estudada, no entanto, tem sido a aplicação desses métodos quando esses processos se apresentam, distintamente, irregularmente

espaçados no tempo. Foram apresentados alguns métodos que podem ser utilizados para esse fim, e foram feitas algumas propostas de melhoria de desempenho desses métodos. Adicionalmente, e de forma comparativa a estes métodos, foi também considerado um modelo de rede neuronal, concretamente, a rede de funções de base normalizadas. Estas diferentes abordagens foram avaliadas através de pequenos estudos experimentais, utilizando-se dados reais estacionários e não estacionários.

As modificações que foram propostas para os métodos de alisamento exponencial revelaram-se apropriadas, e, no caso sazonal, ultrapassando mesmo uma importante limitação à sua utilização. A rede de funções de base normalizadas, ao ter em conta as possíveis correlações não lineares dos dados, mostrou a sua adequabilidade para a previsão de séries irregularmente espaçadas. No caso estacionário, produziu claramente melhores previsões do que o alisamento exponencial, e, para algumas séries com sazonalidade, foi igualmente possível apresentar um melhor desempenho.

Um caminho que se julga interessante a seguir na previsão de séries irregularmente espaçadas é o proporcionado pela combinação de diferentes ideias metodológicas. Assim, baseado nos métodos de alisamento exponencial e na versão recursiva dos mínimos quadrados, encontra-se em preparação uma nova abordagem, integralmente recursiva, agregando na mesma formulação diferentes métodos, e aplicável à estimação de diferentes modelos. Pretende-se ainda avaliar o seu desempenho, não só através de séries reais, com diferentes características, mas também através da simulação adequada de séries representativas de processos irregulares.

MODELO MATEMÁTICO + SISTEMA FÍSICO = TEORIA DOS SISTEMAS

João M. Brito Lima
University of Algarve
(jlima@ualg.pt)

ABSTRACT

Automatic Control Systems are far and wide used in all modern and industrialized societies. Devices designed to control automatized tasks are each time more present from small plants to large industrial buildings.

The development of mathematical models is a compulsory task for whom aim at analyzing or design any control systems. These mathematical models should reproduce some performance measures as accurate as possible. So, no matter the physical nature of the process we aim at control, an accurate mathematical model should be evaluate. So, the development of mathematical models can be considered an hi-level step over the physical nature of the system that we aim at analyze or design. For this reason the study of Systems Theory and Control Systems are considered transversal areas of the knowledge and them studies are compulsory in many branches of sciences and technologies in many universities all over the world. In spite of normal systems are non-linear the linearization procedure simplify the analysis and design of control systems and, depending on the accuracy of the model can give us good results.

Keywords: Physical Systems, Mathematical Models, Differential Equations.

1. INTRODUÇÃO

A Teoria dos Sistemas é composta por métodos formais com vista ao estudo, projeto, interpretação analítica e homogeneizada de sistemas físicos do nosso quotidiano independentemente de quais sejam as suas naturezas (Ribeiro, 2002).

Sistemas de controlo automático estão cada vez mais presentes em todas as sociedades industrializadas, então, facilmente se compreende que a Teoria dos Sistemas inclua temas e metodologias úteis em diferentes ramos das ciências e tecnologias.

Um enquadramento mais palpável da Teoria dos Sistemas pode ser apresentado num contexto de conceção de um sistema de controlo (Ribeiro, 2002). Desta forma, independentemente de qual seja a dimensão ou a natureza física do sistema que se pretenda controlar, o projeto de um controlador deverá ter em conta as seguintes fases:

- Especificação
- Modelação
- Análise
- Verificação das especificações
- Síntese

O controlador que se pretende sintetizar (ou projetar) deverá ter em conta uma lista de especificações que deverão ser atendidas pelo sistema uma vez que este esteja controlado. Um sistema (ou processo) que se pretenda controlar terá uma complexidade mais ou menos elevada. O projeto de controladores é por vezes um procedimento iterativo tal que, até se atingir a solução final, soluções intermédias são experimentadas podendo resultar funcionamentos mais ou menos lesivos para o processo que se pretende controlar. Assim sendo, a utilização direta do processo que se pretende controlar durante o procedimento de síntese do controlador poderá originar danos graves, desta forma, assume-se com especial importância a fase de modelação. A utilização de um modelo adequado do processo que se pretende controlar tem como vantagem a preservação deste durante a fase de síntese do controlador.

Para além disso, em ambiente laboratorial dispõe-se, dum modo geral, de dispositivos que de alguma forma modelam processos do quotidiano.

Um modelo consiste geralmente numa simplificação da realidade e deverá ter em conta as especificações a ser atendidas na fase de síntese do controlador.

Estabelecido um modelo para o processo que se pretende controlar, passa-se à fase de análise deste para se verificar se a lista de especificações é ou não atendida. Nessa altura, consoante o grau de verificação das especificações, assim se se decidirá (ou não) pelo projeto dum controlador. Tal projeto consiste na associação de dispositivos e determinação dos respetivos parâmetros com vista à verificação das especificações.

A Teoria dos Sistemas está presente, em maior ou menor grau, em todas as fases da conceção de um sistema de controlo automático, independentemente de qual seja a sua natureza física. Apesar das abordagens iniciais versarem sobre sistemas elétricos ou mecânicos, presentemente a Teoria dos Sistema encontra aplicabilidade numa larga gama de áreas do conhecimento estendendo-se inclusivamente às ciências sociais (Ribeiro, 2002).

No presente artigo vão ver estudadas, recorrendo a exemplos, representações matemáticas de sistemas que se poderão incluir na etapa de modelação; neste contexto, este artigo é composto pelas secções que se descrevem de seguida. A secção 2 debruçase sobre a representação matemática de sistemas sendo dado ênfase a sistemas lineares e invariantes no tempo SLIT

contínuos. Na secção 3 será exemplificado como diferentes realidades físicas são modeladas pela mesma realidade matemática. Na secção 4 será apresentado um procedimento uniformizador para a representação de sistemas. O artigo termina com a secção 5 onde se concluirá que diferentes realidades físicas podem ser descritas pela mesma realidade matemática.

2. REPRESENTAÇÃO MATEMÁTICA DE SISTEMAS

Os sistemas que usualmente se encontram no quotidiano são dum modo geral não lineares. Sistemas lineares correspondem a aproximações da realidade que, em maior ou menor grau, podem ser consideradas bastante satisfatórias resultando em modelos cuja exatidão deverá ser tida em conta, tendo em vista o fim a que se destinam. Pode-se assim dizer que um modelo é uma abstração da realidade física extraíndo dela as características que se considerem relevantes para o fim em vista, tendo em conta hipóteses simplificativas.

No âmbito da Teoria dos Sistemas, ao modelo chama-se sistema, e este constitui a sua entidade básica sobre a qual ela (Teoria dos Sistemas) se debruça (Ribeiro, 2002).

O carácter simplificado do modelo relativamente ao sistema físico que o originou explica o facto de, a partir de um mesmo sistema físico poderem ser extraídos vários modelos consoantes as questões relativas ao sistema físico que se pretendam ver resolvidas. Por exemplo, considerando o sistema físico (elétrico) transístor sabe-se que o modelo para baixas frequências é diferente do modelo para as altas frequências, então, o modelo a adotar deverá ter em conta a gama de frequência onde se pretende trabalhar.

As hipóteses simplificativas na linearização de um sistema deverão ter em conta o ponto de funcionamento do sistema físico não linear para o qual se pretende extrair o modelo. Por exemplo, a dinâmica do pêndulo gravítico pode ser linearizada assumindo que para pequenas elongações o seno dum ângulo pode ser aproximado pela sua amplitude.

A linearização de um modelo resulta numa simplificação considerável em termos de conceção e uso das ferramentas matemáticas necessárias à sua análise. Por este motivo esta secção desenvolve-se assumindo sistemas lineares e invariantes no tempo, SLIT.

Neste contexto considere-se um sistema contínuo linear e invariante no tempo arbitrário, descrito pela equação diferencial linear e de coeficientes constantes (1).

$$\begin{aligned} y^{(n)}(t) + a_{n-1}y^{(n-1)}(t) + \dots + a_2\ddot{y}(t) + a_1\dot{y}(t) + a_0y(t) = \dots \\ b_m u^{(m)}(t) + b_{m-1}u^{(m-1)}(t) + \dots + b_2\ddot{u}(t) + b_1\dot{u}(t) + b_0u(t), \quad n > m \end{aligned} \quad (1)$$

Trata-se de um sistema de ordem igual à ordem da equação diferencial, (ordem n), em que a entrada é o sinal $u(t)$ e a saída é o sinal $y(t)$.

A linearidade do sistema traduz-se na linearidade da correspondente equação diferencial (1) e a invariância no tempo reflete-se no facto de serem constantes os coeficientes a_i e b_j .

A equação diferencial (1) descreve completamente o correspondente sistema significando isso que, a partir dela, conhecido o sinal de entrada $u(t)$ e n valores iniciais da saída $y(t)$ e das suas $n-1$ primeiras derivadas, é possível determinar, de forma única, a evolução temporal da saída do sistema, $y(t)$.

Partindo-se de (1) pode-se obter representação em termos de entrada-saída, (ou representação externa) e representação em termos de estado (ou representação interna).

Olhando para (1) na perspetiva de entrada-saída e tendo em conta que a transformada de Laplace pode ser usada na resolução de equações diferenciais lineares, então, pode-se obter uma representação externa do sistema que resulta no quociente entre a transformada de Laplace da saída, $Y(s)$, e a transformada de Laplace da entrada, $U(s)$. Esta representação externa denomina-se função de transferência que, para o sistema representado por (1), resulta (2), sendo que, no instante inicial se consideram nula a saída $y(t)$ bem como as suas $n-1$ primeiras derivadas (Dorf and Bishop, 1995).

$$\frac{Y(s)}{U(s)} = \frac{b_ms^m + b_{m-1}s^{m-1} + \dots + b_1s + b_0}{s^n + a_{n-1}s^{n-1} + a_{n-2}s^{n-2} + \dots + a_1s + a_0} \quad (2)$$

A equação diferencial (1) permite a obtenção de uma representação interna alternativa àquela vertida em (2). Esta representação interna denomina-se modelo de estado acomodando, para além da entrada e da saída, a definição de variáveis internas. Estas variáveis internas são funções do tempo e coordenadas do vetor de estado $X(t)$, poderão ter significado

físico ou serem entidades matemáticas abstratas: $X(t) = [x_1(t) \ x_2(t) \ \dots \ x_n(t)]^T$ (Dorf and Bishop, 1995).

A escolha duma representação, interna ou externa, faz-se consoante as técnicas de análise ou projeto que se pretendam utilizar enquadradas num eventual procedimento para controlo do sistema. Nomeadamente, a representação (2) permite calcular a saída $y(t)$ conhecida a entrada $u(t)$ desde que o sistema parta do repouso, ou seja, as condições iniciais sejam nulas. Porém, muitas situações do quotidiano existem em que o sistema não parte do repouso mas sim, apresenta um estado inicial não nulo, nessas circunstâncias o modelo (2) revela-se incompleto, sendo que, uma representação interna, ou modelo de

estado, por acomodar a existência de condições iniciais não nulas, revela-se adequado.

A partir da representação externa (2) pode-se calcular uma infinidade de representações internas, (uma por cada conjunto de variáveis de estado $[x_1(t) \ x_2(t) \ \dots \ x_n(t)]$ que se escolha), sendo que, uma delas está representada pelo diagrama de simulação na Fig. 1.

A leitura direta da Fig. 1 permite estabelecer a equação de estado (3) e a equação de saída (4).

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \vdots \\ \dot{x}_{n-1} \\ \dot{x}_n \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & 0 & \cdots \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & \cdots & 0 & 1 \\ -a_0 & -a_1 & \cdots & -a_{n-2} & -a_{n-1} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_{n-1} \\ x_n \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ 1 \end{bmatrix} u(t) \quad (3)$$

$$y(t) = [b_0 \ b_1 \ \cdots \ b_{m-1} \ b_m \ 0 \ \cdots \ 0] \cdot \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_m \\ x_{m+1} \\ x_{m+2} \\ \vdots \\ x_n \end{bmatrix} \quad (4)$$

O par de equações (3) e (4) pode ser escrito na forma compacta (5).

$$\begin{cases} \dot{X}(t) = AX(t) + BU(t) \\ Y(t) = CX(t) + DU(t) \end{cases} \quad (5)$$

Definindo-se:

- A - matriz da dinâmica $[n \times n]$,
- B - matriz de entrada $[n \times q]$, q is the number of inputs,
- C - matriz de saída $[p \times n]$, p is the number of outputs,
- D - matriz $[p \times q]$ matrix ($D = 0$, para este caso).

Fig. 1 –Diagrama de simulação respeitante à função de transferência (2)

A representação de SLIT desenvolvida nesta secção é genérica, para sistemas contínuos, não tendo havido a necessidade de se particularizar a suas naturezas físicas; semelhante estudo pode ser feito para sistemas discretos. Nessas circunstâncias a equação diferencial linear de coeficientes constantes (1) daria lugar a uma equação com diferenças, linear e de coeficientes constantes. O cálculo da transformada de Laplace de (1) seria substituído pelo cálculo da transformada z da equação com diferenças, originando uma função de transferência discreta análoga à que se apresenta em (2) mas sendo função de z . O diagrama de simulação (Fig. 1) daria lugar a um diagrama de simulação em que os integradores seriam substituídos por elementos de atraso unitários para tempo discreto representados por Z^{-1} . O modelo de estado discreto análogo ao contínuo (5) é dado por (6), tendo as matrizes A , B , C e D denominações análogas.

$$\begin{cases} X[k+1] = AX[k] + BU[k] \\ Y[k] = CX[k] + DU[k] \end{cases} \quad (6)$$

3. MODELOS MATEMÁTICOS DE SISTEMAS FÍSICOS

A função de transferência como representação externa de sistemas em termos de entrada-saída e, o modelo de estado onde se definem variáveis internas (variáveis de estado), foram apresentados na secção anterior para *SLIT* contínuos. Ficou claro nessa secção que a metodologia exposta não mencionava a natureza física de nenhum sistema em particular.

Nesta secção vão ser apresentados exemplos de sistemas físicos para os quais se calcularão as correspondentes representações matemáticas (D'Azzo and Houpis, 1988). Apesar de se tratar de exemplos de sistemas físicos de naturezas diferentes, vai ficar claro que os mesmos serão representáveis pelo mesmo modelo matemático.

3.1 Sistema elétrico

Nesta secção vai ser estudado o sistema da Fig. 2 que consiste num circuito elétrico.

Fig. 2 – Circuito elétrico

Este circuito é composto por uma bobine de indutância L medida em Henry $[H]$ ligada a um paralelo de uma resistência R medida em Ohm $[\Omega]$ com um condensador de capacidade C medida em Farad $[F]$; o circuito é alimentado por uma fonte de corrente $i(t)$. Para este circuito será determinada uma função de transferência e um modelo de estado que serão confrontados com os modelos representados pelas expressões (2), (3) e (4).

Na representação externa (função de transferência), é considerada como entrada a tensão aos terminais da fonte de corrente $v_1(t)$ e como saída a tensão aos terminais do condensador $v_2(t)$. Tratando-se de um sistema de natureza elétrica, as leis fundamentais da análise de circuitos elétricos (Dorf, 1993) vão ser utilizadas para se chegar à função de transferência (7).

$$\frac{V_2(s)}{V_1(s)} = \frac{\frac{1}{LC}}{s^2 + \frac{1}{RC}s + \frac{1}{LC}} \quad (7)$$

A função de transferência dada por (7) é formalmente idêntica ao modelo expresso por (2) tendo em conta que a saída Y corresponde à tensão V_2 , e a entrada U corresponde à tensão V_1 . Para além disso, a função racional (7) obtém-se da que se apresenta em (2) fazendo $m = 0$, $n = 2$ e definindo-se os coeficientes da seguinte forma:

$$\begin{aligned} \bullet \quad b_0 &= \frac{1}{LC} \\ \bullet \quad a_0 &= \frac{1}{LC} \\ \bullet \quad a_1 &= \frac{1}{RC} \end{aligned}$$

Alternativamente, uma representação interna para o circuito elétrico da Fig. 2 pode ser estabelecida. Para os valores dos coeficientes a_0 , a_1 e b_0 , tendo em conta o modelo de estado apresentado em (3) e (4), pode-se estabelecer o modelo de estado para o circuito elétrico da Fig. 2, representado pela equação de estado (8) e a equação de saída (9). A saída $y(t)$ representa $v_2(t)$ e a entrada $u(t)$ representa $v_1(t)$.

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -\frac{1}{LC} & -\frac{1}{RC} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u(t) \quad (8)$$

$$y(t) = \begin{bmatrix} \frac{1}{LC} & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad (9)$$

3.2 Sistema mecânico

Nesta secção vai ser estudado o sistema mecânico translacional da Fig. 3.

Fig. 3 – Sistema mecânico translacional

Trata-se de uma massa M medida em Quilograma $[Kg]$ que se desloca numa superfície horizontal segundo uma reta (eixo dos X), por ação de uma força $f(t)$ medida em Newton $[N]$ aplicada a uma mola em hélice de constante de elasticidade K medida em $\left[\frac{N}{m}\right]$ ligada à massa. Do contacto da massa com a superfície gera-se um atrito de constante B medida em $\left[\frac{Ns}{m}\right]$.

De forma análoga ao que foi feito para o exemplo elétrico anterior, será determinada uma função de transferência e um modelo de estado que serão confrontados com os modelos representados pelas expressões (2), (3) e (4).

Dada a natureza física do sistema em estudo, vão ser utilizadas as leis da mecânica para o estabelecimento das equações diferenciais que descrevem a sua dinâmica (Ribeiro, 2002). Assumindo-se como entrada a velocidade da extremidade da mola onde é aplicada a força f , v_F , e como saída a velocidade da massa, v_M , determina-se a função de transferência (10) a partir das equações diferenciais obtidas previamente.

$$\frac{V_M(s)}{V_F(s)} = \frac{\frac{K}{M}}{s^2 + \frac{B}{M}s + \frac{K}{M}} \quad (10)$$

Semelhantemente ao que aconteceu com o circuito elétrico, a função de transferência agora obtida corresponde àquela representada por (2) tendo em conta que a saída Y corresponde à velocidade e a entrada U corresponde à velocidade V_F . Trata-se de um sistema de 2ª ordem sem zeros pelo que $m = 0$ e $n = 2$, assim, a partir de (2) obtém-se (10) fazendo os coeficientes:

$$\begin{aligned} \bullet \quad b_0 &= \frac{K}{M} \\ \bullet \quad a_0 &= \frac{K}{M} \\ \bullet \quad a_1 &= \frac{B}{M} \end{aligned}$$

Apresenta-se de seguida um modelo de estado para o sistema da Fig. 3. Assim, particularizando o diagrama de simulação da Fig. 1 para os coeficientes a_0 , a_1 e b_0 podem-se então estabelecer as equações de estado (11) e de saída (12).

$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -\frac{K}{M} & -\frac{B}{M} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u(t) \quad (11)$$

$$y(t) = \begin{bmatrix} \frac{K}{M} & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad (12)$$

As representações externas na forma de funções de transferência, respetivamente (7) e (10), bem como as representações internas na forma de modelos de estado, respetivamente (8) e (9), (11) e (12), servem de base tanto a procedimentos de análise como a procedimentos de síntese de controladores. A escolha da representação por função de transferência ou por modelo de estado depende de que técnicas se pretendem utilizar. Tais representações permitem estudos tanto no domínio do tempo quanto no domínio da frequência.

4. REPRESENTAÇÃO UNIFORMIZADA DE SISTEMAS

Na secção anterior foram estudados 2 sistemas físicos de naturezas distintas, eléctrico Fig. 2, e mecânico Fig. 3. Para tais sistemas foram apresentadas as funções de transferência e os modelos de estado respetivos (Dorf and Bishop, 1995). Tratando-se de SLIT as funções de transferência estão na forma de (2) e os modelos de estado estão na forma de (5). Dada a similaridade das representações matemáticas destes 2 sistemas físicos de natureza distinta pode-se colocar a seguinte questão:

- Obtido um modelo para um dado sistema, existirão outros sistemas para os quais esse modelo seja adequado?

No caso da resposta ser afirmativa poder-se-á questionar se os outros sistemas poderão ser de natureza física distinta do sistema original.

Os exemplos apresentados na secção anterior permitem responder afirmativamente à questão colocada, na medida em que, o modelo a que se chega para o circuito eléctrico é idêntico ao modelo a que se chega para o sistema mecânico. Assim, pode-se dizer que o outro sistema para o qual o modelo do sistema eléctrico é adequado é de natureza distinta (mecânico).

Neste contexto, cingindo-se a sistemas de natureza eléctrica e mecânica, vai-se apresentar nesta secção uma metodologia para, partindo-se de um sistema mecânico arbitrário, encontrar-se um sistema (circuito) eléctrico cujo modelo matemático seja idêntico ao modelo matemático do sistema mecânico. Encontrado o circuito eléctrico diz-se que este é um sistema análogo do sistema mecânico.

Consideremos as grandezas físicas envolvidas em cada um dos sistemas da secção anterior; para o circuito eléctrico a perturbação do sistema é feita à custa de uma fonte de corrente enquanto para o sistema mecânico a perturbação é feita pela aplicação de uma força. Assim, pode-se considerar que a corrente eléctrica num circuito tem função análoga a uma força num sistema mecânico. Na verdade, tanto a força como a corrente propagam-se através dos elementos, mecânicos e eléctricos respetivamente. Os respetivos aparelhos de medida, dinamómetro para medição da força e amperímetro para medição da intensidade de corrente, são colocados em série. Assim, na procura de analogias pode-se afirmar que as seguintes grandezas físicas:

$$\text{Intensidade da corrente, } i \sim \text{Força, } f$$

são análogas.

Semelhante leitura pode ser feita relativamente à tensão eléctrica num circuito e à velocidade de um ponto num sistema mecânico. Ambas as grandezas medem-se em relação a uma referência; a tensão num nó dum circuito mede-se relativamente a um nó de referência bem como a velocidade de um ponto se mede em relação a um referencial que se considera parado. Assim, na procura de analogias pode-se afirmar que as seguintes grandezas físicas:

$$\text{Tensão eléctrica, } v \sim \text{Velocidade, } v_e$$

são análogas.

Considere-se agora os elementos básicos dos circuitos eléctricos e dos sistemas mecânicos da Tab. 1 onde se apresentam as leis elementares que os governam.

Com base as leis que governam a massa M e o condensador C , respetivamente, $f(t) = M \frac{dv_e(t)}{dt}$ e

$i(t) = C \frac{dv(t)}{dt}$; então, assumindo as analogias anteriores (força, corrente eléctrico e velocidade, tensão), pode-se dizer

que:

- o modelo da massa M é igual ao modelo do condensador C desde que a capacidade do condensador seja $C = M$.

Considere-se agora as leis que governam a mola de constante de elasticidade K e a bobine de indutância L , respetivamente

$f(t) = Kx(t)$ e $v(t) = L \frac{di(t)}{dt}$. Derivando ambos os membros da lei que governa a mola e resolvendo em ordem

à velocidade tem-se $v_e(t) = \frac{1}{K} \frac{df(t)}{dt}$. Comparando esta expressão com a lei que governa a bobine e tendo em conta as

analogias anteriores, pode-se dizer que:

- o modelo da mola K é igual ao modelo da bobine L desde que a indutância da bobine seja $L = \frac{1}{K}$.

$$v_e(t) = \frac{dx(t)}{dt}$$

² A ausência do sinal negativo relativamente ao que se apresenta na tabela deve-se ao facto de agora não se estar a considerar a força de restituição da mola mas sim a força externa que se deve aplicar para que a mola sofra um alongamento x .

Tab. 1 Elementos básicos de circuitos elétricos e de sistemas mecânicos, suas representações e leis que os governam

Elementos elétricos	Resistência	Bobina	Condensador
			
	$v(t) = Ri(t)$	$v(t) = L \frac{di(t)}{dt}$	$i(t) = C \frac{dv(t)}{dt}$
Elementos mecânicos	Massa	Mola	Atrito
			
	$f(t) = M \frac{d^2x(t)}{dt^2}$	$f(t) = -Kx(t)$	$f(t) = -B \frac{dx(t)}{dt}$

Por último, repare-se no atrito de constante B e na resistência R , bem como nas respectivas leis que as governam,

$f(t) = Bv_e(t)$ e $i(t) = \frac{1}{R}v(t)$; então, tendo em conta as analogias habituais pode-se dizer que:

- o modelo do elemento de atrito B é igual ao modelo da resistência R desde que a resistência seja $R = \frac{1}{B}$.

Resumindo, na Tab. 2 registam-se as condições que se devem verificar entre cada par de elementos análogos para que o modelo dum circuito elétrico seja igual ao modelo do sistema mecânico.

Nesta altura, pode-se verificar que, tanto para a função de transferência (10), como para o modelo de estado (11) e (12), obtidos para o sistema mecânico Fig. 3, substituindo os seus parâmetros M , K e B de acordo com a Tab. 2, resultam na função de transferência (7) e no modelo de estado (8) e (9) do circuito elétrico Fig. 2. De forma inversa, os modelos (função de transferência e modelo de estado) a que se chegaram para o circuito elétrico resultam nos correspondentes modelos para o sistema mecânico desde que se façam as substituições dos parâmetros elétricos de acordo com a Tab. 2.

Tab. 2 Condições a verificar para que elementos análogos sejam governados pelo mesmo modelo

Massa – Condensador	$M = C$
Mola – Bobine	$K = \frac{1}{L}$
Atrito – Resistência	$B = \frac{1}{R}$

5. CONCLUSÕES

Chega-se então à conclusão de que se está perante sistemas físicos distintos que são representáveis pelo mesmo modelo matemático.

Esta conclusão é extrapolável a sistemas de outras naturezas que não elétrica ou mecânica, por exemplo, sistemas de naturezas tão dispares como hidráulicos ou térmicos são constituídos por elementos básicos que terão correspondência em termos de modelos para com, por exemplo, sistemas mecânicos ou elétricos.

Esta conclusão permite dizer que:

- **diferentes realidades físicas são representadas pela mesma realidade matemática.**

Esta conclusão uniformizadora tem implicações para toda a metodologia que integra a Teoria de Sistemas, seja no que se refere à representação de sistemas, análise ou síntese.

APLICAÇÕES DE TRANSFORMADAS INTEGRAIS EM PROCESSAMENTO DE SINAIS

Rui Marreiros

Departamento de Matemática, Faculdade de Ciências e Tecnologia, Universidade do Algarve
(rmarrei@ualg.pt)

RESUMO

As transformadas integrais constituem uma área da matemática de enorme investigação teórica e aplicada em diferentes ramos da ciência e tecnologia. Entre as aplicações destaca-se o seu uso em telecomunicações, no processamento de sinais físicos com vista à transmissão destes. Neste trabalho mostramos a utilização das transformadas integrais de Fourier e de Hilbert na, assim designada, modelação de amplitude.

Palavras-chave: Transformada de Fourier, Transformada de Hilbert, Modelação de Amplitude.

1. INTRODUÇÃO

Seja $f(t)$ uma função de variável real tal que $\int_{-\infty}^{+\infty} |f(t)| dt < \infty$; a *transformada de Fourier* de $f(t)$, ou o espectro de $f(t)$, define-se por

$$\hat{f}(\omega) = \int_{-\infty}^{+\infty} f(t) e^{-2\pi i \omega t} dt.$$

A transformada inversa de Fourier de $\hat{f}(\omega)$, define-se por

$$f(t) = \int_{-\infty}^{+\infty} \hat{f}(\omega) e^{2\pi i \omega t} d\omega.$$

Por um sinal $s(t)$ entende-se uma função real do tempo t tal que

$$\hat{s}(\omega) = \begin{cases} \hat{s}(\omega), & \omega \in [-\omega_0, \omega_0] \\ 0, & \omega \notin [-\omega_0, \omega_0] \end{cases}$$

onde $\omega_0 > 0$ é uma constante (tipicamente, em rádio, $\omega_0 = 4,5 \text{ kHz}$).

Conhecendo $\hat{s}(\omega)$, tem-se

$$s(t) = \int_{-\omega_0}^{+\omega_0} \hat{s}(\omega) e^{2\pi i \omega t} d\omega.$$

Os sinais não podem ser transmitidos directamente por dois motivos:

- 1) as frequências no intervalo $[-\omega_0, \omega_0]$ não são passíveis de transmissão por ondas electromagnéticas;
- 2) para permitir a transmissão simultânea, diferentes emissores deverão utilizar diferentes frequências que não se intersectem.

Assim os sinais devem ser modulados antes de serem transmitidos; são usados dois sistemas de modulação: modulação de amplitude (AM) e modulação de frequência (FM). Vamos descrever dois tipos de AM:

- i) Modulação clássica e ii) Modulação de banda unilateral.

2. MODULAÇÃO CLÁSSICA

O sinal dado é multiplicado por $2\cos 2\pi\omega_c t$, onde ω_c é a designada frequência portadora (frequência que se sintoniza no rádio, característica do emissor considerado, $\omega_c \cong 1000 \text{ kHz}$, $\omega_c \gg \omega_0$). Assim o sinal modulado é

$$S(t) = 2s(t)\cos 2\pi\omega_c t.$$

Calculemos o espectro do sinal modulado; tem-se

$$\begin{aligned}\hat{S}(\omega) &= \int_{-\infty}^{+\infty} S(t) e^{-2\pi i \omega t} dt = \int_{-\infty}^{+\infty} 2s(t) \cos 2\pi \omega_c t e^{-2\pi i \omega t} dt = \\ &= \int_{-\infty}^{+\infty} s(t) (e^{2\pi i \omega t} + e^{-2\pi i \omega t}) e^{-2\pi i \omega t} dt = \\ &= \int_{-\infty}^{+\infty} S(t) e^{-2\pi i (\omega - \omega_c) t} dt + \int_{-\infty}^{+\infty} S(t) e^{-2\pi i (\omega + \omega_c) t} dt \Leftrightarrow \\ &\hat{S}(\omega) = \hat{s}(\omega - \omega_c) + \hat{s}(\omega + \omega_c). \quad (a)\end{aligned}$$

Chegado ao receptor o sinal modulado deve ser demodulado; multiplicando $S(t)$ por $\cos 2\pi \omega_c t$ obtem-se o sinal demodulado $S_1(t) = 2s(t) \cos^2 2\pi \omega_c t$.

De forma análoga ao cálculo de $\hat{S}(\omega)$, calculamos o espectro do sinal demodulado e obtemos

$$\hat{S}_1(\omega) = \frac{1}{2} \hat{s}(\omega - 2\omega_c) + \hat{s}(\omega) + \frac{1}{2} \hat{s}(\omega + 2\omega_c).$$

O receptor filtra os termos de alta frequência $\hat{s}(\omega \pm 2\omega_c)$ e sintetiza o sinal original

$$s(t) = \int_{-\omega_0}^{+\omega_0} \hat{s}(\omega) e^{2\pi i \omega t} d\omega.$$

Desvantagem da modulação clássica: o comprimento do espectro do sinal modulado $\hat{S}(\omega)$ ($= 4\omega_0$) é maior que o comprimento do espectro do sinal original $\hat{s}(\omega)$ ($= 2\omega_0$). Pretende-se economizar o “espaço das frequências” de modo a permitir o seu uso por um maior número de emissores.

Tratamento: existe informação redundante em $\hat{S}(\omega)$; de facto, como o sinal é real tem-se

$$\hat{s}(-\omega) = \overline{\hat{s}(\omega)}. \quad (b)$$

De (a) tem-se

$$\hat{S}(\omega_c + \omega) = \hat{s}(\omega), \quad \hat{S}(\omega_c - \omega) = \hat{s}(-\omega);$$

e, com (b),

$$\hat{S}(\omega_c - \omega) = \overline{\hat{S}(\omega_c + \omega)}.$$

Daqui obtemos que é suficiente conhecer a função $\hat{S}(\omega)$ no intervalo $[\omega_c, \omega_c + \omega_0]$.

Questão: será possível associar ao sinal dado $s(t)$ um sinal $S_0(t)$ cujo espectro $S_0(\omega)$ coincida com $\hat{S}(\omega)$ nos intervalos $\pm[\omega_c, \omega_c + \omega_0]$ e seja igual a zero fora deles? Sim, é possível definir uma função $S_0(t)$ tal que

$$\hat{S}_0(\omega) = \frac{1}{2} [1 + \text{sgn}(\omega - \omega_c)] \hat{s}(\omega - \omega_c) + \frac{1}{2} [1 - \text{sgn}(\omega + \omega_c)] \hat{s}(\omega + \omega_c),$$

onde $\text{sgn}(\omega) = \begin{cases} +1, & \omega > 0 \\ -1, & \omega < 0 \end{cases}$, como mostraremos de seguida.

3. MODULAÇÃO DE BANDA UNILATERAL

O sinal modulado é definido por

$$S_0(t) = s(t) \cos 2\pi \omega_c t - \check{s}(t) \sin 2\pi \omega_c t,$$

onde $\check{s}(t)$ designa a *transformada de Hilbert* da função $s(t)$, i.e.,

$$\check{s}(t) = \frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{s(t_1)}{t - t_1} dt_1.$$

Observação 1. Procedendo ao cálculo da transformada de Fourier da função $S_0(t)$, mostra-se que o seu espectro é a função $\hat{S}_0(\omega)$ mencionada anteriormente.

Observação 2. O integral na definição da transformada de Hilbert existe como integral impróprio para $t \notin \mathbb{R}$ e no sentido do valor principal segundo Cauchy para $t \in \mathbb{R}$, que é o caso presente.

Chegado ao receptor o sinal modulado deve ser demodulado; tal como na modulação clássica obtém-se o sinal demodulado com o produto $S_{01}(t) = 2S_0(t) \cos 2\pi\omega_c t$.

Calculando o espectro do sinal demodulado obtemos

$$\hat{S}_{01}(\omega) = \frac{1}{2} [1 + \text{sgn}(\omega - 2\omega_c)] \hat{s}(\omega - 2\omega_c) + \hat{s}(\omega) + \frac{1}{2} [1 - \text{sgn}(\omega + 2\omega_c)] \hat{s}(\omega + 2\omega_c).$$

O receptor filtra os termos de alta frequência $\hat{s}(\omega \pm 2\omega_c)$ e sintetiza o sinal original

$$s(t) = \int_{-\omega_0}^{+\omega_0} \hat{s}(\omega) e^{2\pi i \omega t} d\omega.$$

Observação 3. O sinal modulado $S_0(t)$ pode ser escrito na forma

$$S_0(t) = \text{Re}\{z(t)e^{2\pi i \omega_c t}\},$$

onde $z(t) = s(t) + i\tilde{s}(t)$ é o sinal analítico associado à função $s(t)$. Tem lugar a seguinte proposição: a função complexa $z(t)$ de variável real t é um sinal analítico se e só se

$$\hat{z}(\omega) = \frac{1}{2} [1 + \text{sgn}(\omega)] \hat{z}(\omega), \quad \hat{z}(\omega) = \begin{cases} \hat{z}(\omega), & \omega > 0 \\ 0, & \omega < 0 \end{cases}, \text{ i.e.,}$$

RESUMO

Este estudo pretende investigar as relações entre o bem-estar psicológico e o rendimento académico. É um design quantitativo, transversal e correlacional, com uma amostra de 411 alunos do ensino secundário, portugueses, com idades compreendidas entre os 15 e os 21 anos. O instrumento de recolha de dados foi a escala multidimensional de Bem-Estar Psicológico de Ryff, adaptada para adolescentes. A capacidade de um aluno concluir em três anos o 3.º ciclo do ensino básico foi considerada rendimento académico. Os resultados apontam significado estatístico para uma diferenciação segundo o género, com as raparigas a pontuarem mais alto nas dimensões autonomia, crescimento pessoal e relações positivas com os outros e a mostrarem que os estudantes mais velhos (>18 anos) percecionam níveis de autonomia mais elevados. Ocorreram correlações significativas positivas entre o rendimento académico e todas as dimensões do bem-estar-psicológico. Salienta-se a importância das intervenções potenciadoras do bem-estar-psicológico dos alunos tendo em vista a promoção do rendimento académico.

Palavras-chave: Alunos, Bem-Estar-Psicológico, Rendimento Académico.

1. INTRODUÇÃO

O bem-estar psicológico é um constructo multidimensional, que envolve elementos cognitivos e emocionais (Salami, 2011), constituindo requisitos para a compreensão global do bem-estar humano em congruência com fatores ao nível individual e social (Ryff & Singer, 1996). Neste sentido, o bem-estar é o nível em que cada indivíduo perceciona a satisfação de sua vida como um todo, sendo uma construção complexa da atividade humana.

O tema, bem-estar, tem despertado interesse em diversas áreas científicas e a cidadãos comuns. Este constructo está alicerçado em torno de duas perspetivas gerais: a abordagem hedónica, que incide sobre a felicidade e define o bem-estar em termos de obtenção de prazer e de evitar a dor, e a abordagem eudaimónica, que se refere à autorrealização do potencial individual, a fim de superar os desafios existenciais, conferindo metas fundamentais à sua vida. Bem-estar respeita ao grau em que uma pessoa está em pleno funcionamento, contemplando diversas dimensões do funcionamento psicológico (Novo, 2003; Salami, 2011). Essas duas visões têm dado origem a diferentes focos de pesquisa e um corpo de conhecimento que é em algumas áreas divergentes e, em outras complementares. Novos desenvolvimentos metodológicos sobre modelagem multinível e comparações de constructo, conduzem à formulação de novas perguntas.

A atenção dispensada ao bem-estar (*well-being*) não é recente. Remonta à Grécia Antiga por parte de diversos pensadores e filósofos, na procura de fatores determinantes da promoção da felicidade e do prazer. Aristóteles na sua obra de *Ética a Nicómano*, aborda o “bem humano” como uma condição principal da “felicidade” (Santos, 2001, p. 20), enquanto que os filósofos Aristippus e Hobbes, do século 4 a.C., sustentavam que o objetivo da vida é a máxima experiência de prazer (Ryan & Deci, 2001, p. 143).

O conceito bem-estar passou a configurar no campo científico da psicologia na última década do século XX (Novo, 2005; Siqueira & Padovam, 2008), segundo Ryan e Deci (2001, p. 142), com o intuito de conhecer os fatores psicológicas que estão associados a uma vida saudável. Até então a psicologia ocupava-se, sobretudo, em dar resposta aos problemas do foro psicopatológico e na área da saúde mental, ou seja, a saúde era interpretada como ausência de doenças (*absence of illness*) em vez de ser presença de bem-estar (*presence of wellness*) (Ryff & Singer, 1996, p. 14).

No âmbito da Psicologia Positiva, centrada no estudo científico das experiências positivas e nas características positivas individuais, foi retomado o interesse em analisar o bem-estar, porque atribui particular importância às variáveis positivas dos comportamentos humanos, nomeadamente à felicidade, amor, esperança, competência, responsabilidade, otimismo, compaixão, entre outras (Novo, 2005). Contudo, no fim do século XX, o conceito de bem-estar é enfatizado em diversos estudos, sobretudo na área de intervenção social, clínica e de avaliação das políticas sociais, passando o tema bem-estar a ser frequentemente aplicado pela população em geral, utilizando diferentes abordagens e tornando-se um componente fundamental na determinação de uma vida saudável (Novo, 2005; Siqueira & Padovam, 2008).

Antes de abordar os antecedentes e os estudos anteriores do constructo BEP importa referenciar que o bem-estar comporta diferentes modelos a citar: bem-estar subjetivo, bem-estar psicológico e bem-estar social (Maia, 2011; Novo, 2005). Porém, entre as várias teorias, metodologias na conceção e operacionalização do constructo bem-estar, destacamos as abordagens do bem-estar psicológico.

O constructo bem-estar psicológico é proposto por Ryff (1989), configurando um novo modelo sustentado nas dimensões nucleares do funcionamento psicológico positivo, integrando o bem-estar no domínio da saúde mental positiva. Ryff considerou que o bem-estar subjectivo-BES não contempla a motivação central na busca do prazer e por isso não fornece elementos suficientes de análise. Como contraponto, o seu modelo é fundamentado na interpretação do conceito aristotélico de *eudaimonia*¹, que consiste na busca do bem supremo, de uma vida justa, boa e feliz, ou seja, permite os indivíduos reconhecerem as suas capacidades, talentos e viverem de acordo com o seu *daimon*, a fim de alcançarem a perfeição e a realização pessoal e, por fim, a sua felicidade e o seu bem-estar (Fernandes, Vasconcelos-Raposo, Bertelli, & Almeida, 2011; Novo, 2005; Siqueira & Padovam, 2008). Com efeito, o modelo de BEP (*psychological well-being*) de Ryff difere do BES por ser mais amplo, teoricamente mais sólido e com capacidade de incluir o bem-estar na promoção da saúde mental e momento do funcionamento psicológico positivo (Fernandes, 2007; Novo, 2003). Para além de abranger a subjetividade o constructo bem-estar psicológico também inclui a satisfação de algumas necessidades (Kesebir & Diener, 2008).

Ryff (1989), ao efetuar uma revisão intensiva da literatura propôs um modelo de BEP que engloba diversos modelos teóricos, nomeadamente da personalidade, da psicologia do desenvolvimento e psicologia clínica, e ainda as mais relevantes propostas do “human flourishing” (Ryan & Deci, 2001). Com efeito, o modelo multidimensional, holístico e teórico-empírico de avaliação do bem-estar proposto pela investigadora Ryff (1989), destinado a maiores de dezoito anos, é constituído por seis dimensões: autonomia (*autonomy*) – sentimento de autodeterminação e capacidade de auto-regulação e liberdade ou independência em relação à aprovação externa; domínio do meio (*environmental mastery*) – capacidade para gerir a vida própria e exigências extrínsecas ao indivíduo; crescimento pessoal (*personal growth*) – sentimento de desenvolvimento contínuo e abertura a novas experiências de vida necessárias à maximização do seu potencial; relações positivas com os outros (*positive relationships*) – estabelecimento de relações positivas e altruístas para com os outros; objetivos na vida (*purpose in life*) – definição de propósitos de vida e atribuição de significação/importância à existência e autorealização pessoal; e, aceitação de si (*self acceptance*) – caracterizada pela perceção e aceitação dos múltiplos aspetos do indivíduo, quer sejam relacionados com características boas ou más, e avaliação positiva do seu passado (Fava & Tomba, 2009; Fernandes, 2007; Novo, 2005; Ryff, 1989, 2013; Ryan & Deci, 2001; Ryff & Keyes, 1995; Ryff & Singer, 2006; Siqueira & Padovam, 2008).

Os estudos de bem-estar psicológico têm sido aplicados maioritariamente a pessoas adultas e a idosos, sendo escassos os estudos sobre populações mais jovens. Neste sentido, Fernandes (2007), no âmbito do seu estudo de doutoramento que aplicou a escala de BEP de Ryff (cento e vinte itens), porém, adaptada e validada à população adolescentes portuguesa, sendo mais compacta com trinta itens, denominada a EBEP-adolescentes, numa amostra de 698 alunos com idades compreendidas entre os 12 e os 18 anos, do 3º Ciclo do Ensino Básico e do Secundário, na zona centro de Portugal. Esta escala mostrou uma boa adequação fatorial.

O estudo desenvolvido por Sá (2012), que teve como objetivo principal a perceção do efeito de uma intervenção sobre as habilidades sociais no comportamento pró-social, autoconceito e aceitação pelos pares, em seis momentos, tendo participado em cada um deles cerca de duzentos e quarenta alunos, do género masculino e feminino, do 3º ciclo básico (7º, 8º e 9º ano) de uma escola pública, na região do norte de Portugal, foi aferido que os alunos ao frequentarem o Programa de Desenvolvimento de Habilidades Sociais- PDHS contribuíam para uma melhoria em quase todos os domínios do BEP, à exceção do BEP-autonomia. Assim como, os resultados indicaram a existência de diferenças estatisticamente significativas entre o bem-estar psicológico global em todos os momentos e o rendimento escolar dos primeiros, segundo e terceiro período. Para este estudo o RE foi avaliado pela média da nota obtida no 3º Ciclo do Ensino Básico-CEB. No que concerne, às diferenças entre o género masculino e o feminino, Sá sugere diferenças estatisticamente significativas no BEP global, em que os alunos do género feminino apresentaram médias do BEP global superiores às apresentadas pelos alunos do género masculino em todos os momentos.

Também Coelho (2015) concluiu que o bem-estar psicológico é crucial na vida de um indivíduo, proporcionando-lhe um desenvolvimento normativo, permitindo lidar com os desafios quotidianos e um ajustamento académico. Ou seja, na perspectiva do referido autor, quanto maior o bem-estar psicológico maior será o sentimento de ajustamento académico, ou vice-versa.

Tendo em consideração que os estudos em torno do BEP a que nós tivemos acesso, são maioritariamente dirigidos a adultos ou jovens universitários, porém, diversos autores defendem a importância da investigação sobre o BEP e eudaimónico na adolescência, por ser considerada uma fase de desenvolvimento cateterizado por mudanças cognitivas, sociais e físicas, pelo papel de construção da identidade e de preparação para a vida adulta (Bizarro, 2001a; Fernandes, 2007; Fernandes, Vasconcelos-Raposo, Bertelli & Almeida, 2011), o presente estudo tem como objetivo investigar as relações entre o bem-estar-psicológico e o rendimento académico em alunos do ensino secundário.

2. MÉTODO

2.1 Participantes

A amostra global da presente investigação empírica foi constituída por 411 alunos, do ensino secundário com idades compreendidas entre 15 e 21 anos ($M= 16,82$; $DP= 1.42$). Ao nível do género, a amostra subdividiu-se em 222 (54%) rapazes e 189 (46%) raparigas.

¹ Segundo a etimologia *eudaimonia* significa “(eu) bem disposto; (*daimon*) que tem um poder divino”.

Foram definidos dois grupos de idades. Assim, o grupo com menos de 18 anos contemplou um total de 272 indivíduos (138 rapazes e 134 raparigas), que se enquadram na escolaridade obrigatória. O grupo com idade igual ou superior a 18 anos foi constituído por 139 indivíduos (84 rapazes e 55 raparigas). Trezentos e trinta e três alunos (81%) completaram o 3.º ciclo do ensino básico no período regulamentar de três anos e 78 (19%) excederam o tempo previsto de três anos.

Para um dos propósitos do estudo, procedeu-se à caracterização da amostra face ao rendimento escolar global obtido no 3.º ciclo do ensino básico. O grupo de nível 3 foi composto por 157 alunos (38,20%), o grupo de nível quatro com 194 alunos (47,20%). O grupo com nível 5 abrangeu um total de 60 alunos (14,60%).

O processo de amostragem norteou-se por um processo não probabilístico, onde buscámos a participação de um número adequado de sujeitos para a consecução dos objetivos a que nos propusemos. Socorrendo-nos da técnica em bola de neve, tomámos como elementos cooperantes na amostragem, docentes que lecionavam numa escola Secundária de meio urbano. Os critérios de inclusão foram ser estudantes do ensino secundário, público, participação voluntária, consentimento informado e ter autorização dos pais/encarregados de educação no caso dos menores de 18 anos.

2.2 Instrumentos

Após os alunos responderem a questões de natureza sociodemográfica (género, idade, ano de escolaridade que frequenta), foi-lhes apresentada uma questão sobre a avaliação global obtida no 3.º ciclo do ensino básico.

Para a medição do bem-estar psicológico foi utilizada a versão portuguesa das escalas de Carol Ryff (1989b) - EBEP-adolescentes, adaptada por Fernandes & Vasconcelos-Raposo (2008). O conjunto dos 30 itens foi respondido numa escala de numa escala de Likert de 5 pontos (1 – discordo plenamente; 5 – concordo plenamente), (os itens 2, 5 e 19 estão invertidos), que quando somados por total de escala permitem analisar a variabilidade por dimensão das escalas de bem-estar psicológico, enquanto adicionados na sua globalidade, dão origem a um resultado designado de bem-estar global que se constitui como indicador do conceito base do bem-estar psicológico.

2.3 Procedimentos

O estudo quantitativo, transversal e correlacional ocorreu em meio urbano, numa escola de ensino público. Procedeu-se à recolha de dados após obtenção do consentimento informado para aplicação do questionário, por parte da Direção Regional de Educação, da direção do estabelecimento de ensino, dos encarregados de educação e dos respetivos alunos, sendo-lhes assegurado a confidencialidade e o anonimato dos dados recolhidos. O preenchimento do questionário decorreu em contexto sala de aula, demorando cerca de 10 a 15 minutos.

Foram verificados os pressupostos da normalidade, cuja prova de Kolmogorov-Smirnov mostrou distribuição não normal em todas as dimensões ($p < 0,001$) (Field, 2011), seguidos pelo cálculo do coeficiente alpha de Cronbach de modo a aferir a consistência interna das escalas de avaliação multi-item. Tendo em conta o cálculo do coeficiente *Alpha de Cronbach*² considerou-se a escala do BEP global ($\alpha = 0,88$), autonomia ($\alpha = 0,60$), Crescimento pessoal ($\alpha = 0,72$), Relações positivas com os outros ($\alpha = 0,66$), Objetivos de vida ($\alpha = 0,76$), Aceitação de si ($\alpha = 0,79$). O Domínio do meio ambiente foi excluído das análises por não apresentar índices minimamente aceitáveis de fiabilidade ($\alpha = 0,45$).

Relativamente à análise estatística, inicialmente foram estimados os indicadores univariados de tendência central média e dispersão (desvio-padrão) das medidas analisadas.

No âmbito da inferência estatística procedeu-se à aplicação do teste de diferenças *Mann-Whitney Test*, *U*, *design* inter-sujeitos para dois grupos independentes e o teste de associação - coeficiente de correlação de Spearman, - com o intuito de compreender com base nos elementos observados, como as variáveis se diferenciam ou associam, consoante a sua natureza, dependente ou independente (Pestana & Gageiro, 2008).

3. RESULTADOS

Efetuuou-se, inicialmente, a análise descritiva das medidas de bem-estar psicológico, apresentadas na tabela 1.

Por uma questão de organização estrutural, subdividimos a análise descritiva dos resultados em caracterização da qualidade de vida e a caracterização do bem-estar psicológico.

Tabela 1 - Medidas centrais e de dispersão da escala do bem-estar psicológico- EBEP-adolescentes

Domínios	N	Média	Desvio padrão	Mínimo	Máximo
Global	383	111.64	12.89	70	141
Autonomia	408	18.83	3.00	5	25
Crescimento pessoal	404	20.87	2.78	9	25
Relações positivas com os outros	407	18.75	3.03	5	25
Objetivos na vida	407	17.52	3.64	5	25
Aceitação de si	408	18.15	3.42	8	25

² O coeficiente *Alpha de Cronbach* é uma das medidas utilizadas para a verificação da consistência interna de uma escala e é comumente usado como uma estimativa da fiabilidade de um teste psicométrico para uma amostra de respondentes. Varia entre 0 e 1, sendo que a regra básica é se o valor estimado do *Alpha de Cronbach*, situar entre 0,7 e 1 é aceitável, sendo inferior a 0,6 é inaceitável (Pestana & Gageiro, 2008).

A análise dos valores expressos na tabela 1 revela que na EBEP-adolescentes os alunos apresentam resultados mais elevados no domínio EBEP-a Global ($M= 111,64$; $DP= 12,89$), seguido do domínio do crescimento pessoal ($M= 20,87$; $DP= 2,78$), autonomia ($M= 18,83$; $DP= 3,00$), relações positivas com os outros ($M= 18,75$; $DP= 3,03$), aceitação de si ($M= 18,15$; $DP= 3,42$) e por fim, o score mais baixo corresponde ao domínio objetivos na vida ($M= 17,52$; $DP= 3,64$).

A fim de determinar a influência do género dos alunos em relação à perceção do nível do bem-estar psicológico aplicou-se o teste de Mann-Whitney (U), por permitir comparar os dois grupos (masculino e feminino), a nível de uma variável com distribuição não normal (tabela 2).

Tabela 2 - Análise do bem-estar psicológico em função do género

Variável	Género	N	Média (DP)	U	p	R_G
Autonomia	Masculino	220	18.54 (2.71)	23550.00	.015	-.14
	Feminino	188	19.16 (3.30)			
Crescimento Pessoal	Masculino	217	20.23 (2.76)	26318.50	.001	-.30
	Feminino	187	21.61 (2.61)			
Relações positivas com os outros	Masculino	218	18.30 (3.22)	24094.00	.003	-.17
	Feminino	189	19.26 (2.71)			

Nota. U : Estatístico de Mann-Whitney; p : Nível de significância; n : total de casos da amostra; R_G : coeficiente de correlação bisserial por ordem de Glass

Os resultados sugerem diferenças significativas em função do género, nos domínios de autonomia ($U= 23550,0$, $p=0,015$), do crescimento pessoal ($U= 26318,5$, $p < 0,001$) e de relações positivas com os outros ($U= 24094,0$, $p= 0,003$), regista-se que as raparigas apresentam scores mais elevados do que os rapazes, embora estas diferenças sejam pequenas, de acordo com o valor das correlações bisseriais por ordem de Glass (r_G).

No que concerne à idade, o resultado do Teste de Mann-Withney, demonstrou diferenças estatisticamente significativas no domínio autonomia ($U= 15859,5$, $p= 0,018$), isto é, os alunos maiores de dezoito anos apresentam níveis de autonomia mais elevados relativamente aos alunos com menos de dezoito anos (tabela 3).

Tabela 3 - Análise do bem-estar psicológico em função da idade

Variável	Idade	N	Média (DP)	U	p	R_G
BEP – Autonomia	≤ 18 anos	272	19.03 (3.08)	15859.50	.018	.14
	> 18 anos	136	18.43 (2.81)			

Nota. U : Estatístico de Mann-Whitney; p : Nível de significância; n : total de casos da amostra; R_G : coeficiente de correlação bisserial por ordem de Glass

O estudo da relação entre as dimensões do bem-estar psicológico e o rendimento académico visa a compreensão da natureza e magnitude das associações entre as diferentes medidas, numa amostra de alunos do ensino secundário. Para analisar o rendimento académico foi tido em consideração a avaliação global dos alunos no 3.º ciclo do ensino básico.

Os coeficientes de correlação produto-momento (r de Spearman) refletiram diversos graus de associação, embora todos evidenciassem significado estatístico (tabela 4).

Tabela 4 - Matriz de inter-correlações entre as dimensões do bem-estar psicológico e o rendimento académico

Bem-estar psicológico						Rendimento académico
Autonomia	Crescimento pessoal	Relações positivas com os outros	Objetivos de vida	Aceitação de si	BEP Global	
.20**	.15**	.11*	.18**	.11*	.22**	
.001	.002	.027	.001	.025	.001	

Nota. r_s : Coeficiente de correlação de Spearman; ** $p < 0,01$; * $p < .05$.

Da leitura da tabela 4 denota-se que autonomia ($r= 0,20$), crescimento pessoal ($r= 0,15$), objetivos de vida ($r= 0,18$) e Bem-estar psicológico global ($r= 0,22$) evidenciam maior coeficiente de associação com o rendimento académico ($p < 0,01$). No que diz respeito às relações positivas com os outros ($r= 0,11$) e aceitação de si ($r= 0,11$) o coeficiente é mais fraco ($p < 0,05$) (Pestana & Gageiro, 2008). Daqui se depreende que quando maior for o bem-estar psicológico dos alunos, maior é o rendimento académico.

4. DISCUSSÃO

Com o presente estudo procurámos investigar as relações entre o bem-estar-psicológico e o rendimento académico em alunos do ensino secundário, visando não só a colmatção da evidência empírica sobre esta problemática, como também, sugerir novas possibilidades de investigação no âmbito educativo/académico.

O rendimento académico está relacionado com obtenção de bons resultados escolares. Em contrapartida, o insucesso escolar deve-se ao baixo rendimento académico, não sendo, porém, linear uma vez que é necessário ter em conta a análise de outras variáveis (Almeida, Gomes, Ribeiro, Dantas, Sampaio, Alves, Rocha, Paulo, Pereira, Nogueira, Gomes, Marques, Sá & Santos, 2005; Formiga, 2004). No presente estudo a variável selecionada para aferir o rendimento académico foi a avaliação global obtida no término do 3.º Ciclo do Ensino Básico.

A análise centrada no bem-estar psicológico global não evidencia diferenças significativas em função do género. Parece, então, notório a supremacia das perceções do género feminino nos domínios “autonomia”, “crescimento pessoal” e “relações positivas com os outros”. Embora estas diferenças são de tamanho pequeno, com a exceção no domínio crescimento pessoal, onde se observa diferenças moderadas, as raparigas apresentam níveis mais elevados de bem-estar psicológico dos que os rapazes. Esta constatação foi igualmente verificada no estudo de Fernandes (2007), com exceção no domínio autonomia, em que não obteve diferenças de superioridades das raparigas. Por sua vez, Sprinthall e Collins (2003) referem que a família assume um papel fundamental, assim como, os estilos parentais, na promoção da autonomia e identidade dos adolescentes, dimensão que não foi abordada no presente estudo. Na aceção de Simões (2007) autonomia está relacionada com todo o processo de socialização, facilitando o desenvolvimento numa perspetiva de identidade pessoal, modificando as representações que o sujeito tem de si e dos outros.

Simões (2007) sustenta que para um adolescente, ser autónomo significa ter poder de decisão de acordo com um sistema de ideias e opiniões, nos mais diversos aspetos da sua vida, nomeadamente na gestão do dinheiro, relacionamentos afetivos, saídas com amigos e organização do seu quarto. A autonomia assume para o adolescente uma reflexão sobre os seus papéis sociais, as normas, e os aspetos de vida do seu quotidiano, em diferentes contextos (escola, casa e espaço lúdicos), por vezes, acentuado numa relação dicotómica com os pais, entre autonomia e dependência.

Quanto aos domínios “crescimento pessoal” e “relações positivas com os outros”, Fernandes (2007) obteve dados mais elevados para os participantes mais velhos e do género feminino. Pois, mudanças biológicas, cognitivas, desenvolvimento social, emocional e construção de identidade difere no *timing*, na forma, de pessoa para pessoa e entre os géneros (Abaid, Dell’Aglia & Koller, 2009; Bizarro, 2001a; Carrasco, Brustad, & Mas, 2007; Garrada, 2004; Fernandes, 2007; Kahneman *et al.*, 1999; Moshman, 2005; Mota & Matos, 2008; Sprinthall & Collins, 2003). Pessoas felizes tendem a investir no seu crescimento pessoal com impacto importante na motivação humana, no desenvolvimento da personalidade e na promoção do bem-estar psicológico (Cabral, 2010). O domínio “crescimento pessoal”, segundo Ryff (1989) é o domínio que mais se aproxima do conceito de eudaimonia - que se baseia na demanda do bem supremo, de uma vida justa, boa e feliz, permitindo as pessoas reconhecerem as suas capacidades (Fernandes *et al.*, 2011; Novo, 2005; Ryff, 1989; Siqueira & Padovam, 2008).

Relativamente ao domínio “relação positiva com os outros” Fernandes (2007), salienta que é através dele que se traduz a amizade, a empatia, e a capacidade de identificação com o outro em que as raparigas valorizam mais a esfera das relações interpessoais, no estabelecimento de relações altruístas para com os outros, em ter novas experiências de vida e no enriquecimento pessoal, do que os rapazes (Knox, Funk, Elliott, & Bush, 2000; La Greca & Harrison, 2005; Sprinthall & Collins, 2003, citados por Fernandes, 2007).

Atendendo à diferença em função da idade, a evidência empírica demonstrou que os adolescentes mais velhos apresentaram níveis de bem-estar psicológico mais elevados que os do grupo com idades inferiores a 18 anos, sobretudo no domínio *autonomia*. Os resultados sugerem que a idade é um bom preditor de bem-estar psicológico, ou seja, à medida que a idade dos adolescentes aumenta, o bem-estar psicológico aumenta. Logo, maior autonomia registada pelos alunos mais velhos, que caracteriza o processo de autonomia e individuação ou identidade pessoal na adolescência é corroborado por Fernandes (2007) e Ryff (1986) ao constatarem que a “autonomia” aumenta ao longo da adolescência, ou seja, os adolescentes mais velhos obtiveram níveis mais elevados neste domínio do bem-estar psicológico, mas não no domínio “aceitação de si”. Estudos efetuados por Ryff (1989b, 1991) e Ryff & Keyes (1995), quer em jovens, quer em adultos, indicam que os resultados são igualmente consistentes uma vez que a “autonomia” aumenta com a idade. Mais recentemente o estudo desenvolvido por Coelho (2015), também verificou que os alunos mais velhos tendem a apresentar maior “autonomia” que os mais novos.

A análise de associação entre o bem-estar psicológico e o rendimento académico, demonstrou correlações significativas positivas entre os diferentes domínios do bem-estar psicológico e o rendimento académico. Este resultado sugere que quando maior for o bem-estar psicológico, maior é o rendimento escolar. O estudo de Sá (2012), também mostrou que os alunos com rendimento escolar elevado, apresentam igualmente níveis mais elevados de bem-estar psicológico e vice-versa, sugerindo que o rendimento académico e o bem-estar psicológico estão associados. Neste estudo o rendimento escolar foi avaliado pela média da nota obtida no 3.º Ciclo do ensino básico.

O estudo de Cabral (2010) também evidenciou relação entre todos os domínios da escala bem-estar psicológico-adolescentes e todos os domínios da escala Cidadania para a Adolescência, realçando, o fato de encontrar correlações mais significativas nos domínios *crescimento pessoal* da escala BEP-adolescentes e os domínios *envolvimento global na escola*, *envolvimento com os professores* e *envolvimentos com os colegas* da escala de cidadania para adolescentes, ou seja, a participação dos alunos no contexto da cidadania é um preditor do bem-estar psicológico dos mesmos.

Conclui-se que as variáveis sociodemográficas evidenciaram diferenças estatisticamente significativas em função do género nas dimensões - bem-estar psicológico global, crescimento pessoal e relações positivas com os outros, com as raparigas a apresentarem scores mais elevados; e em função da idade, com os estudantes maiores de 18 anos a apresentarem níveis de autonomia mais elevados. A nível correlacional, as múltiplas dimensões do bem-estar-psicológico associaram-se

positivamente ao rendimento académico. Perante a relação estatisticamente significativa e positiva, os resultados sugerem que o rendimento académico aumenta à medida que a variável psicológica também aumenta.

Em suma, estes resultados reforçam o papel imprescindível que o bem-estar psicológico exerce no rendimento académico dos alunos, sendo necessário aprofundar a compreensão desta dinâmica durante a infância e juventude, tendo por quadro de referência múltiplas variáveis interventoras bem como diversos contextos de vida dos alunos.

ABSTRACT

Dream Makers is the acronym for the project “Creativity, Multiple Intelligences and 3D printing in pre-school education for disadvantage children”. This is a project funded by Erasmus+ Programme, Cooperation for Innovation and the Exchange of Good Practices, namely Key Action 2 – Strategic Partnerships and specifically Strategic Partnerships for school education. The fundamental aim of this project is the development of innovation. It started September 2016 and will run till August 2019. The project leader is Portugal (Rochinha Kindergarten) with Spain (Cádiz University) and Poland (Zielona Gorá University) as partners. We aim to promote a more inclusive education, by giving pre-school children with fewer opportunities the chance to engage in an array of activities that aim to develop their creativity, their intelligences (according to Gardner Multiple Intelligences Theory) and their technological skills, enhancing their inherent abilities and giving them tools to surpass their economic obstacles. The current article highlights the theoretical framework of the project and its research design.

Keywords: Creativity, Intelligence, 3D Technology, Preschool Education.

JEL Classification: 124

1. DREAM MAKERS THEORETICAL GUIDELINES

New technologies make it possible for us to observe daily the globalization processes¹ that are taking place. Availing ourselves of the resources of the ‘global village’ has become our everyday practice. The world has shrunk - socially, economically and culturally. We are able to do our shopping in various time zones on various continents and track the delivery 24 hours a day in cyberspace². However, one should add here that the process of separating the traditionally understood time and space works both ways. Today, thanks to the use of cyberspace, the world may not only ‘compress’ – come closer, but also ‘expand’ – become more distant. Network participants can create their own worlds to suit their needs. The created worlds may be alternative to reality, and the network user may switch back and forth between the real and the virtual domain while retaining his or her core identity. A person may not feel psychologically attached to the actual physical location where that person is staying; on the other hand, someone staying physically close to us may actually live in a world that is unattainable and distant, because it is artificially created. Another problem that has been manifesting itself is greater and greater diversification of societies and distance between individuals measured by their competences and access to new technologies (Bauman, 2011). Lack of readiness and competences for living in a globalized world may cause a globalization shock leading to apathy and resistance, a certain aversion (Nieman, 2011) or even loss of access to culture (Salzman, 2001).

The problems considered by A. Giddens in his book *Modernity and identity* (2001) concerning a separation of time and space and uprooting of social institutions, have led to a reduced trust in the hitherto used sources of knowledge and guarantors of safety. In the new times, the patterns of life called by S. Bauman (2002) as permanent wanderers, pilgrims, adventurers, loners and traditional settlers are alternative standards of living. The pilgrim and the wanderer are just representatives of some otherness. Bauman (2002) does not point to new forms of existence or new ways of life but to their coexistence in the narrowing space-time of postmodernism. This narrowing is a result of technological progress. In the context of dynamic and multicultural transformations of civilisation, the probability of evaluating others through the prism of stereotypes increases, as this attitude saves the time and effort needed by a post-modernistic man to recognise and test new alternatives of life pathways. This can bring not only escalation of conflicts in the already known areas, but their more frequent experience and appearance of new conflict points.

Social differences make rivalry between the competitors unequal (Farnicka 2016a). This inequality means that layers/groups with higher status or with more power can exclude the weaker ones from the competition using various means.

¹ The term ‘globalization’ was introduced in the theory of culture by M. McLuhan (1960) to describe changes connected with the emergence of new media. Their use resulted in the subjective process of shrinking of the social space and increased velocity of social and economic interactions, which was named globalization or the ‘global village’ effect. A. Giddens (2008) pointed to the separation of time and space and uprooting of social institutions as indicators of that process.

² Cyberspace is understood as the space that has been created and is still being created by new technologies (particularly the Internet).

Rivalry for resources is not the only explanation. There is another conceptual scheme that helps to understand the identity of exclusion. Up till now we have introduced exclusion as a "preemptive strike" against the competition in the fight for social resources. It suggests that the root cause of exclusion is the finite amount of resources, the possibility to accumulate these resources, and the consequence of the accumulation. That is the more successful somebody in the accumulation the more successful they become in all other aspects of their life. The consequence is that it is true that if the resources are becoming scarcer the competition becomes stronger, but its reverse is not true. If the resources are expanding it will not lessen the competition automatically, as accumulation is an adaptive behaviour. Several factors create and maintain social inequality across generations. Certain social strata, and individuals can gain from inequality (Gans, 1992), or they can obtain more favourable positions in socio-economic competition, thus, it is their best interest to maintain the inequality systems. These interests can be realized – among others – through the strategy of exclusion. This is how exclusion becomes the means for sustainability and reproduction at the same time.

However, the most important is integration and finally being a part of new society. It means that an individual adopts the identity of a new culture and is able to treat them as their own context, place and space. The individual could see "cross points" or not. It includes processes of identification, requiring engagement of cognitive and evaluative structures and assimilation and accommodation processes. The outcome of these processes are changes in self-definition, changes in self-evaluation, in evaluation of the individual's ethnic group, also in relation to others. Throughout the whole life this basic structure undergoes development and transformations. For example in the period of adolescence, this structure develops and gets more elastic through the processes of auto-reflection and the formal thinking permits anticipation of its further development and construction (Piaget, 1972). Moreover, specific styles of identity defining the orientation in the individual and in the world are generated. Camilla Pagani (2014) has proposed to treat the process of adaptation as a complex phenomenon encompassing the level of perception of tolerance of one's own and alien group and the level of acceptance of one's own and alien group. This author distinguishes between the two levels, low and high, of functioning in these areas. The low level of this complex (or rather two-dimensional) thinking, the individuals use stereotypes, are driven by emotions and simple examples when evaluating another person recognized as belonging to one's own and alien group. The low level of functioning in these two dimensions means that a given individual follows a multiaspect and many ways of thinking. Complex thinking was defined by Morin in 2008, who pointed out the two main components of this process; the cognitive and emotional ones. This way of thinking is affected by the level of self – awareness, acceptance of lack, open – minded multidirectional activity, creativity, communication and emotional response divided into the emotional response focused on individual and that focused on the group. Extension of the cognitive categories in the process of education and improve creativity can be one of the methods for development of the ability to live in the multicultural world society (Farnicka, 2016).

Social exclusion leads us to think in the need of social inclusion. In this multicultural world we need to promote the awareness for inclusion. Thus, the urgency in decreasing the inequalities of social and economic obstacles.

We understand that social and economic disadvantages have impact in the whole society, but particularly, families and their children are affected. The educational system is crucial to help children develop their skills. Early childhood is the phase where education can have a more significant impact in a child development. Investing in high quality care in early childhood diminishes the costs for society in terms of lost talent and aids in reducing public costs in a long term basis on welfare, health, education and even justice (European Commission/EACEA/Eurydice/Eurostat, 2014). Societies should give their children the best education and care possible and this wish is a crucial feature in the European Union policies. It is a fact that "one in four children under the age of 6 in Europe is at risk of poverty or social exclusion and may need specific measures to support their educational needs" (European Commission/EACEA/Eurydice/Eurostat, 2014, p. 17). To help children in these conditions is one of the fundamental concerns of the European Early Childhood Education and Care policy. This early period of life is critical for the children development and poverty at this stage can cause difficulties in their physical, emotional and psychological development and negatively influence their well-being present and future (European Anti-Poverty Network & EUROCHILD, 2013). Growing up in poverty can have impact also in the social life and children social networks, preventing them from engaging in activities with other children, likewise it can influence negatively children education leading to drop out, affecting their well-being and their own expectations for their future life (Pocinho, 2010). Poverty in childhood is also a danger to society because additional social costs increase and economic productivity diminishes since poor children normally do not reach their entire potential, they have less chances of achieving good jobs and contribute positively to the country economy (European Anti-Poverty Network & EUROCHILD, 2013). In the Member States the severity of child poverty varies. In a study, countries such as Portugal showed deprivation rates from 40% to 80% (Guio, Gordon, and Marlier, 2012). Helping these children develop to their full potential is essential, as it is developing their inherent abilities (Diniz, Pocinho and Almeida, 2011; Pocinho, 2004, 2009a, 2010). Creativity, Intelligence and Technology are fundamental abilities in today societies for a better future time perspective of life. Creativity has two main characteristics: novelty and appropriateness and implies personality traits that can be enhanced or changed by the environment. Creativity is an ability for all, that enables to make new connections, to produce new ideas both original and valuable, that uses divergent thinking skills and requires personality traits, affective processes, cognitive abilities, expertise, motivations, thinking skills, imagination and evaluation and the promotion of a cultural environment (Ferrari, Cachia, and Punie, 2009). A creative personality can be seen in different aspects such as humor, ideational fluency and flexibility, originality, imagination and so on (Garcês, Pocinho, Jesus, Viseu, Imaginário, and Wechsler, 2015), but the way one expresses his or her creativity can be different, according to their own creative styles, which can be define as the way each one of us preferably uses to express creativity (Garcês, Pocinho, Wechsler and Jesus, 2014; Ibérico Nogueira, Almeida, Garcês, Pocinho, and Wechsler, 2015). The importance of creativity for Education is evident and Skinner (2007) reports that giving children the chance to experience creativity will enable them to: a) make connections; b) express and challenge ideas; c) problem solving in a range of situations; c) develop an individual sense of aesthetic beauty; d) develop self-esteem and/or e) acknowledge cultural issues. A good

creative environment is also a key piece for creative production (Garcês, Pocinho, Jesus, and Viseu, 2016) and Education is a privileged field to be a promoter of a free and creative space for learning and enhancing of skills. Gardner proposed that there are not only one intelligence but eight, namely Linguistic, Spatial, Logical/Mathematical, Interpersonal, Intrapersonal, Bodily-Kinesthetic, Musical and Naturalistic. Additionally, he suggested an Existential one (Visser, Ashton, and Vernon, 2006; Pocinho, 2004). These multiple intelligences are many times associated with creativity. In education the promotion of creativity can be a key factor for student's academic achievement but also to promote a friendly environment for their emotional and social development (Garcês, Pocinho & Jesus, 2013). In a more global perspective Dino (2015) states that

The ability to produce and implement new, useful ideas is rapidly becoming the critical attribute for leveraging knowledge and increasing the quality of life, whether that ability is used to create worlds of art, find ways to provide inexpensive and abundant sources of water or energy, develop non invasive surgical devices, eradicate the scourge of cancer, or improve urban infrastructure.

The Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions, in 2012, mentions that skills such as critically thinking, initiative taking, problem solving and collaboratively work are important to prepare people to the changing and unpredictable world that we live today. But especially entrepreneurial skills that are fundamental to new business creation but also to employ young people. Creativity and entrepreneurship are fundamental factors to a country economic growth. Creativity seeks novelty and value and entrepreneurship also seeks novelty in business and new ideas in the market. Creativity and entrepreneurship both make use of depth knowledge, but also they are not limited to it, they seek and challenge new ideas (Matthews, 2007). We can see creativity as the motor behind entrepreneurship which is linked to employment, poverty reduction and innovation (Valerio, Parton, and Robb, 2014). Entrepreneurship education and training is a well established field of study that fosters entrepreneurial mindsets and skills, which integrate socio-emotional aspects such as self-confidence, leadership, creativity, motivation, resilience and self-efficacy (Valerio, Parton, & Robb, 2014). Future time perspective (FTP), a cognitive-motivational concept, is defined as a belief or a personal orientation regarding oneself future, considering time distant goals and is an important concept to develop entrepreneurship skills in young children (Carvalho, Pocinho, and Silva, 2010; Pocinho, Correia, Carvalho, and Silva, 2010; Pocinho, 2011).

Emerging new technologies, such as 3D printing, are an intrinsic part of today lives and consequently to education settings. 3D printing promotes students motivation and allows them to go beyond theoretical concepts to practical products, having an extraordinary impact on children imagination, because children's ideas can transform into real life objects (Szulzyk-Cieplak, Duda, and Sidor, 2014).

3D printers are machines that, from the creation and design of digital files, generate objects from different materials (molten plastic, resin, metal, dust, etc.). This technology has also come to be called rapid prototyping (Canessa, Fonda, and Zennaro, 2013). The lowering of this technology in recent years has allowed us to think about its use for educational contexts (Saorin, Torre Cantero, Melian, Meier and Rivero Trujillo, 2015).

Already in the 2013 annual report of the Horizon Project of the NMC³ was estimated that 3D printing would have widespread adoption in a few years in the educational field. According to this report, digital manufacturing would have an important relevance in education, science and creative research, and ensured that 3D printing would become one of the trends to be adopted in higher education within a period of four to five Years (Johnson, Adams Becker, Estrada, and Freeman, 2013). The 2015 report states that the potential is even greater as this type of technology becomes more accessible:

Creativity, design and engineering are making their way to the forefront of educational considerations... Advocates of education makers emphasize the benefit of students involved in solving higher-order creative problems through Practical approach to design, construction, and iteration. The question of how to renovate or reuse classrooms to meet the needs of the future is being addressed through the concept of the makers of workshops that provide the tools and learning experiences necessary to help people carry out their ideas. (Johnson, Adams Becker, Cummins, Estrada, Freeman, and Ludgate, 2015)

3D technology offers faculty new ways to address the Teaching and learning process. From this perspective, the 3D printer opens a range of possibilities to teachers that was difficult to cover until now, using this tool for the development of entrepreneurship and creativity in its students. John Dewey, a towering educator from the 1950's said, "If we teach today as we taught yesterday we rob our children of tomorrow."

It is customary that 3-dimensional design programs are intended for use by engineers or specialists, ultimately aimed at adults. In recent years are appearing software adapted to young people and adolescents which do not need too much training, which facilitates their use in the classroom. In addition more recently, free programs have appeared that can be used by children. An example is *Tinkercad* that is simple to use, its appearance is attractive and, with a few hours of training, the children can acquire a lot of skill in its use. The designs are very basic and come from direct design options (geometric shapes, letters, symbols ...) that appear in a series of drop down menus in the right. With them students can create simple objects to make toys, prototypes, home or classroom decoration, jewelry and an endless list of possibilities.

Thanks to the different programs of 3D design adapted for the different educational stages we can initiate the students of the stage of Childhood Education in the 3D design.

These perspectives have been taken under consideration during the preparation of the Dream Makers project focusing on improving competencies to protect social capital of societies. The content and scope of the project was drawn from

³ A research project designed to identify and describe emerging technologies that may have an impact on learning, teaching and creative research in Higher Education.

knowledge of the relationships between the various risk factors, protective factors and developmental processes in groups and societies and combine knowledge, practical useful skills and good psychological experience.

2. DREAM MAKERS DESIGN

The Dream Makers Project fundamentals are these three core concepts: Creativity, Multiple Intelligences and 3D Technology. The ground-breaking nature of this project is clear in the combination of these variables to help children in disadvantage situations, promote social inclusion, bilingualism skills and, ultimately, the development of a new methodology for the pre-school education curriculum (Figure 1).

Figure 1. Project conceptual diagram

The priority of the Dream Makers is to develop a new educational method to fight childhood poverty, through innovation and a quality childhood care. It will be developed in a course of three years (from September 2016 till August 2019) and follows a social science methodology. It is an experimental, action-research, longitudinal study with pre and post-test. It is being implemented in Portugal at a kindergarten in Madeira Island, and next will be implemented in Spain and in Poland.

The core of the project is the development of “Creativity Day’s”, which are monthly days with activities aimed to developed one of Gardner Multiple Intelligences and creativity, while, simultaneously, making use of the emergent 3D technology. The biggest innovation of the project is the synergy between different fields of studies, namely social sciences and technology. By developing children skills through social sciences methodologies we aim to help them to gain a better perspective of life and their future; but by introducing 3D technology we aim to develop a must needed skill in this century: digital abilities. The activities surrounding 3D will focus on the abilities to develop modelling skills in age appropriate software and then bring the children imagination and ideas to reality, by printing it in a 3D printer.

Evaluation follows three major directions: children skills; teachers/educators perceptions and parents/legal guardians perceptions. Children, their legal guardians and their teachers will be evaluated to control the project achievements regarding gain or abilities development. We introduce the evaluation of children’s teachers and parents perceptions of their skills in creativity, multiple intelligences and technology, because understanding how they view themselves and if they perceive their skills as important and applicable in their daily and working lives can give us information of how they as teachers and parents may influence or not their students and children behaviors and skills development.

For these measurements psychological tests such as Raven Progressive Matrices and a Creativity Test will be used; also pedagogical tools, developed specifically for the project to evaluate academic achievement, technological skills, bilingualism and teachers/parents perceptions, resorting to semi-structured interviews, questionnaires and/or observational grids will be used.

Participants of the Creativity Day’s are children with four years old, in the first year of the project, with economic difficulties. The economic difficulties were measured through the children who are awarded school social support or that were indicated by school as being children in need. The children are expected to participate in the project during its duration.

The project also focus on the partners organization staff who will receive training in each of the partner countries to developed their skills and bring new insights to each one of the organizations and to the project implementation and development.

As seen the project involves diverse methods and a diversification of ideas from varied fields, but is in these connections that we aim for innovation and for the development of a new extra-curricular program that we hope will make a difference in the children social and economic lives.

The project is being developed in Funchal, Madeira with children who are in economic disadvantages, from this perspective, the project not only supports the materials and resources necessary for the implementation of the learning program, but also provides them with food, displacements and even some needs for clothing or footwear that they may have. It would not be logical to provide them with innovative training and not cover the basic needs of these children in poverty.

3. CONCLUSION

The future holds uncertainty, the best we can do to our children is give them tools that will help them adapt and transform their own future. The Dream Makers project is an innovative and creative approach to education. We bring together a set of variables from different psychological, pedagogical and technological fields that composed a complex project. Its complexity help us understand that to fight social inequality we have to focus on multidisciplinary perspectives and start from a young

age. We need to help our children develop their inner strengths and by doing that give them hope in their current and future live. By focusing on the children we hope that indirectly their families will be positively affected and also learn new skills through their children.

The Dream Makers aims to be a new methodology to extra-curricular activities and to be a new “light” in education. Old curriculum do not fit in our current changing world, we must find new ways to approach education and with this project we hope to do just that, by focusing in the children own abilities, their strengths and their imagination. We need to let children be themselves and simply guide them in their development process and nurture their skills and, ultimately, their dreams. As Einstein once wrote: “We dance for laughter, we dance for tears, we dance for madness, we dance for fears, we dance for hopes, we dance for screams, we are the dancers, we create the dreams.” and we hope that the project ultimately can help children with less opportunities believe they have the potential to make dreams a reality.

RESUMO

A indisciplina é um fenómeno recorrente no contexto escolar, que afeta ou prejudica a aprendizagem dos alunos, e comporta uma complexidade acrescida na determinação dos fatores desencadeantes. O objetivo deste estudo foi identificar os determinantes da indisciplina escolar tendo em conta o contexto familiar, o nível socioeconómico, a motivação escolar e o rendimento escolar. Na análise comparativa entre grupos “grupo com indisciplina”, $n=33$ e “grupo sem indisciplina”, $n=33$, participaram 66 alunos, com idades compreendidas entre os 10 e os 17 anos do 2.º e 3.º ciclo do ensino básico. Os resultados evidenciam diferenças intergrupais significativas com pontuações mais elevadas para o “grupo com indisciplina” nos filhos de pais divorciados e que residem em habitação social; scores mais altos para o “grupo sem indisciplina” na orientação dos objetivos de aprendizagem, perceção do clima de aula, instrumentalidade endógena com regulação interna do aluno, instrumentalidade exógena com regulação interna do aluno, estratégias de repetição, estratégias de elaboração, estratégias de organização, pensamento crítico, estratégias metacognitivas e rendimento escolar. Conclui-se que o contexto familiar, a motivação escolar e o rendimento escolar são determinantes da indisciplina escolar. Sugere-se a implementação de programas de intervenção junto dos alunos e da comunidade envolvente que concorram para a diminuição da indisciplina e promoção do sucesso escolar.

Palavras-chave: Indisciplina, 2.º e 3.º Ciclo do Ensino Básico, Nível Socioeconómico, Motivação Escolar, Rendimento Escolar.

1. INTRODUÇÃO

A indisciplina é um fenómeno complexo que, em contexto escolar, tem vindo a aumentar nos últimos anos (Velez & Veiga, 2010). Uma maior frequência e visibilidade das manifestações deste fenómeno, evidenciadas pelos diversos intervenientes no processo educativo, conduziu a um acréscimo do interesse investigativo a nível nacional e internacional (Caldeira & Veiga, 2011; Lochan, 2010).

Intimamente relacionado com o conceito de disciplina como conjunto de regras ou ordens que regem o comportamento de uma pessoa ou coletividade, observância de regras, capacidade de controlar um determinado comportamento de forma a respeitar regras ou conseguir resultados tende a ser definido pela sua negação ou privação ou pela desordem proveniente das regras estabelecidas (Estrela, 2002). Corresponde ao incumprimento das regras ou a comportamentos desviantes ou disruptivos, persistentes ou ocasionais, iniciados pelo aluno, grupo ou turma e que pode perturbar as relações sociais no interior da escola (Amado & Freire, 2009). As transgressões das normas escolares prejudicam as condições de aprendizagem, o ambiente de ensino ou o relacionamento interpessoal na escola (Veiga, 2001).

Como constructo social, o conceito de indisciplina está, muitas vezes, associado ou difuso noutros conceitos como: agressividade – visto como fenómeno biológico e social decorrente das disposições, significações, motivações e atitudes que utilizam a violência como meio (Ramirez, 2001) e conflito – caracterizado pela divergência de necessidades, interesses e valores entre sujeitos (Carita & Fernandes, 1997). A clarificação destes conceitos é imprescindível para compreender efetivamente a indisciplina. Neste âmbito, quando falamos em indisciplina escolar reportamo-nos aos desvios e incumprimentos das regras estabelecidas para um determinado contexto escolar. Esses desvios comportamentais podem assumir diferentes intensidades e manifestações, tornando difícil a tarefa de definir o conceito de indisciplina podendo, segundo Amado e Freire (2009), enquadrar-se em três níveis, designadamente (1) infrações à regra de trabalho e produção, (2) infrações aos regulamentos e normas culturais e (3) confronto com a autoridade. Nos dois últimos níveis está implícita a eventualidade da indisciplina ser violenta. No entanto, apesar de toda a violência agregar um desvio à norma, nem sempre comporta um carácter violento.

Diferentes abordagens teóricas que sustentam o estudo da indisciplina estão associadas ao modo como os investigadores perspetivam o fenómeno quanto às causas, prevenção e intervenção (Aquino, 2003). Entre as principais correntes teóricas explicativas da indisciplina destaca-se a sociológica que coloca o foco nas mudanças na sociedade e na família, isto é, nas condições externas ao sujeito; a psicológica que versa questões emocionais e psicológicas numa abordagem psicanalítica,

cognitivista ou comportamental; pedagógica, assente no funcionamento escolar, atividades pedagógicas, relação professor-aluno, estrutura escolar e currículo; e socio-histórico-cultural contextualizada, interacionista, integrada, dialética e evolutiva (Pereira, 2009).

A diversidade de formas e expressões, as múltiplas repercussões, a dificuldade em identificar e discernir claramente os fatores desencadeantes da indisciplina escolar, bem como a influência mútua entre os diferentes fatores, converge para o estudo de uma problemática complexa. Genericamente, as causas da indisciplina podem estar associadas a fatores inerentes ao indivíduo (Moffit & Caspi, 2002; Trzesniewski, Moffit, Caspi, Taylor & Maughan, 2005), fatores relacionados com o contexto familiar (Campos, 2007; Steinberg, Blatt-Eisengart & Cauffman, 2006), fatores sociais e políticos (Andréo, 2005) e fatores pedagógicos e escolares (Gouveia-Pereira, 2008; Merle, 2005).

O contexto familiar constitui o primeiro referencial linguístico, cultural e comportamental da criança. A família, estrutura basilar da sociedade, nos seus múltiplos formatos, - tradicional, monoparental, com pais divorciados, entre outras (Mendes & Alves, 1997), podem ser determinantes de um comportamento escolar mais adaptado (DiPrete & Peng, 1981).

O nível socioeconómico poderá condicionar as oportunidades educativas, as perspectivas de futuro, as ocupações e os comportamentos sociais (Pellizzari & Billari, 2011). Neste âmbito, Martinez (2006) apurou que questões de cariz social como grandes desigualdades sociais, concentrações de etnias ou grupos minoritários frequentemente motivados por pressões ou circunstâncias socioeconómicas e facilidade de acesso a substâncias ilícitas e álcool são potenciadores de comportamentos desviantes. Também Auni, Songok, Jepchirchir, Odhiambo, Nabwire e Lyanda (2014) realçam que a prevalência do uso de álcool e abuso de substâncias psicoativas entre estudantes determinou o acréscimo da indisciplina na escola, aumento de obscenidades e inadequada relação social entre alunos e professores.

Além de fatores biológicos, interpessoais e ambientais, também o baixo estatuto socioeconómico, infraestruturas fracas e/ou com baixas condições de habitabilidade podem potenciar episódios de indisciplina (Matos, Negreiros, Simões & Gaspar, 2009).

Uma forma de pensar a disciplina é a partir da motivação do aluno. Isto é, quanto maior a motivação, maior será a intensidade dos esforços orientados para a ação (Huffman, Vernoy & Vernoy, 2003; Oliveira & Alves, 2005).

A orientação dos objetivos dos alunos mantém uma relação obscura, não só com o desempenho académico e o interesse nas aprendizagens, mas também com as estratégias de aprendizagem utilizadas pelos alunos (Cordeiro, 2010). Isto é, alunos indisciplinados não vêm na escola prazer ou instrumentalidade para alcançar objetivos fundamentais, decisivos, numa perspetiva da temporalidade futura (Lens, Paixão & Herrera, 2009) e, aparentemente, a motivação e o rendimento escolar influenciam-se mutuamente (Tavares & Santiago, 2001).

Geralmente, o rendimento escolar é entendido como prestação satisfatória, ou seja, a obtenção de resultados positivos. Em contrapartida, baixo rendimento escolar ou insucesso escolar acontece quando os alunos não cumprem os objetivos nem adquirem as competências expressas nas metas curriculares previstas para um determinado período de tempo e obtêm classificações não satisfatórias. Apesar de sucesso não se reduzir às classificações académicas obtidas, é através destas que os alunos são efetivamente avaliados e posicionados perante escolhas futuras (Saavedra, 2001). Neste sentido, é imperativo proporcionar aos alunos experiências escolares positivas que contribuam para o desenvolvimento pessoal e social harmonioso conforme preconiza a Lei de Bases do Sistema Educativo (Lei n.º 48/86, alterada pela Lei n.º 115/97, Lei n.º 49/05 e Lei n.º 85/2009). Isto é, a dita Lei estabelece uma ação formativa orientada para favorecer o desenvolvimento global da personalidade, o progresso social e a democratização da sociedade.

A escola é uma realidade complexa, composta marcada pela heterogeneidade e multiculturalidade, com organização curricular e relação pedagógica nem sempre ajustada às especificidades dos alunos. Estas especificidades podem estar na génese da indisciplina nos alunos. Neste seguimento, o propósito deste estudo consiste em identificar os determinantes da indisciplina escolar tendo em conta o contexto familiar, o nível socioeconómico, a motivação escolar e o rendimento escolar.

2. MÉTODO

2.1 Participantes

Uma amostra de conveniência constituída por 66 alunos, 10 raparigas e 56 rapazes entre os 10 e os 17 anos, que frequentam o 2.º e 3.º ciclo do ensino básico, numa escola de meio urbano inserida num contexto socioeconómico baixo. A amostra divide-se em dois grupos, com e sem comportamentos de indisciplina.

2.2 Instrumentos

- Questionário de dados sociofamiliares elaborado para o efeito que inclui contexto familiar (pais, com par/sem par), nível socioeconómico (escalo social – 1, 2, sem escalo), situação profissional da mãe (empregada, desempregada, outra), situação profissional do pai (empregado, desempregado, outro) e tipo de habitação (própria, arrendada, social).
- Questionário de motivação escolar (QME) (Cordeiro, 2010) – Multidimensional, de auto-resposta, composto por 101 questões fechadas, organizado sob formato de *rating scale*, tipo likert de cinco pontos (1 – totalmente falso; 2 – Falso; 3 – Mais verdadeira do que falsa; 4 – Verdadeira; 5 – Totalmente verdadeira). É multidimensional na medida em que compreende 6 dimensões e 16 subescalas, distribuídas em 96 questões (do item 3 ao 99), após o indivíduo responder a questões de cariz sociodemográfico, presentes na questão 1 - Dados mais pessoais (idade, sexo, repetências, tipo de escola, tipo de ensino) e disciplina sobre a qual está a responder a este questionário, conducentes às variáveis contexto familiar, rendimento socioeconómico, motivação escolar, rendimento escolar. Neste caso foram consideradas as classificações obtidas pelos alunos disciplinas de português, matemática e inglês.

As pontuações mínimas e máximas atribuídas a cada escalão oscilam entre 20 pontos (orientação dos objetivos de desempenho do professor) e 50 pontos (estratégias metacognitivas). O QME avalia os indicadores da motivação do aluno, apresentando *scores* parcelares por cada escala analisada sendo o atributo considerado relevante quando o valor total da pontuação for superior à média (ponto de corte) (tabela 1).

Tabela 1. Distribuição dos indicadores da motivação do aluno

Escala	Mín.	Máx.	Ponto de corte (média)
A1 – Orientação dos objetivos de aprendizagem do professor	5	25	12.5
A2 – Orientação dos objetivos de desempenho do professor	4	20	10
B1 – Promoção da instrumentalidade exógena com regulação externa	7	35	17.5
B2 – Promoção da instrumentalidade exógena com regulação interna	7	35	17.5
B3 - Promoção da instrumentalidade endógena com regulação interna	5	25	12.5
C1 – Perceção do clima de aula	6	30	15
D1 – Orientação do aluno para objetivos de aprendizagem	7	35	17.5
D2 - Orientação do aluno para objetivos de desempenho	8	40	20
E1 – Instrumentalidade exógena com regulação externa do aluno	6	30	15
E2 – Instrumentalidade exógena com regulação interna do aluno	6	30	15
E3 - E1 – Instrumentalidade endógena com regulação externa do aluno	7	35	17.5

Tabela 1. Distribuição dos indicadores da motivação do aluno (continuação)

Escala	Mín.	Máx.	Ponto de corte (média)
F1 – Estratégias de repetição	4	20	10
F2 – Estratégias de elaboração	6	30	15
F3 – Estratégias de organização	4	20	10
F4 – Pensamento crítico	5	25	12.50
F5 – Estratégias metacognitivas	10	50	25

A fiabilidade dos diferentes subescalas do QME determinada através do cálculo do coeficiente *Alpha de Cronbach* do QME, indica níveis de consistência interna muito bons ($\alpha > 0.90$).

2.3 Procedimentos

Esta investigação foi iniciada após anuência do Diretor Regional de Educação e da direção de uma Escola Básica do 2.º e 3.º Ciclo do Ensino Básico, público, situado em meio urbano, na Região Autónoma da Madeira, bem como do consentimento informado dos encarregados de educação dos alunos participantes.

A amostra constituiu-se após divulgação da avaliação atribuída no 2.º trimestre. Para identificar os determinantes da indisciplina escolar foram constituídos dois grupos: 1 – grupo com indisciplina; 2 – grupo sem indisciplina. Nesse sentido, a única forma de estabelecer uma relação de causa e efeito é comparar os resultados obtidos pelos alunos destes dois grupos. A amostra do grupo sem disciplina apresenta o *N* aproximado ao grupo sem disciplina e engloba as idiosincrasias e critérios de inclusão semelhantes ao grupo sinalizado com indisciplina, mas não associados a comportamentos indisciplinados.

Os dados respeitantes às variáveis contexto familiar, rendimento socioeconómico, motivação escolar, rendimento escolar, extraídos dos registos biográficos de cada aluno bem como os dados do QME foram inseridos no software *Statistical Package for Social Sciences* (SPSS – versão 22.0) e analisados os resultados. Verificou-se os pressupostos da normalidade e homogeneidade das variâncias. A prova de *Kolmogorov-Smirnov* revela que as escalas apresentam distribuição normal. A metodologia empregue foi do tipo analítico, dando lugar à caracterização e classificação dos participantes. Realizou-se análise comparativa dos grupos através de estatística paramétrica. Foram cumpridos os procedimentos éticos em investigação com seres humanos (Feldman, 2001), designadamente o anonimato, o consentimento informado, o direito à intimidade e à não participação e a confidencialidade dos dados obtidos.

3. RESULTADOS

A análise comparativa dos grupos (1 - grupo com indisciplina; 2 - grupo sem indisciplina) teve em consideração a variável contexto familiar (pais, com par/sem par). O resultado da prova de Qui-quadrado sugere diferença associada ao estado civil

dos pais com a probabilidade associada à ocorrência de comportamentos indisciplinados nos filhos de pais que vivem sós ($\chi^2(3) = 5.06; p = .044$) (tabela 2).

Tabela 2. Contexto familiar e indisciplina do aluno (Prova Qui-quadrado)

Variável			Grupo 1	Grupo 2	χ^2	p
Pais	Com par	N	16	24	5.06	.044
		%	48.50	72.7		
	Sem par	N	17	9		
		%	51.50	27.3		

A variável rendimento socioeconómico analisada a partir do escalão social do aluno (escalão 1; escalão 2; sem escalão), da situação profissional dos pais (com emprego; sem emprego) e do tipo de habitação (própria; arrendada) através da prova de Qui-quadrado (χ^2) não exibe diferenças significativas em função da indisciplina dos alunos ($\chi^2(2) = 5.55; p = 0.063$).

No concernente à indisciplina do aluno em função da motivação escolar (tabela 3), o resultado da prova *t-Student* para amostras independentes, aponta *scores* superiores no grupo sem indisciplina nas escalas orientação dos objetivos de aprendizagem do professor ($t(64) = 2.22; p = 0.030$), perceção do clima de aula ($t(64) = 3.41; p = 0.001$), orientação do aluno para objetivos de aprendizagem ($t(64) = 3.77; p < 0.001$), instrumentalidade exógena com regulação externa do aluno ($t(64) = 2.19; p = 0.032$), instrumentalidade endógena com regulação interna do aluno ($t(64) = 2.55; p = 0.013$), estratégias de repetição ($t(64) = 2.73; p = 0.008$), estratégias de elaboração ($t(64) = 3.35; p = 0.001$), estratégias de organização ($t(64) = 3.35; p = 0.001$), pensamento crítico ($t(64) = 2.94; p = 0.005$) e estratégias metacognitivas ($t(64) = 3.48; p = 0.001$). Os resultados não são estatisticamente significativos nas restantes escalas, mas o grupo associado à indisciplina apresenta valores tendencialmente mais baixos em todas as dimensões da motivação escolar.

Tabela 3. Motivação escolar e indisciplina dos alunos

Escalas	Grupo	M	DP	t	p
A1 – Orientação dos objetivos de aprendizagem do professor	Com Indisc.	16.28	5.45	2.22	.030
	Sem Indisc.	18.83	3.75		
C1 – Perceção do clima de aula	Com Indisc.	16.35	6.10	3.41	.001
	Sem Indisc.	20.87	4.55		
D1 – Orientação do aluno para objetivos de aprendizagem	Com Indisc.	21.67	6.47	3.77	.001
	Sem Indisc.	26.87	4.58		
D2 – Orientação do aluno para objetivos de desempenho	Com Indisc.	22.97	8.47	1.39	.169
	Sem Indisc.	25.72	7.61

	Sem Indisc.	16.45	3.92		
F5 – Estratégias metacognitivas	Com Indisc.	25.15	10.72	3.48	.001
	Sem Indisc.	33.65	9.03		

O teste *t-Student* mostra scores significativamente superiores na disciplina de Português ($t(63) = 3.75; p < 0,001$), Matemática ($t(63) = 5,99; p < 0,001$) e Inglês ($t(55) = 6,78; p < 0,001$) por parte do grupo sem indisciplina (tabela 4).

Tabela 4. Rendimento escolar e indisciplina do aluno

Disciplina	Grupo	N	M	DP	t	p
Português	Com Indisc.	32	2.59	.70	3.75	.001
	Sem Indisc.	33	3.30	.76		
Matemática	Com Indisc.	32	2.34	.94	5.99	.001
	Sem Indisc.	33	2.58	.70		
Inglês	Com Indisc.	32	2.81	.86	3.56	.001
	Sem Indisc.	33	3.58	.87		

4. DISCUSSÃO

Os determinantes da indisciplina escolar estão na linha cimeira das preocupações de professores, psicólogos, pais e dos responsáveis pelas políticas de educação. Para identificar os determinantes da indisciplina escolar tendo em conta o contexto familiar, o nível socioeconómico, a motivação escolar e o rendimento escolar recorreu-se à análise comparativa entre grupos de alunos indisciplinados - “grupo com indisciplina” - e grupo de comparação - “grupo sem indisciplina” -, numa amostra de alunos que frequentam o 2.º e 3.º ciclo do ensino básico, numa escola pública da ilha da Madeira. O grupo sem indisciplina engloba as idiossincrasias e critérios de inclusão semelhantes ao grupo sinalizado, mas não associados a comportamentos indisciplinados (Feldman, 2005).

Este estudo sugere que os alunos pertencentes ao grupo com indisciplina coabitam, apenas, com um progenitor. Este resultado encontra suporte em Bedding (2006). Este apurou que existe correlação significativa entre a indisciplina e a monoparentalidade que envolve filhos de pais divorciados ou em casos de morte de um dos progenitores. Shepherd (2003) também constatou que alunos do género masculino, com comportamentos agressivos e disruptivos, viviam com um dos pais a tempo inteiro. Isto é, alunos oriundos de famílias desagregadas, tendencialmente, apresentam condutas inadequadas.

O rendimento socioeconómico na amostra estudada não determina a indisciplina dos alunos. Na aceção de Debarbieux (2002), o estatuto socioeconómico das famílias (baixo rendimento, famílias numerosas e o “stress” causado pela pobreza) poderá estar associado a práticas comportamentais disruptivas. Embora possa existir relação entre as características socioeconómicas e os comportamentos violentos/disruptivos em escolas integradas em contextos sociais vulneráveis, o clima escolar é melhor comparativamente a escolas de meios sociais mais favorecidos (Debarbieux, 2004). A propósito das causas da indisciplina escolar, Ngwokabuenui (2015) aponta a superproteção parental, sistema social pobre, abandono, corrupção, insatisfação com a qualidade de vida, trabalho duro, falta de supervisão parental, desconhecimento parental dos amigos dos seus educandos e desrespeito pelas regras e regulamentos das escolas.

Eccheli (2008) defende que a indisciplina escolar está associada à desmotivação dos alunos perante assuntos lecionados e incompreensão sobre a utilidade da escola a curto, médio/longo prazo. Na presente investigação, o grupo associado à indisciplina apresenta níveis de motivação tendencialmente mais baixos, mas estatisticamente significativos, do que o grupo sem indisciplina no respeitante à orientação dos objetivos de aprendizagem do professor, perceção do clima de aula (perceção do professor enquanto promotor de autonomia *versus* controlo), orientação dos alunos para objetivos de aprendizagem, instrumentalidade exógena com regulação externa do aluno, instrumentalidade endógena com regulação interna do aluno e perceção do aluno sobre a utilização de estratégias de aprendizagem (estratégias de repetição, elaboração, organização, pensamento crítico e estratégias metacognitivas). A orientação para objetivos de aprendizagem correlaciona-se com a utilização de estratégias de aprendizagem (Covington, 2000), com maior adaptabilidade às exigências escolares (Anderman & Wolters, 2006) e a perceção do valor que determinadas tarefas escolares poderão ter (instrumentalidade) está diretamente relacionado com os objetivos intrínsecos dos alunos predizendo de modo positivo a motivação escolar e o desempenho escolar dos alunos (Simon, Dewite & Lens, 2003).

O grupo sem indisciplina apresenta rendimento escolar mais elevado do que o grupo com indisciplina nas áreas curriculares avaliadas (português, matemática e inglês). Também o estudo de Karanja e Bowen (2012) mostra que comportamentos indisciplinados afetam negativamente a performance académica. Por seu turno, Auni, Songok, Jepchirchir, Odhiambo, Nabwire e Lyanda (2015) concluem que um ajustamento social pobre é resultado da ineficácia de programas de orientação, a instalações inadequadas, estratégias de orientação ineficazes e sem o devido acompanhamento usadas nas escolas. Para contrariar esta problemática de modo proactivo prospetivo, Auni, Songok, Jepchirchir, Odhiambo, Nabwire e Lyanda (2015) recomendam lideranças fortes, professores motivados e competentes na apresentação, orientação, acompanhamento e prossecução de regras claras e bem precisas, bem como envolvimento parental e de outros parceiros sociais da comunidade envolvente que contribuam com o seu aconselhamento para o ajuste social dos alunos.

Por fim, estudo coloca em evidência o seguinte:

- 1) Alunos indisciplinados coabitam com um único progenitor;
- 2) O rendimento socioeconómico das famílias não é determinante da indisciplina do aluno;
- 3) A motivação escolar do aluno influencia o respetivo rendimento escolar;
- 4) Alunos com rendimento escolar apresentam níveis de indisciplina baixo.

Para determinar se o contexto familiar, o rendimento socioeconómico, a motivação escolar e o rendimento escolar predizem a indisciplina do aluno seria necessário recorrer à prova de regressão logística binária, cuja variável dependente seria pertencer ou não ao grupo de indisciplina e uma amostra representativa da população, com um número mínimo de dez casos por cada variável preditora (Field, 2011). Ocorre, porém, que somente a variável da motivação escolar comporta 16 escalas, concluindo por isso que a nossa amostra é muito pequena (66 sujeitos) para realizar este tipo de análise e também, pouco representativa, na medida em que está confinada a uma escola da Madeira. Logo, não é possível recorrer à referida prova nem produzir um modelo preditor da indisciplina a partir de diversas variáveis explicativas. Pesquisas implementadas noutros contextos educacionais e com amostras mais alargadas seriam convenientes na identificação dos determinantes da indisciplina escolar.

Conclui-se que o contexto familiar, a motivação escolar e o rendimento escolar são determinantes da indisciplina escolar. Estas conclusões induzem a necessidade de implementação de programas de intervenção junto dos alunos, em articulação com as respetivas famílias e a comunidade envolvente que concorram para diminuição da indisciplina e promoção do sucesso escolar.

RESUMO

A aplicação de técnicas pedagógicas inovadoras num contexto de aprendizagem ativa é uma metodologia de ensino enriquecedora em qualquer área de conhecimento. Esta metodologia de ensino-aprendizagem pode também motivar a adaptação de alguns dos elementos de avaliação.

Neste artigo pretende-se exemplificar como a utilização de uma nova metodologia de avaliação no ensino superior, baseada no conceito de aprendizagem ativa e acrescida de uma prática pedagógica com utilização de software educacional, pode melhorar o desempenho dos alunos.

Palavras-Chave: Aprendizagem Ativa, Avaliação no Ensino Superior, Desempenho do Aluno.

JEL Classification: C02, C65

1. INTRODUÇÃO

Com o objetivo de estimular o interesse e participação dos alunos na apropriação e consolidação de conceitos, promovendo novas formas de raciocinar, ensinar e aprender que facilitam o processo ensino-aprendizagem, foi concebida uma metodologia de avaliação baseada no conceito de aprendizagem ativa. Esta metodologia, acrescida de uma prática pedagógica com utilização de software educacional, foi aplicada a alunos da Universidade do Algarve, inscritos na unidade curricular *Cálculo I*, no ano letivo 2016/17.

Com o propósito de recolher e analisar as opiniões dos alunos sobre a utilização desta metodologia de avaliação integrada numa prática pedagógica em contexto de aprendizagem ativa foi elaborado um questionário e recolhidas as opiniões de discentes matriculados na respetiva unidade curricular e que se submeteram a avaliação.

2. DESCRIÇÃO DA PRÁTICA PEDAGÓGICA

2.1. Objetivos e público-alvo

Cálculo I é uma disciplina, transversal a diversos cursos de ciências naturais, da área científica da Matemática. No início do ano letivo 2016/17 encontravam-se inscritos 48 alunos nesta unidade curricular.

Com o objetivo de melhorar o desempenho dos alunos em *Cálculo I*, decidiu-se utilizar uma metodologia de avaliação, baseada no conceito de aprendizagem ativa e acrescida de uma aplicação prática de técnicas pedagógicas inovadoras.

2.2. Metodologia

Nas aulas teóricas e teórico-práticas, os conteúdos programáticos da disciplina foram explorados através da utilização de software educacional apropriado. Por exemplo, utilizando o conceito F-Tool (Conceição *et al.*, 2012) foram construídos exemplos gráfico-analíticos e dinâmicos em tempo real e foram apresentadas diversas propriedades gerais de várias classes de funções. Os alunos realizaram de uma forma autónoma e reflexiva (dirigida estrategicamente pelo docente) escolhas de entre as várias opções de funções e parâmetros, promovendo uma aprendizagem mais eficaz. Os conteúdos programáticos da unidade curricular foram também explorados através da utilização do Wolfram|Alpha, motor de conhecimento computacional desenvolvido pela Wolfram Research. Foi também sugerida a utilização das F-Tool e do Wolfram|Alpha como ferramentas de validação das resoluções obtidas pelos alunos de exercícios propostos para trabalho autónomo. O enquadramento da utilização destas ferramentas num contexto de aprendizagem ativa encontra-se descrito em (Conceição *et al.*, 2013; Conceição *et al.*, 2015; Conceição *et al.*, 2017; Pereira *et al.*, 2013).

Esta prática pedagógica baseada no conceito de aprendizagem ativa teve como consequência a adaptação de alguns dos elementos de avaliação, permitindo a inclusão de questões com carácter mais conceptual e desviando um pouco o foco da mera aplicação mecânica de fórmulas e do simples cálculo numérico (para uma geração dependente da máquina de calcular). Os alunos foram informados que teriam oportunidade de obter aprovação à unidade curricular sem se submeterem a exame, realizando testes e diversos tipos de atividades em sala de aula (Figura 1).

Figura 1: Informação disponível na tutoria eletrónica relativa à avaliação em *Cálculo I*.**AValiação:**

Realização de testes e sugestão de atividades, dando a possibilidade de obter aproveitamento à UC sem se submeter a exame. A classificação relativa aos testes (*ClassT*) corresponderá à média aritmética das notas obtidas nos mesmos. A classificação relativa à realização de algumas das atividades (*ClassA*) terá o valor máximo de 20 valores. O aluno que realize todos os testes obterá a classificação final (*ClassF*) que corresponde ao $\max(\text{ClassT}; 0,2 \cdot \text{ClassA} + 0,8 \cdot \text{ClassT})$. Serão aprovados os alunos que obtenham uma *ClassF* não inferior a 9,5 valores. Será admitido ao Exame de Época Normal o aluno inscrito na disciplina e aprovado caso obtenha classificação não inferior a 10 valores. Será admitido ao Exame de Recurso o aluno inscrito na disciplina que ainda não tenha obtido aproveitamento e aprovado caso obtenha classificação não inferior a 10 valores.

A classificação obtida nessa fase pré-exames, denominada *ClassF*, foi considerada sempre que o aluno realizou todos os testes. De forma a estimular o interesse e a participação dos alunos em sala de aula foi introduzida a classificação relativa à realização de diversas atividades em sala de aula, *ClassA* (Figura 2).

Figura 2: Informação disponível na tutoria eletrónica relativa à classificação *ClassA*.**ClassA:**

Assiduidade $\rightarrow$ [80%-100%] das aulas (T + TP) $\Rightarrow$ 5 valores.

$\rightarrow$ [65%-80[das aulas (T + TP) $\Rightarrow$ 2,5 valores.

Participação ativa em sala de aula com observações/conclusões interessantes $\Rightarrow$ entre 0,5 e 1 valor

Resolução (com explicação) de exercício no quadro $\Rightarrow$ entre 0,5 e 1 valor

Resolução de exercícios nas aulas TP para correção posterior $\Rightarrow$ entre 1,5 e 3 valores

NOTA: A presença em sala de aula só será contabilizada caso o aluno não perturbe e esteja presente em pelo menos 75% da aula.

NOTA: Nas aulas T só será permitida a entrada na sala de aula durante os primeiros 15 minutos.

A *ClassF* foi calculada através da classificação obtida em testes escritos, *ClassT*, e da classificação *ClassA*, através da fórmula indicada na Figura 1. Dos alunos submetidos a avaliação contínua, 90% optaram pela utilização da *ClassA*, sendo que dois dos alunos não usufruíram da *ClassA* pois não conseguiram realizar tarefas suficientes devido a incompatibilidade de horários com outras disciplinas. Apesar do carácter não obrigatório das aulas teóricas e teórico-práticas decidiu-se incluir a componente “*Assiduidade*” na avaliação. Os 27 alunos que beneficiaram da *ClassA* assistiram a uma média de 82,3% das aulas teóricas e teórico-práticas lecionadas. Foi possível observar que o nº de alunos em sala de aula não sofreu alterações significativas durante o semestre. Só um dos alunos que utilizou a *ClassA* não obteve qualquer classificação através da componente assiduidade (tendo assistido, por opção, a 55% das aulas). Utilizando uma metodologia de avaliação, baseada no conceito de aprendizagem ativa, os alunos foram constantemente convidados a serem participantes realmente ativos e críticos a tudo o que se passava na sala de aula. Assim, com o intuito de motivar os alunos, de tornar mais interessante a aquisição de novos conhecimentos científicos e de melhorar o desempenho dos alunos que frequentaram as aulas de *Cálculo I* optou-se por incluir na *ClassA* a componente “*Participação ativa em sala de aula*”: resolução de exercícios no quadro (Figuras 3 e 4) e a classificação obtida através de uma participação realmente ativa.

Figura 3: Exemplo de atividade proposta na componente “Participação ativa em sala de aula”.

Figura 4: Resolução obtida através das F-Logistic (Pereira *et al.*, 2013), ao exercício referido na Figura 3.

Adicionalmente, nas aulas teórico-práticas, os alunos que optaram pela *ClassA* tiveram acesso à componente “Questões-aula nas aulas TP”: questões-aula sobre a temática abordada durante a semana anterior (Figura 5). Na aula seguinte todos os alunos tinham acesso à classificação obtida e aconselhados a ver a correção e a analisar as observações personalizadas sobre a forma de resolver os exercícios. Só um dos alunos que optou pela *ClassA* não obteve (de forma direta) benefícios na realização de questões-aula devido a incompatibilidade de horários relativamente às aulas teórico-práticas.

Figura 5: Exemplo de atividade proposta na componente “Questões-aula nas aulas TP”.

Calcule o integral indefinido (Exercício a valer no máximo 1,5 valor)

$$\int \frac{\sin(2x)}{\sqrt[3]{10 - \cos(2x)}} dx$$

Devido à diversidade de componentes incluídas na *ClassA*, foram identificados vários perfis de aluno:

- 1) confiante nos seus conhecimentos científicos e com uma participação muito ativa em sala de aula

- 2) tímido, mas com bons conhecimentos científicos
- 3) com fracos conhecimentos científicos, mas com vontade de melhorar o seu desempenho académico na área da Matemática tomando uma atitude de participação ativa em sala de aula
- 4) com fracos conhecimentos científicos e desmotivado em melhorar o seu desempenho académico na área da Matemática
- 5) desanimado com o seu desempenho em anos letivos anteriores, mas interessado nesta nova metodologia de avaliação

A classificação máxima em *ClassA* foi atingida por diversos alunos. Os alunos com perfil do tipo *i)*, *iii)* ou *v)* atingiram muito rapidamente boas classificações nas componentes “Assiduidade” e “Participação ativa em sala de aula”. Como as classificações relativas à *ClassA* foram sendo constantemente atualizadas na tutoria eletrónica, alguns dos alunos com perfis *ii)* e *iv)* ficaram motivados a também participarem na sala de aula de forma mais ativa, melhorando o seu desempenho na unidade curricular. Outros alunos de perfil *ii)* preferiram apostar nas componentes “Assiduidade” e “Questões-aula nas aulas TP”, atingindo também bons resultados na *ClassA*.

3. RESULTADOS

Dos 48 alunos inscritos à unidade curricular só 62,5% (30 alunos) foram abrangidos pela classificação *ClassF*. É importante referir que 35% não tiveram oportunidade de assistir de forma regular às aulas teóricas e teórico-práticas devido a incompatibilidade de horários com disciplinas de outros anos curriculares (7 alunos não assistiram a qualquer aula).

A inclusão da componente “Assiduidade” na avaliação, com o objetivo de manter estável o número de alunos em sala de aula, originou uma participação mais ativa.

Todos os alunos que beneficiaram da *ClassA* foram aprovados à unidade curricular. Só um dos alunos que optou pela *ClassF* não obteve aproveitamento a *Cálculo I*, ficando com a classificação final de 8 valores. A maioria dos alunos que optou pela *ClassA* viu aumentada a sua classificação obtida em testes em 1 valor, sendo que dois alunos beneficiaram de 2 valores devido à classificação obtida nas três componentes da *ClassA* ser muito superior à classificação obtida nos testes (alunos com perfil *iii)*). Só um dos alunos que aderiu à *ClassF* obteve (de forma direta) aproveitamento à unidade curricular devido à inclusão da *ClassA* (caso só fossem contabilizados os testes ficaria com uma classificação final de 8 valores). A classificação média obtida na *ClassF* foi de 14,8 valores. A classificação média em período de exames foi de 5 valores (só tendo comparecido o aluno que reprovou com 8 valores a *ClassF* e um aluno sem classificação *ClassF*).

Com o propósito de recolher e analisar as opiniões dos alunos sobre a utilização desta metodologia de avaliação integrada numa prática pedagógica em contexto de aprendizagem ativa foi elaborado um questionário (Figura 6) e recolhidas as opiniões de alunos matriculados na respetiva unidade curricular e que se submeteram a avaliação. O questionário foi apresentado aos alunos na última semana de aulas.

Figura 6: Questionário utilizado para recolher as opiniões dos alunos sobre a utilização da *ClassA* em *Cálculo I*.

Classificação relativa à realização de atividades na sala de aula (ClassA)
2016/2017 – Cálculo I (Faculdade de Ciências e Tecnologia da Universidade do Algarve)

Questionário

1 – Está inscrito pela 1ª vez em Cálculo I? SIM ☐ NÃO ☐

2 – Que classificação espera obter em Cálculo I? <10 ☐ 10-12 ☐ 13-15 ☐ 16-18 ☐ 19-20 ☐

3 – A “Classificação relativa à realização de atividades na sala de aula (ClassA)” foi uma componente importante da avaliação em Cálculo I? SIM ☐ NÃO ☐

4 – Avalie de 1 a 7.

1: Discordo completamente; 2: Discordo bastante; 3: Discordo; 4: Não concordo nem discordo; 5: Concordo; 6: Concordo bastante; 7: Concordo completamente

4.1. Assiduidade		1	2	3	4	5	6	7
4.1.1.	A assiduidade não deveria ter sido considerada para avaliação.							
4.1.2.	Assisti às aulas T/TP só para ter a classificação relativa à assiduidade.							
4.1.3.	Assistirei às aulas T/TP mesmo que a assiduidade não tivesse sido considerada para avaliação.							

4.2. Participação ativa em sala de aula		1	2	3	4	5	6	7
4.2.1.	A participação ativa em sala de aula não deveria ter sido considerada para avaliação.							
4.2.2.	A participação ativa em sala de aula foi muito importante para esclarecer as minhas dúvidas.							
4.2.3.	A participação ativa em sala de aula foi muito importante para mostrar os meus conhecimentos sobre os conteúdos lecionados.							
4.2.4.	Teria tido uma participação menos ativa em sala de aula se não contasse para avaliação.							
4.2.5.	Deveria ter aprovado melhor a existência da componente “Participação ativa em sala de aula”.							

4.3. Questões-aula nas aulas TP		1	2	3	4	5	6	7
4.3.1.	A realização de questões-aula foi uma componente importante na avaliação em Cálculo I							
4.3.2.	A realização de questões-aula permitiu-me acompanhar, semanalmente, a matéria lecionada.							
4.3.3.	As questões-aula não deveriam ter sido realizadas durante as aulas T/P, mas em horário extra.							
4.3.4.	Assisti às aulas TP só para resolver as questões-aula consideradas para avaliação.							
4.3.5.	A realização de questões-aula não teve qualquer relação com a classificação que obtive nos testes que já realizei em Cálculo I.							

5 – Considera que este tipo de avaliação/classificação deveria ser utilizada em outras unidades curriculares do seu curso? SIM ☐ NÃO ☐
Porquê?

Outros comentários:

A análise das respostas aos 21 questionários validados indica que utilização desta metodologia de avaliação no ensino superior, baseada no conceito de aprendizagem ativa e acrescida de uma aplicação prática de técnicas pedagógicas inovadoras, é considerada uma mais-valia para os alunos inquiridos (Figura 7).

Figura 7: Comentário de um aluno relativamente às mais-valias da utilização da *ClassA* na avaliação.

Relativamente à componente “Assiduidade” é importante referir que 95,2% dos alunos referiu que a possibilidade de adquirir classificação através da assiduidade não teve influência no número de aulas a que assistiu. O único aluno que afirmou só ter assistido às aulas para ter a classificação relativa a essa componente reconheceu que deveria ter aproveitado melhor a componente “Participação ativa em sala de aula”.

Dos 21 alunos inquiridos, 12 admitiram que deveriam ter aproveitado melhor a existência da componente “Participação ativa em sala de aula”. Por sua vez, 19% reconheceu que teria tido uma participação menos ativa em sala de aula caso não fosse considerada para a avaliação na unidade curricular.

Apesar de 3 dos alunos terem assumido ter assistido às aulas teórico-práticas somente para resolverem as questões-aula consideradas para avaliação, 95,2% dos alunos inquiridos reconheceram que a realização das questões-aula permitiu-lhes acompanhar, semanalmente, a matéria lecionada.

De uma forma geral, os alunos sentiram-se motivados a estudar, a consolidar conhecimentos científicos e a aprender novos conceitos (Figura 8).

Figura 8: Comentário de um aluno relativamente à relação entre a *ClassA* e a aquisição de novos conhecimentos.

Todos os alunos inquiridos consideraram que este tipo de avaliação/classificação deveria ser utilizado em outras unidades curriculares do seu curso (Figura 9).

Figura 9: Comentário de um aluno relativamente à utilização da *ClassA* em outras unidades curriculares do seu curso.

4. CONCLUSÕES

A aplicação de técnicas pedagógicas inovadoras num contexto de aprendizagem ativa é uma metodologia de ensino enriquecedora em qualquer área de conhecimento. Esta metodologia de ensino-aprendizagem proporciona um contexto de ensino-aprendizagem onde os alunos e professores são igualmente convidados a contribuir, podendo também motivar a adaptação de alguns dos elementos de avaliação. Além disso, a utilização de software educativo é um recurso valioso para a construção de um profícuo processo de ensino-aprendizagem e reveste-se de especial importância quando acrescida de uma metodologia de avaliação baseada no conceito de aprendizagem ativa e a técnicas pedagógicas inovadoras.

Figura 10: Comentário de um aluno relativamente à relação entre a *ClassA* e o seu desempenho em *Cálculo I*.

A maioria dos alunos reconheceu que esta metodologia de avaliação permitiu melhorar o seu desempenho na unidade curricular (Figura 10) e foram unânimes em considerar que este tipo de avaliação/classificação deveria ser utilizado em outras unidades curriculares do seu curso. De facto, devido ao seu carácter interdisciplinar, esta metodologia de avaliação pode ser adaptada a qualquer unidade curricular da mesma, ou de outra, área de formação (Figura 11).

Figura 11: Comentário de um aluno relativamente à utilização da *ClassA* em outras unidades curriculares.

Estes resultados vêm ao encontro das expectativas adquiridas por observação direta pelo docente em sala de aula.

A ASSIMETRIA DO COEFICIENTE DE CORRELAÇÃO E PROPRIEDADES NA DETECÇÃO DE VARIÁVEIS ENDÓGENAS

Filipe Barros
CEDMES, FCT, Universidade do Algarve
(fbarros@ualg.pt, fssbarros@gmail.com)

RESUMO

Embora a correlação seja um conceito simétrico de 2 variáveis, não o será no caso de uma regressão onde distinguimos uma variável resposta ou endógena a partir de uma variável explicativa.

Existem várias maneiras de exprimir o coeficiente de correlação como uma fórmula assimétrica de duas variáveis envolvidas no modelo de regressão. Contrariamente à alguns resultados bem conhecidos, elas não são necessariamente preservadas na amostra, quando o modelo não é o correcto.

Como consequência, podem ser usadas para verificação e selecção do modelo.

Propõe-se também um critério de escolha da variável endógena num modelo de regressão múltipla.

1. INTRODUÇÃO

Conceitos como regressão e correlação são tão velhas quanto a estatística. Enquanto o coeficiente de correlação de Galton-Pearson é talvez a fórmula mais usada na análise de dados, regressão é talvez o conceito mais importante de toda a Estatística, que conduz à muitas generalizações e novas técnicas.

Embora intuitivamente relacionados um com o outro estes dois conceitos são diferentes pela sua natureza. Ambos envolvem pelo menos duas variáveis, partilham o mesmo papel na correlação, distinguem-se em variável explicatória e variável resposta na regressão.

Por isso um coeficiente de correlação é definido por uma fórmula simétrica a duas variáveis, tal que $\rho_X = \rho_Y$.

Estas fórmulas são em certo sentido não bem adaptadas à regressão linear, onde as duas variáveis têm diferente interpretação.

Um exemplo do campo social, nomeadamente a taxa de natalidade ilustra a teoria.

O coeficiente de correlação entre duas variáveis aleatórias é definido por

$$\rho_X = \frac{\text{cov}(X, Y)}{\sigma_X \sigma_Y}. \quad (1)$$

Se assumirmos um modelo de regressão linear $Y = \alpha + \beta X + \varepsilon$, $E(\varepsilon) = 0$, $V(\varepsilon) = \sigma^2$, tem-se

$$\rho_X = \beta \frac{\sigma_X}{\sigma_Y}. \quad (3)$$

Contrariamente à definição (1), o resultado (3) exprime a correlação como uma fórmula assimétrica em X e Y.

Se tivermos o modelo $\hat{Y} = a + bX$ ou $\hat{y}_i = a + b x_i$ teremos

$$\begin{aligned} \hat{\rho}_X &= \frac{\text{cov}(\hat{X}, \hat{Y})}{\hat{\sigma}_X \hat{\sigma}_Y} = \frac{S_X}{S_X S_Y} \\ &= \frac{\frac{1}{n} \sum_i (X_i - \bar{X})(Y_i - \bar{Y})}{S_X S_Y} = \frac{\frac{b}{n} \sum_i (X_i - \bar{X})^2}{S_X S_Y} = b \frac{S_X^2}{S_X S_Y} = b \frac{S_X}{S_Y} \end{aligned}$$

Para o modelo $\hat{X} = c + dY$, teremos

$$\hat{\rho}_X = \frac{\frac{d}{n} \sum_i (Y_i - \bar{Y})^2}{S_X S_Y} = d \frac{S_Y}{S_X}.$$

Donde se tem $\hat{\rho}_X = b \frac{S_X}{S_Y} \neq d \frac{S_Y}{S_X} = \hat{\rho}_X$ ou seja $\rho_X \neq \rho_Y$.

Considerando a hipótese de na regressão $\hat{Y} = a + bX$ termos $X = -\frac{a}{b} + \frac{Y}{b}$, i. e. admitindo a hipótese de $d = \frac{1}{b}$ e $c = -\frac{a}{b}$, ainda assim teríamos $\rho_X = \frac{1}{\rho_X}$. Ora na regressão linear não é certo que $X = \frac{Y}{b} - \frac{a}{b}$. Num exemplo de SPSS obtivemos:

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	18,250	,623		29,299	,000
	PIBCAPIT	-4,78E-03	,001	-,862	-7,018	,000

a. Dependent Variable: TXNATAL

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2996,461	349,205		8,581	,000
	TXNATAL	-155,530	22,161	-,862	-7,018	,000

a. Dependent Variable: PIBCAPIT

Assim teríamos $a=18,250$; $b = -0,00478$; $c = 2996,461$; $d = -155,53$; $\frac{1}{b} = -209,205 \neq d$; $-\frac{a}{b} = 3817,99 \neq c$.

2. EXPRESSÕES ASSIMÉTRICAS PARA ρ_X

Momentos de ordem (Kendall and Stuart, 1966)

Usando as propriedades fundamentais dos momentos de ordem¹, temos para cada $r \geq 3$

$$K_r(Y) = \beta^r K_r(X) + K_r(\varepsilon), \quad (\mu_r(Y) = \beta^r \mu_r(X) + \mu_r(\varepsilon)) \quad (4)$$

onde $K_r(Y)$, $K_r(X)$ e $K_r(\varepsilon)$ representam os cumulantes de ordem r para Y , X e ε respectivamente. Por isso se

$K_3(\varepsilon) = 0$ (o que é possível se o termo erro for simétrico) teremos através de (3) e (4) (com $K_3(X) \neq 0$),

$$\rho_X^3 = \frac{\gamma_Y}{\gamma_X}, \quad (5)$$

onde $\gamma_X = \frac{K_3(X)}{\sigma_X^3}$ e $\gamma_Y = \frac{K_3(Y)}{\sigma_Y^3}$ são os coeficientes de assimetria de X e Y respectivamente. Como ρ_X é por

definição menos do que ou igual 1 (em valor absoluto), o resultado (5) implica que a assimetria da variável resposta é sempre mais pequena do que a da variável explicativa.

Também interessante é o facto de que o cubo do coeficiente de correlação pode ser descrito como percentagem da assimetria que é “preservado” por um modelo linear.

Mais genericamente, para $r \geq 3$ e se $K_r(\varepsilon) = 0$ (possível para todo o r , se o termo erro for normalmente distribuído) obtém-se de (3) e (4)

$$\rho_X^r = \frac{K_r(Y) / \sigma_Y^r}{K_r(X) / \sigma_X^r} \quad (6)$$

¹ $K_r(X) = E[X - \mu_X]^r$ - momentos de ordem r em relação à origem.

A potência de expoente r do coeficiente de correlação é assim o rácio dos cumulantes estandardizados de ordem r para as variáveis X e Y .

Tem-se também que $|\gamma_r(Y)| \leq |\gamma_r(X)|$, o que significa que a variável resposta é próxima de uma distribuição normal.

Isto não é surpreendente, se Y for definido como a convolução de uma variável explicativa normal com um termo erro normal. Introduzindo covariâncias de ordem superior

$$\text{cov}_k(X, Y) = E[(X - E(X))^j (Y - E(Y))^k],$$

pode ser obtido um segundo conjunto de fórmulas para ρ_X sob condição $Y = \alpha + \beta X + \varepsilon$. Assim

$$\rho_k(X, Y) = \frac{\text{cov}_k(X, Y)}{\sigma_X^j \sigma_Y^k} \quad (7)$$

Note-se que $\text{cov}_3(X, Y) = E(X - E(X))^3 = K_3(X) = \mu_3(X)$, $\rho_3(X, Y) = \gamma_X$ (coef. de assim para X),

$$\rho_0(X, Y) = \gamma_Y.$$

Tem-se para $r \geq 2$

$$\begin{aligned} \text{cov}_{r-1,1}(X, Y) &= E[(X - E(X))^{r-1} (Y - E(Y))] \\ &= E[(X - E(X))^{r-1} (\beta(X - E(X)) + \varepsilon - E(\varepsilon))] \\ &= \\ \beta E[(X - E(X))^r] + E[(X - E(X))^r] E[\varepsilon - E(\varepsilon)] \\ &= \beta E[(X - E(X))^r] \\ &= \beta \text{cov}_{r,0}(X, Y) \end{aligned} \quad (8)$$

Combinando (8), (3) e (7), obtém-se para $r \geq 2$

$$\rho_X = \frac{\rho_{r-1,1}(X, Y)}{\rho_{r,0}(X, Y)}, \quad (9)$$

desde que $\text{cov}_{r,0}(X, Y) \neq 0$, pois $\frac{\rho_{r-1,1}(X, Y)}{\rho_{r,0}(X, Y)} = \frac{\text{cov}_{r-1,1}(X, Y) \sigma_X^r}{\sigma_X^{r-1} \sigma_Y \text{cov}_{r,0}(X, Y)} = \beta \frac{\sigma_X}{\sigma_Y} = \rho_X$.

O caso $r = 2$ é trivial. Tem-se $\rho_0(X, Y) = 1$, $\rho_1(X, Y) = \frac{\text{cov}(X, Y)}{\sigma_X \sigma_Y} = \rho_X$. Tomando $r = 3$ em (9) obtém-se a expressão

$$\rho_X = \frac{\rho_2(X, Y)}{\gamma_X}, \quad (10)$$

um exemplo de uma fórmula assimétrica para ρ_X , desde que $K_3(X) \neq 0$. Por outro lado

$$\rho_X = \frac{\rho_2(X, Y)}{\rho_2(X, Y)}, \quad (11)$$

desde que $\rho_X \neq 0$, $K_3(X) \neq 0$, pois

$$\rho_2(X, Y) = \frac{\text{cov}_2(X, Y)}{\sigma_X^2 \sigma_Y} = \frac{\beta \text{cov}_0(X, Y)}{\sigma_X^2 \sigma_Y} = \frac{\beta K_3(X)}{\sigma_X^2 \sigma_Y};$$

$$\begin{aligned}
cov_{\mathbf{p}}(X, Y) &= E[(X - E(X))(\beta X + \varepsilon - \beta E(X) - E(\varepsilon))^2] = \\
&= \beta^2 E[(X - E(X))^3] + 2\beta E[(X - E(X))^2(\varepsilon - E(\varepsilon))] + E[(X - E(X)(\varepsilon - E(\varepsilon))^2] \\
&= \beta^2 E[(X - E(X))^3] \\
&= \beta^2 K_3(X).
\end{aligned} \tag{12}$$

$$\text{Daí que } \rho_{\mathbf{p}}(X, Y) = \frac{\beta^2 K_3(X)}{\sigma_X \sigma_Y^2} \text{ e } \frac{\rho_{\mathbf{p}}(X, Y)}{\rho_1(X, Y)} = \frac{\beta^2 K_3(X)}{\sigma_X \sigma_Y^2} * \frac{\sigma_X^2 \sigma_Y}{\beta K_3(X)} = \beta \frac{\sigma_X}{\sigma_Y} = \rho_X.$$

Multiplicando (10) e (11) obtém-se uma expressão original para o quadrado do coeficiente de correlação, mais precisamente

$$\rho_X^2 = \frac{\rho_{\mathbf{p}}(X, Y)}{\gamma_X}, \tag{13}$$

desde que $\rho_X \neq 0$, $K_3(X) \neq 0$.

Dividindo $\rho_X^3 = \frac{\gamma_Y}{\gamma_X}$, por (13) teremos

$$\rho_X = \frac{\gamma_Y}{\rho_{\mathbf{p}}(X, Y)}. \tag{14}$$

Em conclusão o coeficiente de correlação pode ser expresso de três maneiras diferentes e relacionadas,

$$\rho_X = \frac{\rho_{\mathbf{p}}(X, Y)}{\rho_{\mathbf{g}}(X, Y)} = \frac{\rho_{\mathbf{p}}(X, Y)}{\rho_1(X, Y)} = \frac{\rho_{\mathbf{g}}(X, Y)}{\rho_1(X, Y)}. \tag{15}$$

3. ESCOLHA DA VARIÁVEL RESPOSTA NUMA REGRESSÃO LINEAR

Consideremos uma amostra dos triplos $(X_i, Y_i, \varepsilon_i)$, $i = 1, 2, \dots, n$ obtidas a partir do vector aleatório (X, Y, ε) e para a qual só X_i e Y_i são observados. Se quisermos investigar um modelo de regressão linear podemos hesitar entre o modelo

$$Y_i = \alpha + \beta X_i + \varepsilon_i, \text{ (com } X_i \text{ independente de } \varepsilon_i) \tag{16}$$

e o modelo

$$X_i = \delta + \eta Y_i + \varepsilon_i \text{ (com } Y_i \text{ independente de } \varepsilon_i) \tag{17}$$

Para responder a esta pergunta, exploremos as propriedades do coeficiente de correlação dado na secção 2 para distinguir a variável resposta da variável explicativa.

Isto não pode ser feito usando a fórmula $\rho_X = \beta \frac{\sigma_X}{\sigma_Y}$, visto que este resultado tem a particularidade de preservar-se na amostra, mesmo que o modelo esteja errado.

Se $\hat{\beta}$ e $\hat{\eta}$ forem estimadores dos mínimos quadrados de β e η em (16) e (17) e se $\hat{\rho}_X$, $\hat{\sigma}_X$ e $\hat{\sigma}_Y$ representam as versões amostrais de ρ_X , σ_X e σ_Y é sabido que

$$\hat{\rho}_X = \hat{\beta} \frac{\hat{\sigma}_X}{\hat{\sigma}_Y} = \hat{\eta} \frac{\hat{\sigma}_Y}{\hat{\sigma}_X}$$

e nada se podendo concluir daí. Por outro lado, fórmulas assimétricas tais como em (15) não são necessariamente preservadas na amostra.

Por isso estas fórmulas podem ser usadas para verificar ou escolher o modelo linear como a seguir se explica.

Como o quadrado do coeficiente de correlação é menor ou igual a 1, teremos sob o modelo (16)

$$\gamma_Y^2 \leq \rho_{\mathbf{p}}^2(X, Y) \leq \rho_1^2(X, Y) \leq \gamma_X^2, \tag{18}$$

onde $K_3(\varepsilon) = 0$, $\rho_X \neq 0$, $K_3(X) \neq 0$.

Sob o modelo (17),

$$\gamma_Y^2 \geq \rho_1^2(X, Y) \geq \rho_2^2(X, Y) \geq \gamma_X^2, \quad (19)$$

se $K_3(\varepsilon) = 0$, $\rho_X \neq 0$, $K_3(Y) \neq 0$.

Devemos portanto, preferir o modelo para a qual as desigualdades apropriadas são satisfeitas na amostra. Especificamente podíamos calcular as quantidades amostrais

$$\hat{\gamma}_Y^2 = \frac{n \left(\sum (Y_i - \bar{Y})^3 \right)^2}{\left(\sum (Y_i - \bar{Y})^2 \right)^2}; \quad (20)$$

$$\hat{\rho}_1^2(X, Y) = \frac{n \sum (X_i - \bar{X})(Y_i - \bar{Y})^2}{\sum (X_i - \bar{X})^2 \left(\sum (Y_i - \bar{Y})^2 \right)^2}; \quad (21)$$

$\hat{\rho}_1^2(X, Y)$ e $\hat{\gamma}_X^2$. Escolhendo depois o modelo (16) se se satisfizer

$$\hat{\gamma}_Y^2 \leq \hat{\rho}_1^2(X, Y) \leq \hat{\rho}_2^2(X, Y) \leq \hat{\gamma}_X^2 \quad (22)$$

ou o modelo (17) se se satisfizer

$$\hat{\gamma}_X^2 \geq \hat{\rho}_1^2(X, Y) \geq \hat{\rho}_2^2(X, Y) \geq \hat{\gamma}_Y^2. \quad (23)$$

Pode acontecer que nem o (22), nem o (23) é satisfeito. Neste caso isto pode indicar que o modelo linear é não adequado para a modelação dos nossos dados ou os estimadores do tipo (20) e (21) têm muita variabilidade para se tirar uma conclusão (se não houver dados suficientes).

Se realmente precisarmos de escolher entre os modelos (16) e (17) podemos aplicar uma regra mais simples, que usa só duas (em vez de quatro) quantidades amostrais.

Uma primeira possibilidade seria comparar as assimetrias amostrais de X_i e Y_i . Assumindo $K_3(\varepsilon) = 0$, $\rho_X \neq 0$, $K_3(X) \neq 0$ a estatística

$$\gamma_Y^2 - \gamma_X^2, \quad (24)$$

fornece alguma evidência empírica para o modelo (16) se ela for menor do que zero e para o modelo (17) se for maior do que zero.

Analogamente, assumindo $\rho_X \neq 0$, $K_3(X) \neq 0$ e $K_3(Y) \neq 0$, poderíamos aplicar a mesma estratégia com a quantidade

$$\rho_1^2(X, Y) - \rho_2^2(X, Y). \quad (25)$$

Esta segunda estratégia tem a importante vantagem de que nenhuma assumption é feita acerca do erro (excepto a sua independência em relação à variável explicativa) e por ser de certo modo mais interpretável, uma vez que toma em conta a interacção entre X_i e Y_i .

Note-se que a probabilidade de tomar a decisão correcta é a mesma sob ambos os modelos (usando qualquer estratégia). Isto ocorre porque a distribuição de (24) tal como a de (25) são as mesmas, (até o sinal). O primeiro contudo terá tipicamente uma esperança maior do que o último (em valor absoluto), visto que

$$|\gamma_Y^2 - \gamma_X^2| \geq |\rho_1^2(X, Y) - \rho_2^2(X, Y)|$$

Isto pode resultar numa maior probabilidade em tomar decisão correcta, quando se usa a primeira estratégia.

Para estar seguro disto, deve-se também comparar as variâncias de ambas as estatísticas. Embora o procedimento é muito simples a usar deve-se ter cautelas nas condições sob as quais ele se aplica.

Em adição à linearidade do modelo, fez-se uma assumption forte de que ambas as variáveis são assimétricas. Em particular o procedimento não se aplica, quando X e/ou Y são normalmente distribuídas (como normalmente se assume na prática). Em tais casos, restringiremos a atenção a um subdomínio, onde a variável explicativa é assimétrica.

4. APLICAÇÃO NA REGRESSÃO LINEAR MÚLTIPLA

No artigo [1] os autores Yadolah Dodge e Valentin Rousson ilustram a teoria com um exemplo de regressão linear. Aqui vamos aplicar esta teoria para para um exemplo de regressão múltipla.

Vamos fazer um estudo sobre a taxa de natalidade (tnat) em Portugal entre os anos de 1971 e 1997, usando as variáveis taxa de casamento (tcas), taxa do divórcio (tdiv), taxa de alfabetização (talf), população (pop), PIB per capita (pibcap), taxa de inflação (tinfl) e taxa de desemprego (tdes), (fonte: INE).

Para os referidos dados temos os seguintes valores para os coeficientes de assimetria e os respectivos quadrados.

	Tnat	Tcas	Tdiv	Txalf	Pop	Pibcap	Tinfl	Txdes
γ_i	0,2	0,7	-0,2	0,0	-0,9	0,6	0,2	-0,3
γ_i^2	0,05	0,43	0,06	0,0	0,85	0,36	0,04	0,08
Ordem (γ_i^2)	3	7	4	1	8	6	2	5

Pela teoria acima exposta a taxa de natalidade (tnat) poderia ser variável resposta num modelo de regressão simples em que as variáveis explicatórias poderiam ser taxa do divórcio (tdiv), taxa de desemprego (tdes), taxa de casamento (tcas), PIB per capita (pibcap) e população (pop).

No entanto, os coeficientes de correlação fornecem informação complementar. Segundo a tabela que a seguir se apresenta verifica-se que as variáveis que influenciam directamente na taxa de natalidade e que se mantêm ao longo de toda a amostra são a taxa de casamento (tcas) e população (pop).

Y	γ_Y^2	$\rho_2^2(X, Y)$	$\rho_1^2(X, Y)$	γ_X^2	X
TNAT	0,05	0,03	0,04	0,06	TXDIV
	0,05	0,19	0,25	0,08	TXDES
	0,05	0,07	0,17	0,43	TCAS
	0,05	0	0,13	0,36	PIBCAP
	0,05	0,14	0,39	0,85	POP

Por outro lado entre estas duas variáveis não existe uma relação linear que se mantenha ao longo de toda a amostra o que sugere a sua independência. A tabela que a seguir se apresenta é ilustrativa disto mesmo.

X	γ_X^2	$\rho_2^2(X, Y)$	$\rho_1^2(X, Y)$	γ_Y^2	Y
POP	0,85	0,23	0,13	0,43	TCAS

Assim a taxa de natalidade pode ser expressa através de um modelo de regressão múltipla do tipo

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \varepsilon,$$

onde Y- **Tnat**, X_1 - **Tcas**, X_2 - **Pop**.

Estes resultados podem ser validados através de outras formas de análise de dados como os clusters, por exemplo.

5. CONCLUSÃO

Um método alternativo para escolha de variáveis endógenas, explicadas ou dependentes numa regressão linear pode ser a comparação dos respectivos coeficientes de assimetrias amostrais das variáveis em estudo.

RESUMO

Um dos objetivos deste estudo foi o de usar métodos ativos (activity-based methods) em prol dos métodos tradicionais e mostrar que o efeito desses métodos em sala de aula não só aumentam a motivação dos alunos como ajudam a melhorar os resultados da avaliação. Embora a pedagogia tenha mudado, o currículo permanece o mesmo. O foco é envolver os alunos no contexto dos conteúdos e ajudá-los a desenvolver o pensamento crítico e construtivo em relação aos assuntos lecionados em sala de aula. Para atingir esse objetivo, foram criados grupos de trabalho com um máximo de três elementos. Após uma abordagem dos conteúdos em sala de aula pelo professor, os alunos desenvolveram seu trabalho no laboratório de computação utilizando a folha de cálculo do Excel. Trata-se da unidade curricular estatística, cujo desenvolvimento dos conteúdos envolve vários cálculos por vezes complexos na resolução de alguns problemas. Sempre em contexto de laboratório, os alunos podem perguntar, discutir e falar com os parceiros do grupo, ou com toda a turma, expressando as suas ideias com ajuda da folha de cálculo Excel utilizada para o tratamento dos dados, através da visualização de gráficos, tabelas e cálculo de medidas estatísticas. No final do semestre, os alunos apresentam os trabalhos em sala de aula aos colegas e ao professor. O resultado final da avaliação é dado pelo somatório da pontuação atribuída pelo professor (60%) e pela avaliação dos colegas (40%). A partir dos resultados finais, pode-se concluir que a mudança da abordagem tradicional de ensino para aulas com uma abordagem mais interativa levaram a uma melhoria das classificações finais da unidade curricular, para além de aumentarem a motivação dos mesmos.

Palavras-chave: Ensino Tradicional, Active Based Methods, Abordagens Interativas, Motivação.

1. INTRODUÇÃO

As mudanças tecnológicas do século XXI são um desafio constante para professores e alunos. No momento presente, o professor deve estar mais preocupado com a aprendizagem do que com o ato de ensinar, consciente de que o ensino ocorre quando o aluno aprendeu. O próprio conteúdo da informação fornecida em sala de aula, por melhor que seja, não é aprendizagem. A pedagogia e a didática atual apontam para a chamada metodologia de aprendizagem ativa (Eison & Bonwell, 1993).

Assim, os papéis tradicionais na sala de aula onde o professor ensina e o aluno aprende, são, de certa forma, invertidos. No Método de Aprendizagem Ativa, o professor incentiva o aluno a produzir conhecimento e apresentá-lo na dinâmica académica. O professor universitário torna-se um mediador nesse processo propondo desafios académicos aos alunos e ajudando-os a superar as suas dificuldades com métodos ativos (Aliaga *et al.*, 2010; Cobb, 1992; Moore, 1997).

Desta forma, o dinamismo da aprendizagem supera o conteúdo da aprendizagem, promovendo a capacidade de aprender e produzir conhecimento e aplicá-lo a situações relevantes, nas quais adquire postura crítica, prática e autonomia no processo de aprendizagem (O'Neil & McMahon, 2005). Durante muitas décadas, o ensino universitário deu ênfase ao processo de ensino focado em aulas expositivas tendo por objetivo cumprir um programa. Nestas circunstâncias, a avaliação equivalia a um exame do que tinha sido assimilado através de aulas tradicionais e notas de classificação (Massetto, 2003).

No entanto, é imperativo que o processo de avaliação evolua e mude o processo de ensino-aprendizagem o qual deve estar orientado para a aprendizagem de habilidades (McAleer, 2001). A utilização de novas tecnologias de informação no processo ensino-aprendizagem tem crescido nas últimas décadas, pelo que o uso de computadores tornou-se generalizado

no processo de formação em todas as áreas do conhecimento, especialmente na disciplina de estatística dos vários cursos introdutórios de ensino superior.

No contexto social e educacional, o ensino da estatística nos diferentes graus de ensino superior, pode representar um mecanismo importante, funcionando como articulador da prática e da teoria, já que incorpora técnicas próprias que, permitem a interpretação da realidade através de dados obtidos de situações reais, comprovando a flexibilidade do método quando aplicado ao ensino desta disciplina.

O objetivo deste estudo foi introduzir o software Excel nas aulas de estatística, para que os alunos possam aprender fazendo, isto é, manipular e exibir dados de forma eficaz, levando a uma maior compreensão dos conceitos de estatística e à obtenção de resultados finais mais satisfatórios aquando da avaliação final desta unidade curricular.

Com o intuito de entender, na perspetiva do aluno, a importância da integração da folha de cálculo Excel e das suas mais-valias como instrumento inovador para a aprendizagem, registaram-se através de um questionário, as opiniões de alunos matriculados, no ano letivo 2015/16, na unidade curricular de Estatística, da Licenciatura em Administração Publicidade e Marketing do Instituto Politécnico de Portalegre. Apresentamos neste artigo uma análise descritiva das respostas obtidas através do questionário.

2. APRENDIZAGEM ATIVA E RECURSOS COMPUTACIONAIS NA EDUCAÇÃO

O ensino da estatística é uma das preocupações da educação estatística vivida nos mais diversos centros académicos do mundo. Muitas discussões levam os educadores a refletir sobre a adoção das melhores alternativas de ensino que proporcionem ao aluno uma aprendizagem mais significativa.

Uma dessas alternativas será a utilização de recursos computacionais - software educacional que é construído para ser usado especificamente na educação e segue uma concepção educacional. Estes softwares constituem uma importante ferramenta pedagógica para o processo de ensino-aprendizagem. O uso desses recursos evidencia uma forma de dinamização no ensino e motivação para a aprendizagem da estatística.

O uso de recursos computacionais - software educacional pode ser um aliado importante no desenvolvimento cognitivo de cada aluno, facilitando um trabalho que se adapte a diferentes ritmos de aprendizagem e permita aos alunos aprender com seus erros (Gladcheff, Zuffi & Silva, 2001). A busca de novas metodologias de ensino que visem favorecer uma participação mais ativa dos alunos no processo de ensino e aprendizagem, associando o uso de computador como uma tecnologia que se conecta a esses processos, possibilita que este seja um trabalho mais orientado para a visão do mundo do século XXI.

A motivação dos alunos pode aumentar quando o professor constrói um clima de confiança, abertura e cordialidade, o que, por sua vez, depende de como as tecnologias são percebidas e utilizadas (Kenski, 2002). Entre os recursos computacionais que podem auxiliar no processo de ensino e aprendizagem, destacam-se as aplicações de programas para produção de textos, folhas de cálculo, gráficos, vídeos e apresentações de trabalhos (Word, Excel, Power Point e Internet). Também se destacam os jogos educativos e a internet com outro alcance (Pesquisa, e-mail, chats, teleconferências e hipertextos).

Uma ação pedagógica inovadora deve contemplar os vários recursos disponíveis. O aluno e o professor podem utilizar estas ferramentas tecnológicas na resolução de problemas de vários domínios do conhecimento. A representação desta resolução pode ser feita de acordo com:

- uma linguagem de programação;
- controle de processos em tempo real (como visualização e manipulação de dados);
- experiências de um laboratório estatístico;
- produção de música;
- comunicação;
- utilização de redes informáticas.
- ... etc.

Por outro lado, não devemos negligenciar que o principal objetivo do uso de recursos computacionais pelos professores deve ser o de melhorar a aprendizagem dos alunos, segundo Meireles (2006: 21), e deve sempre ser justificado à luz dos benefícios e vantagens de Processo de ensino-aprendizagem. No entanto, o uso adequado desses recursos computacionais implica uma mudança na forma de ensinar e aprender. Ou seja, a integração destes recursos computacionais pode ser ainda mais efetiva na exploração de novos modelos pedagógicos diferenciados, onde as pedagogias ativas se encaixam. Como mencionamos antes, queremos mostrar que ensinar com menos aulas tradicionais e mais métodos de aprendizagem ativos inovadores, como a folha de cálculo do Excel (que inclui uma ampla gama de aplicações) ajuda os alunos a pensar sobre as tarefas que estão a realizar levando a um melhor desempenho das mesmas (Bonwell & Eison, 1991).

Existem várias práticas pedagógicas que abordam a questão da aprendizagem do aluno a partir de uma perspetiva diferente das técnicas clássicas de aprendizagem, como as aulas expositivas, onde é esperado que o professor “ensine” e que o aluno “aprenda”. Na aprendizagem ativa entende-se que, o aluno não deve ser meramente um “recetor” de informações, mas deve ativamente participar no processo de aquisição do conhecimento, com focando-se nos seus objetivos e proactivamente procurar o conhecimento. O uso de recursos computacionais em sala de aula e para além desta, contribui para uma aprendizagem mais ativa, beneficiando todo o processo de ensino aprendizagem. De acordo com Neiss (2005), há uma necessidade de integrar a tecnologia no ensino e aprendizagem nas áreas académicas. No passado, uma vez que as fontes de informação eram escassas, era mais difícil de implementar uma aprendizagem ativa, uma vez que, era necessário que a instituição tivesse uma boa biblioteca onde os alunos pudessem buscar os conhecimentos necessários.

Hoje em dia, com a Internet, tornou-se muito mais fácil aplicar estratégias de aprendizagem ativa. According, Michael e Modell (2003), existem algumas abordagens de aprendizagem ativa centradas nos alunos, que devem ser consideradas: (a) aprendizagem baseada em problemas ou baseada em casos; (b) aprendizagem cooperativa / colaborativa / trabalho de grupo de todos os tipos, (d) estratégias de mudança conceitual, (e) Aprendizagem baseada em inquéritos, (f) aprendizagem baseada na investigação, (g) aprendizagem reforçada por tecnologia.

3. A ESTATÍSTICAS E A FOLHA DE CALCULO EXCEL

O Excel é um programa (folha de cálculo) que foi desenvolvido pela Microsoft para operar no ambiente Windows. Como a maioria das aplicações de computador, foi refinado ajustando-se às novas capacidades dos computadores pessoais, sendo um programa facilmente acessível no ambiente escolar. Com a folha de cálculo do Excel é possível visualizar e aplicar muitos dos conceitos estatísticos e ilustrar graficamente várias situações que passam do papel a um ambiente virtual ou computadorizado, atraindo a atenção dos alunos para o assunto, facilitando a aprendizagem do aluno. Podemos associar os avanços tecnológicos ao ensino da estatística, porque através desta folha de cálculo podemos resolver problemas estatísticos através de comandos simples, para além disso é uma ferramenta que permite a visualização gráfica dos dados com maior precisão.

A utilização de computadores, seja através de software ou da Internet, tem marcado uma presença crescente no ensino e estudo da estatística. No caso da folha de cálculo Excel, que é um software facilmente acessível, é usado nas escolas por professores e alunos, especialmente no caso da estatística. A crescente utilização de novos recursos tecnológicos na sociedade de hoje também se reflete na escola onde calculadoras, computadores e internet são utilizados por professores e alunos para melhorar o processo de ensino e aprendizagem. No caso da estatística, em comparação com outras áreas, a utilização destes novos meios ainda é recomendada com maior ênfase.

Propor aos estudantes a resolução de problemas reais com dados reais e relatar os resultados obtidos, é agora praticável de uma forma que não foi no passado, e os educadores acreditam que o uso de dados reais sobre temas de interesse para os alunos contribui para a sua motivação em aprender estatística e para desfrutar de fazê-lo (Fernandes, Carvalho & Correia, 2011).

Entre os novos recursos tecnológicos, a folha de cálculo Excel é especialmente adequada para o estudo da estatística nos diferentes níveis escolares. A sua fácil acessibilidade, resultante da sua integração no software base do PC, aumenta seu interesse em termos educacionais. São várias as funcionalidades do computador, e em especial da folha de cálculo Excel que parecem contribuir para uma melhor compreensão do conteúdo estatístico pelos alunos e para a capacidade de operar com rapidez e precisão.

Moore (1997) considera as ferramentas tecnológicas como um meio de apoiar os alunos na construção ativa do conhecimento, proporcionando oportunidades para que os alunos reflitam sobre os fenômenos observados, ajudando os alunos a desenvolver habilidades metacognitivas renovando o currículo e o ensino baseados em fortes sinergias entre, conteúdo, pedagogia tecnologia. Estas ferramentas, ao fornecerem fácil acesso a representações textuais, gráficas, tabulares e numéricas, podem ajudar o aluno a alternar o discurso entre diferentes domínios, contextual, gráfico e manipulação de dados. A mudança do ensino tradicional da estatística, enfatizando fórmulas e procedimentos de cálculos, para um ensino mais ativo, onde prevalece o raciocínio estatístico e a capacidade de interpretar, avaliar e aplicar de forma flexível as ideias estatísticas, é agora privilegiada e adotada por muitos professores dos diferentes níveis de ensino (Morales & Roig, 2002; Beh, 2006).

Num estudo realizado por Fernandes, Sousa e Ribeiro (2004), todos os professores participantes foram unânimes em reconhecer que o uso de ferramentas tecnológicas, que incluíam a folha de cálculo Excel e outros softwares, para além de serem recursos muito adequados para o ensino e a aprendizagem da estatística, têm um efeito motivador na aprendizagem dos alunos, mantendo-os interessados e perseverantes na resolução das tarefas.

No caso das tabelas e gráficos estatísticos, a capacidade gráfica da folha de cálculo Excel para construí-los de forma rápida e rigorosa, permite que os alunos se concentrem na sua construção e rápida interpretação, melhorando e facilitando a assimilação dos conteúdos estatísticos, melhorando a motivação dos alunos, contribuindo para uma aprendizagem de melhor qualidade e facilitando a resolução de problemas estatísticos por vezes complexos com base em dados reais (Henriques & Colaço, 2012; Bittar, 2011; Agyei, 2013).

3.1 Metodologia

Os conteúdos introdutórios de estatística estão divididos em três secções: estatística descritiva, probabilidades e estatística e estatística inferencial. A estatística descritiva inclui a representação dos dados através de (gráficos, tabelas de distribuição de frequências, histogramas, polígonos, gráfico de dispersão, e boxplot), medidas de tendência central (média, moda e mediana), e medidas de dispersão (amplitude total, amplitude interquartis, variância, coeficiente de variação, desvio padrão). A teoria das probabilidades aborda temas como acontecimentos mutuamente exclusivos, probabilidade conjunta e condicionada, distribuições de probabilidade, distribuições normais e a estatística inferencial inclui a amostragem e a estimação da média populacional e intervalos de confiança e regressão linear. Estes tópicos regra geral implicam uma hora teórica, uma hora pática e uma hora laboratorial. Introduzimos o Excel como fazendo parte do processo pedagógico. Este é um pacote bastante utilizado, amigável no seu uso, acessível e de custo zero para os alunos.

Os alunos aprendem a lidar com a folha de cálculo e usá-la no levantamento e resolução de problemas, analisando dados e fazendo investigação de padrões/distribuição dos dados, produzindo estatísticas de resumo e gráficos, escrevendo equações e usando ferramentas de análise de dados e comandos estatísticos do Excel. Os estudantes têm de assistir às aulas e participar

nas mesmas, embora a frequência das aulas não seja obrigatória, a realização do trabalho de grupo com recurso ao Excel é obrigatório, talvez por isso os alunos são bastante assíduos. Todos os resumos das aulas, assim como sebentas, material de revisão para a avaliação, foram colocados numa pasta digital, à qual os alunos têm acesso através da intranet da escola. Esta nova metodologia de ensino-aprendizagem desviou o foco da mera aplicação mecânica das fórmulas e, do por vezes complexo cálculo numérico, efetuado através da calculadora, permitindo a visualização rápida dos resultados, principalmente através da representação gráfica tão eficaz no Excel.

Para completar a investigação, foi utilizado um questionário dicotómico distribuído pelos alunos que frequentaram esta unidade curricular de estatística, com o intuito de entender o impacto real da utilização da folha de cálculo Excel, como instrumento inovador para a aprendizagem. Através do questionário foi possível recolher também informações demográficas sobre os alunos, que inclui sexo, idade, nacionalidade, e conhecimentos anteriores de estatística (caso existissem). Perguntamos ainda sobre a sua perceção em relação à estatística e aos estilos de ensino.

Figura 1: Frequência absoluta das respostas às questões dicotómicas do questionário.

1) Sexo	
1.1 () Feminino	
1.2 () Masculino	
2) Faixa etária	
2.1 () até 25 anos	2.4 () de 36 a 40 anos
2.2 () de 26 a 30 anos	2.5 () de 41 a 45 anos
2.3 () de 31 a 35 anos	2.6 () mais de 45 anos
3) A realização do trabalho de grupo contribuiu para entender melhor os conceitos estatísticos?	
3.1 () Sim	3.2 () Não
4) Conhece a folha de cálculo Excel?	
4.1 () Sim	4.2 () Não
5) Conseguir calcular medidas estatísticas no Excel?	
5.1 () Sim	5.2 () Não
6) A utilização do Excel foi útil para a realização do trabalho de grupo?	
6.1 () Sim	6.2 () Não
7) Na sua opinião as aulas de estatística melhoraram com a utilização do excel	
7.1 () Sim	7.2 () Não
8) Recomenda a sua utilização nas aulas de Estatística?

3.2 Análise dos dados

O questionário foi apresentado aos alunos durante a última semana de junho. Foram validados 29 questionários, que corresponderam às 29 respostas obtidas.

Figura 2: Percentagem das respostas relativas ao sexo dos alunos e à idade

Fonte: Dados da pesquisa.

Pela análise do gráfico verificamos que 67% dos respondentes são raparigas e 33% são rapazes, com idades inferiores ou iguais a 25 anos, a idade de 25 anos justifica-se devido a alguns alunos serem repetentes.

Figura 3: Frequência absoluta das respostas às questões dicotómicas do questionário

Fonte: Dados da pesquisa

Os resultados do estudo indicam que:

- 1) Mais de 86% dos alunos concordam que o trabalho de grupo contribui para entender melhor os conceitos de Estatística.
- 2) Todos os alunos conhecem a folha de cálculo Excel.
- 3) 79,3% dos alunos sentem-se aptos no cálculo de medidas estatísticas no Excel.
- 4) A utilização do Excel foi considerada útil para a realização do trabalho de grupo por 55,2% dos alunos.
- 5) 51,7% dos alunos consideraram que as aulas de Estatística melhoraram com a utilização da folha de cálculo Excel.
- 6) Aproximadamente 52% dos alunos recomenda a utilização desta ferramenta nas aulas de Estatística.

4. CONCLUSÕES

As conclusões apontam para a manutenção e inclusão desta ferramenta em sala de aula, podemos mesmo afirmar que deu a oportunidade a estes alunos de aplicar os conceitos de estatística a situações da vida real. Os alunos aprenderam a representar dados em tabelas de frequências, histogramas e tabelas de contingência através do uso da folha de cálculo Excel. Também aprenderam a sintetizar informação estatística, utilizando as ferramentas do menu do Excel data analysis. Além disso, percebeu-se ainda que os alunos ao realizarem os trabalhos de grupo, desenvolveram uma atitude positiva perante a estatística e seus conceitos, independentemente do seu desempenho global.

O impacto desta atividade aumentou o nível de motivação dos alunos e, a retenção dos alunos diminuiu, em comparação com os métodos tradicionais.

Em geral, a pesquisa teve resultado significativo, verificando-se que a utilização do Excel como nova ferramenta no processo de ensino/aprendizagem aumenta o desempenho dos alunos.

Enumeram-se de seguida alguns dos efeitos positivos observados ao longo das aulas de estatística, com a integração do Excel em sala de aula:

- pode ser utilizado como uma ferramenta para suportar e reforçar a aprendizagem dos alunos;
- percepção de benefícios mais amplos ao nível da aprendizagem;
- pode fornecer oportunidades únicas para os alunos fazerem tarefas matemáticas de novas maneiras que ajudam a promover a aprendizagem;
- é uma ferramenta importante para promover a matemática e a resolução de problemas;
- os alunos são motivados a conhecer os comandos da folha de cálculo por forma a que eles possam manipular os mesmos, à sua maneira, por exemplo para desenhar gráficos ou para resolver problemas numéricos;
- permite aos alunos utilizarem o computador como ferramentas de recursos, ou como forma de comunicação e partilha das suas ideias com outros alunos;
- compartilham e comparam a sua compreensão e experiências individuais, aquando da exposição dos trabalhos.
- a apresentação do trabalho de grupo estimulou os processos de expressão e comunicação de todos os estudantes.

- Os resultados indicam que se verificou um impacto positivo na forma de aprender estatística, os alunos tornaram-se mais ativos na participação em grupo.
- Os alunos para além de gostarem de trabalhar em grupo melhoraram as suas habilidades estatísticas e de análise de dados.
- positive impact on the culture of statistical learning, students became active in group participation, and students
- enjoyed learning statistics and also improved their understanding and skill in statistics.

Enumeram-se de seguida algumas considerações que consideramos pertinentes sobre o ensino tradicional e o ensino com aulas interativas, que foram observadas durante este estudo:

- enquanto, nas aulas onde se privilegia o ensino tradicional, o professor fala e os alunos ouvem com o mínimo de interrupções, nas aulas interativas o professor fala mas faz pausas periódicas, para realização de atividades estruturadas;
- no ensino tradicional verifica-se que a concentração dos alunos diminuem após os 10-15 minutos iniciais, nas aulas interativas à medida que a concentração dos alunos começa a diminuir, é-lhes atribuída uma curta atividade para realizarem;
- no ensino tradicional as perguntas feitas pelo professor são na maioria das vezes perguntas retóricas, enquanto nas aulas interativas as perguntas do professor requerem uma resposta;
- no ensino tradicional as respostas dos alunos às perguntas do professor são comumente dadas pelos alunos que levantam as mãos, nas aulas interativas, são dadas várias respostas pelos alunos e discutidas em conjunto;
- No ensino tradicional a conversa entre alunos é normalmente desencorajada, enquanto nas aulas interativas verifica-se o contrário;
- no ensino tradicional os alunos ouvem e tiram nota separadamente, nas aulas interativas os alunos trabalham na maioria das vezes em grupo;
- no ensino tradicional a compreensão do aluno durante a leção dos conteúdos não é percebida explicitamente pelo professor, nas aulas interativas a compreensão do aluno sobre os conteúdos lecionados é avaliada diretamente;
- no ensino tradicional as oportunidades para corrigir interpretações erradas não são muitas das vezes levadas em conta e corrigidas, durante o desenvolvimento dos conteúdos, nas aulas interativas as oportunidades para corrigir mal-entendidos são periodicamente fornecidas aquando do desenvolvimento dos conteúdos;
- Nas aulas tradicionais o de absentismo costuma ser mais elevado, nas aulas interativas as taxas de frequência são frequentemente elevadas.

RESUMO

De acordo com a OCDE (2006), a Educação Financeira tem como propósito proporcionar a todos os cidadãos uma melhor compreensão dos conceitos financeiros, tornando-os mais atentos aos riscos e oportunidades financeiras, de forma a tomarem decisões refletidas, saberem onde se dirigir para obter ajuda e adotarem comportamentos que melhorem o seu bem-estar financeiro. A Universidade do Algarve, através do Grupo de Voluntariado da Educação Financeira, associou-se a este desafio realizando várias sessões de divulgação e sensibilização para esta temática para diferentes públicos, nomeadamente formandos adultos e professores e educadores dos ensinos Básico e Secundário. O presente artigo relata algumas destas experiências de formação, que assentaram na realização de tarefas baseadas em situações do quotidiano e que requerem a compreensão de conceitos chave sobre Educação Financeira. Tratou-se de uma atividade experimental que tencionamos aprofundar e expandir, mas que nos permitiu, desde já, compreender a pertinência desta área de formação, tanto no campo da Educação e Formação de Adultos como na formação profissional de docentes e de educadores, de modo a que passem a incluir a Educação Financeira nos projetos de desenvolvimento curricular que são desenvolvidos nas escolas dos ensinos básico e secundário.

Palavras-chave: Educação Financeira, Orçamento Familiar, Despesas, Saldo.

1. INTRODUÇÃO

A evolução da sociedade, marcada pela globalização, integração dos mercados financeiros e inovação tecnológica nos últimos vinte anos na maioria dos países da Organização para a Cooperação e Desenvolvimento Económico (doravante, OCDE), tornou premente a necessidade da Educação Financeira dos indivíduos. Por um lado, observa-se crescente complexidade e diversidade dos serviços e produtos financeiros que, paralelamente, se têm tornado mais acessíveis a pequenos investidores, expansão do crédito ao consumo e maior responsabilização pessoal pela gestão das suas finanças do que no passado. Por outro, as pessoas têm de tomar decisões financeiras que poderão ter importantes consequências ao longo das suas vidas (por exemplo, escolher entre o arrendamento ou aquisição de habitação; poupar para investir em educação ou em planos de reforma) e decisões financeiras de menor impacto (por exemplo, utilizar cartões de crédito; adquirir um seguro de saúde) para as quais, e não raramente, faltam o conhecimento e as competências financeiras.

Os estudos sugerem que somente uma pequena percentagem da população é detentora do conhecimento básico dos conceitos necessários para a tomada de decisões financeiras, tanto em países com mercados financeiros desenvolvidos, como em vias de desenvolvimento (Lusardi & Mitchell, 2014).

Os conceitos de Educação Financeira, conhecimento financeiro e literacia financeira são, muitas vezes, utilizados indiferentemente pelos investigadores e poucos têm tentado definir ou diferenciar estes termos (Huston, 2010). Esta autora acrescenta que, tipicamente, os indicadores de literacia financeira e/ou o conhecimento financeiro são os *inputs* utilizados para modelar a necessidade de Educação Financeira. Noutros termos, a Educação Financeira contribuirá para aumentar o nível de literacia financeira (Sukumaran, 2015), conforme se observará na secção seguinte.

Genericamente, a atenção que tem sido dispensada à Educação Financeira nas últimas duas décadas cresceu em correlação direta com a crescente complexidade de produtos e mercados financeiros (Alsemgeest, 2015). Fatores como a crise financeira

internacional, que afeta as economias desde 2008, o aumento das taxas de desemprego, o decréscimo das taxas de poupança, o sobre-endividamento das famílias e o aumento de famílias que declaram falência contribuíram para despertar, em muitos países, a necessidade de melhorar o nível de Educação Financeira das populações.

“As organizações internacionais como o G20, a OCDE, a União Europeia e o Banco Mundial têm desenvolvido um amplo trabalho de promoção de programas de formação financeira e de sensibilização para a importância da literacia financeira” (Banco de Portugal, 2013). A OCDE tem estado particularmente ativa em prol da melhoria do nível de Educação Financeira, especialmente desde 2005, ano em que publicou um relatório no qual destacava a grave insuficiência de literacia financeira em muitos países (OCDE, 2005), tendo, em 2008, criado uma Rede Internacional de Educação Financeira e, em 2012, no Programa Internacional para Avaliação dos Estudantes (Programme for International Student Assessment – PISA), introduzido a avaliação opcional da literacia financeira em alguns países. Portugal não foi incluído.

À semelhança de outros países, Portugal também tem revelado alguma preocupação com o nível de literacia financeira da sua população, embora formalmente não exista uma estratégia para a promoção da literacia financeira a nível nacional extensível aos diferentes níveis de ensino. Em 2010 o Banco de Portugal aplicou um questionário conhecido por “Inquérito à literacia Financeira da População Portuguesa”.

A Educação Financeira é deveras importante. A evidência empírica mostra que as disparidades de conhecimento financeiro entre os jovens pode atuar como um multiplicador de desigualdade de riqueza entre os adultos mais velhos (Lusardi, 2015), que a literacia financeira é um importante elemento de promoção da inclusão financeira (Sukumaran, 2015), tem um efeito positivo nos comportamentos financeiros dos indivíduos (Shim, Xiao, Barber & Lyons, 2009), e é um importante elemento de estabilidade económica e financeira dos indivíduos e da economia (Lusardi, 2015).

Esta comunicação insere-se na corrente de investigação de Educação Financeira para adultos. Descreve um projeto de formação da responsabilidade da Universidade do Algarve, numa iniciativa de voluntariado de docentes desta instituição de Ensino Superior no Centro de Formação Profissional do Instituto de Emprego e Formação Profissional de Faro (IEFP) e em contextos de formação contínua para professores dos Ensino Básico e Secundário.

2. EDUCAÇÃO FINANCEIRA E LITERACIA FINANCEIRA

Existem inúmeras definições de literacia financeira, mais ou menos abrangentes, mas não há uma universalmente aceite (Huston, 2010), o que poderá, eventualmente, afetar o efeito de programas de Educação Financeira. Este estudo refere que a literacia financeira poderá ser concetualizada através de duas dimensões: *compreensão* - conhecimento financeiro adquirido através da educação e da experiência sobre finanças pessoais; e *aplicação* - capacidade e confiança para aplicar eficazmente o conhecimento na gestão das finanças pessoais. Assim, o conhecimento financeiro surge como uma dimensão da literacia financeira. Por sua vez, a Educação Financeira é um *input* destinado a aumentar o capital humano das pessoas, especificamente conhecimento financeiro e/ou aplicação (i.e. literacia financeira).

Por sua vez, segundo o estudo de Borden, Lee, Serido e Collins (2008), o modelo de literacia financeira inicia-se, normalmente, pela Educação Financeira, que conduzirá à literacia financeira, modificando as atitudes financeiras e tornando mais eficientes os comportamentos financeiros.

Remund (2010) apresenta duas definições de literacia financeira: a definição concetual, que abrange conceitos financeiros, capacidade de comunicar sobre os mesmos, aptidão para gerir as suas finanças pessoais, competências para tomar as decisões financeiras adequadas e confiança para planear eficazmente as suas necessidades futuras; e a definição operacional com quatro segmentos – orçamento, poupança, crédito e investimento.

A OCDE (2014) apresenta uma definição de literacia financeira que abrange não só o conhecimento e compreensão dos assuntos financeiros, mas também a sua aplicação efetiva na tomada de decisões. Acresce o seu objetivo de melhorar o bem-estar financeiro dos indivíduos e da sociedade, e de melhor preparar os cidadãos para uma participação na vida económica. Defende que a literacia financeira é uma competência essencial para o século XXI.

A literacia financeira tem sido objeto de investigação a vários níveis. Além da pesquisa sobre a sua definição a nível dos países, entidades governamentais e organizações privadas, têm aplicado surveys para medir o nível de literacia das populações. Outros investigadores têm estudado determinantes da literacia financeira como, por exemplo, a idade, o sexo, a nacionalidade, o rendimento, a experiência profissional e o nível de educação, conforme se observa nos estudos empíricos seguintes.

Varum, Santos e Afreixo (2014), no seu estudo sobre os determinantes da literacia económica, que envolve aspetos reais e financeiros com base numa amostra de adultos portugueses, investigaram o efeito do nível de educação, da área de educação, do nível de rendimento, do sexo, da idade, da situação profissional e do grupo étnico. Concluem que os indivíduos que se encontram no ativo apresentam scores mais elevados do que aqueles que se encontram sem atividade, ou seja, os que estão no ativo têm melhores conhecimentos. Monticone (2010) confirmou que os indivíduos empregados responderam mais corretamente às questões sobre literacia financeira do que os desempregados ou inativos.

Scheresberg (2013), investigando o nível de literacia financeira entre adultos jovens nos Estados Unidos, conclui que somente 34% dos inquiridos responderam corretamente às questões de literacia financeira. Encontrou uma relação direta entre os níveis de literacia financeira e educacional, mas constatou que os conhecimentos financeiros continuam a escassear, mesmo nos inquiridos com elevados níveis de escolaridade. Na pesquisa de comportamentos financeiros notou que os inquiridos com melhor nível de literacia têm maior sensibilidade ao custo do financiamento, à necessidade de efetuar poupanças para fazer face a imprevistos e à adesão a planos de reforma, pelo que concluiu que a promoção da educação/literacia financeira entre os jovens pode ser particularmente importante e que é abismal a diferença existente entre a responsabilidade financeira que normalmente lhes é atribuída e a sua capacidade para tomar decisões financeiras eficazes.

Lusardi (2012) descreve uma investigação realizada sobre o nível de conhecimento financeiro dos adultos mais velhos e a qualidade da sua tomada de decisões financeiras em vários países (EUA, Holanda, Itália, Suécia, Rússia, Japão e Nova Zelândia). A comparação internacional mostra que o nível de literacia é baixo nesses países e que os adultos mais velhos, consistentemente, apresentam níveis inferiores de conhecimento financeiro.

Relativamente à relevância da idade dos indivíduos como determinante da literacia financeira, não existe consenso na literatura. Por exemplo, Wood e Doyle (2002) defendem que a idade tem reduzida relevância, enquanto Monticone (2010), no seu survey sobre os determinantes do conhecimento financeiro no contexto italiano, conclui que os adultos de meia-idade dominam mais conhecimentos financeiros do que os mais jovens e os mais velhos. O nível de literacia financeira cresce até aos 40-60 anos, decrescendo posteriormente.

Através do “Inquérito à literacia Financeira da População Portuguesa”, aplicado pelo Banco de Portugal em 2010 e 2015, pretendeu-se avaliar as várias dimensões do conceito de literacia financeira (atitudes, comportamentos e conhecimentos financeiros) e recolher informação para a definição de prioridades de formação financeira. Em ambos os inquéritos, os resultados sugerem que os grupos de indivíduos com idade entre 25 e 54 anos e os de trabalhadores apresentam melhores índices de literacia financeira do que os grupos de indivíduos com idade entre 16 e 24 anos e mais de 55 anos e de desempregados, estudantes e aposentados, à semelhança de estudos já referidos anteriormente.

Não obstante, a investigação sobre educação/literacia financeira tem recaído, especialmente, na avaliação dos conhecimentos, atitudes e comportamentos dos participantes, mas a interligação com a avaliação efetiva das finanças pessoais não tem sido estabelecida (Huston, 2010). Segundo Schuchardt, Hanna, Hira, Lyons, Palmer e Xiao (2009), existe evidência bastante consistente de que a Educação Financeira contribui para melhorar o conhecimento financeiro, e que a correlação é positiva entre o conhecimento financeiro e as práticas financeiras. Mas a literatura ainda não consegue estabelecer claramente essas relações como factos empíricos estilizados. Os referidos autores especificam cinco lacunas na investigação em educação/literacia financeira: i) avaliação do sucesso dos programas de educação; ii) diferenças de metodologias de recolha de dados e respetiva análise; iii) investigação sobre os melhores métodos e momentos de Educação Financeira; iv) uma melhor compreensão do processo pelo qual a Educação Financeira pode contribuir para modificar os comportamentos financeiros e para a tomada de decisões financeiras informadas; e, por último, v) se a Educação Financeira, por si, é eficaz na alteração do bem-estar financeiro.

3. A EDUCAÇÃO FINANCEIRA E OS PROCESSOS EDUCATIVOS E FORMATIVOS

Preocupada com os conhecimentos sobre Educação Financeira dos cidadãos, a OCDE realizou, em 2005, um estudo sobre as competências neste domínio, do qual resultou um relatório denominado “Melhoria da Literacia Financeira: análise de questões e políticas” (OCDE, 2005).

Este estudo colocou a descoberto os conhecimentos e as lacunas de informação que os cidadãos apresentavam neste domínio, e contribuiu para que esta área passasse a ser considerada prioritária nos processos de ensino e de aprendizagem, tanto em contextos formais como informais. As razões apresentadas para esta priorização têm a ver com três motivos que passamos a apresentar. O primeiro é a existência de um número crescente de trabalhadores que, muito provavelmente, terão que contar com as suas pensões e com as suas poupanças para financiar a sua reforma. O segundo, a constatação de que muitos consumidores, em particular as camadas mais jovens, se endividam cada vez mais, quer através do crédito ao consumo ou pela aquisição de habitação própria. O terceiro motivo justifica-se pela evidência de que a maior parte das operações financeiras é feita eletronicamente, o que leva à necessidade de que os cidadãos tenham conta bancária, embora uma percentagem muito significativa de consumidores não participe no sistema financeiro.

Outro dos resultados do estudo, e que reforça a necessidade de Educação Financeira para a população em geral, é a complexidade e a diversidade de produtos financeiros disponíveis, a diversidade de opções relativas, por exemplo, a taxas de juros, prazos e honorários, o aumento da esperança média de vida das pessoas e os baixos conhecimentos financeiros dos consumidores.

Estes resultados deram lugar a um conjunto de recomendações que apontam a Educação Financeira como uma prioridade dos processos de ensino e de aprendizagem sendo, neste sentido, entendida como:

O processo pelo qual os consumidores financeiros/investidores melhoram a sua compreensão sobre os conceitos e produtos financeiros e, através da informação, instrução e/ou aconselhamento objetivos, desenvolvem habilidades e a confiança para tomar consciência de riscos e oportunidades financeiras, para fazer escolhas informadas, saber onde procurar ajuda e tomar outras medidas eficazes para melhorar a sua proteção e o seu bem-estar financeiro (Referencial de Educação Financeira para a Educação Pré-Escolar, o Ensino Básico, o Ensino Secundário e a Educação e Formação de Adultos, 2015, p. 5).

Quanto às recomendações sobre as práticas de Educação Financeira, o relatório é muito claro ao afirmar que estas devem começar na escola, o mais precocemente possível, mas é igualmente relevada a necessidade de formação de professores e de educadores nesta área de ensino e de formação. Para tal, o relatório sublinha que devem ser incentivados programas para formar formadores, devendo, igualmente, ser fornecido material de informação e ferramentas específicas para o trabalho pedagógico (Silva & Powell, 2013).

Conscientes da importância desta área de estudo e de investimento no campo educativo e formativo, está em curso um programa de Educação Financeira da responsabilidade da Universidade do Algarve, numa iniciativa de um grupo de voluntariado de docentes desta instituição de Ensino Superior e que abrange públicos distintos. Temos, assim, realizado sessões de formação com públicos variados, nomeadamente formandos do Centro de Formação Profissional do Instituto de Emprego e Formação Profissional de Faro (IEFP), e com a população de reclusos do Centro Prisional de Faro. Numa outra

vertente desta intervenção, através dos Centros de Formação de Professores tem sido dada formação a docentes de vários ciclos de ensino, a qual pretende, de acordo com o relatório da OCDE anteriormente referido, dotar os professores dos ensinos básico e secundário com as competências necessárias para que implementem a Educação Financeira nos processos de ensino e de aprendizagem.

4. ATIVIDADES DESENVOLVIDAS

Na formação destinada aos adultos, formandos do IIEFP e reclusos, a tarefa tinha como objetivo elaborar um orçamento familiar com um determinado rendimento. Após uma abordagem ao conceito de despesas necessárias e extras, fixas e variáveis, tratou-se o conceito de saldo (positivo e negativo), passando-se, em seguida, para um trabalho prático de simulação de um orçamento mensal em função de algumas situações-problema.

No contexto de uma Oficina de Formação Contínua destinada a professores do Ensino Básico e Secundário, realizada num Centro de Formação de Professores da região do Algarve, foram propostas diversas tarefas adequadas a todos os níveis de ensino, desde a Educação Pré-escolar até ao final do Ensino Secundário, de acordo com o Referencial de Educação Financeira para a Educação Pré-Escolar, o Ensino Básico, o Ensino Secundário e a Educação e Formação de Adultos (2015).

A abordagem das tarefas foi realizada tendo em vista a sua integração no processo de ensino e aprendizagem de várias disciplinas e procurou abarcar três temas distintos do aludido Referencial, tais como: Planeamento e Gestão de Orçamento, Sistema e Produtos Financeiros Básicos e Poupança. Para este artigo selecionámos três tarefas: i) Cartão de crédito – o melhor amigo ou inimigo; ii) a Fatura – adaptada de uma proposta das provas PISA (2015) e iii) Poupar – Uma conversa entre amigos.

4.1 Gestão do Orçamento Familiar

Conforme exposto, a literacia financeira cobre diversas áreas e o referido Referencial de Educação no que respeita à Educação e Formação de Adultos contempla várias unidades que encerram os conteúdos fundamentais para a compreensão das finanças pessoais, nomeadamente: Planeamento e Gestão do Orçamento Familiar, Produtos Financeiros Básicos, Poupança, Crédito e Endividamento e Funcionamento do Sistema Financeiro. A atividade “Gestão do Orçamento Familiar” incidiu na primeira unidade.

Num primeiro momento foram apresentados e discutidos vários conceitos relacionados com despesas, tais como despesas necessárias e extras e as que têm um carácter fixo ou que são variáveis ao longo do tempo. Após uma referência ao rendimento que cada formando usufruía mensalmente foi abordada a situação que decorre da diferença entre o rendimento e a despesa mensal.

Para ilustrar os vários conceitos foi solicitada a participação dos formandos para a apresentação de exemplos do seu dia-a-dia que exemplificassem cada um dos tipos de despesas anteriormente referidas. Assim, como exemplos de despesas necessárias fixas surgiu a renda da casa, a mensalidade do empréstimo bancário para a aquisição de habitação própria, a mensalidade do infantário. Para as despesas necessárias variáveis os formandos apresentaram os valores gastos em combustível para o automóvel, o valor pago mensalmente pelo consumo de água, luz e gás. Como despesas extras fixas surgiu o crédito ao consumo e, como despesas extras variáveis, foram apontadas as despesas em restaurantes ou em lazer.

Após os vários exemplos e alguma discussão, e ainda antes de a tarefa ser proposta aos formandos, estes rapidamente concluíram, com base nos seus próprios rendimentos e nas despesas efetuadas, que, com alguma frequência, se deparam com um saldo negativo e, consequentemente, em situação de dívida a familiares, amigos ou a entidades financeiras.

Para apoiar a resolução da tarefa foi disponibilizada uma tabela (fig. 1), que permitiu aos formandos uma maior facilidade na elaboração do orçamento, pela possibilidade de preenchimento dos valores destinados a cada item, bem como as situações-problemas que teriam que resolver (fig 2).

Figura. 1 Exemplo de tabela para elaboração do orçamento familiar

Mês			Janeiro	Fevereiro	Março
			Valor	Valor	Valor

Figura. 2 Tarefa Gestão do Orçamento Familiar

TAREFA

Considere a família Antunes constituída por um casal e dois filhos. O sr. Antunes e a mulher são ambos funcionários da Câmara Municipal da sua terra. Os filhos têm 15 e 19 anos, o mais novo frequenta o 10.º ano da Escola Secundária local e o mais velho frequenta o 1.º ano da Universidade da região.

Simule um orçamento familiar para a família Antunes para os primeiros três meses de 2016.

Suponha que o sr. Antunes tem um salário líquido de 738,05 euros e a sua mulher um salário líquido de 635,07 euros. Esta família possui ainda uma pequena horta da qual recolhe alguns produtos para consumo próprio e que lhes proporciona um pequeno rendimento adicional. Nos meses de janeiro, fevereiro e março conseguiram ganhar 150 €, 200 € e 250 €, respetivamente.

Comece por calcular o rendimento mensal desta família.

Proponha valores para as despesas fixas, variáveis e extraordinárias (siga a tabela dada) de modo a que:

1. O saldo da família ao fim de cada mês seja **SEMPRE POSITIVO**.
2. Haja um saldo negativo num dos meses, mas que seja compensado no mês seguinte.
3. No final destes três meses haja uma poupança de, pelo menos, 300 € para gastar nas férias de verão.
4. Considere que no mês de fevereiro houve uma despesa imprevista de 350 €. Procure que orçamento do mês de março equilibre esta despesa extraordinária.

Na resolução da tarefa foram surgindo diferentes questões e dificuldades, muitas das quais relacionadas com as experiências de vida de cada adulto. Nos grupos mais jovens, em que os formandos ainda vivem em casa dos pais, foi evidente uma falta de consciência em relação aos gastos com a alimentação, luz, água e eletricidade. No entanto, a discussão em pequeno grupo sobre o custo dos bens alimentares, bem como a partilha da experiência de jovens que já constituíram família e que apenas usufruem do subsídio de formação como rendimento mensal, foi determinante para a conclusão da tarefa. Num caso particular, uma jovem explicou às colegas como eram realizadas as compras, semanalmente, no supermercado, qual o contributo de cada um dos elementos do agregado familiar para as despesas, e como ainda conseguia fazer uma pequena poupança para fazer face a despesas imprevistas. Uma das questões mais discutida entre os elementos mais jovens foi, sem dúvida, as despesas com alimentação, consumo de luz e água. Em contrapartida, quase todos os formandos parecem muito esclarecidos e conhecedores do custo dos pacotes de televisão, telemóvel e internet.

Um aspeto que mereceu grande discussão foi o das despesas extras. Rapidamente se constatou que nem todos encaram as despesas extra da mesma forma, e fazer face a uma despesa extra parece ser uma ideia pouco consensual. Nuns casos a despesa extra surge como uma situação que ocorre em virtude da avaria do carro ou de um problema de saúde imprevisto, em outros casos uma despesa extra será aproveitar os saldos para comprar mais vestuário ou calçado, em função da moda e da oportunidade e não da necessidade. Esta discussão foi particularmente rica para acentuar a consciência das compras desnecessárias.

Alguns participantes destas sessões são pessoas que já tiveram rendimentos elevados, que perderam os seus empregos e que necessitam de repensar as suas estratégias de consumo, em particular pela alteração substancial do seu rendimento familiar que passou a ser bastante mais reduzido.

Embora o contexto da tarefa fosse bastante realista, na medida em que apresentava o rendimento de um casal de funcionários públicos com vencimentos pouco superiores ao ordenado mínimo nacional, para alguns participantes o valor do rendimento foi considerado demasiado elevado.

4.2 Cartão de Crédito; o melhor amigo ou o pior inimigo

As questões relacionadas com o cartão de crédito surgem no 3º ciclo do Ensino Secundário, contudo, a tarefa possibilita a introdução da problemática associada à utilização deste meio de pagamento, mas também permite revisitar vários subtemas relacionados com o Planeamento e Gestão do Orçamento, como, por exemplo, necessidades e desejos ou despesas e rendimento que são tratados desde o ensino pré-escolar. Esta tarefa insere-se no tema Sistema e Produtos Financeiros Básicos – caracterização dos meios de pagamento, e pretende conhecer o funcionamento do cartão de crédito como é proposto no referido Referencial.

CRÉDITO – O MELHOR AMIGO OU O PIOR INIMIGO?

Joel é um estudante do ensino superior com um emprego em part-time. Em janeiro, ele adquiriu o seu primeiro cartão de crédito. A sua conta de cartão de crédito cobra uma taxa de juros anual de 18%. Isto significa que todos os meses Joel paga uma taxa de financiamento de 1,5 por cento (que é 18% dividido por 12 meses) sobre o saldo não pago. E em cada mês, Joel deve fazer um pagamento mínimo de 5% do saldo não pago.

Em janeiro, Joel usou o cartão de crédito para comprar duas camisas e um par de calças, a um preço total de 160€. Ele também comprou um novo par de sapatos com o cartão, a um preço de 75€. Quando o seu primeiro extrato do cartão de crédito chegou, em fevereiro, Joel sabia que era melhor pagar a conta inteira a cada mês e, assim, evitar encargos financeiros; mas como estava um pouco apertado de dinheiro, em fevereiro, ele enviou apenas o pagamento mínimo obrigatório.

Em fevereiro, Joel ofereceu a si mesmo e à sua namorada as entradas num concerto de rock. Comprou online dois bilhetes por 50€ cada, mais uma taxa de cartão de 3€ por cada bilhete. Ele aproveitou ainda para comprar três CDs do grupo a 17€, na banca promocional do concerto. Quando o extrato do cartão chegou, em março, ele continuava a ter pouco dinheiro disponível, por isso fez o pagamento mínimo obrigatório.

No mês de março, Joel teve a grande oportunidade de ir esquiar com o seu amigo Tiago. Os pais de Tiago tinham alugado um apartamento e planearam fazer a viagem de carro. Juntando-se a eles, Joel teve hospedagem gratuita, transporte e pequeno almoço. Mas os almoços e jantares para o período de três dias custaram-lhe 150€ (ele convidou o amigo e os pais para almoçar num dos dias). Os ingressos na estância de esqui para três dias custaram-lhe 120€. Assim, a conta de cartão de crédito total do Joel no início de abril incluiu os novos gastos, o saldo anterior e os juros.

Nesse momento, Joel ficou alarmado com o tamanho da sua conta de cartão de crédito. Mas como ainda estava um pouco desprevenido de dinheiro, ele fez de novo o pagamento mínimo obrigatório. Depois de enviar o seu pagamento, Joel decidiu firmemente parar de usar o seu cartão até ter todo o seu saldo pago. Infelizmente, no mês de abril, o seu carro avariou-se e a conta da oficina foi de 190€. Ele precisava do carro para ir trabalhar e estudar e, portanto, pagou com o cartão. Quando chegou o extrato, em maio, ficou chocado com a dívida crescente e prometeu a si mesmo não gastar nem mais um centimo até pagar toda a dívida. Acabou por decidir pagar 55€ por mês durante o tempo necessário até saldar a dívida do seu cartão de crédito.

Tarefa e Discussão:

- 1) Faça os cálculos do extrato do cartão de Joel (complete a tabela seguinte)
- 2) Se Joel cumprir a sua resolução de fazer pagamentos de 55€ por mês, quanto tempo levará ele a pagar o que deve?
- 3) Quais são as vantagens e os inconvenientes de um cartão de crédito?

Para ajudar na resolução desta tarefa foi apresentada a seguinte tabela que permite o registo dos dados de acordo com a situação apresentada:

Janeiro

4.3 A Fatura

A tarefa – A Fatura, foi adaptada do teste PISA 2012 (OCDE, 2014) sobre Literacia Financeira que se realizou em 18 países – Austrália, Bélgica (Flamenga), Shanghai-China, Colômbia, Croácia, República Checa, Estónia, França, Israel, Itália, Letónia, Nova Zelândia, Polónia, Rússia, República Eslovaca, Eslovénia, Espanha e Estados Unidos da América. A versão original é composta por duas questões de escolha múltipla (nível 1 e 2), sendo apresentadas quatro opções de resposta para cada questão, devendo os alunos apenas escolher a opção correta. Na proposta que apresentámos todas as questões são de resposta aberta de modo a promover a discussão em torno de vários tópicos ligados a esta temática. A fatura criada para esta tarefa procura ser o mais próxima possível da realidade portuguesa, nomeadamente na utilização da moeda utilizada em Portugal – o euro. Para além das questões extraídas do teste do PISA 2012 introduzimos outras que estão diretamente relacionadas com os conteúdos curriculares de matemática do ensino básico, o que pode facilitar e contribuir para a integração deste tema na disciplina de matemática. O professor poderá aproveitar a situação problemática para discutir ainda questões de ordem ética e dos direitos e deveres dos cidadãos.

4.4 Poupança

Por fim, apresentamos uma tarefa dedicada ao tema da poupança. A discussão em torno das necessidades e desejos surge desde o ensino pré-escolar. A necessidade de levar os jovens a compreender e a distinguir, desde os primeiros anos, entre “necessitar” e “querer” é uma preocupação presente no referido Referencial em todos os níveis de ensino. Mais, os jovens no final de ensino básico devem ser capazes de “saber o que é a poupança e quais os seus objetivos” assim como “Compreender formas de aplicação e de remuneração da poupança” (p. 33).

Esta tarefa permite ao professor abordar estes tópicos de acordo com as características dos seus alunos e, se o entender, poderá estabelecer conexões com outras situações.

POUPAR - UMA CONVERSA ENTRE AMIGOS

Paulo, Matias, Elisa, Bernardo e Sara conversavam sobre dinheiro. Um dos seus professores, o Prof. Gabriel, tinha-lhes pedido para pensarem na ideia de poupar dinheiro. Este é um excerto da conversa:

Paulo: Na semana passada comprei esta camisola da Nike por 30 €. Na semana anterior, estava por 39 €. Poupei 9 €.

Elisa: Mas, Paulo, tu gastaste 30 €! Não acho que seja isso que o Prof. Gabriel chama de poupar.

Matias: Para o Prof. Gabriel, poupar significa não gastar o nosso dinheiro.

Bernardo: Sim, acho que o Matias tem razão. Mas é TÃO difícil poupar! Eu, para já, não tenho muito dinheiro. E quero montes de coisas.

Sara: Bem, os meus pais querem que eu poupe um pouco da minha mesada. Eles disseram que se eu poupar 100 € no final do ano, eles acrescentam mais 100 €.

Elisa: Uau, isso é muito generoso! E tu vais conseguir isso?

Sara: Vou tentar. Abri uma conta poupança no banco.

Matias: Eu não tenho uma conta poupança, mas tento não gastar todo o dinheiro que tenho porque quero comprar um bom presente de Natal para a minha namorada.

Paulo: Eu ouvi dizer que se ganham juros sobre o dinheiro que se tem numa conta poupança. É verdade, Sara?

Sara: Sim, acho que sim, mas ainda não sei muito sobre isso.

Bernardo: Eu queria mesmo uma bicicleta nova, mas os meus pais disseram que tenho que juntar dinheiro para a comprar. Eles não a vão comprar.

Elisa: Eu quero um iPad e os meus pais também me disseram a mesma coisa.

Paulo: Eu só não sei como posso economizar algum dinheiro. Há muitas coisas em que quero usar o meu dinheiro. E não sei se quero desistir de gastar.

Matias: É isso, Paulo. É difícil desistir de gastar, especialmente quando ainda não temos muito dinheiro.

Bernardo: Eu ouvi um indivíduo na TV, no outro dia, dizer que as pessoas devem primeiro pagar-se a si mesmas. Eu não entendo bem o que ele quis dizer com isso...

Perguntas para Discussão

Em pequenos grupos, discuta e registre as suas respostas às seguintes perguntas:

1. O que acha que significa a frase: "Pague-se a si mesmo primeiro"?
2. Quais são algumas das razões pelas quais as pessoas pouparam?
3. Comprar produtos com desconto (por exemplo, nos saldos) significa poupar?
4. Ter pouco dinheiro significa que não se consegue poupar?
5. Que formas de poupança conhece e como funcionam?
6. O que é uma conta-poupança? E o que são os juros da poupança?
7. Poupar é o mesmo que desistir de gastar?
8. As pessoas que pouparam são mais cuidadosas com os seus orçamentos?
9. Que ideias poderá dar sobre como poupar para comprar um iPad ou uma bicicleta?

5. PARA CONCLUIR

A motivação que levou o grupo de docentes da UALG a preparar e a implementar o programa que acabámos de apresentar assentou na identificação de graves lacunas, em vários setores da população, relativamente à Educação Financeira (Banco de Portugal, 2011 e 2016). Vários estudos mostram que as diferenças de conhecimento financeiro podem atuar como um multiplicador de desigualdade. Assim, a literacia financeira é um importante elemento de promoção da inclusão financeira, tem um efeito positivo nos comportamentos financeiros individuais, e é um importante elemento de estabilidade económica e financeira dos indivíduos e da economia (Lusardi, 2015; Shim, Xiao, Barber & Lyons, 2009; Sukumaran, 2015).

A tarefa que foi proposta a adultos que frequentavam cursos de formação no IIEP ou estavam reclusos colocava os formandos numa situação hipotética, mas foi prontamente transportada para a sua própria realidade. Tornou-se num objeto de reflexão sobre o quotidiano e os formandos compreenderam a sua pertinência. Mas também aproveitaram estes momentos formativos para questionarem processos que usam para gerir os seus orçamentos e mesmo para exporem estratégias pessoais que utilizam. A orientação pedagógica didática utilizada permitiu a aquisição de mais conhecimentos sobre literacia

financeira, proporcionou a troca de saberes e de experiências, e também a oportunidade para que epistemologias pessoais fossem validadas.

A observação da tarefa tornou evidente que a faixa etária pré-determina diferentes atitudes e entendimentos sobre o que é gerir um orçamento familiar. Para os mais jovens gerir o orçamento familiar parece muito distante das suas preocupações e da sua prática quotidiana. Isto é, a situação de dependência financeira e a falta de autonomia parecem perpetuar uma certa ingenuidade (ou iliteracia), que se reflete em questões tão triviais como a falta de noção de quanto é uma despesa “normal” com eletricidade ou com água. Para os adultos mais velhos, muito embora avaliassem a tarefa como muito positiva, mostraram uma maior consciência acerca da necessidade de se priorizarem despesas, uma noção mais realista sobre o custo de muitos bens de consumo e, sobretudo, validaram práticas usuais de gestão de recursos financeiros e partilharam, uns com os outros, estratégias que utilizam no seu quotidiano.

A formação prestada em contexto de Oficina, destinada a professores e a educadores, apontou para um território de intervenção educativa pouco explorado no nosso sistema educativo, a Educação Financeira, bem como para as inúmeras potencialidades pedagógico-didáticas que esta área pode explorar em qualquer ciclo de escolaridade. As tarefas que foram realizadas por estes formandos não eram, obviamente, para testar os seus conhecimentos na área da Educação Financeira, mas para “experimentarem” estratégias a utilizar com os seus alunos. Tornou-se evidente que para além do carácter transdisciplinar que a Educação Financeira aporta, este tipo de tarefas requer modalidades de trabalho de grupo, que ativam a construção de competências nos alunos, e, sobretudo, partem de situações reais e do quotidiano, ingredientes fundamentais para que os processos de aprendizagem se concretizem.

RESUMO

O presente estudo tem como uma das suas motivações a necessidade de melhorar e promover o ensino das Ciências a partir dos anos iniciais. Para tal foi proposto um curso de formação continuada, intitulado Atividades experimentais no ensino e aprendizagem de Matemática e das Ciências, no contexto dos anos iniciais no Ensino Fundamental e da Educação Infantil, com a duração de 20 horas que envolveu 24 professoras de uma escola da região do Rio Grande do Sul, Brasil. Nesta comunicação analisamos alguns episódios desse curso de formação, a partir das vozes dos participantes. Os dados mostram que os professores reconhecem a importância da experimentação no ensino das Ciências e Matemática, como forma de ultrapassar um ensino baseado exclusivamente na transmissão e memorização de conteúdos, mas reconhecem dificuldades para desenvolver tais atividades. A análise dos dados revela que os professores estavam carentes de ajuda e mostram insegurança em desenvolver atividades experimentais, por entenderem que não dominam os conteúdos específicos de cada disciplina.

Palavras-chave: Formação Continuada, Atividades Experimentais, Anos Iniciais, Matemática, Ciências.

1. INTRODUÇÃO

Os Anos Iniciais do Ensino Fundamental constituem-se como um valioso período na formação do cidadão. No Brasil, as crianças geralmente ingressam neste nível de ensino aos seis anos de idade, permanecendo nele até os onze anos. É nessa fase que as crianças “são frequentemente curiosas, buscam explicações para o que veem, ouvem e sentem” (Brasil, 1997), além de já terem “noções informais sobre numeração, medida, espaço e forma, construídas em sua vivência cotidiana” (Brasil, 1997).

Entretanto, mediante a constatação de que muitos alunos chegam aos Anos Finais do Ensino Fundamental com uma aversão a algumas disciplinas específicas, tais como a Matemática, a Física e a Química, entendemos ser imprescindível refletir sobre como estão sendo desenvolvidos os conhecimentos nestas áreas e pensar em estratégias que possam ser exploradas nos primeiros anos de escolarização. Lorenzato (2010) e Carvalho (1998) consideram que a relação que as crianças estabelecem com a Matemática e as Ciências nos primeiros anos escolares, é determinante para a relação que estas crianças terão futuramente com as referidas áreas de conhecimento.

Nesse contexto, os professores dos Anos Iniciais tornam-se o foco principal de uma investigação desenvolvida no âmbito do Mestrado Acadêmico em Ensino, do Centro Universitário Univates. Esta pesquisa teve como objetivo principal analisar como os professores dos Anos Iniciais interagem com situações em que são propostas atividades experimentais para o ensino da Matemática, Física e Química e perceber como encaram o seu uso em sala de aula.

Dessa forma, foi planejado e desenvolvido um curso de formação continuada, com foco na problematização da interação dos professores com as atividades experimentais. O curso de formação continuada foi desenvolvido em uma escola privada do Rio Grande do Sul, tendo a participação de 24 professores do educandário. No presente trabalho, iremos nos deter em três atividades desenvolvidas na formação, sendo elas: Quebra-Cabeça com sólidos; Submarino; e Leite Psicodélico.

2. REFERENCIAL TEÓRICO

Quando nos referimos ao termo atividades experimentais, estamos subentendendo:

[...] atividades práticas como aquelas tarefas educativas que requerem do estudante a experiência direta com o material presente fisicamente, com o fenômeno e/ou com dados brutos obtidos do mundo natural ou social. Nesta experiência, a ação do aluno deve ocorrer – por meio da experiência física –, seja desenvolvendo a tarefa

manualmente, seja observando o professor em uma demonstração, desde que, na tarefa, se apresente o objeto materialmente (Andrade e Massabni, 2011).

Especificadamente em Matemática, Lorenzato (2010, p. 72) aponta que “Inicialmente, a experimentação pode ser concebida como ação sobre objetos (manipulação), com valorização da observação, comparação, montagem, decomposição (separação) distribuição”, enfatizando que experimentar é um processo natural do ser humano, especialmente para as crianças. O autor enfatiza ainda que “A experimentação é o melhor modo para se conseguir a aprendizagem com significado, uma vez que ela realça o “porquê”, a explicação e, assim, valoriza a compreensão” (Lorenzato, 2010).

Sobre a experimentação, Martins *et al.* (2007) alerta que

Não é a simples manipulação de objectos e instrumentos que gera conhecimento. É necessário questionar, reflectir, interagir com outras crianças e com o professor, responder a perguntas, planear maneiras de testar ideias prévias, confrontar opiniões, para que uma actividade prática possa criar na criança o desafio intelectual que a mantenha interessada em querer compreender fenómenos, relacionar situações, desenvolver interpretações, elaborar previsões.

Nesse sentido, Carvalho *et al.* (1998) também destacam a importância de propor aos alunos problemas que estes possam discutir e propor soluções. Segundo Carvalho *et al.*:

“É exatamente isso o que queremos com nossas atividades: primeiramente, criar condições em sala de aula para que os alunos consigam “fazer”, isto é, resolver o problema experimentalmente; depois, que eles compreendam o que fizeram, isto é, que busquem, agora em pensamento, o “como” conseguiram resolver o problema e o “porquê” de ele ter dado certo” (Carvalho *et al.*, 1998).

Ainda para este autor “Os professores das primeiras séries não precisam estar preocupados em sistematizações fora do alcance dos alunos: assim como a Ciência evoluiu nos séculos, também nossos alunos irão evoluir e reconstruir novos significados para os fenômenos estudados” (Carvalho *et al.*, 1998).

No entanto, alguns investigadores que defendem a realização de atividades experimentais desde os Anos Iniciais, constatarem em suas investigações que pouco tem mudado no ensino das Ciências (Rickmann, 2009; Silva, 2013; Santos, 2011; Moreira, 2010; Tavares, 2009) e da Matemática (Oliveira, 2014; Silveira, 2012) nos últimos anos, prevalecendo ainda um ensino baseado na exposição de conteúdos pelo professor.

Os mesmos pesquisadores convergem para a importância do ensino dessas disciplinas desde os primeiros anos de escolarização, verificando em suas pesquisas que muitos professores reconhecem a necessidade de ultrapassar a exposição de conteúdos, mas confessam não saber como o fazer. Dessa forma, apontam como uma alternativa a formação continuada de professores que lecionam nesse nível de ensino, visto a formação inicial não contemplar os aspectos relacionados com a prática de sala de aula.

Dessa forma, nos desafiamos a pensar numa formação para os professores dos Anos Iniciais que permita estabelecer uma relação entre a teoria e a prática de sala de aula. No entanto, para que esta formação fosse útil e permitisse ressignificar o ensino de Matemática e de Ciências por parte dos professores, entendemos a necessidade de manter a formação centrada na profissão, como prevê Nóvoa (2007):

A formação do professor é, por vezes, excessivamente teórica, outras vezes excessivamente metodológica, mas há um déficit de práticas, de refletir sobre as práticas, de trabalhar sobre as práticas, de saber como fazer. É desesperante ver certos professores que têm genuinamente uma enorme vontade de fazer de outro modo e não sabem como. Têm o corpo e a cabeça cheios de teoria, de livros, de teses, de autores, mas não sabem como aquilo tudo se transforma em prática, como aquilo tudo se organiza numa prática coerente. Por isso, tenho defendido, há muitos anos, a necessidade de uma formação centrada nas práticas e na análise dessas práticas.

Sendo assim, de nada servem cursos de formação que estão descentralizados da escola ou que visem à acumulação de conhecimentos e técnicas. A preocupação deve estar centrada na reflexão crítica das práticas pedagógicas, afinal, mais do que um lugar de aquisição de técnicas e de conhecimentos, a formação de professores é o momento-chave de socialização e da configuração profissional (Nóvoa, 1995).

3. A PARTICIPAÇÃO DAS PROFESSORAS NO CURSO DE FORMAÇÃO CONTINUADA

O curso de formação continuada, intitulado de “Atividades experimentais no ensino e aprendizagem de Ciências Exatas, no contexto dos Anos Iniciais do Ensino Fundamental e da Educação Infantil”, envolver 24 professoras de vários níveis de ensino de uma mesma escola. É importante esclarecer que forma convidadas a participar nesta formação todas as professoras desde as que lecionam a educação infantil até aos anos finais, uma vez que a escola prioriza o diálogo constante entre os diferentes níveis de ensino, além agregar as discussões durante os encontros. Também fizeram parte do grupo as coordenadoras pedagógicas dos Anos Iniciais e da Educação Infantil.

Nesse trabalho, iremos nos deter em três atividades desenvolvidas durante a formação, intituladas de Quebra-Cabeça com sólidos, Submarino e Leite Psicodélico. A escolha destas atividades para apresentação neste artigo deve-se ao interesse que as professoras demonstraram na sua utilização em sala de aula, tendo inclusive, duas delas sido exploradas pelas professoras em

suas turmas durante o período de realização da ação. Dessa forma, vamos relatar as observações feitas durante os encontros de formação e o relato das professoras que desenvolveram tais atividades em sala de aula.

A Atividade Quebra-cabeça com sólido tem o objetivo de encaixar duas peças para formar uma pirâmide de base triangular. Contudo, a construção das duas peças que constituem o quebra-cabeça, que são dois pentaedros não regulares, pode tornar-se um momento de revisão de diferentes conteúdos geométricos. Isso porque a planificação é formada a partir de um triângulo equilátero, o qual é dividido em outros dois triângulos menores, um quadrado e dois trapézios.

Para o desenvolvimento da atividade experimental na sessão de formação, optamos por sua construção junto às professoras, utilizando para isso slides de *power point*, para conduzir as etapas da construção.

A construção da planificação do sólido a ser utilizado como quebra-cabeça constituiu um momento rico de revisão de nomenclaturas e definições, como, por exemplo, a diferenciação dos triângulos de acordo com o tamanho de seus lados. O primeiro desenho a ser realizado pelas professoras era um triângulo equilátero, com lados medindo 18 cm. Tal tarefa constituiu um desafio, visto que se procurava colocar as perguntas corretas para que elas percebessem como fazer em vez de lhes dizer o que fazer. Um exemplo de tal situação ocorreu quando a formadora colocou a seguinte questão: “Me ajudem a pensar numa estratégia para vocês comecem a desenhar, que, com certeza, vai garantir que cada lado tenha 18 cm. Porque eu posso fazer uma linha de 18, uma linha de 18 e não necessariamente quando eu ligar os dois pontos vai ter 18 cm”.

As professoras trocaram ideias entre si, até que uma respondeu: “Tem que achar um meio”, e outra complementou: “Tem que achar um meio, pontilhado para cima, pontilhado para cima, junta as pontas em cima”. As professoras estavam se referindo à altura do triângulo e haviam encontrado uma boa estratégia para garantir a igualdade dos lados.

Enquanto as professoras desenhavam a altura, percebemos que algumas a estavam medindo, talvez tentando utilizar também 18 cm. Aproveitamos para interrogar: “Quanto é a altura? Será que é 18?”, sendo que um conjunto de professoras já havia se dado conta e respondeu: “Não.”, enquanto outras olharam desconfiadas, até que uma perguntou: “Como eu sei quanto dá?”. Nesse momento, explicamos que existem diferentes estratégias para descobrir, sendo uma delas através do Teorema de Pitágoras. No entanto, este não era necessário, pois elas poderiam fazer uma linha pontilhada e depois apagar o excedente, como algumas já haviam feito.

Seguimos com a construção (IMAGEM 1), orientando passo a passo, até obter toda a planificação desejada.

Imagem 1 – Participante realizando a planificação

Fonte: das autoras

Em diferentes etapas durante o processo, algumas professoras perceberam que o seu desenho não estava de acordo com os das colegas, uma vez que elas não haviam feito as medidas de forma rigorosa. Algumas corrigiram, mas duas decidiram recomeçar a atividade, pois tinham desenhado o triângulo equilátero inicial, sem que os seus lados medissem 18 cm.

Devido a algum desânimo das professoras que estavam a reiniciar, aproveitamos para argumentar que esse era um processo natural, que, em determinadas situações, é necessário recomeçar. O grupo concordou e relatou diferentes vivências ocorridas em sala de aula quando desenvolveram algum tipo de desenho ou dobradura com seus alunos, constatando que “Eles não têm paciência”. Discutimos tais situações, chegando à conclusão de que é preciso incentivar tais atividades, pois a paciência é uma habilidade que também precisa ser desenvolvida no contexto escolar.

Enquanto discutíamos, as demais professoras recomeçaram ou corrigiram seus desenhos. Quando todas as planificações estavam prontas, foi colocada a seguinte questão: “Pergunto para vocês antes de recortar, o que a gente tem que observar num sólido planificado se nós temos a intenção de montá-lo?”.
